1.0 SITE OVERVIEW

1.1 PHYSICAL SETTING

The Mohonk Road Industrial Plant (Site) (MRIP) site is located in the Hamlet of High Falls, Ulster County, New York, approximately seven miles north-northwest of the Village of New Paltz (Figure 1.1). The Site includes the original MRIP property at 186 Mohonk Road and surrounding properties impacted by the contaminated groundwater plume emanating from the Site.

1.2 SITE HISTORY AND DESCRIPTION

Industrial activities have taken place at the Site since the early 1960s, which included metal finishing, wet spray painting and the manufacture of store display fixtures, card punch machines and computer frames. The property currently contains a 43,000-square foot (ft), single-story building. A septic field serving this building was used to dispose of hazardous substance-containing wastes, such as solvents and wastes from paint and metal-working operations. Drums, paint sludge and other wastes were also buried in several locations on the MRIP Property. Figure 1.2 provides a layout of the Site.

In April 1994, a residential well near the MRIP property was sampled and was found to contain elevated levels of volatile organic compound (VOCs), with the primary contaminant found to be 1,1,1-trichloroethane (1,1,1-TCA), above the New York State (NYS) Class GA drinking water standards. An Immediate Investigation Work Assignment was implemented in 1994, and groundwater sampling results demonstrated that on-site interface wells, bedrock wells, and the in-service production wells, had 1,1,1-TCA and other compounds above groundwater standards, with the highest levels found in the overburden/bedrock interface wells directly downgradient of the underground septic tank area (i.e. MW-4; 82,000 micrograms per liter (µg/L).

Groundwater sampling results collected during a Remedial Investigation/Feasibility Study indicated that downgradient private water supplies contained 1,1,1-TCA concentrations ranging from non-detectable to 880 µg/L and total VOC concentrations ranging from 1.6 µg/L to 1,077 µg/L (Lawler, Matusky & Skelly Engineers [LMS], 1998). In addition, groundwater in the bedrock aquifer beneath the MRIP property exhibited VOC concentrations above the United States Environmental Protection

Agency (USEPA) Maximum Contaminant Level, and NYS Class GA Water Standards. Based on the findings of the initial investigations, 1,1,1-TCA, 1,1-dichloroethene (1,1-DCE), 1,1-dichloroethane, trichloroethene (TCE), tetrachloroethene, ethylbenzene and xylenes were identified as contaminants of concern (COCs). Data collected from groundwater sampling indicated that a dissolved-phase VOC plume extended approximately one mile north-northeast from the MRIP property.

1.3 CLEANUP GOALS AND REMEDIAL PROGRESS

The Record of Decision (ROD) was signed in 2000 (USEPA, 2000). The description of the selected remedy in the ROD as it pertains to contaminant reduction includes:

- Extraction of contaminated groundwater in the near field and far field plume to restore the aquifer to its most beneficial use (as a potable water supply), treatment with an air stripper, and discharge of the treated water to the nearby Rondout Creek and Coxing Kill Creek. The "near field plume" refers to that portion of the groundwater plume with total VOC concentrations greater than 1,000 µg/L, while the "far field plume" refers to the component of the groundwater plume with 10 µg/L to 1,000 µg/L total VOCs.
- The construction of a public water supply system to provide potable water to the residences and businesses in the Towns of Marbletown and Rosendale with impacted or threatened private supply wells. The primary water supply for the system will be the Catskill Aqueduct. In addition, the individual granular activated carbon filtration systems currently in use will be operated until the new public water supply system is operational.
- Implementation of a groundwater monitoring program to evaluate the effectiveness of the remedy. Figure 1.3 presents locations of site monitoring wells, which are used to collect groundwater samples.
- Institutional controls (IC) may be employed to prevent future use of the bedrock aquifer in the impacted or threatened area.
- Excavation of VOC-contaminated soils with concentrations above the cleanup criteria to prevent or minimize cross-media impacts from COCs in soil to groundwater.
- Off-site disposal of the contaminated soil at appropriately permitted facilities.

In September 2008, USEPA issued a ROD Amendment in which the far field treatment system component of the groundwater remedy was replaced by monitored natural attenuation (USEPA, 2008). The Remedial Action Objectives were updated to reflect activities completed including:

- Restoring the aquifer to its most beneficial use, i.e., as a source of potable water, and restore it as a natural resource;
- Eliminating further off-MRIP property contaminated groundwater migration; and

- Eliminating inhalation and ingestion of, and dermal contact with, contaminated groundwater associated with the Site that does not meet state or exceed federal drinking water standards.

The following remedies were implemented to address the contamination originating from the MRIP Site.

- Installation of a near field groundwater extraction and treatment system (GWETS);
- Excavation of contaminated soils;
- Installation of a soil vapor extraction (SVE) system;
- Installation of a vapor intrusion mitigation system;
- Implementation of ICs;
- Operation, maintenance and monitoring of GWETS and SVE system.

1.4 PREVIOUS INVESTIGATIONS

In 2015, MACTEC Engineering and Consulting, P.C., now MACTEC Engineering and Geology, P.C., (MACTEC) conducted a data gap investigation to better understand the contaminant distribution at the Site and associated conceptual site model, address identified data gaps, and provide additional data that can be used to effectively modify the existing remedial measure, if needed. Field activities completed during the data gap investigation included bedrock borehole geophysics, packer groundwater sampling from extraction wells, direct push Membrane Interface Probe soil sampling, and test pitting, as well as completion of a site survey. The data gap investigation was completed as outlined in the 2015 Data Gap Investigation Field Activities Plan (MACTEC, 2015), and results are summarized below.

Direct push sampling results indicated that concentrations of 1,1,1-TCA and TCE were above the Protection of Groundwater SCO (0.68 and 0.47 mg/kg, respectively) at points throughout the former SVE area. Detections of 1,1,1-TCA ranged from 82-11,000 µg/kg, well above the SCO of 680 µg/kg, with TCE detections ranging from 85-1,900 µg/kg. The main COC at the site is 1,1,1-TCA and the following discussion will focus on that contaminant. Despite these elevated concentrations, the onsite SVE system that was removing this contamination had been decommissioned, leaving residual contamination in place.

Packer sampling results showed that groundwater contamination generally decreased with depth, with the greatest concentrations of VOCs (1,1,1-TCA at 94 to 170 µg/L) observed in fractures from

80 to 100 ft below ground surface (bgs). Despite the highest level of contamination at 80 to 100 ft bgs, extraction wells remove groundwater from depths up to 180 ft (lowest water bearing fracture, ERT-1), indicating that less contaminated water is being extracted. Not only could the lower fractures be diluting the more contaminated fractures, but the well could be acting as a preferential pathway for contamination to move deeper into the bedrock matrix.

Following this field investigation, MACTEC reviewed limited data available from a former SVE system and reviewed available operations and maintenance data from the GWETS that was undergoing upgrades at the time. Review of this data, along with data obtained during the data gap investigation report were presented in the Remedial System Optimization (RSO) Report (MACTEC, 2016), which provided recommendations for optimizing the GWETS pumping depths and possibly reinstating the former SVE system.

The following sections outline pilot study field activities completed in 2019 in support of the 2016 RSO Report.

2.0 SOIL VAPOR EXTRACTION PILOT STUDY

2.1 PURPOSE

An SVE system was operated on the Site from February 2008 until late 2011 or early 2012. The system, although reportedly effective at removing contaminant mass under low groundwater conditions, was terminated because of poor recovery during seasonally high water. There is minimal operational data available regarding the former system in terms of air flow, vacuum influence, vapor concentrations, or how the vapor was treated prior to discharge. MACTEC believed the SVE system may have been terminated prematurely; an SVE pilot test was developed to determine the usability of the existing bedrock SVE wells, how groundwater effects soil vapor capture, and whether dual-phase extraction is effective at lowering the groundwater table enough to enhance soil vapor capture during seasonally high water levels. Overburden SVE wells were not used for this test they were previously decommissioned.

2.2 FIELD EQUIPMENT

The following field equipment was used to perform the SVE tests:

- A trailer mounted SVE system containing:
    - an extraction well manifold, which combines flow from SVE wells, including valves to isolate each well individually;
    - a liquid-vapor knockout tank, to remove liquid from extracted soil vapor before it enters the blower and activated carbon vessel;
    - a blower equipped with an 8 HP motor capable of achieving 350 cubic feet per minute (cfm) at 85 inches of water column (in wc) of vacuum at 50 Hz motor speed;
    - a vapor phase carbon vessel capable of removing site COCs from extracted soil vapor prior to atmospheric discharge;
    - a discharge air stack to discharge treated vapor approximately 10’ above ground surface;
    - a dilution air valve to adjust well head vacuum without adjusting motor speed;
    - an analog vacuum gauge, to read instantaneous vacuum on the system and verify electronic meter readings;
    - and electronic controls and programs to control system components and collect system data.
- Atlas Copco model QAS 25 Portable AC generator for powering of SVE system and groundwater pumps (for lowering water table).

- Five transition couplings (one 6 inch (in) x4 in Fernco reducer and one 4 in x 2 in Fernco reducer with short length of 4-in polyvinylchloride (PVC) pipe between), used to reduce the 6-in SVE well to 2 in to facilitate connection of SVE piping.
- SVE piping network of 2 in SCH-40 PVC piping extending from the top of each SVE well transition coupling to the SVE trailer, with 10' of flexible hose used to connect the SCH 40 pipe to the SVE trailer. Each well was connected to its own port on the exterior of the trailer, with flow from all wells combining at the manifold within the trailer.
- Flow, vacuum, and temperature monitoring points for individual wells and combined system readings; vapor sampling ports for individual wells and combined system samples.
- TSI 9565 Veloci-Calc flow meter and handheld manometer, used to gauge vacuum from 0.001-14.99 in wc , airflow, and temperature through the system.
- Pitot tube used to determine measure airflow to check Veloci-calc readings.
- RAE Systems ppbRAE 3000, used for real time estimations of volatile compound concentrations in soil vapor.

2.3 SUMMARY OF FIELD ACTIVITIES

SVE pilot study field activities were performed onsite from 22 to 31 July 2019. Field activities were originally broken into five phases: mobilization of personnel and equipment, SVE tests under static (non-depressed) groundwater conditions, groundwater pumping tests to determine flowrate needed to depress seasonally high groundwater to levels low enough to enhance SVE, dual-phase pumping tests to compare SVE during high water table to SVE during hydraulically lowered water table conditions, and demobilization of personnel and equipment. As explained below, due to the seasonally low groundwater table and lack of recharge upon pumping, the groundwater pumping and dual-phase extraction tests were not performed. The following subsections outline each phase of testing.

2.3.1 Soil Vapor Extraction Under Static Groundwater Conditions

The existing, onsite SVE wells are constructed as open borehole, bedrock wells drilled to approximately 55 ftbgs and cased through bedrock to approximately 20 ft bgs. Records indicate that, during seasonally high water, groundwater elevations rise to approximately 20 to 25 ft bgs, narrowing the available vadose zone necessary for soil vapor capture. Results from this test were to be compared to that of the test outlined in Section 2.3.3 to determine if lowering the groundwater level within the SVE area increased soil vapor capture and mass removal.

Upon arrival to the Site, depth to water (DTW) in SVE-19, -20, -21, -22, and -23 were measured prior to testing (Table 2.1). The water in the wells were subsequently purged and permitted to recharge for 4 hours and the DTW was measured again (Table 2.1). These measurements were conducted to estimate the pumping rates needed to expose the maximum area of bedrock to optimize the SVE. The recharge in each of the wells is extremely slow (0.03-0.08 ft/hr) and a pumping test would not be practical.

Table 2.1

SVE Well Recovery Test

Well	DTW (initial)	DTW after purge	DTW 4 hours after purge	Recovery amount after 4 hours (ft)
SVE-19	40.05	56.24	56.06	0.18
SVE-20	40.11	54.84	54.72	0.12
SVE-21	47.54	54.68	54.4	0.28
SVE-22	39.41	53.83	53.52	0.31
SVE-23	28.55	54.22	54.02	0.2

Note: all measurements are feet below top of casing

Due to the depth of groundwater upon arrival to the Site and lack of recharge upon pumping, an SVE test under static groundwater conditions was not possible and not performed. To effectively test soil vapor extraction with a reduced vadose zone due to elevated groundwater levels, depth to groundwater would need to be 20-30 ft below top of casing (bTOC), which was not achievable during this test.

2.3.2 Groundwater Pumping Test

As outlined in Section 2.3.1 above, groundwater elevations upon arrival to the site were already lower than expected, and after pumping down the wells, wells did not recharge. After 24 hours, the maximum recharge was observed in well SVE-21 at 4.01 ft, which was not enough to justify performing a pumping test, as depth to water in all wells was still greater than 50 ft. Therefore, no sustained groundwater pumping test was performed.

2.3.3 SVE Under Lowered Groundwater Conditions

The following subsections outline SVE tests performed under lowered groundwater conditions.

2.3.3.1 SVE Ramp-up Testing

After pumping down the five SVE wells and evaluation of the groundwater recharge rate, the SVE test under lowered groundwater conditions began. First, an abbreviated ramp-up test was performed on all wells to gauge flow rates, vacuum, and photo ionization detector (PID) readings from each well individually, and to develop a better understanding of how the SVE system itself functions. Results of the initial ramp-up test can be found in Table 2.2 and were used to adjust the steps to be performed in the expanded ramp-up test. In general, airflow from each well decreased as vacuum on the wellhead increased, opposite of what was expected.

Following the initial ramp-up test, the expanded ramp-up test was completed. Results of the expanded test are shown in Table 2.3. In summary, all five SVE wells were connected to the SVE manifold and opened to system vacuum. Vacuum was incrementally increased by either closing the dilution valve, increasing the blower speed, or a combination of the two, at approximately 1-hour increments. Vacuum increments applied to all wellheads were as follows: 2.3, 8.7, 14.7, 19, 26, and 34 in wc. During each step, air flow, vacuum, temperature, and PID readings were taken from each wellhead to record how increased vacuum affected extracted airflow. Results indicate that airflow increased with additional vacuum, but flowrates were lower than expected, with the highest individual well flowrate of 3.35 cfm observed at SVE-20 during the maximum vacuum setpoint of approximately 34 in wc. Typical extraction rates for an effective SVE system can range from 10 to 100 cfm per well.

Analytical samples of extracted soil vapor were collected twice during the SVE ramp-up test. The first sample was collected five minutes into vapor extraction and under low vacuum, intended to represent short term, accumulated vapor concentration. The second sample was collected immediately following completion of the test, intended to represent longer-term vapor concentrations. Both samples were collected with Summa canisters equipped with five-minute regulators and were collected directly from the wellhead transition coupling. Results of these samples are summarized in Table 2.4, and full laboratory data packages are presented in Appendix A. As

observed in results from samples 356023-SV-T1A (initial) and 356023-SV-T1B (long-term), which were collected from the extraction well manifold and represent the combined system, concentrations of 1,1,1-TCA, 1,1-DCE, and TCE increased with time and vacuum. While vapor phase contaminants could accumulate in the bottom of the wells, results indicate that higher concentrations of Site contaminants still exist in the bedrock matrix, as all vapor within the wells was removed early in the test.

2.3.3.2 SVE Radius of Influence Testing

Following completion of the ramp-up test with all extraction wells, a radius of influence test was performed. The purpose of the radius of influence test was to determine how the SVE wells interact with each other and how wide spread the radius of influence is from each extraction point. This interaction is assessed by applying vacuum to one well with the other four wells sealed at the surface, and by gauging vacuum from within the sealed wellheads. Positive vacuum readings indicate that the well is influenced by vapor extraction while no vacuum readings indicate that the well is not hydraulically connected to the active extraction well.

Prior to performing the radius of influence test, Aztech engineers were dispatched to the site to assess the SVE system performance, as results from the ramp-up test were not expected and MACTEC personnel wanted to determine that the lack of airflow and high vacuum was not due to SVE system malfunction. While no issues were found with the system, Aztech engineers notified MACTEC personnel that the upper amperage of the blower could be safely increased to 24-amps, higher than the 21-amp max that was previously used at request of Aztech technicians. This allowed MACTEC personnel to test higher vacuum levels during radius of influence and air inflow testing.

Results of the SVE radius of influence test are shown in Table 2.5 and explained in more detail below; results are explained in order from most cross-well influence to least.

- SVE-22 showed good connection with SVE-19 (>15 in wc at wellhead), SVE-21 (>15 in wc at wellhead) and SVE-23 (6.53 in wc at wellhead) at maximum tested system vacuum (70.5 in wc). No connection with SVE-20 was observed.
- SVE-19 showed good connection with SVE-22 (>15in wc @ wellhead) and SVE-21 (7.61 in wc @ wellhead) and some connection with SVE-23 (0.5 in wc @ wellhead) at maximum tested system vacuum (72 in wc). No connection with SVE-20 was observed.

- SVE-21 showed some connection with SVE-22 (4.35 in wc @ wellhead) and SVE-19 (2.05 in wc @ wellhead) and little connection to SVE-23 (0.57 in wc @ wellhead) at maximum tested system vacuum (72 in wc). No connection with SVE-20 was observed.
- SVE-23 showed little connection with SVE-22 (1.12 in wc @ wellhead) at maximum tested system vacuum (71 in wc). No vacuum influence was observed at wells SVE-19, -20, or -21.
- SVE-20 showed little to no connection with SVE-22 (0.027 in wc @ wellhead) at maximum tested system vacuum. No other vacuum influence was observed. SVE-20 proved to be the SVE well with the least connection to other wells.

Interactions observed between the wells are presented in the graphic below. The graphic presents active extraction wells (the well through which vapor is extracted from) on the vertical axis, with well head influence on the horizontal axis. Green, red, and yellow shading are used to indicate magnitude of vacuum influence, with green cells indicating a high level of influence (good connection between wells), red indicating low influence (little to no interaction between wells) and yellow indicating moderate influence. For example, the first row indicates that, when extracting vapor from SVE-19, good connection was made with SVE-22, moderate connection was made with SVE-21, and little to no connection was made with SVE-20 and SVE-23.

		Influenced Well				
		SVE-19	SVE-20	SVE-21	SVE-22	SVE-23
Active Extraction Well	SVE-19					
	SVE-20					
	SVE-21					
	SVE-22					
	SVE-23					

Notes:

Color schematic as follows:

Good influence, vacuum readings 10-15+ in wc

Moderate influence, vacuum readings 1-9.99 in wc

Little influence, vacuum readings 0-0.99 in wc

Only maximum recorded vacuum readings presented.

Following radius of influence testing, analytical samples were collected from wells SVE-21, -22, and -23, as these well exhibited the highest PID readings during the initial ramp up test. Vapor samples were collected immediately following the test, while the blower was still connected to the respective wellhead. All samples were collected with Summa canisters equipped with five-minute regulators and were collected directly from the wellhead. Results of these samples are summarized in Table 2.4 and full laboratory data packages are presented in Appendix A. Samples 356023-SV-21, 356023-SV-22, and 356023-23 were collected from each respective well following the radius of influence test and represent individual well long-term vapor concentrations. Results for all three wells indicated that site COCs still persist within the bedrock matrix, with concentrations highest in well SVE-21, the southernmost bedrock SVE well.

Based on radius of influence testing, wells SVE-19, -21, and -22 are hydraulically connected, but wells SVE-20 and -23 showed little to moderate hydraulic connection with other SVE wells. Despite the connection between SVE-19, -21, and -22, maximum airflow observed was 4.14 cfm, recorded when applying 70 in wc vacuum to SVE-22.

2.3.3.3 SVE Inflow Testing

An additional SVE test under depressed groundwater conditions was performed to attempt to increase air movement through the bedrock. Although SVE airflow was limited during the radius of influence tests, tests indicated that air is moving between wells SVE-19, -21, and -22 through the bedrock. Due to this hydraulic connection, enhancement to the flow rate was investigated by applying vacuum to one well head (SVE-19, -21, or -22) with the other wells open to the atmosphere to pull air into the ground, through the bedrock, and out through the extraction well, increasing system airflow contaminated volatilize contaminants. The test began with vacuum was applied to one well with the other four wells sealed at the surface (same as the ROI test). System vacuum was gauged. Well caps from non-extraction wells were then removed. After allowing the system to re-equilibrate, airflow into the ground and system airflow were gauged from all wells. Theoretically, if airflow is recorded moving into the wells, the system airflow should increase respectively. Different configurations were tested with system and well airflow and vacuum recorded during all steps. Tests were conducted with extraction individually on wells SVE-19, -21, and -22, as they showed the most connection during the radius of influence testing. Results for the inflow test are presented in Table 2.6 and explained below.

- SVE-19 was tested first, with 73 in wc vacuum applied to the well head. With all other wells sealed, SVE-21 and SVE-22 once again showed the most hydraulic connection, with vacuum readings of 7.35 in wc and >15 in wc, respectively. Upon testing individual wells, SVE-22 was the only well to show recordable airflow into the well at 2.37 cfm; extracted airflow did not increase.
- SVE-21 was tested next, with 73 in wc vacuum applied to the wellhead. With all other wells sealed, SVE-19 and SVE-22 showed the most hydraulic connection, with vacuum readings of 2.6 in wc and 5.8 in wc, respectively. Upon testing individual wells, SVE-19 and -22 showed maximum airflows into the wells of 0.65 cfm and 1.22 cfm. Extracted system airflow increased to 2.17 cfm (+0.64 cfm) and 2.30 cfm (+0.77 cfm), respectively.
- SVE-22 was the final test, with 68 in wc vacuum applied to the wellhead. With all other wells sealed, SVE-19 and SVE-21 showed the most hydraulic connection, with vacuum readings of >15 in wc and 10.41 in wc, respectively. Upon testing individual wells, SVE-19 and -21 showed maximum airflows into the wells of 1.46 cfm and 1.14 cfm, respectively. Extracted airflow did not increase when wells were opened.

2.4 RESULTS

Over the course of the pilot testing period, three tests were conducted to assess SVE flowrates, contaminant concentrations, and interconnection between SVE wells. The first test assessed the SVE system vacuum capacity as a whole. Even under high vacuum, very little air could be extracted from the bedrock matrix, which would limit full-scale SVE efficiency (high vacuum required for little airflow and contaminant removal).

The second test performed assessed the interconnection between the SVE wells. Results indicated that wells SVE-19, -21, and -22 were hydraulically inter-connected, SVE-23 was moderately connected to SVE-22, and SVE-20 was not hydraulically connected to any other SVE wells. Extracted flow rates remained low even when high vacuum was applied to single wells.

The final test evaluated if the hydraulic connection between the SVE wells could be used to increase soil vapor flow across the bedrock matrix by allowing air to flow into four wells while extracting from one well. Once again, results showed that wells SVE-19, -21, and -22 were connected as influence was observed, but there was not enough influence to produce a consistent increase in the system extraction rate. Therefore, there is not enough available air flow from the existing wells to make SVE possible.

2.5 CONCLUSIONS

The following conclusion were made based on results obtained during the soil vapor extraction pilot test:

- Although soil vapor samples indicate elevated levels of Site COCs remain in subsurface vapors, remediation by SVE will not be efficient utilizing the existing bedrock SVE wells, as sufficient airflow could not be extracted from the bedrock matrix. In order to increase soil vapor capture, additional SVE wells or a fracture opening enhancement would be required, but is not recommended due to expense or potential negative effects on the groundwater concentrations.

- While results from the radius of influence test were repeatable during inflow testing, and vacuum influence was observed between wells SVE-19, -21, and -22, the air inflow test was unsuccessful as an increase in extracted system airflow was not observed when non-extraction well caps were removed. Therefore, it is unlikely that SVE will be successful in this area, even if non-extraction wells introduce ambient air at the depth of contaminated fractures.

- Although soil vapor capture with existing SVE wells would be inefficient and have limited effectiveness, vapor samples collected during pilot study activities indicate that elevated concentrations of site COCs, up to 190,000 µg/m^3 1,1,1-TCA, 23,000 µg/m^3 1,1-DCE, and 5,300 µg/m^3 TCE, still exist in the area around the bedrock SVE wells, indicating that contamination is still present.

3.0 EXTRACTION WELL PACKER SAMPLING PILOT STUDY

Packered extraction well pumping tests took place between 26 August and 13 September 2019. Work was completed in accordance with the Field Activities Plan dated 21 August 2019 (MACTEC, 2019a).

One week prior to start of the pumping test, the GWETS was shut off to allow groundwater to stabilize to static levels. The stabilization of groundwater elevations both before pumping tests began and in between pumping tests was measured with pressure transducers. Graphs of these data are included in Appendix D. Each well (ERT-1, MW-5R and MW-7R) was tested individually for 72 hours, with a minimum of 72 hours between pumping tests to allow for re-stabilization of groundwater. Prior to starting the test on each well, a packer was lowered to a pre-determined elevation, intended to seal the well off just below the target fracture. The pump was then placed just above the packer, and the associated transducer was calibrated to run the pump on level controlled setpoints (pump turns off when water level hits a low level setpoint and on when water level hits a high level setpoint).

3.1 BACKGROUND AND PURPOSE

The ROD states that the remedy for the site includes: "Extraction of contaminated groundwater in the nearfield and far field plume to restore the aquifer to its most beneficial use (as a potable water supply) ….". Following the ROD Amendment in 2008 which changed the selected remedy in the far field from groundwater extraction to monitored natural attenuation, the remedial action objectives were updated and included the objective: "eliminate further off-MRIP property contaminated groundwater migration".

The Site/source area is located at the top of a groundwater recharge area. As a result, vertical hydraulic gradients are naturally downward, and recharge to the groundwater is only by precipitation; no groundwater is flowing onto the Site recharging the aquifer.

Packer sampling conducted as part of the RSO data gap investigation in the fall of 2015 in ERT-1, MW-5R and MW-7R showed that 1,1,1-TCA concentrations generally decrease with depth, with the

greatest concentrations found at fracture depths of 75 ft in ERT-1 (170 µg/l), 93 ft in MW-5R (94 µg/l) and 98 ft in MW-7R (130 µg/l) (MACTEC, 2016). These data are summarized on Table 3-5 in the RSO report which is provided in Appendix B of this report. The current operating configuration is that the submersible pumps are positioned at depths of 183.5 ft, 111 ft and 159.5 ft in ERT-1, MW-5R and MW-7R, respectively. The testing also revealed that the deepest water-bearing fractures identified in wells MW-7R and ERT-1 generally had the highest specific capacity of identified fractures within each borehole. The exception to this condition is that the shallowest fracture in MW-5R had the highest specific capacity.

The packer tests conducted in the fall of 2019 were to determine whether pumping from a shallower fracture zone would result in an increase in influent concentrations while not exacerbating the natural downward vertical hydraulic gradient and thus reduce the vertical spread of contaminants while still maintaining hydraulic control of the source area groundwater.

3.2 FIELD EQUIPMENT

The packered extraction well pilot study field activities were performed onsite between 26 August and 13 September 2019. Before the start of the testing, a synoptic round of water level measurements was conducted in select wells (Appendix C). The following field equipment was onsite for the duration of the field activities:

- A Lansas 999-04 6" well packer was used for all three wells during this series of tests.
- Troll data loggers that were placed in nine observation wells (ERT-2, ERT-3, ERT-4, MW-4, MW-5B, MW-6B, MW-7B, MW-11B and MW-11C) for recording water levels throughout the testing period.

3.3 SUMMARY OF FIELD ACTIVITIES

ERT-1 testing began 26 August and ended 29 August with the following conditions:

- Well Elevation: 303.94 ft above mean sea level (amsl)
- Well depth: 195 ft bTOC
- Current pump depth: 183.5 ft bTOC
- Packer top was set at a depth of 124 ft bTOC, targeting fractures at depths 75 ft and 115 ft bTOC
- Pump reset at 120 ft (63.5 ft higher than current configuration)

- Baseline water levels measured in select wells prior to start of testing
- Flow rates were varied between 9.6 and 23.2 gallons per minute (gpm)
- Eleven groundwater samples were collected over testing period of 3 days
- Data loggers recorded water levels throughout the test period (Appendix E)
- Manual water levels were recorded throughout the test period (Appendix C).

MW-5R testing began 3 September and ended 6 September with the following conditions:

- Well Elevation: 313.63 ft amsl
- Well depth: 125 ft bTOC
- Current pump depth: 111 ft bTOC
- Packer top was set at a depth of 103 ft bTOC, targeting the fracture at 93 ft bTOC
- Pump reset at 96 ft (15 ft higher than current configuration)
- Flow rates were varied between 11.7 and 22.8 gpm
- Ten groundwater samples were collected over testing period of 3 days
- Data logger recorded water levels throughout the test period (Appendix E)
- Manual water levels were recorded throughout the test period (Appendix C).

MW-7R testing began 9 September and ended 12 September with the following conditions:

- Well Elevation: 314.3 ft amsl
- Well depth: 180 ft bTOC
- Current pump depth: 159.5 ft bTOC
- Packer top set at depth of 108.5 ft bTOC, targeting fractures at depths 81ft and 98 ft bTOC
- Pump reset at 101.5 ft (58 ft higher than current configuration)
- Flow rates were varied between 10.7 and 11.4 gpm
- Eleven groundwater samples were collected over testing period of 3 days
- Data logger recorded water levels throughout the test period (Appendix E)
- Manual water levels were recorded throughout the test period (Appendix C).

3.4 RESULTS

The results of the packered extraction well pilot test for 1,1,1-TCA concentrations and hydraulic effects are presented in the following subsections.

3.4.1 Effect on 1,1,1-TCA Concentrations

A summary of the sampling is provided in Table 3.1. Complete laboratory data packages are provided in Appendix A. For comparison purposes, monthly influent concentrations of 1,1,1-TCA for the three extraction wells measured throughout 2018 were averaged and are also shown on Table 3.1. The average 1,1,1-TCA concentrations in the three extraction wells at the end of the testing were higher than the average concentrations in the respective wells measured in 2018. Flow rates were varied throughout the testing period to evaluate if flow rate effected influent concentration. There did not appear to be a noticeable change in concentration with flow rate. The greatest difference between the 2018 average concentrations and packer sampling results were for wells MW-5R and MW-7R. The packer-sampled average results for MW-5R were more than seven times greater than the average influent concentration for that well in 2018. Similarly, packer-sampled average results for MW-7R were more than five times that of the average 2018 results. Packer sampling results for ERT-1 were nearly 50% more than that of the average influent concentration for 2018.

The 2018 results from the extraction wells (Table 3.1) are the result of pumping from the entire open borehole. The increase in concentration of 1,1,1-TCA resulting by packer sampling shallow isolated fractures suggests: 1) that the greatest mass of contamination is bound up in shallow fractures; and 2) that the deeper fractures contribute a sufficient volume of less-contaminated water resulting in a five to seven times dilution in 1,1,1-TCA concentration.

Following completion of the packer testing, the packers were removed but the pumps were placed back in their respective wells at the same elevation used for packer sampling (i.e., higher in the well). The pumps were left operating in this configuration for approximately two weeks. Before pulling the pumps and re-installing them at their original depths, samples from each of the wells were collected. The results, which are provided in Appendix B and shown on Table 3.1**,** indicate that 1,1,1-TCA concentrations were, with the exception of well ERT-1, higher than the average influent concentrations from 2018, but lower than samples collected from isolated fractures higher in the wells during the packer testing and sampling. These results further emphasize how dilution from less-contaminated fractures affect influent concentrations when pumping from the entire borehole.

Packer sampling in MW-7R yielded the highest concentration of 1,1,1-TCA in the wells tested (350 µg/l). Based on the water elevation contour map presented in the 2019 Long Term Monitoring (LTM)

report and constructed using July 2019 water level measurements collected during a period when the extraction wells were off, flow lines from MW-7R in the upgradient direction originate on the southwest side of the facility building (MACTEC, 2019b). It is possible that residual contamination is present in soil and shallow bedrock at the southwest end of the building.

The attitude of the targeted fractures (for packer sampling) is similar for MW-7R and ERT-1 with a northwest dip between 3 to 15 degrees (Appendix B). The fracture (one) from the target zone in MW-5R is dipping to the southwest at 13 degrees. An alternative explanation for observed concentrations is that if dense non-aqueous phase liquid entered the bedrock in the vicinity of MW-5R (i.e., the former septic system and presumed contaminant release area), the contaminants may have gravity drained southward along the dip of the fracture. Upon intercepting the bedding plane fractures that dip to the northwest (orientation of fractures tested in both ERT-1 and MW-7R), movement of contaminants to the northwest would occur due to the natural hydraulic gradient in that direction and the compounding effects of pumping.

3.4.2 Hydraulic Effect

Similar to the RSO testing results shown in Appendix B, the specific capacity (i.e., gallons per minute/foot of drawdown) exhibited during the recent packer testing showed that MW-7R had the lowest, followed by ERT-1 and then MW-5R (Table 3.1). In ERT-1 and MW-5R, specific capacity generally declined throughout testing suggesting that fracture dewatering was occurring.

MW-5R likely exhibits the highest specific capacity because of the presence of fractures that dip to the southwest and northwest which, if continuous, will result in their intersection (Table 3.5 from the RSO Report included in Appendix B). The two water-bearing fractures identified in the boring have opposite dip directions and likely intersect each other in proximity to the borehole. Boreholes in which water-bearing intersecting fractures are present tend to produce more water because the fractures tend to cross-cut other water-bearing fractures.

Wells ERT-1 and ERT-2 are close to the same depth (195 vs 200 ft, respectively) and under non-pumping conditions, they are both located approximately on the same hydraulic equipotential line (Figure 3.1). Because of this, their static (pre-test) water levels are very similar with only a difference of 0.39 ft between that water levels (Table 3.1).

Table 3.2

Vertical Flow Evaluation

Monitoring Period	ERT-1 Water Elevation	ERT-1 Well Depth	ERT-2 Water Elevation	ERT-2 Well Depth
Pre-Test	268.34	195	268.73	200
Test End	250.72	124*	258.54	200

*Note: Effective depth of well with packer installed

Table 3.2 illustrates a head difference of approximately 8 ft between the wells at the end of the pumping test in ERT-1 resulting in localized upward vertical flow from the deeper bedrock.

During the test, wells ERT-1 and MW-5R never reached their low level setpoint despite elevated pumping rates, and MW-7R operated nearly the entire time on level setpoints. While normal system operation extracts approximately 9 gpm from each well, ERT-1 was pumped at rates ranging from 10 to 26 gpm over the three days of testing and MW-5R was pumped at rates ranging from 11 to 23 gpm (Appendix E). This data indicates that MW-5R and ERT-1 in the modified configuration can pump significantly more than 9 gpm each, at least until aquifer storage is depleted.

In contrast, because of cycling, MW-7R was off for 2,200 minutes of the 4,300-minute test. When MW-7R was pumping, it pumped at a rate of 11 to 12 gpm, however the well continued to drawdown at that rate until the low level set point was reached at which point the pumping stopped to allow for recharge to occur. In general, MW-7R pumped for 50 minutes at this rate then shut off for 40 to 70 minutes until the well recharged enough to activate the high-level set point. This indicates that the yield of MW-7R is much less than 11 gpm.

Graphs of the water levels versus flow rate in the three extractions wells over the past year (December 2018 to December 2019) indicate static water levels vary throughout the year (Appendix D). On all three graphs there are two distinct groundwater recovery periods when the extraction wells were not pumping for a period of time (e.g., beginning of April and mid-July). In both instances the recovery curve appears almost complete. However, the groundwater elevation differences between the two curves within each of the wells ranges between 13 and 18 ft. The recovery period in April likely

represents a "wet static", and the recovery period in July represents a "dry static". This varying static water levels at the Site is a function of how much water is in storage within the aquifer at the Site at any given time. The seasonal differences in static water levels indicate the extraction wells are likely pumping at a rate, at least periodically, that is greater than the recharge rate of the aquifer (i.e., aquifer dewatering is occurring).

Water level response in monitoring wells was recorded using data loggers in nine wells and the recovery wells. Graphs of the depth to water for the monitoring wells and recovery wells over the testing period are provided in Appendix E and summarized below on Table 3.3. No measurable response to pumping was indicated in overburden well MW-4 and bedrock well MW-5B. MW-4 showed a general draining of the overburden aquifer throughout the testing period. In contrast, bedrock monitoring wells ERT-3 and ERT-2 responded similarly to pumping of the recovery wells. Monitoring wells MW-11B and MW-11C also responded similarly in response to pumping. This suggests that the predominantly low-angle fractures are laterally extensive. Recovery well MW-7R appears to have the least effect with respect to producing drawdown across the site and ERT-4 showed consistently the least amount of drawdown in the monitoring wells regardless of which recovery well was pumping.

Table 3.3
Approximate Drawdown and Distance From Test Well (ft)

			ERT-1		MW-5R		MW-7R

NE: no effect from pumping

bold: pumping water level at end of test

It should be noted that the drawdown in ERT-2 and ERT-3 was approximately the same as in ERT-1 when it was pumping even though the wells are nearly 200 ft apart. This indicates that there is a fracture directly connecting both wells. This type of hydraulic response is inconsistent with porous media groundwater flow and consistent with non-porous media fracture flow. In other words, at this scale, porous media hydraulics are not applicable.

Reviewing twelve groundwater contour maps starting from 1997 up through 2019 showed periods when the extraction system caused groundwater levels to be depressed enough to be mapped as a contour depression (indicating hydraulic control) and periods when no depression was indicated (Appendix F**)**. The contour maps that didn't demonstrate capture appear to be associated with plant shut down, although this couldn't be confirmed in all cases. Six of the maps (1997, 1998, 1999, 2001, 2015 and 2019) showed no capture and the water elevation in the area of the three extraction wells was generally 245 to 290 feet above mean sea level (ft msl). In contrast, groundwater elevation when capture was obvious ranged from 220 to 240 ft msl with four of the six maps showing an elevation of approximately 220 ft msl in the area of the three extraction wells. The well pumps during

the pilot test were placed at elevations 183 ft, 217 ft and 217 ft msl in ERT-1, MW-5R and MW-7R, respectively. With the pumps positioned at these depths, the ability to drawdown and maintain a target groundwater elevation of 220 ft should be achievable.

3.5 CONCLUSIONS

The following conclusion were reached from the packered extraction well pumping tests:

- Sampling results indicate that pumping from a higher elevation and cutting off flow from lower, presumably less contaminated fractures, increased the concentration of site contaminates of concern in treatment plant influent.
- The lack of marked reduction in concentration over the duration of testing suggests that matrix diffusion may not play a significant role in the detected concentrations.
- ERT-1 and MW-5R were able to maintain 15 gpm each in the reduced well depth configuration; however, the flow may be less if modified wells are all pumping.
- The pump in MW-7R cycled on and off throughout the entire test due to the low specific capacity of the targeted shallow fractures. The fracture identified toward the bottom of the well in MW-7R has the highest specific capacity of the four fractures identified in the well. The lower fracture likely accounts for the majority of water when the entire borehole is pumped resulting in dilution of the more contaminated shallow fractures.
- Water levels vary (13 to 18 ft) due to depletion (or recharge) of aquifer storage. This may affect the degree of hydraulic capture created by the extraction wells.
- The variation in water levels due to seasonal fluctuations in recharge likely results in natural dewatering of shallow contaminated fractures. The extraction system has no effect on unsaturated fractures.
- Because the Site is located on a groundwater recharge area, vertical hydraulic gradients are downward. Pumping from the shallow fractures appears to cause upward flow from deeper in the aquifer as demonstrated by water level elevations in wells ERT-1 and ERT-2. Based on these observations, pumping shallow in the aquifer will reduce the downward vertical spreading of contaminants.
- Based on historical maps, groundwater elevation associated with hydraulic capture in vicinity of the extraction wells is approximately 220 ft msl. With pumps positioned at a shallower level, a groundwater elevation of 220 msl should be able to be achieved along with a reduction or reversing of the natural downward vertical gradients present at the site.

4.0 RECOMMENDATIONS

4.1 SOIL VAPOR EXTRACTION SYSTEM RECOMMENDATIONS

Given the inability to extract sufficient vapor, reinstating the former bedrock SVE system with existing SVE wells is not recommended. However, vapor samples collected during pilot study have concentrations of up to 190,000 µg/m^3 1,1,1-TCA, 23,000 µg/m^3 1,1-DCE, and 5,300 µg/m^3 TCE, indicating that contamination is likely still present and potentially contributing to groundwater contamination. While soil vapor capture from bedrock wells is ineffective, concentrations of site COCs in bedrock groundwater in this area is unknown. Although recharge is extremely slow, groundwater capture from the SVE wells could be effective at removing contaminant mass depending on the concentrations observed. MACTEC recommends further investigating the potential of groundwater capture from the existing SVE wells by performing the following activities on a monthly basis:

- Purge SVE wells dry.
    - Collect depth to water measurements before and after purging
    - Determine volume of water purged
    - Collect grab sample of purge water for analysis of VOCs.
    - Collect depth to water measurements four-hours after purging of well (to estimate seasonal change in recharge rate).

Purge water may be transported to the GWETS for treatment.

Data obtained from routine purging and sampling of the SVE wells will determine:

- how seasonality affects groundwater levels and groundwater recharge in the SVE area;
- how seasonality affects contaminant concentration in bedrock SVE well groundwater;
- whether contaminant mass removal by purging wells and treating purge water is logistically effective.
    - If not, partial or total grouting of wells will be required to prevent potential vertical migration of contaminants into deeper bedrock.

In their current state and with current site knowledge, the bedrock SVE wells are not effective at soil vapor or groundwater extraction, but additional information is required before the wells should be decommissioned by grouting, as vapor analytical results indicate that high levels of contaminants

still exist in the SVE well area. Additional recommendations will be provided following receipt of multiple months of groundwater measurements and analytical results.

4.2 EXTRACTION WELL NETWORK MODIFICATIONS

While the pilot study was successful at proving that higher elevation fractures yielded higher concentrations of site contaminants in extracted groundwater and that lower fractures could be contributing to dilution of the extracted groundwater, the test was not conducted over a long enough period of time to determine whether hydraulic control of the plume could be maintained year-round, especially during times of seasonally low water. Because of this, MACTEC recommends the following:

- Replace pumps with appropriately sized pumps that are better suited to pumping at variable rates between 5 and 15 gpm at both the upper (pilot study) setting and the original, lower setting.
    - This may require upgraded VFDs for pump controls, as the current pumps are oversized, as well as programming changes for pump operation.
- Prior to making permanent changes, modify each extraction well by installing inflatable packers in each well to hydraulically isolate the lower portion of the wells and conduct a long-term pilot test to verify that influent concentrations increase and hydraulic capture is maintained.
- Program pumps to collectively operate at maximum flow capacity of the treatment plant until a low-set point is reached, then the pumps would transition over to level operation.

4.3 GROUNDWATER EXTRACTION AND TREATMENT SYSTEM MODIFICATIONS

As identified in section 4.2 above, MACTEC recommends installing appropriately sized extraction well pumps to replace the existing, oversized pumps. Current pumps are able to maintain a *minimum* flowrate of 9 gpm, while proposed changes may drop the required flowrates below 9 gpm. While no GWETS upgrades are expected, if new pumps are installed, new VFDs may be required to operate the pumps, as the existing VFDs may be oversized. The air stripper's capacity to remove the elevated concentrations of site contaminants will also need to be reassessed, and a larger capacity air stripper may be required. If a larger air stripper is required, a larger blower may also be required.

During long term monitoring sampling in July 2019, it was discovered that elevated concentrations of 1,4 dioxane are present in Site groundwater at levels up to 6.4 µg/l (MW-4). New York state does not currently have any discharge criteria in place for 1,4 dioxane, but the proposed MCL of 1 µg/l was met or exceeded in 14 of 17 samples collected onsite during LTM activities. Although not currently required and not identified in the pilot study, the GWETS may require upgrades to removed 1,4 dioxane.

Notes:
Goal of Test: Determine maximum allowable airflow, pressure, and associated PID readings from the vadose zone under non-pumping groundwater conditions (to be compared with airflow/pressure/PID readings during lowered groundwater (pumping) conditions)
min = minutes
°F = degrees fahrenheit
"H2O = vacuum measure in inches of water column
ppm = parts per million
cfm = cubic feet per minute.
*-Collected through geopump to overcome system vacuum
NM = not measured

Comments From Test:

Velocicalc handheld manometer has a maximum vacuum limit of 15 "H2O. This limit was reached with the dilution valve closed all the way and the blower VFD set to 8 amps. During testing, all wells were within the same vacuum range, and the analog vacuum gauge installed within the SVE trailer continuously read within the same range. All tests with vacuum measurments below 15 "H2O were gauged for vacuum using the analog vacuum meter.

LABORATORY RESULTS

eurofins | Environment Testing TestAmerica

ANALYTICAL REPORT

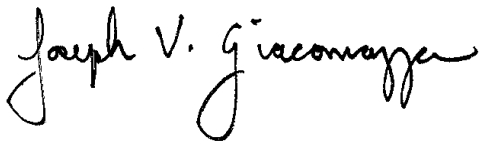
Job Number: 480-158436-1

Job Description: Mohonk Rd. #356023 Groundwaters

Contract Number: C100700

For:
New York State D.E.C.
625 Broadway
Division of Environmental Remediation
Albany, NY 12233-7014

Attention: Charles Gregory



Approved for release.
Joe V Giacomazza
Project Management Assistant II
9/13/2019 4:15 PM

Designee for
Judy L Stone, Senior Project Manager
10 Hazelwood Drive, Amherst, NY, 14228-2298
(484)685-0868
judy.stone@testamericainc.com
09/13/2019

The test results in this report meet all NELAP requirements for analytes for which accreditation is required or available. Any exceptions to the NELAP requirements are noted in this report. Pursuant to NELAP, this report may not be reproduced, except in full, without the written approval of the laboratory. All questions regarding this test report should be directed to the TestAmerica Project Manager who has signed this report. TestAmerica Buffalo NELAC Certifications: CADPH 01169CA, FLDOH E87672, ILEPA 200003, KSDOH E-10187, LADEQ 30708, MDH 036-999-337, NHELAP 2973, NJDEP NY455, NYDOH 10026, ORELAP NY200003, PADEP 68-00281, TXCEQ T-104704412-10-1

The test results in this report relate only to the samples as received by the laboratory and will meet all requirements of the methodology, with any exceptions noted. This report shall not be reproduced except in full, without the express written approval of the laboratory. All questions should be directed to the Eurofins TestAmerica Project Manager.

This report has been electronically signed and authorized by the signatory. Electronic signature is intended to be the legally binding equivalent of a traditionally handwritten signature.

Comments
No additional comments.

Receipt
The samples were received on 8/30/2019 9:40 AM; the samples arrived in good condition, properly preserved and, where required, on ice. The temperature of the cooler at receipt was 3.8º C.

GC/MS VOA
Method(s) 8260C: The continuing calibration verification (CCV) associated with batch 480-490741 recovered above the upper control limit for Trichlorofluoromethane. The samples associated with this CCV were non-detects for the affected analytes; therefore, the data have been reported. The following samples are impacted: 356023-GW-ERT-1-115-1 (480-158436-1), 356023-GW-ERT-1-115-2 (480-158436-2), 356023-GW-ERT-1-115-3 (480-158436-3), 356023-GW-ERT-1-115-4 (480-158436-4), 356023-GW-ERT-1-115-5 (480-158436-5), 356023-GW-ERT-1-115-6 (480-158436-6), 356023-GW-ERT-1-115-7 (480-158436-7), 356023-GW-ERT-1-115-8 (480-158436-8), 356023-GW-ERT-1-115-9 (480-158436-9), 356023-GW-ERT-1-115-10 (480-158436-10) and 356023-GW-ERT-1-115-11 (480-158436-11).

Method(s) 8260C: The following samples were diluted to bring the concentration of target analytes within the calibration range: 356023-GW-ERT-1-115-1 (480-158436-1), 356023-GW-ERT-1-115-2 (480-158436-2), 356023-GW-ERT-1-115-3 (480-158436-3), 356023-GW-ERT-1-115-5 (480-158436-5), 356023-GW-ERT-1-115-6 (480-158436-6), 356023-GW-ERT-1-115-7 (480-158436-7), 356023-GW-ERT-1-115-9 (480-158436-9), 356023-GW-ERT-1-115-10 (480-158436-10) and 356023-GW-ERT-1-115-11 (480-158436-11). Elevated reporting limits (RLs) are provided.

Method(s) 8260C: The following sample was diluted to bring the concentration of target analytes within the calibration range: 356023-GW-ERT-1-115-4 (480-158436-4). Elevated reporting limits (RLs) are provided.

Method(s) 8260C: The continuing calibration verification (CCV) associated with batch 480-490780 recovered above the upper control limit for Trichlorofluoromethane. The samples associated with this CCV were non-detects for the affected analytes; therefore, the data have been reported. The following samples are impacted: 356023-GW-ERT-1-115-4 (480-158436-4) and TRIP BLANK-1 (480-158436-12).

Method(s) 8260C: The laboratory control sample (LCS) for analytical batch 480-490780 recovered outside control limits for the following analytes: Chloroethane. These analytes were biased high in the LCS and were not detected in the associated samples; therefore, the data have been reported. The following samples are impacted:356023-GW-ERT-1-115-4 (480-158436-4) and TRIP BLANK-1 (480-158436-12).

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

Definitions/Glossary

Client: New York State D.E.C. Job ID: 480-158436-1
Project/Site: Mohonk Rd. #356023 Groundwaters

Qualifiers

GC/MS VOA

Qualifier	Qualifier Description
*	LCS or LCSD is outside acceptance limits.
E	Result exceeded calibration range.
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
¤	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CNF	Contains No Free Liquid
DER	Duplicate Error Ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL	Detection Limit (DoD/DOE)
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision Level Concentration (Radiochemistry)
EDL	Estimated Detection Limit (Dioxin)
LOD	Limit of Detection (DoD/DOE)
LOQ	Limit of Quantitation (DoD/DOE)
MDA	Minimum Detectable Activity (Radiochemistry)
MDC	Minimum Detectable Concentration (Radiochemistry)
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
NC	Not Calculated
ND	Not Detected at the reporting limit (or MDL or EDL if shown)
PQL	Practical Quantitation Limit
QC	Quality Control
RER	Relative Error Ratio (Radiochemistry)
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)

No Detections.

This Detection Summary does not include radiochemical test results.

Method Summary

Client: New York State D.E.C.
Job ID: 480-158436-1
Project/Site: Mohonk Rd. #356023 Groundwaters

Method	Method Description	Protocol	Laboratory
8260C	Volatile Organic Compounds by GC/MS	SW846	TAL BUF
5030C	Purge and Trap	SW846	TAL BUF

Protocol References:

SW846 = "Test Methods For Evaluating Solid Waste, Physical/Chemical Methods", Third Edition, November 1986 And Its Updates.

Laboratory References:

TAL BUF = Eurofins TestAmerica, Buffalo, 10 Hazelwood Drive, Amherst, NY 14228-2298, TEL (716)691-2600

Client Sample ID: 356023-GW-ERT-1-115-1
Lab Sample ID: 480-158436-1

Date Collected: 08/26/19 16:25
Matrix: Water
Date Received: 08/30/19 09:40

Method: 8260C - Volatile Organic Compounds by GC/MS

List Number: 1
Creator: Harper, Marcus D

Question	Answer	Comment
Radioactivity either was not measured or, if measured, is at or below background	True	
The cooler's custody seal, if present, is intact.	True	
The cooler or samples do not appear to have been compromised or tampered with.	True	
Samples were received on ice.	True	
Cooler Temperature is acceptable.	True	
Cooler Temperature is recorded.	True	
COC is present.	True	
COC is filled out in ink and legible.	True	
COC is filled out with all pertinent information.	True	
Is the Field Sampler's name present on COC?	True	
There are no discrepancies between the sample IDs on the containers and the COC.	True	
Samples are received within Holding Time (Excluding tests with immediate HTs)..	True	
Sample containers have legible labels.	True	
Containers are not broken or leaking.	True	
Sample collection date/times are provided.	True	
Appropriate sample containers are used.	True	
Sample bottles are completely filled.	True	
Sample Preservation Verified	True	
There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs	True	
VOA sample vials do not have headspace or bubble is <6mm (1/4") in diameter.	True	
If necessary, staff have been informed of any short hold time or quick TAT needs	True	
Multiphasic samples are not present.	True	
Samples do not require splitting or compositing.	True	
Sampling Company provided.	True	WOOD
Samples received within 48 hours of sampling.	True	
Samples requiring field filtration have been filtered in the field.	N/A	
Chlorine Residual checked.	N/A

ANALYTICAL REPORT

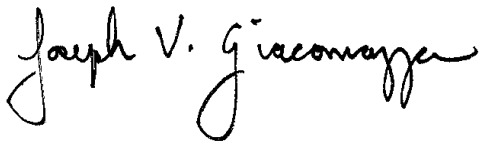
Job Number: 480-158822-1

Job Description: Mohonk Rd. #356023 Groundwaters

Contract Number: C100700

For:
New York State D.E.C.
625 Broadway
Division of Environmental Remediation
Albany, NY 12233-7014

Attention: Charles Gregory



Approved for release.
Joe V Giacomazza
Project Management Assistant II
9/20/2019 1:01 PM

Designee for
Judy L Stone, Senior Project Manager
10 Hazelwood Drive, Amherst, NY, 14228-2298
(484)685-0868
judy.stone@testamericainc.com
09/20/2019

The test results in this report meet all NELAP requirements for analytes for which accreditation is required or available. Any exceptions to the NELAP requirements are noted in this report. Pursuant to NELAP, this report may not be reproduced, except in full, without the written approval of the laboratory. All questions regarding this test report should be directed to the TestAmerica Project Manager who has signed this report. TestAmerica Buffalo NELAC Certifications: CADPH 01169CA, FLDOH E87672, ILEPA 200003, KSDOH E-10187, LADEQ 30708, MDH 036-999-337, NHELAP 2973, NJDEP NY455, NYDOH 10026, ORELAP NY200003, PADEP 68-00281, TXCEQ T-104704412-10-1

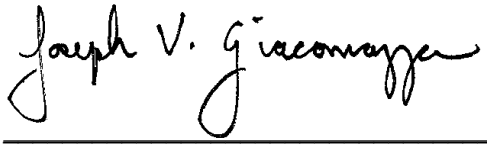
The test results in this report relate only to the samples as received by the laboratory and will meet all requirements of the methodology, with any exceptions noted. This report shall not be reproduced except in full, without the express written approval of the laboratory. All questions should be directed to the Eurofins TestAmerica Project Manager.

This report has been electronically signed and authorized by the signatory. Electronic signature is intended to be the legally binding equivalent of a traditionally handwritten signature.

Job Number: 480-158822-1

Job Description: Mohonk Rd. #356023 Groundwaters

I certify that this data package is in compliance with the terms and conditions of the contract, both technically and for completeness, for other than the conditions detailed within the body of this report. Release of the data contained in this sample data package and in the electronic data deliverable has been authorized by the Laboratory Manager or his/her designee, as verified by the following signature.



Approved for release.

Comments
No additional comments.

Receipt
The samples were received on 9/7/2019 9:30 AM; the samples arrived in good condition, properly preserved and, where required, on ice. The temperature of the cooler at receipt was 2.7º C.

GC/MS VOA
Method(s) 8260C: The following samples were diluted to bring the concentration of target analytes within the calibration range: 356023-GW-MW-5R-93-3 (480-158822-3), 356023-GW-MW-5R-93-4 (480-158822-4) and 356023-GW-MW-5R-93-5 (480-158822-5). Elevated reporting limits (RLs) are provided.

Method(s) 8260C: The following samples were diluted to bring the concentration of target analytes within the calibration range: 356023-GW-MW-5R-93-1 (480-158822-1) and 356023-GW-MW-5R-93-2 (480-158822-2). Elevated reporting limits (RLs) are provided.

Method(s) 8260C: The following volatile samples were analyzed with significant headspace in the sample container(s): 356023-GW-MW-5R-93-1 (480-158822-1) and 356023-GW-MW-5R-93-2 (480-158822-2). Significant headspace is defined as a bubble greater than 6 mm in diameter.

Method(s) 8260C: The following samples were diluted to bring the concentration of target analytes within the calibration range: 356023-GW-MW-5R-93-6 (480-158822-6), 356023-GW-MW-5R-93-7 (480-158822-7) and 356023-GW-MW-5R-93-8 (480-158822-8). Elevated reporting limits (RLs) are provided.

Method(s) 8260C: The initial calibration curve analyzed in analytical batch 480-491176 and associated with analytical batch 480-492066 was outside method criteria for the following analyte: 1,2,3-Trichlorobenzene. As indicated in the reference method, sample analysis may proceed; however, any detection or non-detection for the affected analyte(s) is considered an estimated concentration.

Method(s) 8260C: The following samples were diluted to bring the concentration of target analytes within the calibration range: 356023-GW-MW-5R-93-9 (480-158822-9) and 356023-GW-MW-5R-93-10 (480-158822-10). Elevated reporting limits (RLs) are provided.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
¤	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CNF	Contains No Free Liquid
DER	Duplicate Error Ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL	Detection Limit (DoD/DOE)
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision Level Concentration (Radiochemistry)
EDL	Estimated Detection Limit (Dioxin)
LOD	Limit of Detection (DoD/DOE)
LOQ	Limit of Quantitation (DoD/DOE)
MDA	Minimum Detectable Activity (Radiochemistry)
MDC	Minimum Detectable Concentration (Radiochemistry)
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
NC	Not Calculated
ND	Not Detected at the reporting limit (or MDL or EDL if shown)
PQL	Practical Quantitation Limit
QC	Quality Control
RER	Relative Error Ratio (Radiochemistry)
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)

Detection Summary

Client: New York State D.E.C.
Job ID: 480-158822-1
Project/Site: Mohonk Rd. #356023 Groundwaters

Client Sample ID: 356023-GW-MW-5R-93-1 — Lab Sample ID: 480-158822-1

Analyte	Result	Qualifier	RL	MDL	Unit	Dil Fac	D	Method	Prep Type
1,1,1-Trichloroethane	320		10	8.2	ug/L	10		8260C	Total/NA
1,1-Dichloroethane	20		10	3.8	ug/L	10		8260C	Total/NA
1,1-Dichloroethene	71		10	2.9	ug/L	10		8260C	Total/NA
Trichloroethene	19		10	4.6	ug/L	10		8260C	Total/NA

Client Sample ID: 356023-GW-MW-5R-93-2 — Lab Sample ID: 480-158822-2

Analyte	Result	Qualifier	RL	MDL	Unit	Dil Fac	D	Method	Prep Type
1,1,1-Trichloroethane	230		10	8.2	ug/L	10		8260C	Total/NA
1,1-Dichloroethane	17		10	3.8	ug/L	10		8260C	Total/NA
1,1-Dichloroethene	51		10	2.9	ug/L	10		8260C	Total/NA
Trichloroethene	16		10	4.6	ug/L	10		8260C	Total/NA

Client Sample ID: 356023-GW-MW-5R-93-3 — Lab Sample ID: 480-158822-3

Analyte	Result	Qualifier	RL	MDL	Unit	Dil Fac	D	Method	Prep Type
1,1,1-Trichloroethane	240		5.0	4.1	ug/L	5		8260C	Total/NA
1,1-Dichloroethane	17		5.0	1.9	ug/L	5		8260C	Total/NA
1,1-Dichloroethene	68		5.0	1.5	ug/L	5		8260C	Total/NA
Trichloroethene	16		5.0	2.3	ug/L	5		8260C	Total/NA

Client Sample ID: 356023-GW-MW-5R-93-4 — Lab Sample ID: 480-158822-4

Analyte	Result	Qualifier	RL	MDL	Unit	Dil Fac	D	Method	Prep Type
1,1,1-Trichloroethane	260		5.0	4.1	ug/L	5		8260C	Total/NA
1,1-Dichloroethane	19		5.0	1.9	ug/L	5		8260C	Total/NA
1,1-Dichloroethene	68		5.0	1.5	ug/L	5		8260C	Total/NA
Trichloroethene	17		5.0	2.3	ug/L	5		8260C	Total/NA

Client Sample ID: 356023-GW-MW-5R-93-5 — Lab Sample ID: 480-158822-5

Analyte	Result	Qualifier	RL	MDL	Unit	Dil Fac	D	Method	Prep Type
1,1,1-Trichloroethane	240		5.0	4.1	ug/L	5		8260C	Total/NA
1,1-Dichloroethane	17		5.0	1.9	ug/L	5		8260C	Total/NA
1,1-Dichloroethene	68		5.0	1.5	ug/L	5		8260C	Total/NA
Trichloroethene	17		5.0	2.3	ug/L	5		8260C	Total/NA

Client Sample ID: 356023-GW-MW-5R-93-6 — Lab Sample ID: 480-158822-6

Analyte	Result	Qualifier	RL	MDL	Unit	Dil Fac	D	Method	Prep Type
1,1,1-Trichloroethane	220		5.0	4.1	ug/L	5		8260C	Total/NA
1,1-Dichloroethane	16		5.0	1.9	ug/L	5		8260C	Total/NA
1,1-Dichloroethene	54		5.0	1.5	ug/L	5		8260C	Total/NA
Trichloroethene	15		5.0	2.3	ug/L	5		8260C	Total/NA

Client Sample ID: 356023-GW-MW-5R-93-7 — Lab Sample ID: 480-158822-7

Analyte	Result	Qualifier	RL	MDL	Unit	Dil Fac	D	Method	Prep Type
1,1,1-Trichloroethane	250		5.0	4.1	ug/L	5		8260C	Total/NA
1,1-Dichloroethane	18		5.0	1.9	ug/L	5		8260C	Total/NA
1,1-Dichloroethene	63		5.0	1.5	ug/L	5		8260C	Total/NA
Trichloroethene	16		5.0	2.3	ug/L	5		8260C	Total/NA

This Detection Summary does not include radiochemical test results.

Detection Summary

Client: New York State D.E.C.
Job ID: 480-158822-1
Project/Site: Mohonk Rd. #356023 Groundwaters

Client Sample ID: 356023-GW-MW-5R-93-8
Lab Sample ID: 480-158822-8

Analyte	Result	Qualifier	RL	MDL	Unit	Dil Fac	D	Method	Prep Type
1,1,1-Trichloroethane	210		5.0	4.1	ug/L	5		8260C	Total/NA

List Number: 1
Creator: Kolb, Chris M

Question	Answer	Comment
Radioactivity either was not measured or, if measured, is at or below background	True	
The cooler's custody seal, if present, is intact.	True	
The cooler or samples do not appear to have been compromised or tampered with.	True	
Samples were received on ice.	True	
Cooler Temperature is acceptable.	True	
Cooler Temperature is recorded.	True	
COC is present.	True	
COC is filled out in ink and legible.	True	
COC is filled out with all pertinent information.	True	
Is the Field Sampler's name present on COC?	True	
There are no discrepancies between the sample IDs on the containers and the COC.	True	
Samples are received within Holding Time (Excluding tests with immediate HTs)..	True	
Sample containers have legible labels.	True	
Containers are not broken or leaking.	True	
Sample collection date/times are provided.	True	
Appropriate sample containers are used.	True	
Sample bottles are completely filled.	True	
Sample Preservation Verified	True	
There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs	True	
VOA sample vials do not have headspace or bubble is <6mm (1/4") in diameter.	True	
If necessary, staff have been informed of any short hold time or quick TAT needs	True	
Multiphasic samples are not present.	True	
Samples do not require splitting or compositing.	True	
Sampling Company provided.	True	WOOD E+IS
Samples received within 48 hours of sampling.	False	
Samples requiring field filtration have been filtered in the field.	True	
Chlorine Residual checked.	N/A

ANALYTICAL REPORT

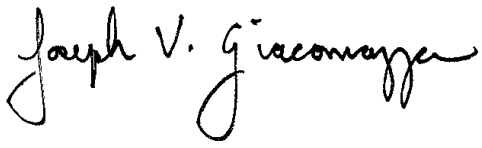
Job Number: 480-159208-1

Job Description: Mohonk Rd. #356023 Groundwaters

Contract Number: C100700

For:
New York State D.E.C.
625 Broadway
Division of Environmental Remediation
Albany, NY 12233-7014

Attention: Charles Gregory



Approved for release.
Joe V Giacomazza
Project Management Assistant II
9/28/2019 10:57 AM

Designee for
Judy L Stone, Senior Project Manager
10 Hazelwood Drive, Amherst, NY, 14228-2298
(484)685-0868
judy.stone@testamericainc.com
09/28/2019

The test results in this report meet all NELAP requirements for analytes for which accreditation is required or available. Any exceptions to the NELAP requirements are noted in this report. Pursuant to NELAP, this report may not be reproduced, except in full, without the written approval of the laboratory. All questions regarding this test report should be directed to the TestAmerica Project Manager who has signed this report. TestAmerica Buffalo NELAC Certifications: CADPH 01169CA, FLDOH E87672, ILEPA 200003, KSDOH E-10187, LADEQ 30708, MDH 036-999-337, NHELAP 2973, NJDEP NY455, NYDOH 10026, ORELAP NY200003, PADEP 68-00281, TXCEQ T-104704412-10-1

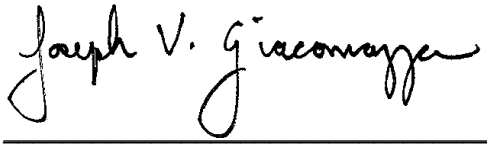
The test results in this report relate only to the samples as received by the laboratory and will meet all requirements of the methodology, with any exceptions noted. This report shall not be reproduced except in full, without the express written approval of the laboratory. All questions should be directed to the Eurofins TestAmerica Project Manager.

This report has been electronically signed and authorized by the signatory. Electronic signature is intended to be the legally binding equivalent of a traditionally handwritten signature.

Job Number: 480-159208-1

Job Description: Mohonk Rd. #356023 Groundwaters

I certify that this data package is in compliance with the terms and conditions of the contract, both technically and for completeness, for other than the conditions detailed within the body of this report. Release of the data contained in this sample data package and in the electronic data deliverable has been authorized by the Laboratory Manager or his/her designee, as verified by the following signature.



Approved for release.
Joe V Giacomazza

Comments
No additional comments.

Receipt
The samples were received on 9/14/2019 9:00 AM; the samples arrived in good condition, properly preserved and, where required, on ice. The temperature of the cooler at receipt was 3.3º C.

GC/MS VOA
Method(s) 8260C: The continuing calibration verification (CCV) associated with batch 480-493096 recovered above the upper control limit for 2-Butanone (MEK). The samples associated with this CCV were non-detect above the reporting limit (RL) for the affected analytes; therefore, the data have been reported. The following samples are impacted: TRIP BLANK 3 (480-159208-1), 356023-GW-MW-7R-98-1 (480-159208-2) and 356023-GW-MW-7R-98-2 (480-159208-3).

Method(s) 8260C: The following samples were diluted to bring the concentration of target analytes within the calibration range: 356023-GW-MW-7R-98-1 (480-159208-2), 356023-GW-MW-7R-98-2 (480-159208-3), 356023-GW-MW-7R-98-3 (480-159208-4), 356023-GW-MW-7R-98-4 (480-159208-5) and 356023-GW-MW-7R-98-5 (480-159208-6). Elevated reporting limits (RLs) are provided.

Method(s) 8260C: The continuing calibration verification (CCV) associated with batch 480-493246 recovered above the upper control limit for 2-Butanone. The samples associated with this CCV were non-detects for the affected analytes; therefore, the data have been reported. The following samples are impacted: 356023-GW-MW-7R-98-1 (480-159208-2), 356023-GW-MW-7R-98-2 (480-159208-3), 356023-GW-MW-7R-98-3 (480-159208-4), 356023-GW-MW-7R-98-4 (480-159208-5) and 356023-GW-MW-7R-98-5 (480-159208-6).

Method(s) 8260C: The following samples were diluted to bring the concentration of target analytes within the calibration range: 356023-GW-MW-7R-98-6 (480-159208-7), 356023-GW-MW-7R-98-7 (480-159208-8), 356023-GW-MW-7R-98-8 (480-159208-9), (480-159208-C-9 MS) and (480-159208-C-9 MSD). Elevated reporting limits (RLs) are provided.

Method(s) 8260C: The following samples were diluted to bring the concentration of target analytes within the calibration range: 356023-GW-MW-7R-98-9 (480-159208-10), 356023-GW-MW-7R-98-10 (480-159208-11) and 356023-GW-MW-7R-98-11 (480-159208-12). Elevated reporting limits (RLs) are provided.

Method(s) 8260C: The continuing calibration verification (CCV) associated with batch 480-493682 recovered outside acceptance criteria, low biased, for Vinyl chloride and Chloromethane. A reporting limit (RL) standard was analyzed, and the target analytes were detected. Since the associated samples were non-detect for these analyte, the data have been reported. The following samples are impacted: 356023-GW-MW-7R-98-9 (480-159208-10), 356023-GW-MW-7R-98-10 (480-159208-11) and 356023-GW-MW-7R-98-11 (480-159208-12).

Method(s) 8260C: The initial calibration curve analyzed in analytical batch 480-491176 and associated with analytical batches 480-493096 and 480-493246 was outside method criteria for the analyte 1,2,3-Trichlorobenzene. As indicated in the reference method, sample analysis may proceed; however, any detection or non-detection for this analyte is considered an estimated concentration.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

Qualifiers

GC/MS VOA

Qualifier	Qualifier Description
E	Result exceeded calibration range.
F1	MS and/or MSD Recovery is outside acceptance limits.
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
¤	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CNF	Contains No Free Liquid
DER	Duplicate Error Ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL	Detection Limit (DoD/DOE)
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision Level Concentration (Radiochemistry)
EDL	Estimated Detection Limit (Dioxin)
LOD	Limit of Detection (DoD/DOE)
LOQ	Limit of Quantitation (DoD/DOE)
MDA	Minimum Detectable Activity (Radiochemistry)
MDC	Minimum Detectable Concentration (Radiochemistry)
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
NC	Not Calculated
ND	Not Detected at the reporting limit (or MDL or EDL if shown)
PQL	Practical Quantitation Limit
QC	Quality Control
RER	Relative Error Ratio (Radiochemistry)
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)

Accreditation/Certification Summary

Client: New York State D.E.C. Job ID: 480-159208-1
Project/Site: Mohonk Rd. #356023 Groundwaters

Laboratory: Eurofins TestAmerica, Buffalo

The accreditations/certifications listed below are applicable to this report.

Authority	Program	Identification Number	Expiration Date
New York	NELAP	10026	03-31-20

Method 8260C

Volatile Organic Compounds (GC/MS) by Method 8260C
