ENVIRONMENTAL
ASSESSMENT &
REMEDIATIONS

August 30, 2024 **Transmitted via email only**

Caroline Jalanti, EIT
Assistant Engineer
New York State Department of Environmental Conservation
Division of Environmental Remediation-Remedial Bureau C
625 Broadway
Albany, NY 12233

RE: 338 Broadway Kingston, Ulster County NY Site ID 356058 -Site Characterization (SC) Addendum

Dear Caroline:

This letter represents the SC Addendum, as prepared by Environmental Assessment & Remediations (EAR) for the above referenced site. New York State Department of Environmental Conservation (NYSDEC) requested EAR to prepare an addendum to the November 2023 SC report prepared by LaBella Associates for this site. NYSDEC requested additional graphic presentations of the data sets associated with the SC activities conducted as well as a record review of properties immediately to the north and west of the subject site.

Additional Figures

The figures prepared continue the enumeration in SC report for ease of reference. The following figures are presented based upon NYSDEC comment letter dated February 2024:

- **Figure 17** consolidates the 2020 & 2023 soil boring locations in one map and includes posted concentrations of select chlorinated volatile organic compounds (VOCs)
- **Figure 18** consolidates the 2020 & 2023 ground water data sets and includes posted concentrations of select chlorinated VOCs
- **Figure 19** consolidates the 2020 & 2021 soil gas data sets and includes posted concentrations of select chlorinated VOCs
- **Figure 20** presents the 2020 surface sample locations and includes posted concentrations of select chlorinated VOCs
- **Figure 21** presents the 2020 surface sample locations and includes post concentrations of detected SVOC, pesticides, PFAs and select metals.

Record Review

NYSDEC requested a record review of the properties immediately to the north and west of the subject site be conducted to determine if there are any potential tetrachloroethane (PCE) sources in the upgradient direction of the site (338 Broadway).

The record review generated Sanborn Fire Insurance Maps dated 1887 through 1987 for the area surrounding the site. Structure use and observations for each year are tabulated below:

<table>
<tr><th rowspan="2">Sanborn Map Year</th><th rowspan="2">338 Broadway</th><th colspan="4">Immediately West of site-future 340/342/344 Broadway & 25 Jansen Ave</th><th>Immediately North of site</th></tr>
<tr><th>340 Broadway</th><th>342 Broadway</th><th>344 Broadway</th><th>25 Jansen Ave</th><th>2 Jansen Ave</th></tr>
<tr><td>1887-earliest history of properties identified</td><td>store</td><td>dwelling</td><td>undeveloped</td><td>dwelling</td><td>stable</td><td>Undeveloped-corn patch</td></tr>
<tr><td rowspan="2">1899</td><td rowspan="2">saloon</td><td>dwelling</td><td>store</td><td>dwelling</td><td>dwelling</td><td rowspan="2">Wagon shed & stable observed</td></tr>
<tr><td></td><td colspan="3">These 3 properties appear as one lot & with stable/auto garage structure located between them</td></tr>
<tr><td>1950</td><td>Dry cleaning</td><td>undertaker</td><td>store</td><td>grocery store</td><td>dwelling</td><td rowspan="2">Former wagon shed & stable now reported as beverage warehouse
2nd building on the property reported as contractors warehouse</td></tr>
<tr><td></td><td></td><td colspan="3">Auto structure still present</td></tr>
<tr><td>1957</td><td>Dry cleaning</td><td>undertaker</td><td>store</td><td>dwelling</td><td>dwelling</td><td>Former beverage warehouse reported as auto repair shop
contractors warehouse reported as ice cream manufactory</td></tr>
<tr><td colspan="4">Property lines consistent with present observed, smaller auto garage noted on 25 Jansen Avenue</td></tr>
<tr><td>1972</td><td colspan="2">Structure classification “C” noted for both these properties, new building footprint for 340 observed</td><td>store</td><td>dwelling-structure expanded</td><td>dwelling & auto garage</td><td>Auto repair reported as cable TV, ice cream manufactory remains</td></tr>
<tr><td colspan="7">1984 & 1987 maps reported consistent structure and use types for all properties</td></tr>
</table>

Sanborn maps obtained during the record review are included as **Appendix A** for reference. The most recent Sanborn map provided was dated 1987, which is several decades ago, but based upon these maps for the time period provided no historical use of the properties immediately to the north or west of the subject site appears to be indicative of a potential PCE source.

A review of environmental records was conducted within a 1-mile area surrounding the subject site. This record review did not report any records associated with properties immediately adjacent to the north or west of the site that could be indicative of a potential PCE source, though 2 historical dry cleaners located within 1/8-mile of the site were reported:

- Classic Cleaners 384 Hasbrouck Avenue of the site, located northwest/up-gradient of the site
- Econo Wash Dry CLGL 2 East Chester St, located to the southeast/down-gradient of site

The summary report for Classic Cleaners is included as **Figure 22**, and the compilation of the environmental records review (EDR report) is included in **Appendix A**. The summary report indicates dry cleaner operations as early as 2001 through 2014 at this location. Google earth street view imagery documents dry cleaner operations as of June 2012, with a change of business noted in June 2018 imagery reported as bicycle shop. Former Classic Cleaners location at 384 Hasbrouck Avenue is shown in **Figure 23**.

Review of environmental records at the subject property (338 Broadway) report this location as a historical dry cleaner consistently between 1969 – 1971, then again in 1986 (**See Figure 24**). The years between 1972-1979 show the property as a miscellaneous personnel services type.

Property use a dry cleaner is also documented in the city directory for the years 1964 and 1968. The city directory (included in **Appendix A**) did not contain information for the time period between 1968 and 1992. Most recent business listing of the subject site included the following:

- 1992-2000 Kingston Reproductions Inc
- 2005 Broadways Fantasy Tattoos and Piercing
- 2010 Fashionista Fashionista Finesse
- 2014 Finesse
- 2017 & 2020 no business listed

The various information sources indicate that the subject site was operational as a dry cleaner for over 20 years, consistently between 1950 – 1971, and possibly again in 1986.

Should you have any questions regarding the information provided in this letter, please feel free to contact me at 631-447-6400, extension 131 or via email at lawrence@enviro-asmnt.com.

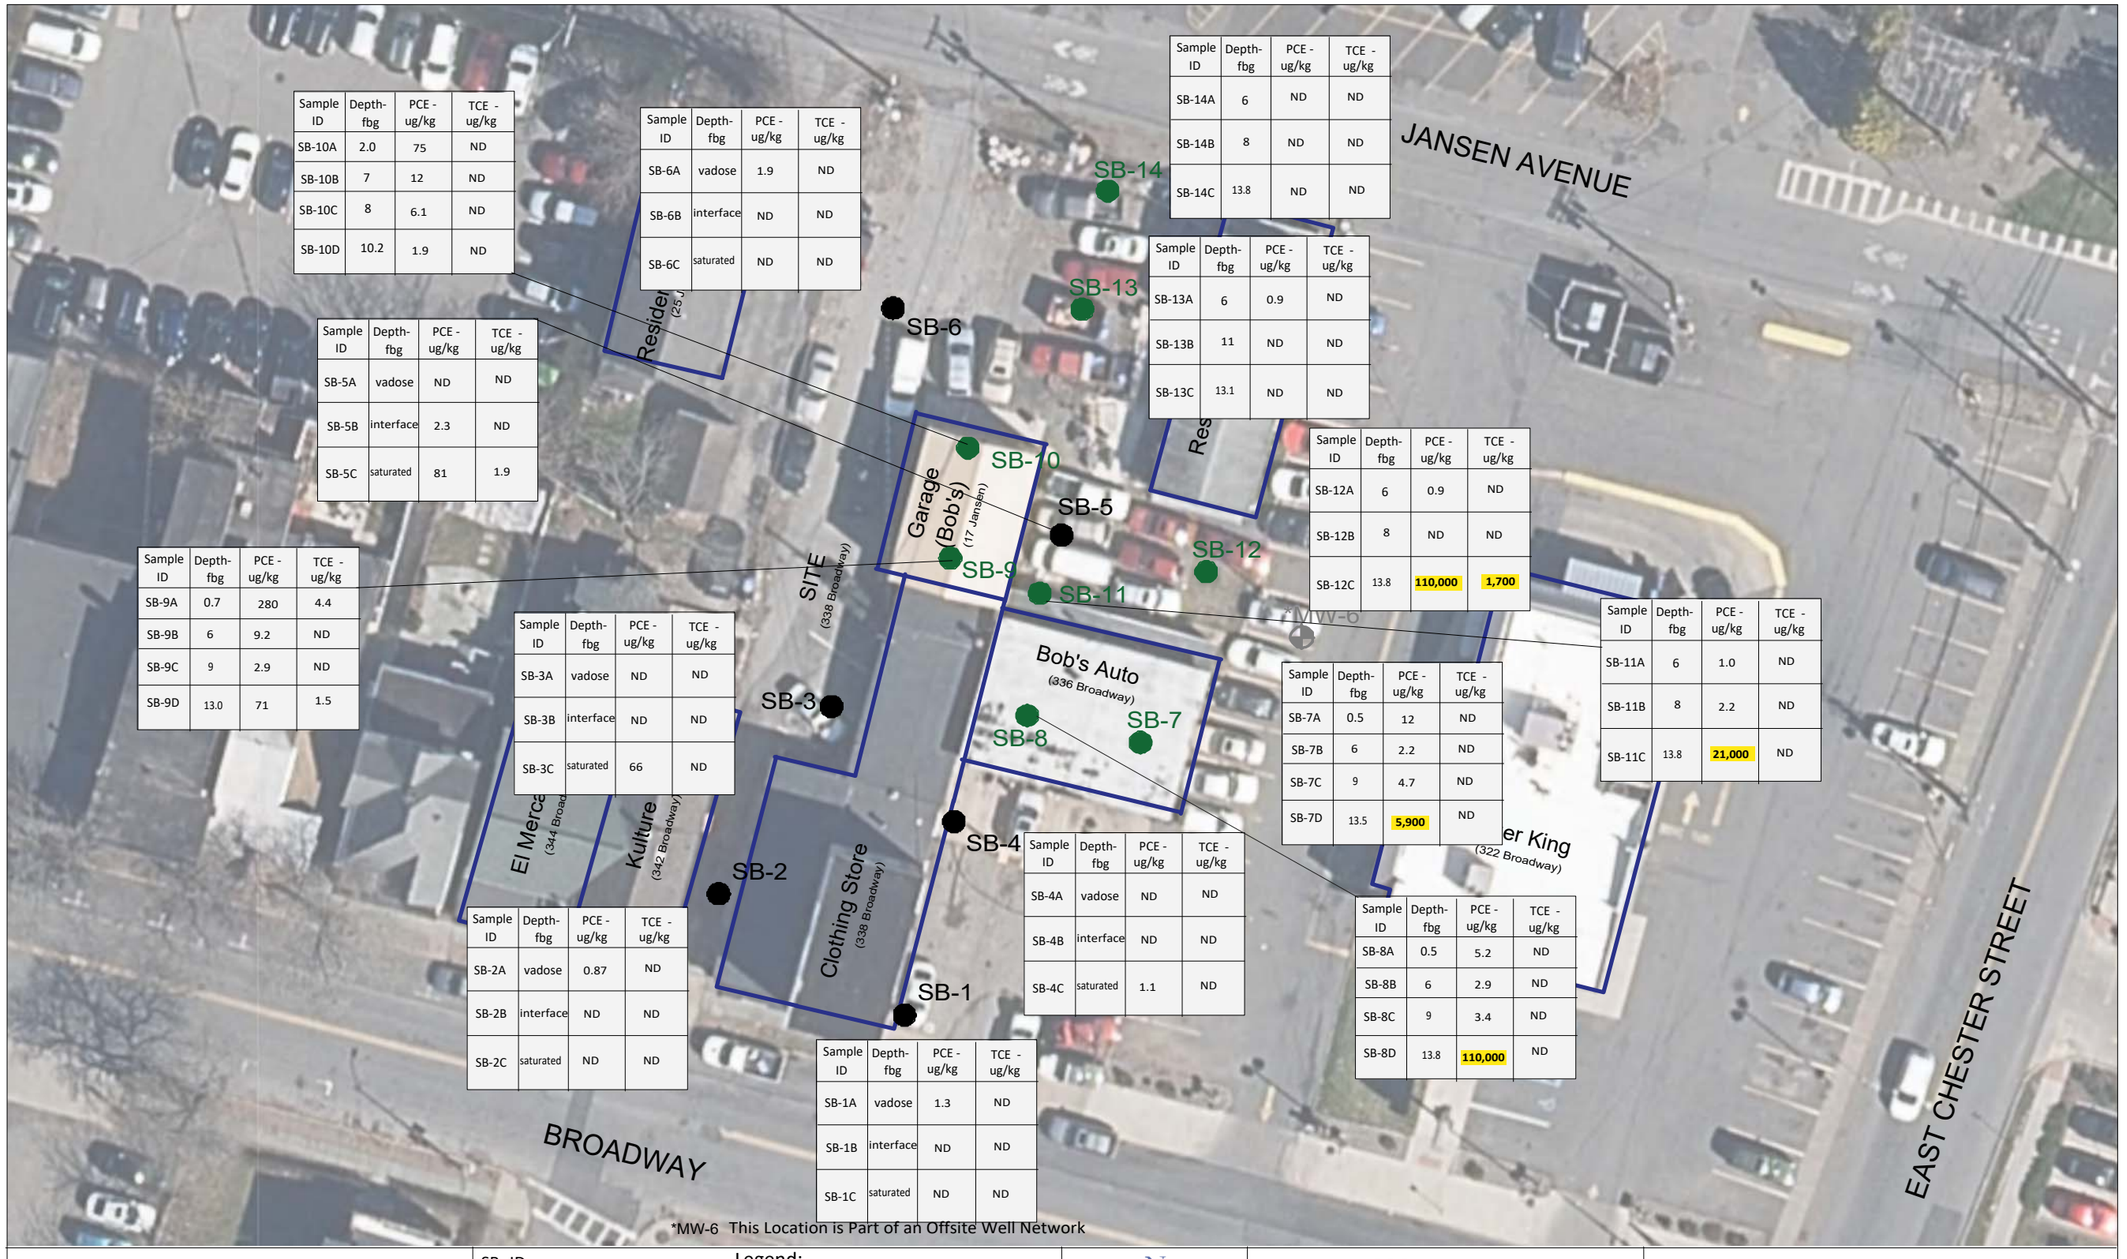

Sincerely,
Environmental Assessment and Remediations

The Sanborn Library has been searched by EDR and maps covering the target property location as provided by Env. Assessment & Remediation were identified for the years listed below. The Sanborn Library is the largest, most complete collection of fire insurance maps. The collection includes maps from Sanborn, Bromley, Perris & Browne, Hopkins, Barlow, and others. Only Environmental Data Resources Inc. (EDR) is authorized to grant rights for commercial reproduction of maps by the Sanborn Library LLC, the copyright holder for the collection. Results can be authenticated by visiting www.edrnet.com/sanborn.

The Sanborn Library is continually enhanced with newly identified map archives. This report accesses all maps in the collection as of the day this report was generated.

EXECUTIVE SUMMARY

A search of available environmental records was conducted by Environmental Data Resources, Inc (EDR). The report was designed to assist parties seeking to meet the search requirements of EPA's Standards and Practices for All Appropriate Inquiries (40 CFR Part 312), the ASTM Standard Practice for Environmental Site Assessments (E1527 - 21), the ASTM Standard Practice for Environmental Site Assessments for Forestland or Rural Property (E2247 - 16), the ASTM Standard Practice for Limited Environmental Due Diligence: Transaction Screen Process (E1528 - 22) or custom requirements developed for the evaluation of environmental risk associated with a parcel of real estate.

SURROUNDING SITES: SEARCH RESULTS

Surrounding sites were identified in the following databases.

Elevations have been determined from the USGS Digital Elevation Model and should be evaluated on a relative (not an absolute) basis. Relative elevation information between sites of close proximity should be field verified. Sites with an elevation equal to or higher than the target property have been differentiated below from sites with an elevation lower than the target property.
Page numbers and map identification numbers refer to the EDR Radius Map report where detailed data on individual sites can be reviewed.

Sites listed in ***bold italics*** are in multiple databases.

Unmappable (orphan) sites are not considered in the foregoing analysis.

STANDARD ENVIRONMENTAL RECORDS

Lists of Federal NPL (Superfund) sites

NPL: Also known as Superfund, the National Priority List database is a subset of CERCLIS and identifies over 1,200 sites for priority cleanup under the Superfund program. The source of this database is the U.S. EPA.

A review of the NPL list, as provided by EDR, and dated 12/26/2023 has revealed that there is 1 NPL site within approximately 1 mile of the target property.

Lists of Federal RCRA facilities undergoing Corrective Action

CORRACTS: CORRACTS is a list of handlers with RCRA Corrective Action Activity. This report shows which nationally-defined corrective action core events have occurred for every handler that has had corrective action activity.

A review of the CORRACTS list, as provided by EDR, and dated 12/04/2023 has revealed that there is 1 CORRACTS site within approximately 1 mile of the target property.

Lists of Federal RCRA TSD facilities

RCRA-TSDF: RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Transporters are individuals or entities that move hazardous waste from the generator offsite to a facility that can recycle, treat, store, or dispose of the waste. TSDFs treat, store, or dispose of the waste.

A review of the RCRA-TSDF list, as provided by EDR, and dated 12/04/2023 has revealed that there is 1 RCRA-TSDF site within approximately 0.5 miles of the target property.

Lists of Federal RCRA generators

RCRA-LQG: RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Large quantity generators (LQGs) generate over 1,000 kilograms (kg) of hazardous waste, or over 1 kg of acutely hazardous waste per month.

A review of the RCRA-LQG list, as provided by EDR, and dated 12/04/2023 has revealed that there is 1 RCRA-LQG site within approximately 0.25 miles of the target property.

RCRA-SQG: RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Small quantity generators (SQGs) generate between 100 kg and 1,000 kg of hazardous waste per month.

A review of the RCRA-SQG list, as provided by EDR, and dated 12/04/2023 has revealed that there is 1 RCRA-SQG site within approximately 0.25 miles of the target property.

RCRA-VSQG: RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Very small quantity generators (VSQGs) generate less than 100 kg of hazardous waste, or less than 1 kg of acutely hazardous waste per month.

A review of the RCRA-VSQG list, as provided by EDR, and dated 12/04/2023 has revealed that there are 4 RCRA-VSQG sites within approximately 0.25 miles of the target property.

Lists of state- and tribal hazardous waste facilities

NY SHWS: The State Hazardous Waste Sites records are the states' equivalent to CERCLIS. These sites may or may not already be listed on the federal CERCLIS list. Priority sites planned for cleanup using state funds (state equivalent of Superfund) are identified along with sites where cleanup will be paid for by potentially responsible parties. The data come from the Department of Environmental Conservation's Inactive Hazardous waste Disposal Sites in New York State.

A review of the NY SHWS list, as provided by EDR, and dated 11/06/2023 has revealed that there are 4 NY SHWS sites within approximately 1 mile of the target property.

Lists of state and tribal leaking storage tanks

NY LTANKS: Leaking Storage Tank Incident Reports. These records contain an inventory of reported leaking storage tank incidents reported from 4/1/86 through the most recent update. They can be either leaking underground storage tanks or leaking aboveground storage tanks. The causes of the incidents are tank test failures, tank failures or tank overfills

A review of the NY LTANKS list, as provided by EDR, and dated 01/24/2024 has revealed that there are 32 NY LTANKS sites within approximately 0.5 miles of the target property.

NY ERP: In an effort to spur the cleanup and redevelopment of brownfields, New Yorkers approved a $200 million Environmental Restoration or Brownfields Fund as part of the $1.75 billion Clean Water/Clean Air Bond Act of 1996 (1996 Bond Act). Enhancements to the program were enacted on October 7, 2003. Under the Environmental Restoration Program, the State provides grants to municipalities to reimburse up to 90 percent of on-site eligible costs and 100% of off-site eligible costs for site investigation and remediation activities. Once remediated, the property may then be reused for commercial, industrial, residential or public use.

A review of the NY ERP list, as provided by EDR, and dated 11/06/2023 has revealed that there is 1 NY ERP site within approximately 0.5 miles of the target property.

EXECUTIVE SUMMARY

Records of Emergency Release Reports

NY Spills: Data collected on spills reported to NYSDEC. is required by one or more of the following: Article 12 of the Navigation Law, 6 NYCRR Section 613.8 (from PBS regs), or 6 NYCRR Section 595.2 (from CBS regs). It includes spills active as of April 1, 1986, as well as spills occurring since this date.

A review of the NY Spills list, as provided by EDR, and dated 01/24/2024 has revealed that there are 23 NY Spills sites within approximately 0.125 miles of the target property.

Other Ascertainable Records

RCRA NonGen / NLR: RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Non-Generators do not presently generate hazardous waste.

A review of the RCRA NonGen / NLR list, as provided by EDR, and dated 12/04/2023 has revealed that there are 9 RCRA NonGen / NLR sites within approximately 0.25 miles of the target property.

UST FINDER RELEASE: US EPA's UST Finder data is a national composite of leaking underground storage tanks. This data contains information about, and locations of, leaking underground storage tanks. Data was collected from state sources and standardized into a national profile by EPA's Office of Underground Storage Tanks, Office of Research and Development, and the Association of State and Territorial Solid Waste Management Officials.

A review of the UST FINDER RELEASE list, as provided by EDR, and dated 06/08/2023 has revealed that

there are 12 UST FINDER RELEASE sites within approximately 0.5 miles of the target property.

UST FINDER: EPA developed UST Finder, a web map application containing a comprehensive, state-sourced national map of underground storage tank (UST) and leaking UST (LUST) data. It provides the attributes and locations of active and closed USTs, UST facilities, and LUST sites from states and from Tribal lands and US territories . UST Finder contains information about proximity of UST facilities and LUST sites to: surface and groundwater public drinking water protection areas; estimated number of private domestic wells and number of people living nearby; and flooding and wildfires.

A review of the UST FINDER list, as provided by EDR, and dated 06/08/2023 has revealed that there are 9 UST FINDER sites within approximately 0.25 miles of the target property.

EDR HIGH RISK HISTORICAL RECORDS

EDR Exclusive Records

EDR MGP: The EDR Proprietary Manufactured Gas Plant Database includes records of coal gas plants (manufactured gas plants) compiled by EDR's researchers. Manufactured gas sites were used in the United States from the 1800's to 1950's to produce a gas that could be distributed and used as fuel. These plants used

whale oil, rosin, coal, or a mixture of coal, oil, and water that also produced a significant amount of waste. Many of the byproducts of the gas production, such as coal tar (oily waste containing volatile and non-volatile chemicals), sludges, oils and other compounds are potentially hazardous to human health and the environment. The byproduct from this process was frequently disposed of directly at the plant site and can remain or spread slowly, serving as a continuous source of soil and groundwater contamination.

A review of the EDR MGP list, as provided by EDR, has revealed that there is 1 EDR MGP site within approximately 1 mile of the target property.

Lower Elevation	Address	Direction / Distance	Map ID	Page
KINGSTON GAS PLANT	W. PIERPONT	SE 1/2 - 1 (0.501 mi.)	124	578

EDR Hist Auto: EDR has searched selected national collections of business directories and has collected listings of potential gas station/filling station/service station sites that were available to EDR researchers. EDR's review was limited to those categories of sources that might, in EDR's opinion, include gas station/filling station/service station establishments. The categories reviewed included, but were not limited to gas, gas station, gasoline station, filling station, auto, automobile repair, auto service station, service station, etc. This database falls within a category of information EDR classifies as "High Risk Historical Records", or HRHR. EDR's HRHR effort presents unique and sometimes proprietary data about past sites and operations that typically create environmental concerns, but may not show up in current government records searches.

A review of the EDR Hist Auto list, as provided by EDR, has revealed that there are 4 EDR Hist Auto sites within approximately 0.125 miles of the target property.

Equal/Higher Elevation	Address	Direction / Distance	Map ID	Page
SUHAIL PETROLEUM INC	327 BROADWAY	SSE 0 - 1/8 (0.027 mi.)	A15	77
FERRARO ARTHUR	316 BROADWAY	ESE 0 - 1/8 (0.048 mi.)	B25	113
HESS CORPORATION	307 BROADWAY	SE 0 - 1/8 (0.080 mi.)	F40	165
APPA MICHAEL	291 HASBROUCK AVE	E 0 - 1/8 (0.124 mi.)	K65	269

EDR Hist Cleaner: EDR has searched selected national collections of business directories and has collected listings of potential dry cleaner sites that were available to EDR researchers. EDR's review was limited to those categories of sources that might, in EDR's opinion, include dry cleaning establishments. The categories reviewed included, but were not limited to dry cleaners, cleaners, laundry, laundromat, cleaning/laundry, wash & dry etc. This database falls within a category of information EDR classifies as "High Risk Historical Records", or HRHR. EDR's HRHR effort presents unique and sometimes proprietary data about past sites and operations that typically create environmental concerns, but may not show up in current government records searches.

A review of the EDR Hist Cleaner list, as provided by EDR, has revealed that there are 2 EDR Hist Cleaner sites within approximately 0.125 miles of the target property.

Record Upd: 12/27/2022
Updated By: KAMALONE
Site Description: Location: Site is located in an urban area at 338 Broadway in City of Kingston. Site is approximately 0.23 acres. Broadway and Jensen Avenue are toward south and north of the site respectively. Immediately east of the site is an automobile repair shop. Site Features: The site is generally flat, with a single, three-story building. The building is split into multiple units, with the ground floor units currently occupied by AAA Uniform, Sultana's Closet and residential apartments on upper floors. The remainder of the site is paved. Current Zoning and Land use: The site is currently zoned commercial. The site is located in a predominately commercial area of the city, however there are a few residences along Jensen Ave. Past use of the Site: Around the 1950s, a dry cleaner operated at the site. Site Geology and Hydrology: The subsurface soil typically consists of loose fine to medium sand with varying amounts of silt from just beneath the surface and ranging to approximately 10 to 14' below ground surface(bgs). The sand and silt soils were found to overlay a layer of silt and clay. Groundwater was observed at the approximate depth of 8 ft bgs and flowing east southeasterly.
Env Problem: Nature and Extent of Contamination: Soil and groundwater samples were collected from site and surrounding parcels owned by same owner were analyzed for volatile organic compounds (VOCs), semi-volatile organic compounds (SVOCs), metals, polychlorinated biphenyls (PCBs), per- and polyfluoroalkyl substances (PFAS), and pesticides. Soil gas and sub-slab soil vapor samples were collected from the site and adjacent parcels owned by the site owner and analyzed for VOCs. Based upon investigations conducted to date, the primary contaminants of concern tetrachloroethene (PCE), trichloroethene (TCE) and Perfluorooctane Sulfonic Acid (PFOS). Surface Soil: Total of four (4) surface soil samples collected. One (1) sample which was collected for inorganics and SVOC analysis were collected from between the surface and two (2) inches below ground surface (bgs). All four (4) samples collected for VOCs analysis were collected between two (2) and six (6) inches below grade. Total of four pesticide compounds exceeded their respective USCOs in a single sample collected. Copper, lead, zinc and mercury were reported at a concentration of 51.9, 365, 508 and 0.27 mg/Kg respectively which exceeded their respective USCOs of 50, 63, 109and 0.18 mg/kg. No other exceedance of USCOs were reported in surface soil samples. Subsurface Soil: Total 18 subsurface soils were collected from six (6) locations and analyzed for VOCs and two samples were analyzed for the remainder of the parameters. Out of two

338 BROADWAY (Continued) **S125298848**

subsurface soil sample collected, one (1) sample reported Nickel at a concentration of 36.8 mg/Kg which exceeded Unrestricted Use Soil cleanup objective (USCO) of 30 mg/Kg. No other exceedance of USCOs were reported in subsurface soil samples. Groundwater Total of six (6) groundwater monitoring wells were installed at the approximate depth of 16 . Out of six (6) samples collected, one sample was analyzed for metals, SVOCs and PFAS. PCE was detected in five (5) samples but only sample which had concentration of 12 ug/l which exceeded NYSDEC groundwater quality standard (GWQS) level of 5 ug/l. PFOS was reported at a concentration of 24 ?g/L in the single sample analyzed which exceeded the GWQS of 2.7 ?g/L. No other exceedance of USCOs were reported in groundwater samples. Soil Gas: Total of 20 soil gas samples were collected within 3 of the groundwater level observed during drilling. PCE was detected above Office of Solid Waste and Emergency Response (OSWER) guidance value of 81 ug/m3 in 17 samples out 20 with the maximum of 7,700 ug/m3 observed at north edge of the site boundary which is upgradient to the alleged former dry cleaners building. TCE was detected above the OSWER guidance value of 2.2 ?g/m3 at three locations with the maximum of 100 ?g/m3 observed at the same location. Soil Vapor & Indoor Air Total of nine (9) sub-slab soil vapor sample and collocated indoor air samples were collected from the buildings located on-site and at adjacent parcels owned by the site owner. PCE was detected in sub-slab soil vapor sample at 240, 1300 and 3800 ug/m3 with the corresponding indoor air concentration of 14, 63 and 260 ug/m3 respectively in the samples collected from the two structures.

Health Problem:	As information for this site becomes available, it will be reviewed by the NYSDOH to determine if site contamination presents public health exposure concerns.

Summary Details:

Conditions at listing September 1983): The Hudson River PCBs Site is a 40-mile stretch of the Hudson River between Mechanicville and Fort Edward, New York. General Electric Co. discharged an estimated l.l million pounds of PCBs into this stretch of river. The State has identified 40 hot spots, defined as sediments contaminated with greater than 50 parts per million ppm) of PCBs. Also included in the site are five remnant areas, which are river sediments exposed when thelevel of the river was lowered due to removal of the Fort Edward Dam. The State has taken initial measures to stabili e the remnant areas from erosion. In September 1980, Congress passed an amendment to the Clean Water Act CWA) that included the Hudson River PCB Reclamation Demonstration Project. Under this legislation, the EPA Administrator could authori e a 75 percent grant, not to exceed 20 million. EPA issued a final Environmental Impact Statement in October 1982 evaluating various dredging alternatives for a demonstration project. EPA has prepared a feasibility study to evaluate alternative remedial actions under CERCLA. The Administrator has determined that CERCLA funds may be used for remedial action atthe remnant areas and for evaluating the effectiveness of the water supply system at Waterford, New York. Status June 1984): EPA has completed a draft feasibility study identifying alternatives for remedial action. A search for partiespotentially responsible for wastes associated with the site has been completed, and EPA has sent letters to two potentially responsible parties notifying them of possible legal action under CERCLA.

DEC Memo:	1000 gal agt in basment
Remarks:	4-10-14: V.Mc. call to Alysen Beesmer/Hospital: Left Mess.: Req.Callbk.to Dispt. 4-10-14: Ms.Alysen Beesmer/Hospital callbk. to Dispt./V.Mc.: AST is in vault under stairway of vacant building. Hopeing to sell building at some point. Started noticing odor a couple of days ago, now seeing some leakage. Likely to have AST removed. Provided contact info for Am.Petro., MEG, VazCo & CSC, as well as D.Tr. for follow up. 4/17/14- Site inspection. C2G Env. on site. Allison Beesmer of hospital also on site. Tank has been removed. Groundwater present in former tank location under stairwell. Some impacted soils removed, but bottom of footing now exposed and groundwater entering excavation. Unable to remove additional soils. C2G Env. to install monitoring well sump in excavation and monitor. They will also conduct limited subsurface investigation on exterior of bldg. and thru basement slab. DT 4/25/14- Site inspection with C2G Env. and Allison of Kingston Hospital. Additional soils and impacted

KINGSTON HOSPITAL: 1K AST (Continued) **S116554351**

groundwater removed in former tank location. Dark colored free product globules are present on groundwater in East of former tank location excavation. sorbant pads in place. C2G reports that soil borings completed on outside of building and in basement slab; no significant impacts found in soil or groundwater. C2G Env. proposes to backfill former tank excavation area and install MW/RW sump in end of excavation where some free product is present. C2G Env. to monitor and conduct vac events as needed. DT Received report from C2G Env. of above work conducted. MW/RW sump was installed and demonstrated no visual signs of impact after monitored. No Further Remedial Action required at this time. DT

Record Added:	10/30/2003
Record Updated:	03/16/2005
Updated By:	MJKOMORO
Site Description:	The site is located in an urban portion of the City of Kingston. The City submitted a Brownfield (ERP) applicaton for three contiguous parcels. The site had been used as a bus fueling and maintenance facility, and as a dry cleaning establishment. Because the school district was responsible for petroleum contamination at the site, the application was denied. The site has subsequently entered the Brownfield Cleanup Program as project #C356032.

Click Here for FRS Facility Detail Report:

Environmental Interest/Information System:
The Resource Conservation and Recovery Act Information System (RCRAInfo) is EPA's comprehensive information system in support of the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. It tracks many types of information about generators, transporters, treaters, storers, and disposers of hazardous waste.

Click this hyperlink while viewing on your computer to access additional FINDS: detail in the EDR Site Report.

Environmental Interest/Information System:
The Resource Conservation and Recovery Act Information System (RCRAInfo) is EPA's comprehensive information system in support of the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. It tracks many types of information about generators, transporters, treaters, storers, and disposers of hazardous waste.

Click this hyperlink while viewing on your computer to access additional FINDS: detail in the EDR Site Report.

Spiller Company:	CUSTOMER
Spiller Address:	327 BROADWAY
Spiller Company:	999
Contact Name:	ULSTER CO 911
DEC Memo:	Spilled onto blacktop and flow down to street. FD on scene containing & trying to cleanup.
Remarks:	5/21/11: I spoke with Kingston FD Deputy Nocton = greater than cell 845-234-0336 Customer drove into the gas pump at the Citgo S/S. He reports gasoline spilled flowing out into the street. FD putting down speedi-dry to dam off catch basins. Road is being foamed. Spill initially reported as approx 30 gallons. Subsequent reports estimate amount released as greater than initial estimate. Joe McCarthy responded to the location. He reports the customer who caused the spill drove off but rthe incident was recorded on security camera. It appears the emergency shut off (shear valve) did not function properly. When the Fire Dept arrived on scene gasoline was still flowing from the damaged pump and FD had to cut power to the building. Conklin Environmental contacted and have arrived on scene. jod I arrived on site approx 1900 hrs. KFD, KPD on site. As John said, FD had foamed the area to control vapors. All material was contained by FD before reaching any storm drains. FD built dike to contain spill. Conklin arrived on site and began cleanup. They used pad and speedi dri to completed cleanup. All materials were drummed and removed from site. Cleanup completed. Station will remain shut down until repairs can be made and the KFD gives permission to store owner tha they can reopen. Store is owned by Singh(?). No spill buckets under dispensers. This area is definitely going to need to be excavated - alot of gas soaked into stone and soils under dispenser. jm 10-11-12 Spoke with Marty Rowan. He has recently completed installing test borings and 2 wells. He still needs to survey wells to determine GW flow direction. Once he completes this he will submit report to this office. He figures within the next several weeks. Marty was hired by contractor for owner. Contractor is Jerry Morse, owner of Hudson Valley Pump & Tank. Marty also mentioned that very shortly the owner will be upgrading the dispenser island (pump that was involved in accident). I asked Marty to call or email me with this work schedule. jm 7-9-13 Received Site Assessment Report on 4-3-13. 4 MW's installed - only one showed soil contamination which is below CP-51 unrestricted use guidance. Also, soils were excavated from under affected dispenser while upgrading. These were also under CP-51 guidance values. They will still need to grab gw confirmation samples from the 4 MW's. 7-25-16 Called present owner (from PBS reg) left message. 7-26-16: Owner (Ranvir Singh) called with no knowledge of spill although he knew Hudson Valley Tank investigated site. Asked

BROADWAY CITGO (Continued) **S102560802**

that he provide proof of GW remediation. GHP 10-5-17 Reviewed record found GW samples, all parameters ND or below standards. NFA

DEC Memo:	car hit gas pump - 8 gallon in sump and 2 on ground - cleanup in progress
Remarks:	3/8/2020 Spoke to caller, Steve from UPT. He is not onsite but knows that UPT got a call from the station that there was fuel in a dispenser sump that needed to be vac d. Spoke to Corey from UPT who is on-site. He responded to the call and found that the dispenser 3/4 had been damaged, about 8 gallons were in the sump and about 2 gallons had impacted the nearby concrete. Speedy dry had been put down by the station on this and was otherwise dried up and staining the concrete. Shear valves were still open when he got there. He has shut down the whole tank system and is replacing the shear valves now. MS 3/8/2020 I just confirmed with Corey, he is telling the station owner that they will need to conduct line tightness testing before the system is used again. Also, no product hit any drains, waterways nor well caps. MS 3/8/2020 Dispenser sump has been vac d out. Product released has been contained. Testing will likely be performed tomorrow morning. MS 3/9/20- PBS #3-448796 has been linked to this spill. Called The station, operator says that the station is still selling gas. I inform him that they should not be until the lines are tested. I spoke to the co-owner, Ranvir Singh and ask him about the status of the line testing. He says that there was no spill, it was contained. They are not operating/selling gas and they have a tester out there now. I inform him that he is not to sell gas until I have seen the line testing from a certified tester. He confirms that he still has my email and that Chris from CK Testing is out there now. Ranvir has sent me a picture showing the dispensers blocked off by caution tape. -MS Received Passing line TT from a certified tester. Told Ranvir the station can sell gas again, but I want a shear valve operability test. -MS Received shear valve testing results. Spill can now be closed. D2'd testing docs. -MS

Name:	10 EAST CHESTER STREET
Address:	306-318 BROADWAY
City,State,Zip:	KINGSTON, NY 12401
Site Code:	58514
HW Code:	C356032
Control Code:	15
Control Type:	ENG
Date Record Added:	01/02/2007
Date Rec Updated:	07/25/2023
Updated By:	PBAMIN
Site Description:	Location: The 10 East Chester Street site is comprised of three contiguous lots located at 10-16 East Chester Street, 318-320 Broadway, and 306-316 Broadway in the City of Kingston, Ulster County. Site Features: Site topography is flat, with a ground elevation of approximately 186 to 187 feet above mean sea level. Current Zoning and Land Use: The site is zoned commercial and has been redeveloped for use as a Walgreen's Pharmacy. Past Use of the Site: Historic sources of contamination include a gas/service station formerly located at 306-316 Broadway, a former dry cleaner located at 318-320 Broadway, and a vehicle storage/service building located at 10-16 East Chester Street. Site Geology and Hydrogeology: The site geology consists primarily of a stratified glacial outwash sequence overlying lacustrine varved silt and clay deposits. Depth to groundwater ranges from approximately 8 to 10 feet below ground surface. The prevailing groundwater flow direction in both the shallow and deep zones is towards the southeast.
Env Problem:	Nature and Extent of Contamination: Remediation at the site is complete to address tetrachloroethene (PCE), a solvent associated in the dry cleaners and petroleum related contamination present at the site. Site is currently being managed under a Site Management Plan (SMP). Periodic ground water monitoring performed as required by the SMP indicates that recalcitrant levels of PCE are still present in the site ground water which continues to migrate off-site. Corrective Measures work plan is approved to control contamination migrating off-site.
Health Problem:	Soils contaminated with volatile(VOC) and semi-volatile(SVOC) organic compounds have been excavated and disposed of off-site. In addition, two injections of potassium permanganate have been conducted to address the presence of VOCs and SVOCs in onsite groundwater. Continued destruction of contaminant mass is expected. The SMP calls for monitoring of groundwater conditions and additional injection events if necessary. The area is served by public water and, therefore, exposure through ingestion is not expected. To prevent exposure to contaminants within the onsite soil vapor, a sub-slab depressurization system and vapor barrier will be installed in any future buildings constructed at the site.

Updated By:	PBAMIN
Site Code:	58514
Site Description:	Location: The 10 East Chester Street site is comprised of three contiguous lots located at 10-16 East Chester Street, 318-320 Broadway, and 306-316 Broadway in the City of Kingston, Ulster County. Site Features: Site topography is flat, with a ground elevation of approximately 186 to 187 feet above mean sea level. Current Zoning and Land Use: The site is zoned commercial and has been redeveloped for use as a Walgreen's Pharmacy. Past Use of the Site: Historic sources of contamination include a gas/service station formerly located at 306-316 Broadway, a former dry cleaner located at 318-320 Broadway, and a vehicle storage/service building located at 10-16 East Chester Street. Site Geology and Hydrogeology: The site geology consists primarily of a stratified glacial outwash sequence overlying lacustrine varved silt and clay deposits. Depth to groundwater ranges from approximately 8 to 10 feet below ground surface. The prevailing groundwater flow direction in both the shallow and deep zones is towards the southeast.
Env Problem:	Nature and Extent of Contamination: Remediation at the site is complete to address tetrachloroethene (PCE), a solvent associated in the dry cleaners and petroleum related contamination present at the site. Site is currently being managed under a Site Management Plan (SMP). Periodic ground water monitoring performed as required by the SMP indicates that recalcitrant levels of PCE are still present in the site ground water which continues to migrate off-site. Corrective Measures work plan is approved to control contamination migrating off-site.
Health Problem:	Soils contaminated with volatile(VOC) and semi-volatile(SVOC) organic compounds have been excavated and disposed of off-site. In addition, two injections of potassium permanganate have been conducted to address the presence of VOCs and SVOCs in onsite groundwater. Continued destruction of contaminant mass is expected. The SMP calls for monitoring of groundwater conditions and additional injection events if necessary. The area is served by public water and, therefore, exposure through ingestion is not expected. To prevent exposure to contaminants within the onsite soil vapor, a sub-slab depressurization system and vapor barrier will be installed in any future buildings constructed at the site.

Site Code: 58514
Site Description: Location: The 10 East Chester Street site is comprised of three contiguous lots located at 10-16 East Chester Street, 318-320 Broadway, and 306-316 Broadway in the City of Kingston, Ulster County. Site Features: Site topography is flat, with a ground elevation of approximately 186 to 187 feet above mean sea level.

10 EAST CHESTER STREET (Continued) **S106122164**

	Current Zoning and Land Use: The site is zoned commercial and has been redeveloped for use as a Walgreen's Pharmacy. Past Use of the Site: Historic sources of contamination include a gas/service station formerly located at 306-316 Broadway, a former dry cleaner located at 318-320 Broadway, and a vehicle storage/service building located at 10-16 East Chester Street. Site Geology and Hydrogeology: The site geology consists primarily of a stratified glacial outwash sequence overlying lacustrine varved silt and clay deposits. Depth to groundwater ranges from approximately 8 to 10 feet below ground surface. The prevailing groundwater flow direction in both the shallow and deep zones is towards the southeast.
Env Problem:	Nature and Extent of Contamination: Remediation at the site is complete to address tetrachloroethene (PCE), a solvent associated in the dry cleaners and petroleum related contamination present at the site. Site is currently being managed under a Site Management Plan (SMP). Periodic ground water monitoring performed as required by the SMP indicates that recalcitrant levels of PCE are still present in the site ground water which continues to migrate off-site. Corrective Measures work plan is approved to control contamination migrating off-site.
Health Problem:	Soils contaminated with volatile(VOC) and semi-volatile(SVOC) organic compounds have been excavated and disposed of off-site. In addition, two injections of potassium permanganate have been conducted to address the presence of VOCs and SVOCs in onsite groundwater. Continued destruction of contaminant mass is expected. The SMP calls for monitoring of groundwater conditions and additional injection events if necessary. The area is served by public water and, therefore, exposure through ingestion is not expected. To prevent exposure to contaminants within the onsite soil vapor, a sub-slab depressurization system and vapor barrier will be installed in any future buildings constructed at the site.

DEC Region:	3
DER Facility ID:	271655
DEC Memo:	01/17/2005 Believed to be 1k tank. Leak from return line, product in basement. Tank has been pumped out. New 275 AST being installed in basement. Arrangements being made to remove UST. 1/31/05- UST under front porch. Tank cut open and cleaned out. Internal inspection revealed no corrosion holes per MEG. MEG to propose to owner to investigate under basement floor where oil lines ran. No oil noted in sump since spill report date. 2/16/05- Core drills thru basement floor near u/g line location completed per MEG. MEG reports that soil contamination identified in most core drills. MEG to propose further cleanup to owner. Portion of floor removed and soils removed underneath. Small amout of product found and recovered. Area backfilled and new floor poured. DEC inspection revealed no impacts (odors nor sheen) to sump pit. NFA
Remarks:	TANK IS UNDERGROUND THEY PUMPED OUT 650 GAL. DONT WHERE IT IS OR HOW MUCH IS ON THE GROUND.

DEC Memo:	Caller advised unknown amount of oil spilled into the walls of basement from an old tank. Clean up is pending.
Remarks:	9/9/11: Paul Fiore from Kosco states they believe there is an abandoned UST outside, and water with a heavy sheen and odors are coming through the basement wall. Kosco says Fire Dept pumped the basement out twice yesterday, water with sheen reportedly just pumped out to the street. Kosco says they were first contacted today and shut off sump pump. Kosco states pads were put down but it is mostly sheen and not free product. Paul states customer turned the sump pump back on and is again discharging water with sheen to the street. Kosco states they can not do anything more for customer and they have left the site. Owner is reportedly Frank Bonacci and his number is 845-331-1445. Called owner and keep reaching answering machine. Dave Traver notified. He has been on site before. Also see Spill 0411256. jod Miller performed cleanup under previous spill #. Tank was filled in place and accessible soils removed. Sheen likely related to high water table due to Tropical Storm and inaccessible soils not previously removed. NFA DT

DEC Memo:	cleanup pending
Remarks:	5/09/14: I spoke with Christina at Vazco. Tank was located under the front sidewalk, she states the cleanup will be very difficult. Owners currently live in Washington DC and are in the process of selling the house. She states Vazco was hired by the Realtor handling the sale. She will contact DEC once the Realtor is notified. jod VazCo entered tank and cleaned. Pin holes noted in tank. Soil samples collected from under tank by obtaining samples thru tank bottom. Soil samples came back with non-detect concentrations. No Further Remedial Action necessary. Closure report received. VazCo to abandon tank in place. DT Not reported

Environmental Interest/Information System:

The Resource Conservation and Recovery Act Information System (RCRAInfo) is EPA's comprehensive information system in support of the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. It tracks many types of information about generators, transporters, treaters, storers, and disposers of hazardous waste.

Click this hyperlink while viewing on your computer to access additional FINDS: detail in the EDR Site Report.

DEC Memo:	IN 1986 THERE WAS A TANK FAILURE REPORTED FOR ABOVE LOCATION. TANK WAS REMOVED - REMEDIATED AND CASE WAS CLOSED. 8603032 IS THE OLD SPILL NUMBER.
Remarks:	Prior to Sept, 2004 data translation this spill Lead_DEC Field was TRAVER SITE INSPECTION ON 4/29/03. AREA BEING INVESTIGATED DUE TO PROPOSED CONSTRUCTION. ONE OF TWO BORINGS CAME UP WITH BLACK OIL FROM PREVIOUS #6 OIL TANK. OIL WAS DISCOVERED APPROX. 10 FEET BG, AND BORING TERMINATED ON BEDROCK AT APPROX. 50 FEET. DEC ADVISED HOSPITAL THAT CONTIGENCY PLAN TO ADDRESS CONTAMINATION DURING FUTURE CONSTRUCTION ACTIUVITIES NEEDS TO BE PREPARED AND SUBMITTED TO DEC.

Site Code:	58890
Site Description:	Location: The site is located at 49 Foxhall Avenue in the City of Kingston, Ulster County. Site Features: The property encompasses

49 FOXHALL AVENUE (Continued) **S108667358**

approximately 0.25 acres in a residential/commercial setting. Current Zoning and Land Use: The site is an irregular shaped lot that contains a vacant residence with an attached garage. The property is bordered to the north by a commercial office and parking area, to the east by Foxhall Avenue, to the south by residential properties and Hasbrouck Avenue, and more residential properties to the west. Past Use of the Site: Historical uses included automotive repair and furniture refinishing. The site was the subject of a Phase I Environmental Assessment in 2000. The Phase I report identified two areas of potential concern associated with historical uses of the property. In 2001, the areas of concern were excavated and contaminated soils were removed. In June of 2002, additional soil borings were installed. The borings were advanced to bedrock and soil samples were collected and analyzed for metals, volatile organic compounds (VOCs), and semi-volatile organic compounds (SVOCs). Site Geology and Hydrogeology: The site geology consists primarily of a stratified glacial outwash sequence overlying lacustrine varved silt and clay deposits. Depth to groundwater ranges from approximately 8 to 10 feet below ground surface.

Env Problem: Nature and Extent of Contamination: Remediation at the site is complete. Prior to remediation, the primary contaminants of concered were metals including arsenic, cadmium, chromium and lead in soil. The residual contamination is being managed under a Site Management Plan.

Health Problem: The site is a vacant property in a residential/commercial area. Previous investigations excavated and removed VOC-contaminated soil from within the on-site garage. Elevated levels of metals are known to remain in subsurface soils, however, concentrations are below the soil cleanup objectives for commercial use. A deed restriction has been filed limiting future use to commercial. The area is served by public water.

VCP:
Name: 49 FOXHALL AVENUE
Address: 49 FOXHALL AVE.
City,State,Zip: KINGSTON, NY 12401-5127
Program Type: VCP
Site Code: 58890
HW Code: V00617
Site Class: C
SWIS: 5608
Region: 3
Town: Kingston (c)
Acres: 0.138
Date Record Added: 09/27/2002
Date Record Updated: 04/27/2023
Updated By: JEBROWN
Site Description: Location: The site is located at 49 Foxhall Avenue in the City of Kingston, Ulster County. Site Features: The property encompasses approximately 0.25 acres in a residential/commercial setting. Current Zoning and Land Use: The site is an irregular shaped lot that contains a vacant residence with an attached garage. The property is

49 FOXHALL AVENUE (Continued) **S108667358**

bordered to the north by a commercial office and parking area, to the east by Foxhall Avenue, to the south by residential properties and Hasbrouck Avenue, and more residential properties to the west. Past Use of the Site: Historical uses included automotive repair and furniture refinishing. The site was the subject of a Phase I Environmental Assessment in 2000. The Phase I report identified two areas of potential concern associated with historical uses of the property. In 2001, the areas of concern were excavated and contaminated soils were removed. In June of 2002, additional soil borings were installed. The borings were advanced to bedrock and soil samples were collected and analyzed for metals, volatile organic compounds (VOCs), and semi-volatile organic compounds (SVOCs). Site Geology and Hydrogeology: The site geology consists primarily of a stratified glacial outwash sequence overlying lacustrine varved silt and clay deposits. Depth to groundwater ranges from approximately 8 to 10 feet below ground surface.

Env Problem: Nature and Extent of Contamination: Remediation at the site is complete. Prior to remediation, the primary contaminants of concered were metals including arsenic, cadmium, chromium and lead in soil. The residual contamination is being managed under a Site Management Plan.

Health Problem: The site is a vacant property in a residential/commercial area. Previous investigations excavated and removed VOC-contaminated soil from within the on-site garage. Elevated levels of metals are known to remain in subsurface soils, however, concentrations are below the soil cleanup objectives for commercial use. A deed restriction has been filed limiting future use to commercial. The area is served by public water.

FINDS:
Registry ID: 110039530530

Click Here for FRS Facility Detail Report:

Environmental Interest/Information System:
The Assessment, Cleanup and Redevelopment Exchange System (ACRES) stores information reported by EPA Brownfields grant recipients on Brownfields properties assessed or cleaned up with grant funding, as well as information on Targeted Brownfields Assessments (TBA) performed by EPA Regions.
Registry ID: 110001586659

Click Here for FRS Facility Detail Report:

Environmental Interest/Information System:
The Air Facility System (AFS) contains compliance and permit data for stationary sources of air pollution regulated by the EPA, state, and local air pollution agencies.
ICIS-Air (AIR) AIR is the modernization of the Air Facility System (AFS) into the Integrated Compliance Information System (ICIS). AIR contains enforcement, compliance, and permit data for stationary sources of air pollution regulated by the EPA, State, and Local air pollution agencies.
The New York Department of Environmental Conservation Facility Information System (FIS) database houses all information about facilities that are regulated or of environmental interest to the state of New York.
The Resource Conservation and Recovery Act Information System (RCRAInfo) is EPA's comprehensive information system in support of the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. It tracks many types of information about generators, transporters, treaters, storers, and disposers of hazardous waste.

DEC Memo:	old tank - leaking - unsure of where it is leaking from - inside basement - CALLBACK REQUESTED
Remarks:	2/26/19 Homeowner called - noticed tank in basement leaking from bottom to concrete floor. Homeowner has been cleaning up the spill with kitty litter. There is now a pan under the tank to catch the oil dripping out. Leak is contained. Called Cosco/Paraco to check tank. Homeowner has used 1/4 of tank in 3 weeks. Basement floor is concrete, unsure of cracks. No drains, no sump in basement, no

JOHNSTON RESIDENCE (Continued) **S123661412**

waterways on property. Home on municipal water. Sending draft guidance and contractor list. Homeowner will call insurance. ga 2/26/19 Also called in by Cosco Oil as spill# 1811801. They said the tech put a patch on the tank, but it is not stopping the leak. Pan is under the leak to contain spill, kitty litter has been applied. Tank is up against brick wall, spill is leaking into wall and into next room. Closing Spill # 1811801, sending all info to Spill# 1811796. ga 2/26/19 Homeowner has contracted C2G to preform clean up. ML 2/28/19 C2G has installed temp tank, is working on cleanup. ga 4/17/19 received spill closure report from C2G. Report in D2. BW 5/22/19 C2G resubmitted report and asked for review. BW 6/17/19 requested C2G to send report with final disposal manifests. BW 6/18/19 C2G resent report. BW 6/28/19 Reviewed report, NFA. BW

Environmental Interest/Information System:
All generators and treatment, storage, and disposal (TSD) facilities who handle hazardous waste are required to report to the EPA Administrator at least once every two years. The data collected is used to create the National Biennial Resource Conservation and Recovery Act (RCRA) Hazardous Waste Report. This data is processed within the RCRA Information (RCRAInfo) database
The Resource Conservation and Recovery Act Information System (RCRAInfo) is EPA's comprehensive information system in support of the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. It tracks many types of information about generators, transporters, treaters, storers, and disposers of hazardous waste.

Date Test:	08/01/1997
Next Test Date:	Not reported
Pipe Model:	Not reported
Modified By:	MJGRIFFI
Last Modified:	05/09/2022

Equipment Records:

F07 - Pipe External Protection - Retrofitted Sacrificial Anode
L00 - Piping Leak Detection - None
C03 - Pipe Location - Aboveground/Underground Combination
G00 - Tank Secondary Containment - None
J02 - Dispenser - Suction Dispenser
D02 - Pipe Type - Galvanized Steel
H04 - Tank Leak Detection - Groundwater Well
B04 - Tank External Protection - Fiberglass
E00 - Piping Secondary Containment - None
I00 - Overfill - None
A00 - Tank Internal Protection - None
K00 - Spill Prevention - None

Tank Number:	160
Tank ID:	75008
Tank Status:	Closed Prior to Micro Conversion, 03/91
Material Name:	Closed Prior to Micro Conversion, 03/91
Capacity Gallons:	6000
Install Date:	12/01/1961

MEAGHER SCHOOL (Continued) **U000380992**

Date Tank Closed: Not reported
Registered: True
Tank Location: Underground
Tank Type: Steel/carbon steel
Material Code: 0009
Common Name of Substance: Gasoline

H00 - Tank Leak Detection - None
I00 - Overfill - None
G00 - Tank Secondary Containment - None
J02 - Dispenser - Suction Dispenser
B00 - Tank External Protection - None
C00 - Pipe Location - No Piping
D02 - Pipe Type - Galvanized Steel
F00 - Pipe External Protection - None

Tank Number: 16A
Tank ID: 223981
Tank Status: In Service
Material Name: In Service
Capacity Gallons: 5000
Install Date: 08/08/2006
Date Tank Closed: Not reported
Registered: True
Tank Location: Underground
Tank Type: Equivalent technology
Material Code: 0001
Common Name of Substance: #2 Fuel Oil (On-Site Consumption)

Tightness Test Method: NN
Date Test: Not reported
Next Test Date: Not reported
Pipe Model: E
Modified By: MJGRIFFI
Last Modified: 05/09/2022

Equipment Records:

G04 - Tank Secondary Containment - Double-Walled (Underground)
D11 - Pipe Type - Flexible Piping
F05 - Pipe External Protection - Jacketed
A03 - Tank Internal Protection - Fiberglass Liner (FRP)
J02 - Dispenser - Suction Dispenser
L01 - Piping Leak Detection - Interstitial - Electronic Monitoring
C02 - Pipe Location - Underground/On-ground
K01 - Spill Prevention - Catch Basin
I02 - Overfill - High Level Alarm
B04 - Tank External Protection - Fiberglass
E04 - Piping Secondary Containment - Double walled UG

MEAGHER SCHOOL (Continued) **U000380992**

H01 - Tank Leak Detection - Interstitial - Electronic Monitoring
I01 - Overfill - Float Vent Valve

Environmental Interest/Information System:
The Resource Conservation and Recovery Act Information System (RCRAInfo) is EPA's comprehensive information system in support of the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. It tracks many types of information about generators, transporters, treaters, storers, and disposers of hazardous waste.

Environmental Interest/Information System:

The Resource Conservation and Recovery Act Information System (RCRAInfo) is EPA's comprehensive information system in support of the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. It tracks many types of information about generators, transporters, treaters, storers, and disposers of hazardous waste.

Click this hyperlink while viewing on your computer to access additional FINDS: detail in the EDR Site Report.

DEC Memo:	CLOSURE REPORT RECEIVED 6-22-05. AS STATED IN REPORT. TANK WAS LOCATED ON A ROCK SLAB AND ENDED UP UNDER AN ADDITION TO THE HOUSE. HOME OWNER NOTICED OIL ODOR AND RETAINED THE SERVICES OF VAZ-CO TO PUMP, REMOVE AND DISPOSE OF FLAT 275 GALLON TANK. TANK WAS CLEANED IN THE CRAWL SPACE AND HAD TO BE CUT UP TO REMOVE IT FROM UNDER THE HOUSE. THERE WAS A MINIMUM AMOUNT OF SOIL THAT HAD ACCUMULATED UNDER THE TANK WHICH WAS SCRAPPED UP AND DRUMMED WITH THE TANK BOTTOM FOR DISPOSAL. AREA IS SERVICED BY MUNICIPAL WATER AND SEWER.

FRISS RESIDENCE (Continued) **S106869150**

Hazardous Waste Summary:

Waste Code:	D000
Waste Description:	Not Defined
Waste Code:	D001
Waste Description:	Ignitable Waste
Waste Code:	F001
Waste Description:	The Following Spent Halogenated Solvents Used In Degreasing: Tetrachloroethylene, Trichlorethylene, Methylene Chloride, 1,1,1-Trichloroethane, Carbon Tetrachloride And Chlorinated Fluorocarbons; All Spent Solvent Mixtures/Blends Used In Degreasing Containing, Before Use, A Total Of Ten Percent Or More (By Volume) Of One Or More Of The Above Halogenated Solvents Or Those Solvents Listed In F002, F004, And F005; And Still Bottoms From The Recovery Of These Spent Solvents And Spent Solvent Mixtures.
Waste Code:	F003
Waste Description:	The Following Spent Nonhalogenated Solvents: Xylene, Acetone, Ethyl Acetate, Ethyl Benzene, Ethyl Ether, Methyl Isobutyl Ketone, N-Butyl Alcohol, Cyclohexanone, And Methanol; All Spent Solvent Mixtures/Blends Containing, Before Use, Only The Above Spent Nonhalogenated Solvents; And All Spent Solvent Mixtures/Blends Containing, Before Use, One Or More Of The Above Nonhalogenated Solvents, And A Total Of Ten Percent Or More (By Volume) Of One Or More Of Those Solvents Listed In F001, F002, F004, And F005; And Still Bottoms From The Recovery Of These Spent Solvents And Spent Solvent Mixtures.
Waste Code:	F005
Waste Description:	The Following Spent Nonhalogenated Solvents: Toluene, Methyl Ethyl Ketone, Carbon Disulfide, Isobutanol, Pyridine, Benzene, 2-Ethoxyethanol, And 2-Nitropropane; All Spent Solvent Mixtures/Blends Containing, Before Use, A Total Of Ten Percent Or More (By Volume) Of One Or More Of The Above Nonhalogenated Solvents Or Those Solvents Listed In F001, F002, Or F004; And Still Bottoms From The Recovery Of These Spent Solvents And Spent Solvent Mixtures.

Updated By:	LSZINOMA
Site Description:	Location: The Federal-Mogul/Huck Site is located at 85 Grand Street in the City of Kingston in Ulster County. Site Features: The site consists of two buildings, a former manufacturing building and an attached office building, together occupying 105,000 square feet of the approximately 4-acre site. The remainder of the site consists of paved parking lots, access roads, a grassy area near the office building and narrow landscaped areas in the eastern and southern parking lots. Current Zoning and Land Use: The site is zoned M-2 General Manufacturing, which includes wholesale storage and warehousing. The former manufacturing building houses self-storage units and the office building is used by a moving and truck rental company. Residential and commercial properties border the site across Tenbroeck Avenue to the northeast and residences and a vacant commercial building are located across Grand Street to the southeast. Two commercial properties, a bottle return center and a warehouse, adjoin the property to the south and CSX Transportation, Inc. (railroad tracks) border the site to the west. Commercial and light industrial properties are directly west of the CSX railroad tracks. All properties within a one-mile radius of the site are serviced by municipal water. Past Use of the Site: The site has been in operation

HUCK INTL INC (Continued) **1000266777**

since 1889, used by various companies for automotive, electrical, and refrigeration supplies manufacturing. Site media have been impacted from various manufacturing processes that are known to have occurred at the site, including metal finishing, heat treating, degreasing, and chemical handling and storage. Chlorinated VOCs, SVOCs, metals, and PCBs have been identified in the soil and storm sewer sediment at the site, while metals and VOCs have also been identified in the groundwater at the site. A Phase I environmental assessment was performed in 1991 and Phase II investigations were performed in 1993 and 1997 to evaluate site conditions. Based on the results of the Phase II investigations, Federal-Mogul entered into a Voluntary Cleanup Agreement with the New York State Department of Environmental Conservation on February 6, 2002 (Index no. A3-0372-9807) to investigate and remediate the site. Site Geology and Hydrogeology: Site soils generally consist of 0 to 3 feet of sand or sand and gravel fill material that contains fragments of concrete, glass, asphalt, wood, and other construction debris. The fill material is underlain by a dark yellowish-brown, poorly sorted, fine- to medium-grained sand that grades to a silty sand with increasing depth. The silty sand is underlain by a low permeability clayey silt unit at a depth of approximately 68 feet below ground surface (bgs). The shallow water bearing zone is located approximately 13 to 15 feet bgs. Groundwater flows in a west-southwest direction across the site area.

Env Problem: Nature and Extent of Contamination: Based upon investigations conducted to date, the primary contaminants of concern include chlorinated VOCs, namely trichloroethene (TCE) and tetrachloroethene (PCE). While most of the site has been sufficiently investigated, the nature and extent of contamination in areas under the former manufacturing building and office building where access was previously limited or unavailable has not been fully delineated. Soil Numerous soil borings were installed on-site from 2002 to 2008 to delineate the horizontal and vertical extent of VOCs in the soil. Based on the results of these investigations, the primary VOCs detected in the on-site soils were TCE, PCE and cis-1,2-dichloroethene (cis-1,2-DCE). They were found at several locations in shallow and deeper soils at concentrations above both the commercial and industrial use soil cleanup objectives (SCOs) established for these compounds. TCE, PCE and cis-1,2-DCE were detected at maximum concentrations of 610 parts per million (ppm), 540 ppm and 1,200 ppm, respectively. Commercial use SCOs for these compounds are 200 ppm, 150 ppm and 500 ppm, respectively. Industrial use SCOs for these compounds are 400 ppm, 300 ppm and 1,000 ppm respectively. SVOCs detected in soil include benzo(a)anthracene, benzo(a)pyrene and benzo(b)fluoranthene at maximum concentrations of 18 ppm, 15 ppm and 15ppm, respectively. Commercial use SCOs for these compounds are 5.6 ppm, 1.0 ppm and 5.6 ppm, respectively. Industrial use SCOs for these compounds are 11 ppm, 1.1 ppm and 11 ppm, respectively. Metals detected in soil include lead at a maximum concentration of 13,600 ppm, arsenic at a maximum concentration of 32 ppm and cadmium at a maximum concentration of 490 ppm. Commercial use SCOs for these metals are 1,000 ppm, 16 ppm and 9.3 ppm, respectively. Industrial use SCOs for these metals are 3,900 ppm, 16 ppm and 60 ppm, respectively. PCBs were not detected above commercial use SCOs in any of the soil samples. Groundwater Several groundwater investigations have been performed in relation to this site from 2002 through 2011. These investigations found the highest VOC

HUCK INTL INC (Continued) **1000266777**

concentrations in groundwater in two areas located under the former manufacturing building. VOCs detected in the groundwater include PCE, TCE, and their breakdown products. Evaluation of the vertical extent of VOCs in the groundwater indicated VOC levels above the New York State Ambient Water Quality Standards were confined mainly to the upper ten feet of the groundwater table. As a result, an AS/SVE system was installed as an IRM in April 2014 with the primary objective of reducing VOCs in groundwater in two source areas under the former manufacturing building that exhibited the highest VOC concentrations. The on-site groundwater sampling results from December 2022 showed a reduction in concentration of the primary contaminants in groundwater compared to the June 2014 sampling results. Maximum concentrations of PCE dropped from 723 parts per billion (ppb) to 224 ppb, while TCE dropped from 4,480 ppb to 564 ppb. There was however, an increase in the degradation product concentrations; cis-1,2-DCE from 4,570 ppb to 6,940 ppb and trans-1,2-DCE from 10.6 ppb to 29.8 ppb, indicating that breakdown is occurring. Likewise, the off-site groundwater sampling results from December 2022 showed a reduction in concentration of the primary contaminants in groundwater when compared to the June 2014 results. Maximum concentrations of PCE dropped from 174 ppb to 30.9 ppb, TCE dropped from 151 ppb to 21.5 ppb, cis-1,2-DCE dropped overall from 35.3 ppb to 8.6 ppb, and trans-1,2-DCE overall remains non-detect, indicating that breakdown is occurring. The sample results indicate that concentrations of site-related VOCs in groundwater have generally decreased in the source areas and in areas adjacent to, and downgradient from, the source areas. VOC concentrations in monitoring wells located outside the influence of the AS/SVE system have generally remained stable with concentrations of PCE ranging from non-detect to 27.4 ppb, TCE from non-detect to 68.4 ppb, and cis-1,2-DCE ranging from non-detect to 90.5 ppb. Soil Vapor and Indoor Air Former Manufacturing Building - In 2003 soil vapor samples were collected on-site and found to be impacted by site-related contamination. Additionally, indoor air samples collected in the former manufacturing building were found to be impacted by site-related contamination. As a result, a soil vapor extraction (SVE) system was installed on-site in February 2004 as an IRM along the periphery of the former finish and chemical storage area of the former manufacturing building, and along the eastern and southern property boundaries to address shallow soil vapor impacts in these areas and mitigate their off-site migration. TCE levels measured in the indoor air of the former manufacturing building in 2003 ranged from 17.7 to 258 g/m3. In January 2005, following implementation of the SVE trench system, reductions were observed in concentrations of TCE in the indoor air with levels ranging from non-detect to a maximum of 51.6 g/m3 in an unoccupied space in the southwest corner of the former manufacturing building. The site property was sold in 2008, and the former manufacturing building is currently used as mini-storage, with an office area that is likely occupied during normal business hours. In 2008, three additional rounds of indoor air testing were performed in the newly occupied office area. The indoor air samples collected in June, July, and August 2008 contained TCE at concentrations of 21.5 g/m3, 18.27 g/m3, and 9.62 g/m3, respectively. Indoor air sampling conducted during the 2018/2019 heating season (March/April 2019) found TCE levels at various locations ranging from 0.29 to 6.8 g/m3, and 4.8 to 5.5 g/m3 in the office area. The remedial party implemented actions to improve air quality in the

HUCK INTL INC (Continued) **1000266777**

building: sealing cracks and openings in the concrete floor in accessible portions of the building, including any remaining floor drains and sumps; evaluated operation of AS/SVE and SVE treatment systems to improve indoor air quality; and evaluated existing air handling system in office area. Additional indoor air sampling was conducted in the former manufacturing building in November of 2020. TCE levels at various locations ranged from 3.8 to 6.2 g/m3, and 6.3 g/m3 in the office area, exceeding NYSDOH indoor air guidance levels for TCE of 2 g/m3. On March 8-9, 2021 the remedial party conducted a pilot test to increase sub-slab vacuum at select locations in the former manufacturing building. The pilot test resulted in the installation of one suction point which was tied into the existing AS/SVE system. Another indoor air sampling event was conducted on March 31, 2021 to evaluate the potential impact of the additional suction point on indoor air quality. TCE levels found at various locations ranged from 1.1 to 3.7 g/m3, and 3.0 g/m3 in the office area. While the indoor levels showed a marked decrease over the previous sampling event, four of the five sampling locations exceeded NYSDOH indoor air guidance levels for TCE of 2 g/m3. The remedial party installed an SSD system in February 2022 with two extraction points in the northwest portion of the main building to address the potential for vapor intrusion in this area. Follow-up indoor air sampling was conducted on March 30, 2022 to evaluate the potential impact of the SSD system installed in February 2022 on indoor air quality. TCE levels found at various locations ranged from 0.55 to 6.9 g/m3, and 0.58 g/m3 in the office area. The indoor levels showed a marked decrease over the previous sampling event, with only one of the five sampling locations exceeding NYSDOH indoor air guidance levels for TCE of 2 g/m3. On-Site Office Building - In August 2003, TCE levels measured in the indoor air of the on-site office building ranged from 96.7 to 167 g/m3. As a result, a SSDS was installed as an IRM in the on-site office building in March 2004. During the following heating season in January 2005, noticeable reductions in TCE levels were observed in the indoor air of the on-site office building, with concentrations ranging from non-detect to 0.81 g/m3. The on-site SSDS is inspected on an annual basis to verify proper operation; therefore, no additional indoor air samples have been collected in the on-site office building since 2005. Off-Site Locations - Eighteen SSDSs have been installed at 17 off-site locations beginning in 2006 to address off-site sub-slab soil vapor and indoor air impacts. Offers were made to conduct soil vapor intrusion (SVI) investigations at 43 off-site properties and sampling has been performed at 22 properties. The remaining 21 property owners either declined or did not respond to the request for sampling. Based on a comparison of data from the 22 buildings to the decision matrices provided in the NYSDOH s Guidance for Evaluating Soil Vapor Intrusion in the State of New York, no further action was ultimately recommended at 10 properties and vapor mitigation was recommended at 12 properties; SSDSs have been installed at each of the 12 properties. Actions were taken to install SSDSs in five additional buildings not sampled for soil vapor intrusion, but based on sampling results of nearby buildings where mitigation was recommended. Further monitoring is not currently required at any of the off-site properties.

Health Problem: Direct contact with contaminants in the soil is unlikely because the majority of the site is covered with buildings and pavement. Contaminated groundwater at the site is not used for drinking or

HUCK INTL INC (Continued) **1000266777**

other purposes and the site is served by a public water supply that obtains water from a different source not affected by this contamination. Volatile organic compounds in the soil or groundwater may move into the soil vapor (air spaces within the soil), which in turn may move into overlying buildings and affect the indoor air quality. This process, which is similar to the movement of radon gas from the subsurface into the indoor air of buildings, is referred to as soil vapor intrusion. A sub-slab depressurization system has been installed in the office building and a soil vapor extraction system has been installed adjacent to the former manufacturing building in the vicinity of the main office and former metal finish area to prevent the indoor air quality from being affected by contamination in soil vapor beneath the building. However, the potential exists for inhalation of site contaminants due to soil vapor intrusion for any future on-site redevelopment. Sub-slab depressurization systems have been installed in 17 off-site buildings to prevent the indoor air quality from being affected by the contamination in soil vapor beneath the buildings. The investigation of soil vapor intrusion is on-going at off-site structures with actions being taken as necessary to address exposures.

Site Description: Location: The Federal-Mogul/Huck Site is located at 85 Grand Street in the City of Kingston in Ulster County. Site Features: The site consists of two buildings, a former manufacturing building and an attached office building, together occupying 105,000 square feet of the approximately 4-acre site. The remainder of the site consists of paved parking lots, access roads, a grassy area near the office building and narrow landscaped areas in the eastern and southern parking lots. Current Zoning and Land Use: The site is zoned M-2 General Manufacturing, which includes wholesale storage and warehousing. The former manufacturing building houses self-storage units and the office building is used by a moving and truck rental company. Residential and commercial properties border the site across Tenbroeck Avenue to the northeast and residences and a vacant commercial building are located across Grand Street to the southeast. Two commercial properties, a bottle return center and a warehouse, adjoin the property to the south and CSX Transportation, Inc. (railroad tracks) border the site to the west. Commercial and light industrial properties are directly west of the CSX railroad tracks. All properties within a one-mile radius of the site are serviced by municipal water. Past Use of the Site: The site has been in operation since 1889, used by various companies for automotive, electrical, and refrigeration supplies manufacturing. Site media have been impacted from various manufacturing processes that are known to have occurred at the site, including metal finishing, heat treating, degreasing, and chemical handling and storage. Chlorinated VOCs, SVOCs, metals, and PCBs have been identified in the soil and storm sewer sediment at the site, while metals and VOCs have also been identified in the groundwater at the site. A Phase I environmental assessment was performed in 1991 and Phase II investigations were performed in 1993 and 1997 to evaluate site conditions. Based on the results of the Phase II investigations, Federal-Mogul entered into a Voluntary Cleanup Agreement with the New York State Department of Environmental Conservation on February 6, 2002 (Index no. A3-0372-9807) to investigate and remediate the site. Site Geology and Hydrogeology: Site soils generally consist of 0 to 3 feet of sand or sand and gravel fill material that contains fragments of concrete, glass, asphalt, wood, and other construction debris. The fill material is underlain by a dark yellowish-brown, poorly sorted, fine- to medium-grained sand that grades to a silty sand with increasing depth. The silty sand is underlain by a low permeability clayey silt unit at a depth of approximately 68 feet below ground surface (bgs). The shallow water bearing zone is located approximately 13 to 15 feet bgs. Groundwater flows in a west-southwest direction across the site area.
Env Problem: Nature and Extent of Contamination: Based upon investigations conducted to date, the primary contaminants of concern include chlorinated VOCs, namely trichloroethene (TCE) and tetrachloroethene (PCE). While most of the site has been sufficiently investigated, the nature and extent of contamination in areas under the former

HUCK INTL INC (Continued) **1000266777**

manufacturing building and office building where access was previously limited or unavailable has not been fully delineated. Soil Numerous soil borings were installed on-site from 2002 to 2008 to delineate the horizontal and vertical extent of VOCs in the soil. Based on the results of these investigations, the primary VOCs detected in the on-site soils were TCE, PCE and cis-1,2-dichloroethene (cis-1,2-DCE). They were found at several locations in shallow and deeper soils at concentrations above both the commercial and industrial use soil cleanup objectives (SCOs) established for these compounds. TCE, PCE and cis-1,2-DCE were detected at maximum concentrations of 610 parts per million (ppm), 540 ppm and 1,200 ppm, respectively. Commercial use SCOs for these compounds are 200 ppm, 150 ppm and 500 ppm, respectively. Industrial use SCOs for these compounds are 400 ppm, 300 ppm and 1,000 ppm respectively. SVOCs detected in soil include benzo(a)anthracene, benzo(a)pyrene and benzo(b)fluoranthene at maximum concentrations of 18 ppm, 15 ppm and 15ppm, respectively. Commercial use SCOs for these compounds are 5.6 ppm, 1.0 ppm and 5.6 ppm, respectively. Industrial use SCOs for these compounds are 11 ppm, 1.1 ppm and 11 ppm, respectively. Metals detected in soil include lead at a maximum concentration of 13,600 ppm, arsenic at a maximum concentration of 32 ppm and cadmium at a maximum concentration of 490 ppm. Commercial use SCOs for these metals are 1,000 ppm, 16 ppm and 9.3 ppm, respectively. Industrial use SCOs for these metals are 3,900 ppm, 16 ppm and 60 ppm, respectively. PCBs were not detected above commercial use SCOs in any of the soil samples. Groundwater Several groundwater investigations have been performed in relation to this site from 2002 through 2011. These investigations found the highest VOC concentrations in groundwater in two areas located under the former manufacturing building. VOCs detected in the groundwater include PCE, TCE, and their breakdown products. Evaluation of the vertical extent of VOCs in the groundwater indicated VOC levels above the New York State Ambient Water Quality Standards were confined mainly to the upper ten feet of the groundwater table. As a result, an AS/SVE system was installed as an IRM in April 2014 with the primary objective of reducing VOCs in groundwater in two source areas under the former manufacturing building that exhibited the highest VOC concentrations. The on-site groundwater sampling results from December 2022 showed a reduction in concentration of the primary contaminants in groundwater compared to the June 2014 sampling results. Maximum concentrations of PCE dropped from 723 parts per billion (ppb) to 224 ppb, while TCE dropped from 4,480 ppb to 564 ppb. There was however, an increase in the degradation product concentrations; cis-1,2-DCE from 4,570 ppb to 6,940 ppb and trans-1,2-DCE from 10.6 ppb to 29.8 ppb, indicating that breakdown is occurring. Likewise, the off-site groundwater sampling results from December 2022 showed a reduction in concentration of the primary contaminants in groundwater when compared to the June 2014 results. Maximum concentrations of PCE dropped from 174 ppb to 30.9 ppb, TCE dropped from 151 ppb to 21.5 ppb, cis-1,2-DCE dropped overall from 35.3 ppb to 8.6 ppb, and trans-1,2-DCE overall remains non-detect, indicating that breakdown is occurring. The sample results indicate that concentrations of site-related VOCs in groundwater have generally decreased in the source areas and in areas adjacent to, and downgradient from, the source areas. VOC concentrations in monitoring wells located outside the influence of the AS/SVE system have generally remained stable with concentrations of PCE ranging from

HUCK INTL INC (Continued) **1000266777**

non-detect to 27.4 ppb, TCE from non-detect to 68.4 ppb, and cis-1,2-DCE ranging from non-detect to 90.5 ppb. Soil Vapor and Indoor Air Former Manufacturing Building - In 2003 soil vapor samples were collected on-site and found to be impacted by site-related contamination. Additionally, indoor air samples collected in the former manufacturing building were found to be impacted by site-related contamination. As a result, a soil vapor extraction (SVE) system was installed on-site in February 2004 as an IRM along the periphery of the former finish and chemical storage area of the former manufacturing building, and along the eastern and southern property boundaries to address shallow soil vapor impacts in these areas and mitigate their off-site migration. TCE levels measured in the indoor air of the former manufacturing building in 2003 ranged from 17.7 to 258 g/m3. In January 2005, following implementation of the SVE trench system, reductions were observed in concentrations of TCE in the indoor air with levels ranging from non-detect to a maximum of 51.6 g/m3 in an unoccupied space in the southwest corner of the former manufacturing building. The site property was sold in 2008, and the former manufacturing building is currently used as mini-storage, with an office area that is likely occupied during normal business hours. In 2008, three additional rounds of indoor air testing were performed in the newly occupied office area. The indoor air samples collected in June, July, and August 2008 contained TCE at concentrations of 21.5 g/m3, 18.27 g/m3, and 9.62 g/m3, respectively. Indoor air sampling conducted during the 2018/2019 heating season (March/April 2019) found TCE levels at various locations ranging from 0.29 to 6.8 g/m3, and 4.8 to 5.5 g/m3 in the office area. The remedial party implemented actions to improve air quality in the building: sealing cracks and openings in the concrete floor in accessible portions of the building, including any remaining floor drains and sumps; evaluated operation of AS/SVE and SVE treatment systems to improve indoor air quality; and evaluated existing air handling system in office area. Additional indoor air sampling was conducted in the former manufacturing building in November of 2020. TCE levels at various locations ranged from 3.8 to 6.2 g/m3, and 6.3 g/m3 in the office area, exceeding NYSDOH indoor air guidance levels for TCE of 2 g/m3. On March 8-9, 2021 the remedial party conducted a pilot test to increase sub-slab vacuum at select locations in the former manufacturing building. The pilot test resulted in the installation of one suction point which was tied into the existing AS/SVE system. Another indoor air sampling event was conducted on March 31, 2021 to evaluate the potential impact of the additional suction point on indoor air quality. TCE levels found at various locations ranged from 1.1 to 3.7 g/m3, and 3.0 g/m3 in the office area. While the indoor levels showed a marked decrease over the previous sampling event, four of the five sampling locations exceeded NYSDOH indoor air guidance levels for TCE of 2 g/m3. The remedial party installed an SSD system in February 2022 with two extraction points in the northwest portion of the main building to address the potential for vapor intrusion in this area. Follow-up indoor air sampling was conducted on March 30, 2022 to evaluate the potential impact of the SSD system installed in February 2022 on indoor air quality. TCE levels found at various locations ranged from 0.55 to 6.9 g/m3, and 0.58 g/m3 in the office area. The indoor levels showed a marked decrease over the previous sampling event, with only one of the five sampling locations exceeding NYSDOH indoor air guidance levels for TCE of 2 g/m3. On-Site Office Building - In August 2003,

HUCK INTL INC (Continued) **1000266777**

TCE levels measured in the indoor air of the on-site office building ranged from 96.7 to 167 g/m3. As a result, a SSDS was installed as an IRM in the on-site office building in March 2004. During the following heating season in January 2005, noticeable reductions in TCE levels were observed in the indoor air of the on-site office building, with concentrations ranging from non-detect to 0.81 g/m3. The on-site SSDS is inspected on an annual basis to verify proper operation; therefore, no additional indoor air samples have been collected in the on-site office building since 2005. Off-Site Locations - Eighteen SSDSs have been installed at 17 off-site locations beginning in 2006 to address off-site sub-slab soil vapor and indoor air impacts. Offers were made to conduct soil vapor intrusion (SVI) investigations at 43 off-site properties and sampling has been performed at 22 properties. The remaining 21 property owners either declined or did not respond to the request for sampling. Based on a comparison of data from the 22 buildings to the decision matrices provided in the NYSDOH s Guidance for Evaluating Soil Vapor Intrusion in the State of New York, no further action was ultimately recommended at 10 properties and vapor mitigation was recommended at 12 properties; SSDSs have been installed at each of the 12 properties. Actions were taken to install SSDSs in five additional buildings not sampled for soil vapor intrusion, but based on sampling results of nearby buildings where mitigation was recommended. Further monitoring is not currently required at any of the off-site properties.

Health Problem: Direct contact with contaminants in the soil is unlikely because the majority of the site is covered with buildings and pavement. Contaminated groundwater at the site is not used for drinking or other purposes and the site is served by a public water supply that obtains water from a different source not affected by this contamination. Volatile organic compounds in the soil or groundwater may move into the soil vapor (air spaces within the soil), which in turn may move into overlying buildings and affect the indoor air quality. This process, which is similar to the movement of radon gas from the subsurface into the indoor air of buildings, is referred to as soil vapor intrusion. A sub-slab depressurization system has been installed in the office building and a soil vapor extraction system has been installed adjacent to the former manufacturing building in the vicinity of the main office and former metal finish area to prevent the indoor air quality from being affected by contamination in soil vapor beneath the building. However, the potential exists for inhalation of site contaminants due to soil vapor intrusion for any future on-site redevelopment. Sub-slab depressurization systems have been installed in 17 off-site buildings to prevent the indoor air quality from being affected by the contamination in soil vapor beneath the buildings. The investigation of soil vapor intrusion is on-going at off-site structures with actions being taken as necessary to address exposures.

Site Description:	Location: The Federal-Mogul/Huck Site is located at 85 Grand Street in the City of Kingston in Ulster County. Site Features: The site consists of two buildings, a former manufacturing building and an attached office building, together occupying 105,000 square feet of the approximately 4-acre site. The remainder of the site consists of paved parking lots, access roads, a grassy area near the office building and narrow landscaped areas in the eastern and southern parking lots. Current Zoning and Land Use: The site is zoned M-2 General Manufacturing, which includes wholesale storage and warehousing. The former manufacturing building houses self-storage units and the office building is used by a moving and truck rental company. Residential and commercial properties border the site across Tenbroeck Avenue to the northeast and residences and a vacant commercial building are located across Grand Street to the southeast. Two commercial properties, a bottle return center and a warehouse, adjoin the property to the south and CSX Transportation, Inc. (railroad tracks) border the site to the west. Commercial and light industrial properties are directly west of the CSX railroad tracks. All properties within a one-mile radius of the site are serviced by municipal water. Past Use of the Site: The site has been in operation since 1889, used by various companies for automotive, electrical, and

HUCK INTL INC (Continued) **1000266777**

refrigeration supplies manufacturing. Site media have been impacted from various manufacturing processes that are known to have occurred at the site, including metal finishing, heat treating, degreasing, and chemical handling and storage. Chlorinated VOCs, SVOCs, metals, and PCBs have been identified in the soil and storm sewer sediment at the site, while metals and VOCs have also been identified in the groundwater at the site. A Phase I environmental assessment was performed in 1991 and Phase II investigations were performed in 1993 and 1997 to evaluate site conditions. Based on the results of the Phase II investigations, Federal-Mogul entered into a Voluntary Cleanup Agreement with the New York State Department of Environmental Conservation on February 6, 2002 (Index no. A3-0372-9807) to investigate and remediate the site. Site Geology and Hydrogeology: Site soils generally consist of 0 to 3 feet of sand or sand and gravel fill material that contains fragments of concrete, glass, asphalt, wood, and other construction debris. The fill material is underlain by a dark yellowish-brown, poorly sorted, fine- to medium-grained sand that grades to a silty sand with increasing depth. The silty sand is underlain by a low permeability clayey silt unit at a depth of approximately 68 feet below ground surface (bgs). The shallow water bearing zone is located approximately 13 to 15 feet bgs. Groundwater flows in a west-southwest direction across the site area.

Env Problem: Nature and Extent of Contamination: Based upon investigations conducted to date, the primary contaminants of concern include chlorinated VOCs, namely trichloroethene (TCE) and tetrachloroethene (PCE). While most of the site has been sufficiently investigated, the nature and extent of contamination in areas under the former manufacturing building and office building where access was previously limited or unavailable has not been fully delineated. Soil Numerous soil borings were installed on-site from 2002 to 2008 to delineate the horizontal and vertical extent of VOCs in the soil. Based on the results of these investigations, the primary VOCs detected in the on-site soils were TCE, PCE and cis-1,2-dichloroethene (cis-1,2-DCE). They were found at several locations in shallow and deeper soils at concentrations above both the commercial and industrial use soil cleanup objectives (SCOs) established for these compounds. TCE, PCE and cis-1,2-DCE were detected at maximum concentrations of 610 parts per million (ppm), 540 ppm and 1,200 ppm, respectively. Commercial use SCOs for these compounds are 200 ppm, 150 ppm and 500 ppm, respectively. Industrial use SCOs for these compounds are 400 ppm, 300 ppm and 1,000 ppm respectively. SVOCs detected in soil include benzo(a)anthracene, benzo(a)pyrene and benzo(b)fluoranthene at maximum concentrations of 18 ppm, 15 ppm and 15ppm, respectively. Commercial use SCOs for these compounds are 5.6 ppm, 1.0 ppm and 5.6 ppm, respectively. Industrial use SCOs for these compounds are 11 ppm, 1.1 ppm and 11 ppm, respectively. Metals detected in soil include lead at a maximum concentration of 13,600 ppm, arsenic at a maximum concentration of 32 ppm and cadmium at a maximum concentration of 490 ppm. Commercial use SCOs for these metals are 1,000 ppm, 16 ppm and 9.3 ppm, respectively. Industrial use SCOs for these metals are 3,900 ppm, 16 ppm and 60 ppm, respectively. PCBs were not detected above commercial use SCOs in any of the soil samples. Groundwater Several groundwater investigations have been performed in relation to this site from 2002 through 2011. These investigations found the highest VOC concentrations in groundwater in two areas located under the former

HUCK INTL INC (Continued) **1000266777**

manufacturing building. VOCs detected in the groundwater include PCE, TCE, and their breakdown products. Evaluation of the vertical extent of VOCs in the groundwater indicated VOC levels above the New York State Ambient Water Quality Standards were confined mainly to the upper ten feet of the groundwater table. As a result, an AS/SVE system was installed as an IRM in April 2014 with the primary objective of reducing VOCs in groundwater in two source areas under the former manufacturing building that exhibited the highest VOC concentrations. The on-site groundwater sampling results from December 2022 showed a reduction in concentration of the primary contaminants in groundwater compared to the June 2014 sampling results. Maximum concentrations of PCE dropped from 723 parts per billion (ppb) to 224 ppb, while TCE dropped from 4,480 ppb to 564 ppb. There was however, an increase in the degradation product concentrations; cis-1,2-DCE from 4,570 ppb to 6,940 ppb and trans-1,2-DCE from 10.6 ppb to 29.8 ppb, indicating that breakdown is occurring. Likewise, the off-site groundwater sampling results from December 2022 showed a reduction in concentration of the primary contaminants in groundwater when compared to the June 2014 results. Maximum concentrations of PCE dropped from 174 ppb to 30.9 ppb, TCE dropped from 151 ppb to 21.5 ppb, cis-1,2-DCE dropped overall from 35.3 ppb to 8.6 ppb, and trans-1,2-DCE overall remains non-detect, indicating that breakdown is occurring. The sample results indicate that concentrations of site-related VOCs in groundwater have generally decreased in the source areas and in areas adjacent to, and downgradient from, the source areas. VOC concentrations in monitoring wells located outside the influence of the AS/SVE system have generally remained stable with concentrations of PCE ranging from non-detect to 27.4 ppb, TCE from non-detect to 68.4 ppb, and cis-1,2-DCE ranging from non-detect to 90.5 ppb. Soil Vapor and Indoor Air Former Manufacturing Building - In 2003 soil vapor samples were collected on-site and found to be impacted by site-related contamination. Additionally, indoor air samples collected in the former manufacturing building were found to be impacted by site-related contamination. As a result, a soil vapor extraction (SVE) system was installed on-site in February 2004 as an IRM along the periphery of the former finish and chemical storage area of the former manufacturing building, and along the eastern and southern property boundaries to address shallow soil vapor impacts in these areas and mitigate their off-site migration. TCE levels measured in the indoor air of the former manufacturing building in 2003 ranged from 17.7 to 258 g/m3. In January 2005, following implementation of the SVE trench system, reductions were observed in concentrations of TCE in the indoor air with levels ranging from non-detect to a maximum of 51.6 g/m3 in an unoccupied space in the southwest corner of the former manufacturing building. The site property was sold in 2008, and the former manufacturing building is currently used as mini-storage, with an office area that is likely occupied during normal business hours. In 2008, three additional rounds of indoor air testing were performed in the newly occupied office area. The indoor air samples collected in June, July, and August 2008 contained TCE at concentrations of 21.5 g/m3, 18.27 g/m3, and 9.62 g/m3, respectively. Indoor air sampling conducted during the 2018/2019 heating season (March/April 2019) found TCE levels at various locations ranging from 0.29 to 6.8 g/m3, and 4.8 to 5.5 g/m3 in the office area. The remedial party implemented actions to improve air quality in the building: sealing cracks and openings in the concrete floor in

HUCK INTL INC (Continued) **1000266777**

accessible portions of the building, including any remaining floor drains and sumps; evaluated operation of AS/SVE and SVE treatment systems to improve indoor air quality; and evaluated existing air handling system in office area. Additional indoor air sampling was conducted in the former manufacturing building in November of 2020. TCE levels at various locations ranged from 3.8 to 6.2 g/m3, and 6.3 g/m3 in the office area, exceeding NYSDOH indoor air guidance levels for TCE of 2 g/m3. On March 8-9, 2021 the remedial party conducted a pilot test to increase sub-slab vacuum at select locations in the former manufacturing building. The pilot test resulted in the installation of one suction point which was tied into the existing AS/SVE system. Another indoor air sampling event was conducted on March 31, 2021 to evaluate the potential impact of the additional suction point on indoor air quality. TCE levels found at various locations ranged from 1.1 to 3.7 g/m3, and 3.0 g/m3 in the office area. While the indoor levels showed a marked decrease over the previous sampling event, four of the five sampling locations exceeded NYSDOH indoor air guidance levels for TCE of 2 g/m3. The remedial party installed an SSD system in February 2022 with two extraction points in the northwest portion of the main building to address the potential for vapor intrusion in this area. Follow-up indoor air sampling was conducted on March 30, 2022 to evaluate the potential impact of the SSD system installed in February 2022 on indoor air quality. TCE levels found at various locations ranged from 0.55 to 6.9 g/m3, and 0.58 g/m3 in the office area. The indoor levels showed a marked decrease over the previous sampling event, with only one of the five sampling locations exceeding NYSDOH indoor air guidance levels for TCE of 2 g/m3. On-Site Office Building - In August 2003, TCE levels measured in the indoor air of the on-site office building ranged from 96.7 to 167 g/m3. As a result, a SSDS was installed as an IRM in the on-site office building in March 2004. During the following heating season in January 2005, noticeable reductions in TCE levels were observed in the indoor air of the on-site office building, with concentrations ranging from non-detect to 0.81 g/m3. The on-site SSDS is inspected on an annual basis to verify proper operation; therefore, no additional indoor air samples have been collected in the on-site office building since 2005. Off-Site Locations - Eighteen SSDSs have been installed at 17 off-site locations beginning in 2006 to address off-site sub-slab soil vapor and indoor air impacts. Offers were made to conduct soil vapor intrusion (SVI) investigations at 43 off-site properties and sampling has been performed at 22 properties. The remaining 21 property owners either declined or did not respond to the request for sampling. Based on a comparison of data from the 22 buildings to the decision matrices provided in the NYSDOH s Guidance for Evaluating Soil Vapor Intrusion in the State of New York, no further action was ultimately recommended at 10 properties and vapor mitigation was recommended at 12 properties; SSDSs have been installed at each of the 12 properties. Actions were taken to install SSDSs in five additional buildings not sampled for soil vapor intrusion, but based on sampling results of nearby buildings where mitigation was recommended. Further monitoring is not currently required at any of the off-site properties.

Health Problem: Direct contact with contaminants in the soil is unlikely because the majority of the site is covered with buildings and pavement. Contaminated groundwater at the site is not used for drinking or other purposes and the site is served by a public water supply that

HUCK INTL INC (Continued) **1000266777**

obtains water from a different source not affected by this contamination. Volatile organic compounds in the soil or groundwater may move into the soil vapor (air spaces within the soil), which in turn may move into overlying buildings and affect the indoor air quality. This process, which is similar to the movement of radon gas from the subsurface into the indoor air of buildings, is referred to as soil vapor intrusion. A sub-slab depressurization system has been installed in the office building and a soil vapor extraction system has been installed adjacent to the former manufacturing building in the vicinity of the main office and former metal finish area to prevent the indoor air quality from being affected by contamination in soil vapor beneath the building. However, the potential exists for inhalation of site contaminants due to soil vapor intrusion for any future on-site redevelopment. Sub-slab depressurization systems have been installed in 17 off-site buildings to prevent the indoor air quality from being affected by the contamination in soil vapor beneath the buildings. The investigation of soil vapor intrusion is on-going at off-site structures with actions being taken as necessary to address exposures.

The silty sand is underlain by a low permeability clayey silt unit at a depth of approximately 68 feet below ground surface (bgs). The shallow water bearing zone is located approximately 13 to 15 feet bgs. Groundwater flows in a west-southwest direction across the site area.
Env Problem:	Nature and Extent of Contamination: Based upon investigations conducted to date, the primary contaminants of concern include chlorinated VOCs, namely trichloroethene (TCE) and tetrachloroethene (PCE). While most of the site has been sufficiently investigated, the nature and extent of contamination in areas under the former manufacturing building and office building where access was

HUCK INTL INC (Continued) **1000266777**

previously limited or unavailable has not been fully delineated. Soil Numerous soil borings were installed on-site from 2002 to 2008 to delineate the horizontal and vertical extent of VOCs in the soil. Based on the results of these investigations, the primary VOCs detected in the on-site soils were TCE, PCE and cis-1,2-dichloroethene (cis-1,2-DCE). They were found at several locations in shallow and deeper soils at concentrations above both the commercial and industrial use soil cleanup objectives (SCOs) established for these compounds. TCE, PCE and cis-1,2-DCE were detected at maximum concentrations of 610 parts per million (ppm), 540 ppm and 1,200 ppm, respectively. Commercial use SCOs for these compounds are 200 ppm, 150 ppm and 500 ppm, respectively. Industrial use SCOs for these compounds are 400 ppm, 300 ppm and 1,000 ppm respectively. SVOCs detected in soil include benzo(a)anthracene, benzo(a)pyrene and benzo(b)fluoranthene at maximum concentrations of 18 ppm, 15 ppm and 15ppm, respectively. Commercial use SCOs for these compounds are 5.6 ppm, 1.0 ppm and 5.6 ppm, respectively. Industrial use SCOs for these compounds are 11 ppm, 1.1 ppm and 11 ppm, respectively. Metals detected in soil include lead at a maximum concentration of 13,600 ppm, arsenic at a maximum concentration of 32 ppm and cadmium at a maximum concentration of 490 ppm. Commercial use SCOs for these metals are 1,000 ppm, 16 ppm and 9.3 ppm, respectively. Industrial use SCOs for these metals are 3,900 ppm, 16 ppm and 60 ppm, respectively. PCBs were not detected above commercial use SCOs in any of the soil samples. Groundwater Several groundwater investigations have been performed in relation to this site from 2002 through 2011. These investigations found the highest VOC concentrations in groundwater in two areas located under the former manufacturing building. VOCs detected in the groundwater include PCE, TCE, and their breakdown products. Evaluation of the vertical extent of VOCs in the groundwater indicated VOC levels above the New York State Ambient Water Quality Standards were confined mainly to the upper ten feet of the groundwater table. As a result, an AS/SVE system was installed as an IRM in April 2014 with the primary objective of reducing VOCs in groundwater in two source areas under the former manufacturing building that exhibited the highest VOC concentrations. The on-site groundwater sampling results from December 2022 showed a reduction in concentration of the primary contaminants in groundwater compared to the June 2014 sampling results. Maximum concentrations of PCE dropped from 723 parts per billion (ppb) to 224 ppb, while TCE dropped from 4,480 ppb to 564 ppb. There was however, an increase in the degradation product concentrations; cis-1,2-DCE from 4,570 ppb to 6,940 ppb and trans-1,2-DCE from 10.6 ppb to 29.8 ppb, indicating that breakdown is occurring. Likewise, the off-site groundwater sampling results from December 2022 showed a reduction in concentration of the primary contaminants in groundwater when compared to the June 2014 results. Maximum concentrations of PCE dropped from 174 ppb to 30.9 ppb, TCE dropped from 151 ppb to 21.5 ppb, cis-1,2-DCE dropped overall from 35.3 ppb to 8.6 ppb, and trans-1,2-DCE overall remains non-detect, indicating that breakdown is occurring. The sample results indicate that concentrations of site-related VOCs in groundwater have generally decreased in the source areas and in areas adjacent to, and downgradient from, the source areas. VOC concentrations in monitoring wells located outside the influence of the AS/SVE system have generally remained stable with concentrations of PCE ranging from non-detect to 27.4 ppb, TCE from non-detect to 68.4 ppb, and

HUCK INTL INC (Continued) **1000266777**

cis-1,2-DCE ranging from non-detect to 90.5 ppb. Soil Vapor and Indoor Air Former Manufacturing Building - In 2003 soil vapor samples were collected on-site and found to be impacted by site-related contamination. Additionally, indoor air samples collected in the former manufacturing building were found to be impacted by site-related contamination. As a result, a soil vapor extraction (SVE) system was installed on-site in February 2004 as an IRM along the periphery of the former finish and chemical storage area of the former manufacturing building, and along the eastern and southern property boundaries to address shallow soil vapor impacts in these areas and mitigate their off-site migration. TCE levels measured in the indoor air of the former manufacturing building in 2003 ranged from 17.7 to 258 g/m3. In January 2005, following implementation of the SVE trench system, reductions were observed in concentrations of TCE in the indoor air with levels ranging from non-detect to a maximum of 51.6 g/m3 in an unoccupied space in the southwest corner of the former manufacturing building. The site property was sold in 2008, and the former manufacturing building is currently used as mini-storage, with an office area that is likely occupied during normal business hours. In 2008, three additional rounds of indoor air testing were performed in the newly occupied office area. The indoor air samples collected in June, July, and August 2008 contained TCE at concentrations of 21.5 g/m3, 18.27 g/m3, and 9.62 g/m3, respectively. Indoor air sampling conducted during the 2018/2019 heating season (March/April 2019) found TCE levels at various locations ranging from 0.29 to 6.8 g/m3, and 4.8 to 5.5 g/m3 in the office area. The remedial party implemented actions to improve air quality in the building: sealing cracks and openings in the concrete floor in accessible portions of the building, including any remaining floor drains and sumps; evaluated operation of AS/SVE and SVE treatment systems to improve indoor air quality; and evaluated existing air handling system in office area. Additional indoor air sampling was conducted in the former manufacturing building in November of 2020. TCE levels at various locations ranged from 3.8 to 6.2 g/m3, and 6.3 g/m3 in the office area, exceeding NYSDOH indoor air guidance levels for TCE of 2 g/m3. On March 8-9, 2021 the remedial party conducted a pilot test to increase sub-slab vacuum at select locations in the former manufacturing building. The pilot test resulted in the installation of one suction point which was tied into the existing AS/SVE system. Another indoor air sampling event was conducted on March 31, 2021 to evaluate the potential impact of the additional suction point on indoor air quality. TCE levels found at various locations ranged from 1.1 to 3.7 g/m3, and 3.0 g/m3 in the office area. While the indoor levels showed a marked decrease over the previous sampling event, four of the five sampling locations exceeded NYSDOH indoor air guidance levels for TCE of 2 g/m3. The remedial party installed an SSD system in February 2022 with two extraction points in the northwest portion of the main building to address the potential for vapor intrusion in this area. Follow-up indoor air sampling was conducted on March 30, 2022 to evaluate the potential impact of the SSD system installed in February 2022 on indoor air quality. TCE levels found at various locations ranged from 0.55 to 6.9 g/m3, and 0.58 g/m3 in the office area. The indoor levels showed a marked decrease over the previous sampling event, with only one of the five sampling locations exceeding NYSDOH indoor air guidance levels for TCE of 2 g/m3. On-Site Office Building - In August 2003, TCE levels measured in the indoor air of the on-site office building

HUCK INTL INC (Continued) **1000266777**

ranged from 96.7 to 167 g/m3. As a result, a SSDS was installed as an IRM in the on-site office building in March 2004. During the following heating season in January 2005, noticeable reductions in TCE levels were observed in the indoor air of the on-site office building, with concentrations ranging from non-detect to 0.81 g/m3. The on-site SSDS is inspected on an annual basis to verify proper operation; therefore, no additional indoor air samples have been collected in the on-site office building since 2005. Off-Site Locations - Eighteen SSDSs have been installed at 17 off-site locations beginning in 2006 to address off-site sub-slab soil vapor and indoor air impacts. Offers were made to conduct soil vapor intrusion (SVI) investigations at 43 off-site properties and sampling has been performed at 22 properties. The remaining 21 property owners either declined or did not respond to the request for sampling. Based on a comparison of data from the 22 buildings to the decision matrices provided in the NYSDOH s Guidance for Evaluating Soil Vapor Intrusion in the State of New York, no further action was ultimately recommended at 10 properties and vapor mitigation was recommended at 12 properties; SSDSs have been installed at each of the 12 properties. Actions were taken to install SSDSs in five additional buildings not sampled for soil vapor intrusion, but based on sampling results of nearby buildings where mitigation was recommended. Further monitoring is not currently required at any of the off-site properties.

Health Problem: Direct contact with contaminants in the soil is unlikely because the majority of the site is covered with buildings and pavement. Contaminated groundwater at the site is not used for drinking or other purposes and the site is served by a public water supply that obtains water from a different source not affected by this contamination. Volatile organic compounds in the soil or groundwater may move into the soil vapor (air spaces within the soil), which in turn may move into overlying buildings and affect the indoor air quality. This process, which is similar to the movement of radon gas from the subsurface into the indoor air of buildings, is referred to as soil vapor intrusion. A sub-slab depressurization system has been installed in the office building and a soil vapor extraction system has been installed adjacent to the former manufacturing building in the vicinity of the main office and former metal finish area to prevent the indoor air quality from being affected by contamination in soil vapor beneath the building. However, the potential exists for inhalation of site contaminants due to soil vapor intrusion for any future on-site redevelopment. Sub-slab depressurization systems have been installed in 17 off-site buildings to prevent the indoor air quality from being affected by the contamination in soil vapor beneath the buildings. The investigation of soil vapor intrusion is on-going at off-site structures with actions being taken as necessary to address exposures.

Site Code: 56863
Site Description: Location: The Federal-Mogul/Huck Site is located at 85 Grand Street in the City of Kingston in Ulster County. Site Features: The site consists of two buildings, a former manufacturing building and an attached office building, together occupying 105,000 square feet of the approximately 4-acre site. The remainder of the site consists of paved parking lots, access roads, a grassy area near the office building and narrow landscaped areas in the eastern and southern parking lots. Current Zoning and Land Use: The site is zoned M-2 General Manufacturing, which includes wholesale storage and warehousing. The former manufacturing building houses self-storage units and the office building is used by a moving and truck rental company. Residential and commercial properties border the site across Tenbroeck Avenue to the northeast and residences and a vacant commercial building are located across Grand Street to the southeast. Two commercial properties, a bottle return center and a warehouse, adjoin the property to the south and CSX Transportation, Inc. (railroad tracks) border the site to the west. Commercial and light industrial properties are directly west of the CSX railroad tracks. All properties within a one-mile radius of the site are serviced by

HUCK INTL INC (Continued) **1000266777**

municipal water. Past Use of the Site: The site has been in operation since 1889, used by various companies for automotive, electrical, and refrigeration supplies manufacturing. Site media have been impacted from various manufacturing processes that are known to have occurred at the site, including metal finishing, heat treating, degreasing, and chemical handling and storage. Chlorinated VOCs, SVOCs, metals, and PCBs have been identified in the soil and storm sewer sediment at the site, while metals and VOCs have also been identified in the groundwater at the site. A Phase I environmental assessment was performed in 1991 and Phase II investigations were performed in 1993 and 1997 to evaluate site conditions. Based on the results of the Phase II investigations, Federal-Mogul entered into a Voluntary Cleanup Agreement with the New York State Department of Environmental Conservation on February 6, 2002 (Index no. A3-0372-9807) to investigate and remediate the site. Site Geology and Hydrogeology: Site soils generally consist of 0 to 3 feet of sand or sand and gravel fill material that contains fragments of concrete, glass, asphalt, wood, and other construction debris. The fill material is underlain by a dark yellowish-brown, poorly sorted, fine- to medium-grained sand that grades to a silty sand with increasing depth. The silty sand is underlain by a low permeability clayey silt unit at a depth of approximately 68 feet below ground surface (bgs). The shallow water bearing zone is located approximately 13 to 15 feet bgs. Groundwater flows in a west-southwest direction across the site area.

Env Problem: Nature and Extent of Contamination: Based upon investigations conducted to date, the primary contaminants of concern include chlorinated VOCs, namely trichloroethene (TCE) and tetrachloroethene (PCE). While most of the site has been sufficiently investigated, the nature and extent of contamination in areas under the former manufacturing building and office building where access was previously limited or unavailable has not been fully delineated. Soil Numerous soil borings were installed on-site from 2002 to 2008 to delineate the horizontal and vertical extent of VOCs in the soil. Based on the results of these investigations, the primary VOCs detected in the on-site soils were TCE, PCE and cis-1,2-dichloroethene (cis-1,2-DCE). They were found at several locations in shallow and deeper soils at concentrations above both the commercial and industrial use soil cleanup objectives (SCOs) established for these compounds. TCE, PCE and cis-1,2-DCE were detected at maximum concentrations of 610 parts per million (ppm), 540 ppm and 1,200 ppm, respectively. Commercial use SCOs for these compounds are 200 ppm, 150 ppm and 500 ppm, respectively. Industrial use SCOs for these compounds are 400 ppm, 300 ppm and 1,000 ppm respectively. SVOCs detected in soil include benzo(a)anthracene, benzo(a)pyrene and benzo(b)fluoranthene at maximum concentrations of 18 ppm, 15 ppm and 15ppm, respectively. Commercial use SCOs for these compounds are 5.6 ppm, 1.0 ppm and 5.6 ppm, respectively. Industrial use SCOs for these compounds are 11 ppm, 1.1 ppm and 11 ppm, respectively. Metals detected in soil include lead at a maximum concentration of 13,600 ppm, arsenic at a maximum concentration of 32 ppm and cadmium at a maximum concentration of 490 ppm. Commercial use SCOs for these metals are 1,000 ppm, 16 ppm and 9.3 ppm, respectively. Industrial use SCOs for these metals are 3,900 ppm, 16 ppm and 60 ppm, respectively. PCBs were not detected above commercial use SCOs in any of the soil samples. Groundwater Several groundwater investigations have been performed in relation to this site from 2002

HUCK INTL INC (Continued) **1000266777**

through 2011. These investigations found the highest VOC concentrations in groundwater in two areas located under the former manufacturing building. VOCs detected in the groundwater include PCE, TCE, and their breakdown products. Evaluation of the vertical extent of VOCs in the groundwater indicated VOC levels above the New York State Ambient Water Quality Standards were confined mainly to the upper ten feet of the groundwater table. As a result, an AS/SVE system was installed as an IRM in April 2014 with the primary objective of reducing VOCs in groundwater in two source areas under the former manufacturing building that exhibited the highest VOC concentrations. The on-site groundwater sampling results from December 2022 showed a reduction in concentration of the primary contaminants in groundwater compared to the June 2014 sampling results. Maximum concentrations of PCE dropped from 723 parts per billion (ppb) to 224 ppb, while TCE dropped from 4,480 ppb to 564 ppb. There was however, an increase in the degradation product concentrations; cis-1,2-DCE from 4,570 ppb to 6,940 ppb and trans-1,2-DCE from 10.6 ppb to 29.8 ppb, indicating that breakdown is occurring. Likewise, the off-site groundwater sampling results from December 2022 showed a reduction in concentration of the primary contaminants in groundwater when compared to the June 2014 results. Maximum concentrations of PCE dropped from 174 ppb to 30.9 ppb, TCE dropped from 151 ppb to 21.5 ppb, cis-1,2-DCE dropped overall from 35.3 ppb to 8.6 ppb, and trans-1,2-DCE overall remains non-detect, indicating that breakdown is occurring. The sample results indicate that concentrations of site-related VOCs in groundwater have generally decreased in the source areas and in areas adjacent to, and downgradient from, the source areas. VOC concentrations in monitoring wells located outside the influence of the AS/SVE system have generally remained stable with concentrations of PCE ranging from non-detect to 27.4 ppb, TCE from non-detect to 68.4 ppb, and cis-1,2-DCE ranging from non-detect to 90.5 ppb. Soil Vapor and Indoor Air Former Manufacturing Building - In 2003 soil vapor samples were collected on-site and found to be impacted by site-related contamination. Additionally, indoor air samples collected in the former manufacturing building were found to be impacted by site-related contamination. As a result, a soil vapor extraction (SVE) system was installed on-site in February 2004 as an IRM along the periphery of the former finish and chemical storage area of the former manufacturing building, and along the eastern and southern property boundaries to address shallow soil vapor impacts in these areas and mitigate their off-site migration. TCE levels measured in the indoor air of the former manufacturing building in 2003 ranged from 17.7 to 258 g/m3. In January 2005, following implementation of the SVE trench system, reductions were observed in concentrations of TCE in the indoor air with levels ranging from non-detect to a maximum of 51.6 g/m3 in an unoccupied space in the southwest corner of the former manufacturing building. The site property was sold in 2008, and the former manufacturing building is currently used as mini-storage, with an office area that is likely occupied during normal business hours. In 2008, three additional rounds of indoor air testing were performed in the newly occupied office area. The indoor air samples collected in June, July, and August 2008 contained TCE at concentrations of 21.5 g/m3, 18.27 g/m3, and 9.62 g/m3, respectively. Indoor air sampling conducted during the 2018/2019 heating season (March/April 2019) found TCE levels at various locations ranging from 0.29 to 6.8 g/m3, and 4.8 to 5.5 g/m3 in the office area. The

HUCK INTL INC (Continued) **1000266777**

remedial party implemented actions to improve air quality in the building: sealing cracks and openings in the concrete floor in accessible portions of the building, including any remaining floor drains and sumps; evaluated operation of AS/SVE and SVE treatment systems to improve indoor air quality; and evaluated existing air handling system in office area. Additional indoor air sampling was conducted in the former manufacturing building in November of 2020. TCE levels at various locations ranged from 3.8 to 6.2 g/m3, and 6.3 g/m3 in the office area, exceeding NYSDOH indoor air guidance levels for TCE of 2 g/m3. On March 8-9, 2021 the remedial party conducted a pilot test to increase sub-slab vacuum at select locations in the former manufacturing building. The pilot test resulted in the installation of one suction point which was tied into the existing AS/SVE system. Another indoor air sampling event was conducted on March 31, 2021 to evaluate the potential impact of the additional suction point on indoor air quality. TCE levels found at various locations ranged from 1.1 to 3.7 g/m3, and 3.0 g/m3 in the office area. While the indoor levels showed a marked decrease over the previous sampling event, four of the five sampling locations exceeded NYSDOH indoor air guidance levels for TCE of 2 g/m3. The remedial party installed an SSD system in February 2022 with two extraction points in the northwest portion of the main building to address the potential for vapor intrusion in this area. Follow-up indoor air sampling was conducted on March 30, 2022 to evaluate the potential impact of the SSD system installed in February 2022 on indoor air quality. TCE levels found at various locations ranged from 0.55 to 6.9 g/m3, and 0.58 g/m3 in the office area. The indoor levels showed a marked decrease over the previous sampling event, with only one of the five sampling locations exceeding NYSDOH indoor air guidance levels for TCE of 2 g/m3. On-Site Office Building - In August 2003, TCE levels measured in the indoor air of the on-site office building ranged from 96.7 to 167 g/m3. As a result, a SSDS was installed as an IRM in the on-site office building in March 2004. During the following heating season in January 2005, noticeable reductions in TCE levels were observed in the indoor air of the on-site office building, with concentrations ranging from non-detect to 0.81 g/m3. The on-site SSDS is inspected on an annual basis to verify proper operation; therefore, no additional indoor air samples have been collected in the on-site office building since 2005. Off-Site Locations - Eighteen SSDSs have been installed at 17 off-site locations beginning in 2006 to address off-site sub-slab soil vapor and indoor air impacts. Offers were made to conduct soil vapor intrusion (SVI) investigations at 43 off-site properties and sampling has been performed at 22 properties. The remaining 21 property owners either declined or did not respond to the request for sampling. Based on a comparison of data from the 22 buildings to the decision matrices provided in the NYSDOH s Guidance for Evaluating Soil Vapor Intrusion in the State of New York, no further action was ultimately recommended at 10 properties and vapor mitigation was recommended at 12 properties; SSDSs have been installed at each of the 12 properties. Actions were taken to install SSDSs in five additional buildings not sampled for soil vapor intrusion, but based on sampling results of nearby buildings where mitigation was recommended. Further monitoring is not currently required at any of the off-site properties.

Health Problem: Direct contact with contaminants in the soil is unlikely because the majority of the site is covered with buildings and pavement.

HUCK INTL INC (Continued) **1000266777**

Contaminated groundwater at the site is not used for drinking or other purposes and the site is served by a public water supply that obtains water from a different source not affected by this contamination. Volatile organic compounds in the soil or groundwater may move into the soil vapor (air spaces within the soil), which in turn may move into overlying buildings and affect the indoor air quality. This process, which is similar to the movement of radon gas from the subsurface into the indoor air of buildings, is referred to as soil vapor intrusion. A sub-slab depressurization system has been installed in the office building and a soil vapor extraction system has been installed adjacent to the former manufacturing building in the vicinity of the main office and former metal finish area to prevent the indoor air quality from being affected by contamination in soil vapor beneath the building. However, the potential exists for inhalation of site contaminants due to soil vapor intrusion for any future on-site redevelopment. Sub-slab depressurization systems have been installed in 17 off-site buildings to prevent the indoor air quality from being affected by the contamination in soil vapor beneath the buildings. The investigation of soil vapor intrusion is on-going at off-site structures with actions being taken as necessary to address exposures.

Site Code: 56863
Site Description: Location: The Federal-Mogul/Huck Site is located at 85 Grand Street in the City of Kingston in Ulster County. Site Features: The site consists of two buildings, a former manufacturing building and an attached office building, together occupying 105,000 square feet of the approximately 4-acre site. The remainder of the site consists of paved parking lots, access roads, a grassy area near the office building and narrow landscaped areas in the eastern and southern parking lots. Current Zoning and Land Use: The site is zoned M-2 General Manufacturing, which includes wholesale storage and warehousing. The former manufacturing building houses self-storage units and the office building is used by a moving and truck rental company. Residential and commercial properties border the site across Tenbroeck Avenue to the northeast and residences and a vacant commercial building are located across Grand Street to the southeast. Two commercial properties, a bottle return center and a warehouse, adjoin the property to the south and CSX Transportation, Inc. (railroad tracks) border the site to the west. Commercial and light industrial properties are directly west of the CSX railroad tracks. All properties within a one-mile radius of the site are serviced by municipal water. Past Use of the Site: The site has been in operation since 1889, used by various companies for automotive, electrical, and refrigeration supplies manufacturing. Site media have been impacted from various manufacturing processes that are known to have occurred at the site, including metal finishing, heat treating, degreasing, and chemical handling and storage. Chlorinated VOCs, SVOCs, metals, and PCBs have been identified in the soil and storm sewer sediment at the site, while metals and VOCs have also been identified in the groundwater at the site. A Phase I environmental assessment was performed in 1991 and Phase II investigations were performed in 1993 and 1997 to evaluate site conditions. Based on the results of the Phase II investigations, Federal-Mogul entered into a Voluntary Cleanup Agreement with the New York State Department of Environmental Conservation on February 6, 2002 (Index no. A3-0372-9807) to investigate and remediate the site. Site Geology and Hydrogeology: Site soils generally consist of 0 to 3 feet of sand or sand and gravel fill material that contains fragments of concrete, glass, asphalt, wood, and other construction debris. The fill material is underlain by a dark yellowish-brown, poorly sorted, fine- to medium-grained sand that grades to a silty sand with increasing depth. The silty sand is underlain by a low permeability clayey silt unit at a depth of approximately 68 feet below ground surface (bgs). The shallow water bearing zone is located approximately 13 to 15 feet bgs. Groundwater flows in a west-southwest direction across the site area.
Env Problem: Nature and Extent of Contamination: Based upon investigations conducted to date, the primary contaminants of concern include

HUCK INTL INC (Continued) **1000266777**

chlorinated VOCs, namely trichloroethene (TCE) and tetrachloroethene (PCE). While most of the site has been sufficiently investigated, the nature and extent of contamination in areas under the former manufacturing building and office building where access was previously limited or unavailable has not been fully delineated. Soil Numerous soil borings were installed on-site from 2002 to 2008 to delineate the horizontal and vertical extent of VOCs in the soil. Based on the results of these investigations, the primary VOCs detected in the on-site soils were TCE, PCE and cis-1,2-dichloroethene (cis-1,2-DCE). They were found at several locations in shallow and deeper soils at concentrations above both the commercial and industrial use soil cleanup objectives (SCOs) established for these compounds. TCE, PCE and cis-1,2-DCE were detected at maximum concentrations of 610 parts per million (ppm), 540 ppm and 1,200 ppm, respectively. Commercial use SCOs for these compounds are 200 ppm, 150 ppm and 500 ppm, respectively. Industrial use SCOs for these compounds are 400 ppm, 300 ppm and 1,000 ppm respectively. SVOCs detected in soil include benzo(a)anthracene, benzo(a)pyrene and benzo(b)fluoranthene at maximum concentrations of 18 ppm, 15 ppm and 15ppm, respectively. Commercial use SCOs for these compounds are 5.6 ppm, 1.0 ppm and 5.6 ppm, respectively. Industrial use SCOs for these compounds are 11 ppm, 1.1 ppm and 11 ppm, respectively. Metals detected in soil include lead at a maximum concentration of 13,600 ppm, arsenic at a maximum concentration of 32 ppm and cadmium at a maximum concentration of 490 ppm. Commercial use SCOs for these metals are 1,000 ppm, 16 ppm and 9.3 ppm, respectively. Industrial use SCOs for these metals are 3,900 ppm, 16 ppm and 60 ppm, respectively. PCBs were not detected above commercial use SCOs in any of the soil samples. Groundwater Several groundwater investigations have been performed in relation to this site from 2002 through 2011. These investigations found the highest VOC concentrations in groundwater in two areas located under the former manufacturing building. VOCs detected in the groundwater include PCE, TCE, and their breakdown products. Evaluation of the vertical extent of VOCs in the groundwater indicated VOC levels above the New York State Ambient Water Quality Standards were confined mainly to the upper ten feet of the groundwater table. As a result, an AS/SVE system was installed as an IRM in April 2014 with the primary objective of reducing VOCs in groundwater in two source areas under the former manufacturing building that exhibited the highest VOC concentrations. The on-site groundwater sampling results from December 2022 showed a reduction in concentration of the primary contaminants in groundwater compared to the June 2014 sampling results. Maximum concentrations of PCE dropped from 723 parts per billion (ppb) to 224 ppb, while TCE dropped from 4,480 ppb to 564 ppb. There was however, an increase in the degradation product concentrations; cis-1,2-DCE from 4,570 ppb to 6,940 ppb and trans-1,2-DCE from 10.6 ppb to 29.8 ppb, indicating that breakdown is occurring. Likewise, the off-site groundwater sampling results from December 2022 showed a reduction in concentration of the primary contaminants in groundwater when compared to the June 2014 results. Maximum concentrations of PCE dropped from 174 ppb to 30.9 ppb, TCE dropped from 151 ppb to 21.5 ppb, cis-1,2-DCE dropped overall from 35.3 ppb to 8.6 ppb, and trans-1,2-DCE overall remains non-detect, indicating that breakdown is occurring. The sample results indicate that concentrations of site-related VOCs in groundwater have generally decreased in the source areas and in areas adjacent to, and

HUCK INTL INC (Continued) **1000266777**

downgradient from, the source areas. VOC concentrations in monitoring wells located outside the influence of the AS/SVE system have generally remained stable with concentrations of PCE ranging from non-detect to 27.4 ppb, TCE from non-detect to 68.4 ppb, and cis-1,2-DCE ranging from non-detect to 90.5 ppb. Soil Vapor and Indoor Air Former Manufacturing Building - In 2003 soil vapor samples were collected on-site and found to be impacted by site-related contamination. Additionally, indoor air samples collected in the former manufacturing building were found to be impacted by site-related contamination. As a result, a soil vapor extraction (SVE) system was installed on-site in February 2004 as an IRM along the periphery of the former finish and chemical storage area of the former manufacturing building, and along the eastern and southern property boundaries to address shallow soil vapor impacts in these areas and mitigate their off-site migration. TCE levels measured in the indoor air of the former manufacturing building in 2003 ranged from 17.7 to 258 g/m3. In January 2005, following implementation of the SVE trench system, reductions were observed in concentrations of TCE in the indoor air with levels ranging from non-detect to a maximum of 51.6 g/m3 in an unoccupied space in the southwest corner of the former manufacturing building. The site property was sold in 2008, and the former manufacturing building is currently used as mini-storage, with an office area that is likely occupied during normal business hours. In 2008, three additional rounds of indoor air testing were performed in the newly occupied office area. The indoor air samples collected in June, July, and August 2008 contained TCE at concentrations of 21.5 g/m3, 18.27 g/m3, and 9.62 g/m3, respectively. Indoor air sampling conducted during the 2018/2019 heating season (March/April 2019) found TCE levels at various locations ranging from 0.29 to 6.8 g/m3, and 4.8 to 5.5 g/m3 in the office area. The remedial party implemented actions to improve air quality in the building: sealing cracks and openings in the concrete floor in accessible portions of the building, including any remaining floor drains and sumps; evaluated operation of AS/SVE and SVE treatment systems to improve indoor air quality; and evaluated existing air handling system in office area. Additional indoor air sampling was conducted in the former manufacturing building in November of 2020. TCE levels at various locations ranged from 3.8 to 6.2 g/m3, and 6.3 g/m3 in the office area, exceeding NYSDOH indoor air guidance levels for TCE of 2 g/m3. On March 8-9, 2021 the remedial party conducted a pilot test to increase sub-slab vacuum at select locations in the former manufacturing building. The pilot test resulted in the installation of one suction point which was tied into the existing AS/SVE system. Another indoor air sampling event was conducted on March 31, 2021 to evaluate the potential impact of the additional suction point on indoor air quality. TCE levels found at various locations ranged from 1.1 to 3.7 g/m3, and 3.0 g/m3 in the office area. While the indoor levels showed a marked decrease over the previous sampling event, four of the five sampling locations exceeded NYSDOH indoor air guidance levels for TCE of 2 g/m3. The remedial party installed an SSD system in February 2022 with two extraction points in the northwest portion of the main building to address the potential for vapor intrusion in this area. Follow-up indoor air sampling was conducted on March 30, 2022 to evaluate the potential impact of the SSD system installed in February 2022 on indoor air quality. TCE levels found at various locations ranged from 0.55 to 6.9 g/m3, and 0.58 g/m3 in the office area. The indoor levels showed

HUCK INTL INC (Continued) **1000266777**

a marked decrease over the previous sampling event, with only one of the five sampling locations exceeding NYSDOH indoor air guidance levels for TCE of 2 g/m3. On-Site Office Building - In August 2003, TCE levels measured in the indoor air of the on-site office building ranged from 96.7 to 167 g/m3. As a result, a SSDS was installed as an IRM in the on-site office building in March 2004. During the following heating season in January 2005, noticeable reductions in TCE levels were observed in the indoor air of the on-site office building, with concentrations ranging from non-detect to 0.81 g/m3. The on-site SSDS is inspected on an annual basis to verify proper operation; therefore, no additional indoor air samples have been collected in the on-site office building since 2005. Off-Site Locations - Eighteen SSDSs have been installed at 17 off-site locations beginning in 2006 to address off-site sub-slab soil vapor and indoor air impacts. Offers were made to conduct soil vapor intrusion (SVI) investigations at 43 off-site properties and sampling has been performed at 22 properties. The remaining 21 property owners either declined or did not respond to the request for sampling. Based on a comparison of data from the 22 buildings to the decision matrices provided in the NYSDOH s Guidance for Evaluating Soil Vapor Intrusion in the State of New York, no further action was ultimately recommended at 10 properties and vapor mitigation was recommended at 12 properties; SSDSs have been installed at each of the 12 properties. Actions were taken to install SSDSs in five additional buildings not sampled for soil vapor intrusion, but based on sampling results of nearby buildings where mitigation was recommended. Further monitoring is not currently required at any of the off-site properties.

Health Problem: Direct contact with contaminants in the soil is unlikely because the majority of the site is covered with buildings and pavement. Contaminated groundwater at the site is not used for drinking or other purposes and the site is served by a public water supply that obtains water from a different source not affected by this contamination. Volatile organic compounds in the soil or groundwater may move into the soil vapor (air spaces within the soil), which in turn may move into overlying buildings and affect the indoor air quality. This process, which is similar to the movement of radon gas from the subsurface into the indoor air of buildings, is referred to as soil vapor intrusion. A sub-slab depressurization system has been installed in the office building and a soil vapor extraction system has been installed adjacent to the former manufacturing building in the vicinity of the main office and former metal finish area to prevent the indoor air quality from being affected by contamination in soil vapor beneath the building. However, the potential exists for inhalation of site contaminants due to soil vapor intrusion for any future on-site redevelopment. Sub-slab depressurization systems have been installed in 17 off-site buildings to prevent the indoor air quality from being affected by the contamination in soil vapor beneath the buildings. The investigation of soil vapor intrusion is on-going at off-site structures with actions being taken as necessary to address exposures.

Env Problem: Nature and Extent of Contamination: Based upon investigations conducted to date, the primary contaminants of concern include chlorinated VOCs, namely trichloroethene (TCE) and tetrachloroethene (PCE). While most of the site has been sufficiently investigated, the nature and extent of contamination in areas under the former manufacturing building and office building where access was previously limited or unavailable has not been fully delineated. Soil Numerous soil borings were installed on-site from 2002 to 2008 to delineate the horizontal and vertical extent of VOCs in the soil. Based on the results of these investigations, the primary VOCs detected in the on-site soils were TCE, PCE and cis-1,2-dichloroethene (cis-1,2-DCE). They were found at several locations in shallow and deeper soils at concentrations above both the commercial and industrial use soil cleanup objectives (SCOs) established for these compounds. TCE, PCE and cis-1,2-DCE were detected at maximum concentrations of 610 parts per million (ppm), 540 ppm and 1,200 ppm, respectively. Commercial use SCOs for these compounds are 200 ppm, 150 ppm and 500 ppm, respectively. Industrial use SCOs for these compounds are 400 ppm, 300 ppm and 1,000 ppm respectively. SVOCs detected in soil include benzo(a)anthracene, benzo(a)pyrene and benzo(b)fluoranthene at maximum concentrations of 18 ppm, 15 ppm and 15ppm, respectively. Commercial use SCOs for these compounds are 5.6 ppm, 1.0 ppm and 5.6 ppm, respectively. Industrial use SCOs for these compounds are 11 ppm, 1.1 ppm and 11 ppm, respectively. Metals detected in soil include lead at a maximum concentration of 13,600 ppm, arsenic at a maximum concentration of 32 ppm and cadmium at a maximum concentration of 490 ppm. Commercial use SCOs for these metals are 1,000 ppm, 16 ppm and 9.3 ppm, respectively. Industrial use SCOs for these metals are 3,900 ppm, 16

HUCK INTL INC (Continued) **1000266777**

ppm and 60 ppm, respectively. PCBs were not detected above commercial use SCOs in any of the soil samples. Groundwater Several groundwater investigations have been performed in relation to this site from 2002 through 2011. These investigations found the highest VOC concentrations in groundwater in two areas located under the former manufacturing building. VOCs detected in the groundwater include PCE, TCE, and their breakdown products. Evaluation of the vertical extent of VOCs in the groundwater indicated VOC levels above the New York State Ambient Water Quality Standards were confined mainly to the upper ten feet of the groundwater table. As a result, an AS/SVE system was installed as an IRM in April 2014 with the primary objective of reducing VOCs in groundwater in two source areas under the former manufacturing building that exhibited the highest VOC concentrations. The on-site groundwater sampling results from December 2022 showed a reduction in concentration of the primary contaminants in groundwater compared to the June 2014 sampling results. Maximum concentrations of PCE dropped from 723 parts per billion (ppb) to 224 ppb, while TCE dropped from 4,480 ppb to 564 ppb. There was however, an increase in the degradation product concentrations; cis-1,2-DCE from 4,570 ppb to 6,940 ppb and trans-1,2-DCE from 10.6 ppb to 29.8 ppb, indicating that breakdown is occurring. Likewise, the off-site groundwater sampling results from December 2022 showed a reduction in concentration of the primary contaminants in groundwater when compared to the June 2014 results. Maximum concentrations of PCE dropped from 174 ppb to 30.9 ppb, TCE dropped from 151 ppb to 21.5 ppb, cis-1,2-DCE dropped overall from 35.3 ppb to 8.6 ppb, and trans-1,2-DCE overall remains non-detect, indicating that breakdown is occurring. The sample results indicate that concentrations of site-related VOCs in groundwater have generally decreased in the source areas and in areas adjacent to, and downgradient from, the source areas. VOC concentrations in monitoring wells located outside the influence of the AS/SVE system have generally remained stable with concentrations of PCE ranging from non-detect to 27.4 ppb, TCE from non-detect to 68.4 ppb, and cis-1,2-DCE ranging from non-detect to 90.5 ppb. Soil Vapor and Indoor Air Former Manufacturing Building - In 2003 soil vapor samples were collected on-site and found to be impacted by site-related contamination. Additionally, indoor air samples collected in the former manufacturing building were found to be impacted by site-related contamination. As a result, a soil vapor extraction (SVE) system was installed on-site in February 2004 as an IRM along the periphery of the former finish and chemical storage area of the former manufacturing building, and along the eastern and southern property boundaries to address shallow soil vapor impacts in these areas and mitigate their off-site migration. TCE levels measured in the indoor air of the former manufacturing building in 2003 ranged from 17.7 to 258 g/m3. In January 2005, following implementation of the SVE trench system, reductions were observed in concentrations of TCE in the indoor air with levels ranging from non-detect to a maximum of 51.6 g/m3 in an unoccupied space in the southwest corner of the former manufacturing building. The site property was sold in 2008, and the former manufacturing building is currently used as mini-storage, with an office area that is likely occupied during normal business hours. In 2008, three additional rounds of indoor air testing were performed in the newly occupied office area. The indoor air samples collected in June, July, and August 2008 contained TCE at concentrations of 21.5 g/m3, 18.27 g/m3, and 9.62 g/m3, respectively.

HUCK INTL INC (Continued) **1000266777**

Indoor air sampling conducted during the 2018/2019 heating season (March/April 2019) found TCE levels at various locations ranging from 0.29 to 6.8 g/m3, and 4.8 to 5.5 g/m3 in the office area. The remedial party implemented actions to improve air quality in the building: sealing cracks and openings in the concrete floor in accessible portions of the building, including any remaining floor drains and sumps; evaluated operation of AS/SVE and SVE treatment systems to improve indoor air quality; and evaluated existing air handling system in office area. Additional indoor air sampling was conducted in the former manufacturing building in November of 2020. TCE levels at various locations ranged from 3.8 to 6.2 g/m3, and 6.3 g/m3 in the office area, exceeding NYSDOH indoor air guidance levels for TCE of 2 g/m3. On March 8-9, 2021 the remedial party conducted a pilot test to increase sub-slab vacuum at select locations in the former manufacturing building. The pilot test resulted in the installation of one suction point which was tied into the existing AS/SVE system. Another indoor air sampling event was conducted on March 31, 2021 to evaluate the potential impact of the additional suction point on indoor air quality. TCE levels found at various locations ranged from 1.1 to 3.7 g/m3, and 3.0 g/m3 in the office area. While the indoor levels showed a marked decrease over the previous sampling event, four of the five sampling locations exceeded NYSDOH indoor air guidance levels for TCE of 2 g/m3. The remedial party installed an SSD system in February 2022 with two extraction points in the northwest portion of the main building to address the potential for vapor intrusion in this area. Follow-up indoor air sampling was conducted on March 30, 2022 to evaluate the potential impact of the SSD system installed in February 2022 on indoor air quality. TCE levels found at various locations ranged from 0.55 to 6.9 g/m3, and 0.58 g/m3 in the office area. The indoor levels showed a marked decrease over the previous sampling event, with only one of the five sampling locations exceeding NYSDOH indoor air guidance levels for TCE of 2 g/m3. On-Site Office Building - In August 2003, TCE levels measured in the indoor air of the on-site office building ranged from 96.7 to 167 g/m3. As a result, a SSDS was installed as an IRM in the on-site office building in March 2004. During the following heating season in January 2005, noticeable reductions in TCE levels were observed in the indoor air of the on-site office building, with concentrations ranging from non-detect to 0.81 g/m3. The on-site SSDS is inspected on an annual basis to verify proper operation; therefore, no additional indoor air samples have been collected in the on-site office building since 2005. Off-Site Locations - Eighteen SSDSs have been installed at 17 off-site locations beginning in 2006 to address off-site sub-slab soil vapor and indoor air impacts. Offers were made to conduct soil vapor intrusion (SVI) investigations at 43 off-site properties and sampling has been performed at 22 properties. The remaining 21 property owners either declined or did not respond to the request for sampling. Based on a comparison of data from the 22 buildings to the decision matrices provided in the NYSDOH s Guidance for Evaluating Soil Vapor Intrusion in the State of New York, no further action was ultimately recommended at 10 properties and vapor mitigation was recommended at 12 properties; SSDSs have been installed at each of the 12 properties. Actions were taken to install SSDSs in five additional buildings not sampled for soil vapor intrusion, but based on sampling results of nearby buildings where mitigation was recommended. Further monitoring is not currently required at any of the off-site

HUCK INTL INC (Continued) **1000266777**

properties.
Health Problem: Direct contact with contaminants in the soil is unlikely because the majority of the site is covered with buildings and pavement. Contaminated groundwater at the site is not used for drinking or other purposes and the site is served by a public water supply that obtains water from a different source not affected by this contamination. Volatile organic compounds in the soil or groundwater may move into the soil vapor (air spaces within the soil), which in turn may move into overlying buildings and affect the indoor air quality. This process, which is similar to the movement of radon gas from the subsurface into the indoor air of buildings, is referred to as soil vapor intrusion. A sub-slab depressurization system has been installed in the office building and a soil vapor extraction system has been installed adjacent to the former manufacturing building in the vicinity of the main office and former metal finish area to prevent the indoor air quality from being affected by contamination in soil vapor beneath the building. However, the potential exists for inhalation of site contaminants due to soil vapor intrusion for any future on-site redevelopment. Sub-slab depressurization systems have been installed in 17 off-site buildings to prevent the indoor air quality from being affected by the contamination in soil vapor beneath the buildings. The investigation of soil vapor intrusion is on-going at off-site structures with actions being taken as necessary to address exposures.

Site Code: 56863
Site Description: Location: The Federal-Mogul/Huck Site is located at 85 Grand Street in the City of Kingston in Ulster County. Site Features: The site consists of two buildings, a former manufacturing building and an attached office building, together occupying 105,000 square feet of the approximately 4-acre site. The remainder of the site consists of paved parking lots, access roads, a grassy area near the office building and narrow landscaped areas in the eastern and southern parking lots. Current Zoning and Land Use: The site is zoned M-2 General Manufacturing, which includes wholesale storage and warehousing. The former manufacturing building houses self-storage units and the office building is used by a moving and truck rental company. Residential and commercial properties border the site across Tenbroeck Avenue to the northeast and residences and a vacant commercial building are located across Grand Street to the southeast. Two commercial properties, a bottle return center and a warehouse, adjoin the property to the south and CSX Transportation, Inc. (railroad tracks) border the site to the west. Commercial and light industrial properties are directly west of the CSX railroad tracks. All properties within a one-mile radius of the site are serviced by municipal water. Past Use of the Site: The site has been in operation since 1889, used by various companies for automotive, electrical, and refrigeration supplies manufacturing. Site media have been impacted from various manufacturing processes that are known to have occurred at the site, including metal finishing, heat treating, degreasing, and chemical handling and storage. Chlorinated VOCs, SVOCs, metals, and PCBs have been identified in the soil and storm sewer sediment at the site, while metals and VOCs have also been identified in the groundwater at the site. A Phase I environmental assessment was performed in 1991 and Phase II investigations were performed in 1993 and 1997 to evaluate site conditions. Based on the results of the Phase II investigations, Federal-Mogul entered into a Voluntary Cleanup Agreement with the New York State Department of Environmental Conservation on February 6, 2002 (Index no. A3-0372-9807) to investigate and remediate the site. Site Geology and Hydrogeology: Site soils generally consist of 0 to 3 feet of sand or sand and gravel fill material that contains fragments of concrete, glass, asphalt, wood, and other construction debris. The fill material is underlain by a dark yellowish-brown, poorly sorted, fine- to medium-grained sand that grades to a silty sand with increasing depth. The silty sand is underlain by a low permeability clayey silt unit at a depth of approximately 68 feet below ground surface (bgs). The shallow water bearing zone is located approximately 13 to 15 feet bgs. Groundwater flows in a west-southwest direction across the site

HUCK INTL INC (Continued) **1000266777**

area.

Env Problem: Nature and Extent of Contamination: Based upon investigations conducted to date, the primary contaminants of concern include chlorinated VOCs, namely trichloroethene (TCE) and tetrachloroethene (PCE). While most of the site has been sufficiently investigated, the nature and extent of contamination in areas under the former manufacturing building and office building where access was previously limited or unavailable has not been fully delineated. Soil Numerous soil borings were installed on-site from 2002 to 2008 to delineate the horizontal and vertical extent of VOCs in the soil. Based on the results of these investigations, the primary VOCs detected in the on-site soils were TCE, PCE and cis-1,2-dichloroethene (cis-1,2-DCE). They were found at several locations in shallow and deeper soils at concentrations above both the commercial and industrial use soil cleanup objectives (SCOs) established for these compounds. TCE, PCE and cis-1,2-DCE were detected at maximum concentrations of 610 parts per million (ppm), 540 ppm and 1,200 ppm, respectively. Commercial use SCOs for these compounds are 200 ppm, 150 ppm and 500 ppm, respectively. Industrial use SCOs for these compounds are 400 ppm, 300 ppm and 1,000 ppm respectively. SVOCs detected in soil include benzo(a)anthracene, benzo(a)pyrene and benzo(b)fluoranthene at maximum concentrations of 18 ppm, 15 ppm and 15ppm, respectively. Commercial use SCOs for these compounds are 5.6 ppm, 1.0 ppm and 5.6 ppm, respectively. Industrial use SCOs for these compounds are 11 ppm, 1.1 ppm and 11 ppm, respectively. Metals detected in soil include lead at a maximum concentration of 13,600 ppm, arsenic at a maximum concentration of 32 ppm and cadmium at a maximum concentration of 490 ppm. Commercial use SCOs for these metals are 1,000 ppm, 16 ppm and 9.3 ppm, respectively. Industrial use SCOs for these metals are 3,900 ppm, 16 ppm and 60 ppm, respectively. PCBs were not detected above commercial use SCOs in any of the soil samples. Groundwater Several groundwater investigations have been performed in relation to this site from 2002 through 2011. These investigations found the highest VOC concentrations in groundwater in two areas located under the former manufacturing building. VOCs detected in the groundwater include PCE, TCE, and their breakdown products. Evaluation of the vertical extent of VOCs in the groundwater indicated VOC levels above the New York State Ambient Water Quality Standards were confined mainly to the upper ten feet of the groundwater table. As a result, an AS/SVE system was installed as an IRM in April 2014 with the primary objective of reducing VOCs in groundwater in two source areas under the former manufacturing building that exhibited the highest VOC concentrations. The on-site groundwater sampling results from December 2022 showed a reduction in concentration of the primary contaminants in groundwater compared to the June 2014 sampling results. Maximum concentrations of PCE dropped from 723 parts per billion (ppb) to 224 ppb, while TCE dropped from 4,480 ppb to 564 ppb. There was however, an increase in the degradation product concentrations; cis-1,2-DCE from 4,570 ppb to 6,940 ppb and trans-1,2-DCE from 10.6 ppb to 29.8 ppb, indicating that breakdown is occurring. Likewise, the off-site groundwater sampling results from December 2022 showed a reduction in concentration of the primary contaminants in groundwater when compared to the June 2014 results. Maximum concentrations of PCE dropped from 174 ppb to 30.9 ppb, TCE dropped from 151 ppb to 21.5 ppb, cis-1,2-DCE dropped overall from 35.3 ppb to 8.6 ppb, and trans-1,2-DCE overall remains non-detect,

HUCK INTL INC (Continued) **1000266777**

indicating that breakdown is occurring. The sample results indicate that concentrations of site-related VOCs in groundwater have generally decreased in the source areas and in areas adjacent to, and downgradient from, the source areas. VOC concentrations in monitoring wells located outside the influence of the AS/SVE system have generally remained stable with concentrations of PCE ranging from non-detect to 27.4 ppb, TCE from non-detect to 68.4 ppb, and cis-1,2-DCE ranging from non-detect to 90.5 ppb. Soil Vapor and Indoor Air Former Manufacturing Building - In 2003 soil vapor samples were collected on-site and found to be impacted by site-related contamination. Additionally, indoor air samples collected in the former manufacturing building were found to be impacted by site-related contamination. As a result, a soil vapor extraction (SVE) system was installed on-site in February 2004 as an IRM along the periphery of the former finish and chemical storage area of the former manufacturing building, and along the eastern and southern property boundaries to address shallow soil vapor impacts in these areas and mitigate their off-site migration. TCE levels measured in the indoor air of the former manufacturing building in 2003 ranged from 17.7 to 258 g/m3. In January 2005, following implementation of the SVE trench system, reductions were observed in concentrations of TCE in the indoor air with levels ranging from non-detect to a maximum of 51.6 g/m3 in an unoccupied space in the southwest corner of the former manufacturing building. The site property was sold in 2008, and the former manufacturing building is currently used as mini-storage, with an office area that is likely occupied during normal business hours. In 2008, three additional rounds of indoor air testing were performed in the newly occupied office area. The indoor air samples collected in June, July, and August 2008 contained TCE at concentrations of 21.5 g/m3, 18.27 g/m3, and 9.62 g/m3, respectively. Indoor air sampling conducted during the 2018/2019 heating season (March/April 2019) found TCE levels at various locations ranging from 0.29 to 6.8 g/m3, and 4.8 to 5.5 g/m3 in the office area. The remedial party implemented actions to improve air quality in the building: sealing cracks and openings in the concrete floor in accessible portions of the building, including any remaining floor drains and sumps; evaluated operation of AS/SVE and SVE treatment systems to improve indoor air quality; and evaluated existing air handling system in office area. Additional indoor air sampling was conducted in the former manufacturing building in November of 2020. TCE levels at various locations ranged from 3.8 to 6.2 g/m3, and 6.3 g/m3 in the office area, exceeding NYSDOH indoor air guidance levels for TCE of 2 g/m3. On March 8-9, 2021 the remedial party conducted a pilot test to increase sub-slab vacuum at select locations in the former manufacturing building. The pilot test resulted in the installation of one suction point which was tied into the existing AS/SVE system. Another indoor air sampling event was conducted on March 31, 2021 to evaluate the potential impact of the additional suction point on indoor air quality. TCE levels found at various locations ranged from 1.1 to 3.7 g/m3, and 3.0 g/m3 in the office area. While the indoor levels showed a marked decrease over the previous sampling event, four of the five sampling locations exceeded NYSDOH indoor air guidance levels for TCE of 2 g/m3. The remedial party installed an SSD system in February 2022 with two extraction points in the northwest portion of the main building to address the potential for vapor intrusion in this area. Follow-up indoor air sampling was conducted on March 30, 2022 to evaluate the potential

HUCK INTL INC (Continued) **1000266777**

impact of the SSD system installed in February 2022 on indoor air quality. TCE levels found at various locations ranged from 0.55 to 6.9 g/m3, and 0.58 g/m3 in the office area. The indoor levels showed a marked decrease over the previous sampling event, with only one of the five sampling locations exceeding NYSDOH indoor air guidance levels for TCE of 2 g/m3. On-Site Office Building - In August 2003, TCE levels measured in the indoor air of the on-site office building ranged from 96.7 to 167 g/m3. As a result, a SSDS was installed as an IRM in the on-site office building in March 2004. During the following heating season in January 2005, noticeable reductions in TCE levels were observed in the indoor air of the on-site office building, with concentrations ranging from non-detect to 0.81 g/m3. The on-site SSDS is inspected on an annual basis to verify proper operation; therefore, no additional indoor air samples have been collected in the on-site office building since 2005. Off-Site Locations - Eighteen SSDSs have been installed at 17 off-site locations beginning in 2006 to address off-site sub-slab soil vapor and indoor air impacts. Offers were made to conduct soil vapor intrusion (SVI) investigations at 43 off-site properties and sampling has been performed at 22 properties. The remaining 21 property owners either declined or did not respond to the request for sampling. Based on a comparison of data from the 22 buildings to the decision matrices provided in the NYSDOH s Guidance for Evaluating Soil Vapor Intrusion in the State of New York, no further action was ultimately recommended at 10 properties and vapor mitigation was recommended at 12 properties; SSDSs have been installed at each of the 12 properties. Actions were taken to install SSDSs in five additional buildings not sampled for soil vapor intrusion, but based on sampling results of nearby buildings where mitigation was recommended. Further monitoring is not currently required at any of the off-site properties.

Health Problem: Direct contact with contaminants in the soil is unlikely because the majority of the site is covered with buildings and pavement. Contaminated groundwater at the site is not used for drinking or other purposes and the site is served by a public water supply that obtains water from a different source not affected by this contamination. Volatile organic compounds in the soil or groundwater may move into the soil vapor (air spaces within the soil), which in turn may move into overlying buildings and affect the indoor air quality. This process, which is similar to the movement of radon gas from the subsurface into the indoor air of buildings, is referred to as soil vapor intrusion. A sub-slab depressurization system has been installed in the office building and a soil vapor extraction system has been installed adjacent to the former manufacturing building in the vicinity of the main office and former metal finish area to prevent the indoor air quality from being affected by contamination in soil vapor beneath the building. However, the potential exists for inhalation of site contaminants due to soil vapor intrusion for any future on-site redevelopment. Sub-slab depressurization systems have been installed in 17 off-site buildings to prevent the indoor air quality from being affected by the contamination in soil vapor beneath the buildings. The investigation of soil vapor intrusion is on-going at off-site structures with actions being taken as necessary to address exposures.

Site Code: 56863
Site Description: Location: The Federal-Mogul/Huck Site is located at 85 Grand Street in the City of Kingston in Ulster County. Site Features: The site consists of two buildings, a former manufacturing building and an attached office building, together occupying 105,000 square feet of the approximately 4-acre site. The remainder of the site consists of paved parking lots, access roads, a grassy area near the office building and narrow landscaped areas in the eastern and southern parking lots. Current Zoning and Land Use: The site is zoned M-2 General Manufacturing, which includes wholesale storage and warehousing. The former manufacturing building houses self-storage units and the office building is used by a moving and truck rental company. Residential and commercial properties border the site across Tenbroeck Avenue to the northeast and residences and a vacant

HUCK INTL INC (Continued) **1000266777**

commercial building are located across Grand Street to the southeast. Two commercial properties, a bottle return center and a warehouse, adjoin the property to the south and CSX Transportation, Inc. (railroad tracks) border the site to the west. Commercial and light industrial properties are directly west of the CSX railroad tracks. All properties within a one-mile radius of the site are serviced by municipal water. Past Use of the Site: The site has been in operation since 1889, used by various companies for automotive, electrical, and refrigeration supplies manufacturing. Site media have been impacted from various manufacturing processes that are known to have occurred at the site, including metal finishing, heat treating, degreasing, and chemical handling and storage. Chlorinated VOCs, SVOCs, metals, and PCBs have been identified in the soil and storm sewer sediment at the site, while metals and VOCs have also been identified in the groundwater at the site. A Phase I environmental assessment was performed in 1991 and Phase II investigations were performed in 1993 and 1997 to evaluate site conditions. Based on the results of the Phase II investigations, Federal-Mogul entered into a Voluntary Cleanup Agreement with the New York State Department of Environmental Conservation on February 6, 2002 (Index no. A3-0372-9807) to investigate and remediate the site. Site Geology and Hydrogeology: Site soils generally consist of 0 to 3 feet of sand or sand and gravel fill material that contains fragments of concrete, glass, asphalt, wood, and other construction debris. The fill material is underlain by a dark yellowish-brown, poorly sorted, fine- to medium-grained sand that grades to a silty sand with increasing depth. The silty sand is underlain by a low permeability clayey silt unit at a depth of approximately 68 feet below ground surface (bgs). The shallow water bearing zone is located approximately 13 to 15 feet bgs. Groundwater flows in a west-southwest direction across the site area.

Env Problem: Nature and Extent of Contamination: Based upon investigations conducted to date, the primary contaminants of concern include chlorinated VOCs, namely trichloroethene (TCE) and tetrachloroethene (PCE). While most of the site has been sufficiently investigated, the nature and extent of contamination in areas under the former manufacturing building and office building where access was previously limited or unavailable has not been fully delineated. Soil Numerous soil borings were installed on-site from 2002 to 2008 to delineate the horizontal and vertical extent of VOCs in the soil. Based on the results of these investigations, the primary VOCs detected in the on-site soils were TCE, PCE and cis-1,2-dichloroethene (cis-1,2-DCE). They were found at several locations in shallow and deeper soils at concentrations above both the commercial and industrial use soil cleanup objectives (SCOs) established for these compounds. TCE, PCE and cis-1,2-DCE were detected at maximum concentrations of 610 parts per million (ppm), 540 ppm and 1,200 ppm, respectively. Commercial use SCOs for these compounds are 200 ppm, 150 ppm and 500 ppm, respectively. Industrial use SCOs for these compounds are 400 ppm, 300 ppm and 1,000 ppm respectively. SVOCs detected in soil include benzo(a)anthracene, benzo(a)pyrene and benzo(b)fluoranthene at maximum concentrations of 18 ppm, 15 ppm and 15ppm, respectively. Commercial use SCOs for these compounds are 5.6 ppm, 1.0 ppm and 5.6 ppm, respectively. Industrial use SCOs for these compounds are 11 ppm, 1.1 ppm and 11 ppm, respectively. Metals detected in soil include lead at a maximum concentration of 13,600 ppm, arsenic at a maximum concentration of 32

HUCK INTL INC (Continued) **1000266777**

ppm and cadmium at a maximum concentration of 490 ppm. Commercial use SCOs for these metals are 1,000 ppm, 16 ppm and 9.3 ppm, respectively. Industrial use SCOs for these metals are 3,900 ppm, 16 ppm and 60 ppm, respectively. PCBs were not detected above commercial use SCOs in any of the soil samples. Groundwater Several groundwater investigations have been performed in relation to this site from 2002 through 2011. These investigations found the highest VOC concentrations in groundwater in two areas located under the former manufacturing building. VOCs detected in the groundwater include PCE, TCE, and their breakdown products. Evaluation of the vertical extent of VOCs in the groundwater indicated VOC levels above the New York State Ambient Water Quality Standards were confined mainly to the upper ten feet of the groundwater table. As a result, an AS/SVE system was installed as an IRM in April 2014 with the primary objective of reducing VOCs in groundwater in two source areas under the former manufacturing building that exhibited the highest VOC concentrations. The on-site groundwater sampling results from December 2022 showed a reduction in concentration of the primary contaminants in groundwater compared to the June 2014 sampling results. Maximum concentrations of PCE dropped from 723 parts per billion (ppb) to 224 ppb, while TCE dropped from 4,480 ppb to 564 ppb. There was however, an increase in the degradation product concentrations; cis-1,2-DCE from 4,570 ppb to 6,940 ppb and trans-1,2-DCE from 10.6 ppb to 29.8 ppb, indicating that breakdown is occurring. Likewise, the off-site groundwater sampling results from December 2022 showed a reduction in concentration of the primary contaminants in groundwater when compared to the June 2014 results. Maximum concentrations of PCE dropped from 174 ppb to 30.9 ppb, TCE dropped from 151 ppb to 21.5 ppb, cis-1,2-DCE dropped overall from 35.3 ppb to 8.6 ppb, and trans-1,2-DCE overall remains non-detect, indicating that breakdown is occurring. The sample results indicate that concentrations of site-related VOCs in groundwater have generally decreased in the source areas and in areas adjacent to, and downgradient from, the source areas. VOC concentrations in monitoring wells located outside the influence of the AS/SVE system have generally remained stable with concentrations of PCE ranging from non-detect to 27.4 ppb, TCE from non-detect to 68.4 ppb, and cis-1,2-DCE ranging from non-detect to 90.5 ppb. Soil Vapor and Indoor Air Former Manufacturing Building - In 2003 soil vapor samples were collected on-site and found to be impacted by site-related contamination. Additionally, indoor air samples collected in the former manufacturing building were found to be impacted by site-related contamination. As a result, a soil vapor extraction (SVE) system was installed on-site in February 2004 as an IRM along the periphery of the former finish and chemical storage area of the former manufacturing building, and along the eastern and southern property boundaries to address shallow soil vapor impacts in these areas and mitigate their off-site migration. TCE levels measured in the indoor air of the former manufacturing building in 2003 ranged from 17.7 to 258 g/m3. In January 2005, following implementation of the SVE trench system, reductions were observed in concentrations of TCE in the indoor air with levels ranging from non-detect to a maximum of 51.6 g/m3 in an unoccupied space in the southwest corner of the former manufacturing building. The site property was sold in 2008, and the former manufacturing building is currently used as mini-storage, with an office area that is likely occupied during normal business hours. In 2008, three additional rounds of indoor air

HUCK INTL INC (Continued) **1000266777**

testing were performed in the newly occupied office area. The indoor air samples collected in June, July, and August 2008 contained TCE at concentrations of 21.5 g/m3, 18.27 g/m3, and 9.62 g/m3, respectively. Indoor air sampling conducted during the 2018/2019 heating season (March/April 2019) found TCE levels at various locations ranging from 0.29 to 6.8 g/m3, and 4.8 to 5.5 g/m3 in the office area. The remedial party implemented actions to improve air quality in the building: sealing cracks and openings in the concrete floor in accessible portions of the building, including any remaining floor drains and sumps; evaluated operation of AS/SVE and SVE treatment systems to improve indoor air quality; and evaluated existing air handling system in office area. Additional indoor air sampling was conducted in the former manufacturing building in November of 2020. TCE levels at various locations ranged from 3.8 to 6.2 g/m3, and 6.3 g/m3 in the office area, exceeding NYSDOH indoor air guidance levels for TCE of 2 g/m3. On March 8-9, 2021 the remedial party conducted a pilot test to increase sub-slab vacuum at select locations in the former manufacturing building. The pilot test resulted in the installation of one suction point which was tied into the existing AS/SVE system. Another indoor air sampling event was conducted on March 31, 2021 to evaluate the potential impact of the additional suction point on indoor air quality. TCE levels found at various locations ranged from 1.1 to 3.7 g/m3, and 3.0 g/m3 in the office area. While the indoor levels showed a marked decrease over the previous sampling event, four of the five sampling locations exceeded NYSDOH indoor air guidance levels for TCE of 2 g/m3. The remedial party installed an SSD system in February 2022 with two extraction points in the northwest portion of the main building to address the potential for vapor intrusion in this area. Follow-up indoor air sampling was conducted on March 30, 2022 to evaluate the potential impact of the SSD system installed in February 2022 on indoor air quality. TCE levels found at various locations ranged from 0.55 to 6.9 g/m3, and 0.58 g/m3 in the office area. The indoor levels showed a marked decrease over the previous sampling event, with only one of the five sampling locations exceeding NYSDOH indoor air guidance levels for TCE of 2 g/m3. On-Site Office Building - In August 2003, TCE levels measured in the indoor air of the on-site office building ranged from 96.7 to 167 g/m3. As a result, a SSDS was installed as an IRM in the on-site office building in March 2004. During the following heating season in January 2005, noticeable reductions in TCE levels were observed in the indoor air of the on-site office building, with concentrations ranging from non-detect to 0.81 g/m3. The on-site SSDS is inspected on an annual basis to verify proper operation; therefore, no additional indoor air samples have been collected in the on-site office building since 2005. Off-Site Locations - Eighteen SSDSs have been installed at 17 off-site locations beginning in 2006 to address off-site sub-slab soil vapor and indoor air impacts. Offers were made to conduct soil vapor intrusion (SVI) investigations at 43 off-site properties and sampling has been performed at 22 properties. The remaining 21 property owners either declined or did not respond to the request for sampling. Based on a comparison of data from the 22 buildings to the decision matrices provided in the NYSDOH s Guidance for Evaluating Soil Vapor Intrusion in the State of New York, no further action was ultimately recommended at 10 properties and vapor mitigation was recommended at 12 properties; SSDSs have been installed at each of the 12 properties. Actions were taken to install SSDSs in five additional

HUCK INTL INC (Continued) **1000266777**

buildings not sampled for soil vapor intrusion, but based on sampling results of nearby buildings where mitigation was recommended. Further monitoring is not currently required at any of the off-site properties.

Health Problem: Direct contact with contaminants in the soil is unlikely because the majority of the site is covered with buildings and pavement. Contaminated groundwater at the site is not used for drinking or other purposes and the site is served by a public water supply that obtains water from a different source not affected by this contamination. Volatile organic compounds in the soil or groundwater may move into the soil vapor (air spaces within the soil), which in turn may move into overlying buildings and affect the indoor air quality. This process, which is similar to the movement of radon gas from the subsurface into the indoor air of buildings, is referred to as soil vapor intrusion. A sub-slab depressurization system has been installed in the office building and a soil vapor extraction system has been installed adjacent to the former manufacturing building in the vicinity of the main office and former metal finish area to prevent the indoor air quality from being affected by contamination in soil vapor beneath the building. However, the potential exists for inhalation of site contaminants due to soil vapor intrusion for any future on-site redevelopment. Sub-slab depressurization systems have been installed in 17 off-site buildings to prevent the indoor air quality from being affected by the contamination in soil vapor beneath the buildings. The investigation of soil vapor intrusion is on-going at off-site structures with actions being taken as necessary to address exposures.

unit at a depth of approximately 68 feet below ground surface (bgs). The shallow water bearing zone is located approximately 13 to 15 feet bgs. Groundwater flows in a west-southwest direction across the site area.

Env Problem: Nature and Extent of Contamination: Based upon investigations conducted to date, the primary contaminants of concern include chlorinated VOCs, namely trichloroethene (TCE) and tetrachloroethene (PCE). While most of the site has been sufficiently investigated, the nature and extent of contamination in areas under the former manufacturing building and office building where access was previously limited or unavailable has not been fully delineated. Soil Numerous soil borings were installed on-site from 2002 to 2008 to delineate the horizontal and vertical extent of VOCs in the soil. Based on the results of these investigations, the primary VOCs detected in the on-site soils were TCE, PCE and cis-1,2-dichloroethene (cis-1,2-DCE). They were found at several locations in shallow and deeper soils at concentrations above both the commercial and industrial use soil cleanup objectives (SCOs) established for these compounds. TCE, PCE and cis-1,2-DCE were detected at maximum concentrations of 610 parts per million (ppm), 540 ppm and 1,200 ppm, respectively. Commercial use SCOs for these compounds are 200 ppm, 150 ppm and 500 ppm, respectively. Industrial use SCOs for these compounds are 400 ppm, 300 ppm and 1,000 ppm respectively. SVOCs detected in soil include benzo(a)anthracene, benzo(a)pyrene and benzo(b)fluoranthene at maximum concentrations of 18 ppm, 15 ppm and 15ppm, respectively. Commercial use SCOs for these compounds are 5.6 ppm, 1.0 ppm and 5.6 ppm, respectively. Industrial use SCOs for these compounds are 11 ppm, 1.1 ppm and 11 ppm, respectively. Metals detected in soil include lead at a maximum concentration of 13,600 ppm, arsenic at a maximum concentration of 32 ppm and cadmium at a maximum concentration of 490 ppm. Commercial use SCOs for these metals are 1,000 ppm, 16 ppm and 9.3 ppm, respectively. Industrial use SCOs for these metals are 3,900 ppm, 16 ppm and 60 ppm, respectively. PCBs were not detected above commercial use SCOs in any of the soil samples. Groundwater Several groundwater investigations have been performed in relation to this site from 2002 through 2011. These investigations found the highest VOC concentrations in groundwater in two areas located under the former manufacturing building. VOCs detected in the groundwater include PCE, TCE, and their breakdown products. Evaluation of the vertical extent of VOCs in the groundwater indicated VOC levels above the New York State Ambient Water Quality Standards were confined mainly to the upper ten feet of the groundwater table. As a result, an AS/SVE system was installed as an IRM in April 2014 with the primary objective of reducing VOCs in groundwater in two source areas under the former manufacturing building that exhibited the highest VOC concentrations. The on-site groundwater sampling results from December 2022 showed a reduction in concentration of the primary contaminants in groundwater compared to the June 2014 sampling results. Maximum concentrations of PCE dropped from 723 parts per billion (ppb) to 224 ppb, while TCE dropped from 4,480 ppb to 564 ppb. There was however, an increase in the degradation product concentrations; cis-1,2-DCE from 4,570 ppb to 6,940 ppb and trans-1,2-DCE from 10.6 ppb to 29.8 ppb, indicating that breakdown is occurring. Likewise, the off-site groundwater sampling results from December 2022 showed a reduction in concentration of the primary contaminants in groundwater when compared to the June 2014 results.

HUCK INTL INC (Continued) **1000266777**

Maximum concentrations of PCE dropped from 174 ppb to 30.9 ppb, TCE dropped from 151 ppb to 21.5 ppb, cis-1,2-DCE dropped overall from 35.3 ppb to 8.6 ppb, and trans-1,2-DCE overall remains non-detect, indicating that breakdown is occurring. The sample results indicate that concentrations of site-related VOCs in groundwater have generally decreased in the source areas and in areas adjacent to, and downgradient from, the source areas. VOC concentrations in monitoring wells located outside the influence of the AS/SVE system have generally remained stable with concentrations of PCE ranging from non-detect to 27.4 ppb, TCE from non-detect to 68.4 ppb, and cis-1,2-DCE ranging from non-detect to 90.5 ppb. Soil Vapor and Indoor Air Former Manufacturing Building - In 2003 soil vapor samples were collected on-site and found to be impacted by site-related contamination. Additionally, indoor air samples collected in the former manufacturing building were found to be impacted by site-related contamination. As a result, a soil vapor extraction (SVE) system was installed on-site in February 2004 as an IRM along the periphery of the former finish and chemical storage area of the former manufacturing building, and along the eastern and southern property boundaries to address shallow soil vapor impacts in these areas and mitigate their off-site migration. TCE levels measured in the indoor air of the former manufacturing building in 2003 ranged from 17.7 to 258 g/m3. In January 2005, following implementation of the SVE trench system, reductions were observed in concentrations of TCE in the indoor air with levels ranging from non-detect to a maximum of 51.6 g/m3 in an unoccupied space in the southwest corner of the former manufacturing building. The site property was sold in 2008, and the former manufacturing building is currently used as mini-storage, with an office area that is likely occupied during normal business hours. In 2008, three additional rounds of indoor air testing were performed in the newly occupied office area. The indoor air samples collected in June, July, and August 2008 contained TCE at concentrations of 21.5 g/m3, 18.27 g/m3, and 9.62 g/m3, respectively. Indoor air sampling conducted during the 2018/2019 heating season (March/April 2019) found TCE levels at various locations ranging from 0.29 to 6.8 g/m3, and 4.8 to 5.5 g/m3 in the office area. The remedial party implemented actions to improve air quality in the building: sealing cracks and openings in the concrete floor in accessible portions of the building, including any remaining floor drains and sumps; evaluated operation of AS/SVE and SVE treatment systems to improve indoor air quality; and evaluated existing air handling system in office area. Additional indoor air sampling was conducted in the former manufacturing building in November of 2020. TCE levels at various locations ranged from 3.8 to 6.2 g/m3, and 6.3 g/m3 in the office area, exceeding NYSDOH indoor air guidance levels for TCE of 2 g/m3. On March 8-9, 2021 the remedial party conducted a pilot test to increase sub-slab vacuum at select locations in the former manufacturing building. The pilot test resulted in the installation of one suction point which was tied into the existing AS/SVE system. Another indoor air sampling event was conducted on March 31, 2021 to evaluate the potential impact of the additional suction point on indoor air quality. TCE levels found at various locations ranged from 1.1 to 3.7 g/m3, and 3.0 g/m3 in the office area. While the indoor levels showed a marked decrease over the previous sampling event, four of the five sampling locations exceeded NYSDOH indoor air guidance levels for TCE of 2 g/m3. The remedial party installed an SSD system in February 2022 with two extraction

HUCK INTL INC (Continued) **1000266777**

points in the northwest portion of the main building to address the potential for vapor intrusion in this area. Follow-up indoor air sampling was conducted on March 30, 2022 to evaluate the potential impact of the SSD system installed in February 2022 on indoor air quality. TCE levels found at various locations ranged from 0.55 to 6.9 g/m3, and 0.58 g/m3 in the office area. The indoor levels showed a marked decrease over the previous sampling event, with only one of the five sampling locations exceeding NYSDOH indoor air guidance levels for TCE of 2 g/m3. On-Site Office Building - In August 2003, TCE levels measured in the indoor air of the on-site office building ranged from 96.7 to 167 g/m3. As a result, a SSDS was installed as an IRM in the on-site office building in March 2004. During the following heating season in January 2005, noticeable reductions in TCE levels were observed in the indoor air of the on-site office building, with concentrations ranging from non-detect to 0.81 g/m3. The on-site SSDS is inspected on an annual basis to verify proper operation; therefore, no additional indoor air samples have been collected in the on-site office building since 2005. Off-Site Locations - Eighteen SSDSs have been installed at 17 off-site locations beginning in 2006 to address off-site sub-slab soil vapor and indoor air impacts. Offers were made to conduct soil vapor intrusion (SVI) investigations at 43 off-site properties and sampling has been performed at 22 properties. The remaining 21 property owners either declined or did not respond to the request for sampling. Based on a comparison of data from the 22 buildings to the decision matrices provided in the NYSDOH s Guidance for Evaluating Soil Vapor Intrusion in the State of New York, no further action was ultimately recommended at 10 properties and vapor mitigation was recommended at 12 properties; SSDSs have been installed at each of the 12 properties. Actions were taken to install SSDSs in five additional buildings not sampled for soil vapor intrusion, but based on sampling results of nearby buildings where mitigation was recommended. Further monitoring is not currently required at any of the off-site properties.

Health Problem: Direct contact with contaminants in the soil is unlikely because the majority of the site is covered with buildings and pavement. Contaminated groundwater at the site is not used for drinking or other purposes and the site is served by a public water supply that obtains water from a different source not affected by this contamination. Volatile organic compounds in the soil or groundwater may move into the soil vapor (air spaces within the soil), which in turn may move into overlying buildings and affect the indoor air quality. This process, which is similar to the movement of radon gas from the subsurface into the indoor air of buildings, is referred to as soil vapor intrusion. A sub-slab depressurization system has been installed in the office building and a soil vapor extraction system has been installed adjacent to the former manufacturing building in the vicinity of the main office and former metal finish area to prevent the indoor air quality from being affected by contamination in soil vapor beneath the building. However, the potential exists for inhalation of site contaminants due to soil vapor intrusion for any future on-site redevelopment. Sub-slab depressurization systems have been installed in 17 off-site buildings to prevent the indoor air quality from being affected by the contamination in soil vapor beneath the buildings. The investigation of soil vapor intrusion is on-going at off-site structures with actions being taken as necessary to address exposures.

Dt record added: 04/06/2020
Dt rec updated: 04/07/2020
Updated By: LSZINOMA
Site Code: 56863
Site Description: Location: The Federal-Mogul/Huck Site is located at 85 Grand Street in the City of Kingston in Ulster County. Site Features: The site consists of two buildings, a former manufacturing building and an attached office building, together occupying 105,000 square feet of the approximately 4-acre site. The remainder of the site consists of paved parking lots, access roads, a grassy area near the office building and narrow landscaped areas in the eastern and southern parking lots. Current Zoning and Land Use: The site is zoned M-2 General Manufacturing, which includes wholesale storage and warehousing. The former manufacturing building houses self-storage

HUCK INTL INC (Continued) **1000266777**

units and the office building is used by a moving and truck rental company. Residential and commercial properties border the site across Tenbroeck Avenue to the northeast and residences and a vacant commercial building are located across Grand Street to the southeast. Two commercial properties, a bottle return center and a warehouse, adjoin the property to the south and CSX Transportation, Inc. (railroad tracks) border the site to the west. Commercial and light industrial properties are directly west of the CSX railroad tracks. All properties within a one-mile radius of the site are serviced by municipal water. Past Use of the Site: The site has been in operation since 1889, used by various companies for automotive, electrical, and refrigeration supplies manufacturing. Site media have been impacted from various manufacturing processes that are known to have occurred at the site, including metal finishing, heat treating, degreasing, and chemical handling and storage. Chlorinated VOCs, SVOCs, metals, and PCBs have been identified in the soil and storm sewer sediment at the site, while metals and VOCs have also been identified in the groundwater at the site. A Phase I environmental assessment was performed in 1991 and Phase II investigations were performed in 1993 and 1997 to evaluate site conditions. Based on the results of the Phase II investigations, Federal-Mogul entered into a Voluntary Cleanup Agreement with the New York State Department of Environmental Conservation on February 6, 2002 (Index no. A3-0372-9807) to investigate and remediate the site. Site Geology and Hydrogeology: Site soils generally consist of 0 to 3 feet of sand or sand and gravel fill material that contains fragments of concrete, glass, asphalt, wood, and other construction debris. The fill material is underlain by a dark yellowish-brown, poorly sorted, fine- to medium-grained sand that grades to a silty sand with increasing depth. The silty sand is underlain by a low permeability clayey silt unit at a depth of approximately 68 feet below ground surface (bgs). The shallow water bearing zone is located approximately 13 to 15 feet bgs. Groundwater flows in a west-southwest direction across the site area.

Env Problem: Nature and Extent of Contamination: Based upon investigations conducted to date, the primary contaminants of concern include chlorinated VOCs, namely trichloroethene (TCE) and tetrachloroethene (PCE). While most of the site has been sufficiently investigated, the nature and extent of contamination in areas under the former manufacturing building and office building where access was previously limited or unavailable has not been fully delineated. Soil Numerous soil borings were installed on-site from 2002 to 2008 to delineate the horizontal and vertical extent of VOCs in the soil. Based on the results of these investigations, the primary VOCs detected in the on-site soils were TCE, PCE and cis-1,2-dichloroethene (cis-1,2-DCE). They were found at several locations in shallow and deeper soils at concentrations above both the commercial and industrial use soil cleanup objectives (SCOs) established for these compounds. TCE, PCE and cis-1,2-DCE were detected at maximum concentrations of 610 parts per million (ppm), 540 ppm and 1,200 ppm, respectively. Commercial use SCOs for these compounds are 200 ppm, 150 ppm and 500 ppm, respectively. Industrial use SCOs for these compounds are 400 ppm, 300 ppm and 1,000 ppm respectively. SVOCs detected in soil include benzo(a)anthracene, benzo(a)pyrene and benzo(b)fluoranthene at maximum concentrations of 18 ppm, 15 ppm and 15ppm, respectively. Commercial use SCOs for these compounds are 5.6 ppm, 1.0 ppm and 5.6 ppm, respectively. Industrial

HUCK INTL INC (Continued) **1000266777**

use SCOs for these compounds are 11 ppm, 1.1 ppm and 11 ppm, respectively. Metals detected in soil include lead at a maximum concentration of 13,600 ppm, arsenic at a maximum concentration of 32 ppm and cadmium at a maximum concentration of 490 ppm. Commercial use SCOs for these metals are 1,000 ppm, 16 ppm and 9.3 ppm, respectively. Industrial use SCOs for these metals are 3,900 ppm, 16 ppm and 60 ppm, respectively. PCBs were not detected above commercial use SCOs in any of the soil samples. Groundwater Several groundwater investigations have been performed in relation to this site from 2002 through 2011. These investigations found the highest VOC concentrations in groundwater in two areas located under the former manufacturing building. VOCs detected in the groundwater include PCE, TCE, and their breakdown products. Evaluation of the vertical extent of VOCs in the groundwater indicated VOC levels above the New York State Ambient Water Quality Standards were confined mainly to the upper ten feet of the groundwater table. As a result, an AS/SVE system was installed as an IRM in April 2014 with the primary objective of reducing VOCs in groundwater in two source areas under the former manufacturing building that exhibited the highest VOC concentrations. The on-site groundwater sampling results from December 2022 showed a reduction in concentration of the primary contaminants in groundwater compared to the June 2014 sampling results. Maximum concentrations of PCE dropped from 723 parts per billion (ppb) to 224 ppb, while TCE dropped from 4,480 ppb to 564 ppb. There was however, an increase in the degradation product concentrations; cis-1,2-DCE from 4,570 ppb to 6,940 ppb and trans-1,2-DCE from 10.6 ppb to 29.8 ppb, indicating that breakdown is occurring. Likewise, the off-site groundwater sampling results from December 2022 showed a reduction in concentration of the primary contaminants in groundwater when compared to the June 2014 results. Maximum concentrations of PCE dropped from 174 ppb to 30.9 ppb, TCE dropped from 151 ppb to 21.5 ppb, cis-1,2-DCE dropped overall from 35.3 ppb to 8.6 ppb, and trans-1,2-DCE overall remains non-detect, indicating that breakdown is occurring. The sample results indicate that concentrations of site-related VOCs in groundwater have generally decreased in the source areas and in areas adjacent to, and downgradient from, the source areas. VOC concentrations in monitoring wells located outside the influence of the AS/SVE system have generally remained stable with concentrations of PCE ranging from non-detect to 27.4 ppb, TCE from non-detect to 68.4 ppb, and cis-1,2-DCE ranging from non-detect to 90.5 ppb. Soil Vapor and Indoor Air Former Manufacturing Building - In 2003 soil vapor samples were collected on-site and found to be impacted by site-related contamination. Additionally, indoor air samples collected in the former manufacturing building were found to be impacted by site-related contamination. As a result, a soil vapor extraction (SVE) system was installed on-site in February 2004 as an IRM along the periphery of the former finish and chemical storage area of the former manufacturing building, and along the eastern and southern property boundaries to address shallow soil vapor impacts in these areas and mitigate their off-site migration. TCE levels measured in the indoor air of the former manufacturing building in 2003 ranged from 17.7 to 258 g/m3. In January 2005, following implementation of the SVE trench system, reductions were observed in concentrations of TCE in the indoor air with levels ranging from non-detect to a maximum of 51.6 g/m3 in an unoccupied space in the southwest corner of the former manufacturing building. The site property was sold in

HUCK INTL INC (Continued) **1000266777**

2008, and the former manufacturing building is currently used as mini-storage, with an office area that is likely occupied during normal business hours. In 2008, three additional rounds of indoor air testing were performed in the newly occupied office area. The indoor air samples collected in June, July, and August 2008 contained TCE at concentrations of 21.5 g/m3, 18.27 g/m3, and 9.62 g/m3, respectively. Indoor air sampling conducted during the 2018/2019 heating season (March/April 2019) found TCE levels at various locations ranging from 0.29 to 6.8 g/m3, and 4.8 to 5.5 g/m3 in the office area. The remedial party implemented actions to improve air quality in the building: sealing cracks and openings in the concrete floor in accessible portions of the building, including any remaining floor drains and sumps; evaluated operation of AS/SVE and SVE treatment systems to improve indoor air quality; and evaluated existing air handling system in office area. Additional indoor air sampling was conducted in the former manufacturing building in November of 2020. TCE levels at various locations ranged from 3.8 to 6.2 g/m3, and 6.3 g/m3 in the office area, exceeding NYSDOH indoor air guidance levels for TCE of 2 g/m3. On March 8-9, 2021 the remedial party conducted a pilot test to increase sub-slab vacuum at select locations in the former manufacturing building. The pilot test resulted in the installation of one suction point which was tied into the existing AS/SVE system. Another indoor air sampling event was conducted on March 31, 2021 to evaluate the potential impact of the additional suction point on indoor air quality. TCE levels found at various locations ranged from 1.1 to 3.7 g/m3, and 3.0 g/m3 in the office area. While the indoor levels showed a marked decrease over the previous sampling event, four of the five sampling locations exceeded NYSDOH indoor air guidance levels for TCE of 2 g/m3. The remedial party installed an SSD system in February 2022 with two extraction points in the northwest portion of the main building to address the potential for vapor intrusion in this area. Follow-up indoor air sampling was conducted on March 30, 2022 to evaluate the potential impact of the SSD system installed in February 2022 on indoor air quality. TCE levels found at various locations ranged from 0.55 to 6.9 g/m3, and 0.58 g/m3 in the office area. The indoor levels showed a marked decrease over the previous sampling event, with only one of the five sampling locations exceeding NYSDOH indoor air guidance levels for TCE of 2 g/m3. On-Site Office Building - In August 2003, TCE levels measured in the indoor air of the on-site office building ranged from 96.7 to 167 g/m3. As a result, a SSDS was installed as an IRM in the on-site office building in March 2004. During the following heating season in January 2005, noticeable reductions in TCE levels were observed in the indoor air of the on-site office building, with concentrations ranging from non-detect to 0.81 g/m3. The on-site SSDS is inspected on an annual basis to verify proper operation; therefore, no additional indoor air samples have been collected in the on-site office building since 2005. Off-Site Locations - Eighteen SSDSs have been installed at 17 off-site locations beginning in 2006 to address off-site sub-slab soil vapor and indoor air impacts. Offers were made to conduct soil vapor intrusion (SVI) investigations at 43 off-site properties and sampling has been performed at 22 properties. The remaining 21 property owners either declined or did not respond to the request for sampling. Based on a comparison of data from the 22 buildings to the decision matrices provided in the NYSDOH s Guidance for Evaluating Soil Vapor Intrusion in the State of New York, no further action was ultimately

HUCK INTL INC (Continued) **1000266777**

recommended at 10 properties and vapor mitigation was recommended at 12 properties; SSDSs have been installed at each of the 12 properties. Actions were taken to install SSDSs in five additional buildings not sampled for soil vapor intrusion, but based on sampling results of nearby buildings where mitigation was recommended. Further monitoring is not currently required at any of the off-site properties.

Health Problem: Direct contact with contaminants in the soil is unlikely because the majority of the site is covered with buildings and pavement. Contaminated groundwater at the site is not used for drinking or other purposes and the site is served by a public water supply that obtains water from a different source not affected by this contamination. Volatile organic compounds in the soil or groundwater may move into the soil vapor (air spaces within the soil), which in turn may move into overlying buildings and affect the indoor air quality. This process, which is similar to the movement of radon gas from the subsurface into the indoor air of buildings, is referred to as soil vapor intrusion. A sub-slab depressurization system has been installed in the office building and a soil vapor extraction system has been installed adjacent to the former manufacturing building in the vicinity of the main office and former metal finish area to prevent the indoor air quality from being affected by contamination in soil vapor beneath the building. However, the potential exists for inhalation of site contaminants due to soil vapor intrusion for any future on-site redevelopment. Sub-slab depressurization systems have been installed in 17 off-site buildings to prevent the indoor air quality from being affected by the contamination in soil vapor beneath the buildings. The investigation of soil vapor intrusion is on-going at off-site structures with actions being taken as necessary to address exposures.

Site Code: 56863
Site Description: Location: The Federal-Mogul/Huck Site is located at 85 Grand Street in the City of Kingston in Ulster County. Site Features: The site consists of two buildings, a former manufacturing building and an attached office building, together occupying 105,000 square feet of the approximately 4-acre site. The remainder of the site consists of paved parking lots, access roads, a grassy area near the office building and narrow landscaped areas in the eastern and southern parking lots. Current Zoning and Land Use: The site is zoned M-2 General Manufacturing, which includes wholesale storage and warehousing. The former manufacturing building houses self-storage units and the office building is used by a moving and truck rental company. Residential and commercial properties border the site across Tenbroeck Avenue to the northeast and residences and a vacant commercial building are located across Grand Street to the southeast. Two commercial properties, a bottle return center and a warehouse, adjoin the property to the south and CSX Transportation, Inc. (railroad tracks) border the site to the west. Commercial and light industrial properties are directly west of the CSX railroad tracks. All properties within a one-mile radius of the site are serviced by municipal water. Past Use of the Site: The site has been in operation since 1889, used by various companies for automotive, electrical, and refrigeration supplies manufacturing. Site media have been impacted from various manufacturing processes that are known to have occurred at the site, including metal finishing, heat treating, degreasing, and chemical handling and storage. Chlorinated VOCs, SVOCs, metals, and PCBs have been identified in the soil and storm sewer sediment at the site, while metals and VOCs have also been identified in the groundwater at the site. A Phase I environmental assessment was performed in 1991 and Phase II investigations were performed in 1993 and 1997 to evaluate site conditions. Based on the results of the Phase II investigations, Federal-Mogul entered into a Voluntary Cleanup Agreement with the New York State Department of Environmental Conservation on February 6, 2002 (Index no. A3-0372-9807) to investigate and remediate the site. Site Geology and Hydrogeology: Site soils generally consist of 0 to 3 feet of sand or sand and gravel fill material that contains fragments of concrete, glass, asphalt, wood, and other construction debris. The fill material is

HUCK INTL INC (Continued) **1000266777**

underlain by a dark yellowish-brown, poorly sorted, fine- to medium-grained sand that grades to a silty sand with increasing depth. The silty sand is underlain by a low permeability clayey silt unit at a depth of approximately 68 feet below ground surface (bgs). The shallow water bearing zone is located approximately 13 to 15 feet bgs. Groundwater flows in a west-southwest direction across the site area.

Env Problem: Nature and Extent of Contamination: Based upon investigations conducted to date, the primary contaminants of concern include chlorinated VOCs, namely trichloroethene (TCE) and tetrachloroethene (PCE). While most of the site has been sufficiently investigated, the nature and extent of contamination in areas under the former manufacturing building and office building where access was previously limited or unavailable has not been fully delineated. Soil Numerous soil borings were installed on-site from 2002 to 2008 to delineate the horizontal and vertical extent of VOCs in the soil. Based on the results of these investigations, the primary VOCs detected in the on-site soils were TCE, PCE and cis-1,2-dichloroethene (cis-1,2-DCE). They were found at several locations in shallow and deeper soils at concentrations above both the commercial and industrial use soil cleanup objectives (SCOs) established for these compounds. TCE, PCE and cis-1,2-DCE were detected at maximum concentrations of 610 parts per million (ppm), 540 ppm and 1,200 ppm, respectively. Commercial use SCOs for these compounds are 200 ppm, 150 ppm and 500 ppm, respectively. Industrial use SCOs for these compounds are 400 ppm, 300 ppm and 1,000 ppm respectively. SVOCs detected in soil include benzo(a)anthracene, benzo(a)pyrene and benzo(b)fluoranthene at maximum concentrations of 18 ppm, 15 ppm and 15ppm, respectively. Commercial use SCOs for these compounds are 5.6 ppm, 1.0 ppm and 5.6 ppm, respectively. Industrial use SCOs for these compounds are 11 ppm, 1.1 ppm and 11 ppm, respectively. Metals detected in soil include lead at a maximum concentration of 13,600 ppm, arsenic at a maximum concentration of 32 ppm and cadmium at a maximum concentration of 490 ppm. Commercial use SCOs for these metals are 1,000 ppm, 16 ppm and 9.3 ppm, respectively. Industrial use SCOs for these metals are 3,900 ppm, 16 ppm and 60 ppm, respectively. PCBs were not detected above commercial use SCOs in any of the soil samples. Groundwater Several groundwater investigations have been performed in relation to this site from 2002 through 2011. These investigations found the highest VOC concentrations in groundwater in two areas located under the former manufacturing building. VOCs detected in the groundwater include PCE, TCE, and their breakdown products. Evaluation of the vertical extent of VOCs in the groundwater indicated VOC levels above the New York State Ambient Water Quality Standards were confined mainly to the upper ten feet of the groundwater table. As a result, an AS/SVE system was installed as an IRM in April 2014 with the primary objective of reducing VOCs in groundwater in two source areas under the former manufacturing building that exhibited the highest VOC concentrations. The on-site groundwater sampling results from December 2022 showed a reduction in concentration of the primary contaminants in groundwater compared to the June 2014 sampling results. Maximum concentrations of PCE dropped from 723 parts per billion (ppb) to 224 ppb, while TCE dropped from 4,480 ppb to 564 ppb. There was however, an increase in the degradation product concentrations; cis-1,2-DCE from 4,570 ppb to 6,940 ppb and trans-1,2-DCE from 10.6 ppb to 29.8 ppb, indicating that breakdown is

HUCK INTL INC (Continued) **1000266777**

occurring. Likewise, the off-site groundwater sampling results from December 2022 showed a reduction in concentration of the primary contaminants in groundwater when compared to the June 2014 results. Maximum concentrations of PCE dropped from 174 ppb to 30.9 ppb, TCE dropped from 151 ppb to 21.5 ppb, cis-1,2-DCE dropped overall from 35.3 ppb to 8.6 ppb, and trans-1,2-DCE overall remains non-detect, indicating that breakdown is occurring. The sample results indicate that concentrations of site-related VOCs in groundwater have generally decreased in the source areas and in areas adjacent to, and downgradient from, the source areas. VOC concentrations in monitoring wells located outside the influence of the AS/SVE system have generally remained stable with concentrations of PCE ranging from non-detect to 27.4 ppb, TCE from non-detect to 68.4 ppb, and cis-1,2-DCE ranging from non-detect to 90.5 ppb. Soil Vapor and Indoor Air Former Manufacturing Building - In 2003 soil vapor samples were collected on-site and found to be impacted by site-related contamination. Additionally, indoor air samples collected in the former manufacturing building were found to be impacted by site-related contamination. As a result, a soil vapor extraction (SVE) system was installed on-site in February 2004 as an IRM along the periphery of the former finish and chemical storage area of the former manufacturing building, and along the eastern and southern property boundaries to address shallow soil vapor impacts in these areas and mitigate their off-site migration. TCE levels measured in the indoor air of the former manufacturing building in 2003 ranged from 17.7 to 258 g/m3. In January 2005, following implementation of the SVE trench system, reductions were observed in concentrations of TCE in the indoor air with levels ranging from non-detect to a maximum of 51.6 g/m3 in an unoccupied space in the southwest corner of the former manufacturing building. The site property was sold in 2008, and the former manufacturing building is currently used as mini-storage, with an office area that is likely occupied during normal business hours. In 2008, three additional rounds of indoor air testing were performed in the newly occupied office area. The indoor air samples collected in June, July, and August 2008 contained TCE at concentrations of 21.5 g/m3, 18.27 g/m3, and 9.62 g/m3, respectively. Indoor air sampling conducted during the 2018/2019 heating season (March/April 2019) found TCE levels at various locations ranging from 0.29 to 6.8 g/m3, and 4.8 to 5.5 g/m3 in the office area. The remedial party implemented actions to improve air quality in the building: sealing cracks and openings in the concrete floor in accessible portions of the building, including any remaining floor drains and sumps; evaluated operation of AS/SVE and SVE treatment systems to improve indoor air quality; and evaluated existing air handling system in office area. Additional indoor air sampling was conducted in the former manufacturing building in November of 2020. TCE levels at various locations ranged from 3.8 to 6.2 g/m3, and 6.3 g/m3 in the office area, exceeding NYSDOH indoor air guidance levels for TCE of 2 g/m3. On March 8-9, 2021 the remedial party conducted a pilot test to increase sub-slab vacuum at select locations in the former manufacturing building. The pilot test resulted in the installation of one suction point which was tied into the existing AS/SVE system. Another indoor air sampling event was conducted on March 31, 2021 to evaluate the potential impact of the additional suction point on indoor air quality. TCE levels found at various locations ranged from 1.1 to 3.7 g/m3, and 3.0 g/m3 in the office area. While the indoor levels showed a marked decrease over the

HUCK INTL INC (Continued) **1000266777**

previous sampling event, four of the five sampling locations exceeded NYSDOH indoor air guidance levels for TCE of 2 g/m3. The remedial party installed an SSD system in February 2022 with two extraction points in the northwest portion of the main building to address the potential for vapor intrusion in this area. Follow-up indoor air sampling was conducted on March 30, 2022 to evaluate the potential impact of the SSD system installed in February 2022 on indoor air quality. TCE levels found at various locations ranged from 0.55 to 6.9 g/m3, and 0.58 g/m3 in the office area. The indoor levels showed a marked decrease over the previous sampling event, with only one of the five sampling locations exceeding NYSDOH indoor air guidance levels for TCE of 2 g/m3. On-Site Office Building - In August 2003, TCE levels measured in the indoor air of the on-site office building ranged from 96.7 to 167 g/m3. As a result, a SSDS was installed as an IRM in the on-site office building in March 2004. During the following heating season in January 2005, noticeable reductions in TCE levels were observed in the indoor air of the on-site office building, with concentrations ranging from non-detect to 0.81 g/m3. The on-site SSDS is inspected on an annual basis to verify proper operation; therefore, no additional indoor air samples have been collected in the on-site office building since 2005. Off-Site Locations - Eighteen SSDSs have been installed at 17 off-site locations beginning in 2006 to address off-site sub-slab soil vapor and indoor air impacts. Offers were made to conduct soil vapor intrusion (SVI) investigations at 43 off-site properties and sampling has been performed at 22 properties. The remaining 21 property owners either declined or did not respond to the request for sampling. Based on a comparison of data from the 22 buildings to the decision matrices provided in the NYSDOH s Guidance for Evaluating Soil Vapor Intrusion in the State of New York, no further action was ultimately recommended at 10 properties and vapor mitigation was recommended at 12 properties; SSDSs have been installed at each of the 12 properties. Actions were taken to install SSDSs in five additional buildings not sampled for soil vapor intrusion, but based on sampling results of nearby buildings where mitigation was recommended. Further monitoring is not currently required at any of the off-site properties.

Health Problem: Direct contact with contaminants in the soil is unlikely because the majority of the site is covered with buildings and pavement. Contaminated groundwater at the site is not used for drinking or other purposes and the site is served by a public water supply that obtains water from a different source not affected by this contamination. Volatile organic compounds in the soil or groundwater may move into the soil vapor (air spaces within the soil), which in turn may move into overlying buildings and affect the indoor air quality. This process, which is similar to the movement of radon gas from the subsurface into the indoor air of buildings, is referred to as soil vapor intrusion. A sub-slab depressurization system has been installed in the office building and a soil vapor extraction system has been installed adjacent to the former manufacturing building in the vicinity of the main office and former metal finish area to prevent the indoor air quality from being affected by contamination in soil vapor beneath the building. However, the potential exists for inhalation of site contaminants due to soil vapor intrusion for any future on-site redevelopment. Sub-slab depressurization systems have been installed in 17 off-site buildings to prevent the indoor air quality from being affected by the contamination in soil vapor

HUCK INTL INC (Continued) **1000266777**

beneath the buildings. The investigation of soil vapor intrusion is on-going at off-site structures with actions being taken as necessary to address exposures.

TCE levels measured in

HUCK INTL INC (Continued) **1000266777**

the indoor air of the former manufacturing building in 2003 ranged from 17.7 to 258 g/m3. In January 2005, following implementation of the SVE trench system, reductions were observed in concentrations of TCE in the indoor air with levels ranging from non-detect to a maximum of 51.6 g/m3 in an unoccupied space in the southwest corner of the former manufacturing building. The site property was sold in 2008, and the former manufacturing building is currently used as mini-storage, with an office area that is likely occupied during normal business hours. In 2008, three additional rounds of indoor air testing were performed in the newly occupied office area. The indoor air samples collected in June, July, and August 2008 contained TCE at concentrations of 21.5 g/m3, 18.27 g/m3, and 9.62 g/m3, respectively. Indoor air sampling conducted during the 2018/2019 heating season (March/April 2019) found TCE levels at various locations ranging from 0.29 to 6.8 g/m3, and 4.8 to 5.5 g/m3 in the office area. The remedial party implemented actions to improve air quality in the building: sealing cracks and openings in the concrete floor in accessible portions of the building, including any remaining floor drains and sumps; evaluated operation of AS/SVE and SVE treatment systems to improve indoor air quality; and evaluated existing air handling system in office area. Additional indoor air sampling was conducted in the former manufacturing building in November of 2020. TCE levels at various locations ranged from 3.8 to 6.2 g/m3, and 6.3 g/m3 in the office area, exceeding NYSDOH indoor air guidance levels for TCE of 2 g/m3. On March 8-9, 2021 the remedial party conducted a pilot test to increase sub-slab vacuum at select locations in the former manufacturing building. The pilot test resulted in the installation of one suction point which was tied into the existing AS/SVE system. Another indoor air sampling event was conducted on March 31, 2021 to evaluate the potential impact of the additional suction point on indoor air quality. TCE levels found at various locations ranged from 1.1 to 3.7 g/m3, and 3.0 g/m3 in the office area. While the indoor levels showed a marked decrease over the previous sampling event, four of the five sampling locations exceeded NYSDOH indoor air guidance levels for TCE of 2 g/m3. The remedial party installed an SSD system in February 2022 with two extraction points in the northwest portion of the main building to address the potential for vapor intrusion in this area. Follow-up indoor air sampling was conducted on March 30, 2022 to evaluate the potential impact of the SSD system installed in February 2022 on indoor air quality. TCE levels found at various locations ranged from 0.55 to 6.9 g/m3, and 0.58 g/m3 in the office area. The indoor levels showed a marked decrease over the previous sampling event, with only one of the five sampling locations exceeding NYSDOH indoor air guidance levels for TCE of 2 g/m3. On-Site Office Building - In August 2003, TCE levels measured in the indoor air of the on-site office building ranged from 96.7 to 167 g/m3. As a result, a SSDS was installed as an IRM in the on-site office building in March 2004. During the following heating season in January 2005, noticeable reductions in TCE levels were observed in the indoor air of the on-site office building, with concentrations ranging from non-detect to 0.81 g/m3. The on-site SSDS is inspected on an annual basis to verify proper operation; therefore, no additional indoor air samples have been collected in the on-site office building since 2005. Off-Site Locations - Eighteen SSDSs have been installed at 17 off-site locations beginning in 2006 to address off-site sub-slab soil vapor and indoor air impacts. Offers were made to conduct soil vapor

HUCK INTL INC (Continued) **1000266777**

intrusion (SVI) investigations at 43 off-site properties and sampling has been performed at 22 properties. The remaining 21 property owners either declined or did not respond to the request for sampling. Based on a comparison of data from the 22 buildings to the decision matrices provided in the NYSDOH s Guidance for Evaluating Soil Vapor Intrusion in the State of New York, no further action was ultimately recommended at 10 properties and vapor mitigation was recommended at 12 properties; SSDSs have been installed at each of the 12 properties. Actions were taken to install SSDSs in five additional buildings not sampled for soil vapor intrusion, but based on sampling results of nearby buildings where mitigation was recommended. Further monitoring is not currently required at any of the off-site properties.

Health Problem: Direct contact with contaminants in the soil is unlikely because the majority of the site is covered with buildings and pavement. Contaminated groundwater at the site is not used for drinking or other purposes and the site is served by a public water supply that obtains water from a different source not affected by this contamination. Volatile organic compounds in the soil or groundwater may move into the soil vapor (air spaces within the soil), which in turn may move into overlying buildings and affect the indoor air quality. This process, which is similar to the movement of radon gas from the subsurface into the indoor air of buildings, is referred to as soil vapor intrusion. A sub-slab depressurization system has been installed in the office building and a soil vapor extraction system has been installed adjacent to the former manufacturing building in the vicinity of the main office and former metal finish area to prevent the indoor air quality from being affected by contamination in soil vapor beneath the building. However, the potential exists for inhalation of site contaminants due to soil vapor intrusion for any future on-site redevelopment. Sub-slab depressurization systems have been installed in 17 off-site buildings to prevent the indoor air quality from being affected by the contamination in soil vapor beneath the buildings. The investigation of soil vapor intrusion is on-going at off-site structures with actions being taken as necessary to address exposures.

BROWNFIELDS:

Name:	FORMER HUCK MANUFACTURING SITE
Address:	85 GRAND STREET
City,State,Zip:	KINGSTON, NY 12401
Program:	BCP
Site Code:	554332
Acres:	4.010
HW Code:	C356054
SWIS:	5608
Town:	Kingston (c)
Record Added Date:	06/30/2017
Record Updated Date:	07/30/2018
Update By:	BRHUMPHR
Site Description:	Location: The Former Huck Manufacturing Site is located at 85 Grand Street in the city of Kingston in Ulster County. Site Features: The site consists of two buildings, a former manufacturing building and an attached office building, together occupying 105,000 square feet of the 4.5-acre site. The remainder of the site consists of paved parking lots, access roads and a grassy area near the office building. Current Zoning and Land Use: The site is located in a mixed light-industrial, commercial, and residential area, with residences located both northeast and southeast of the site. All properties within a one-mile radius of the site are serviced by municipal water. Currently, Allways Moving and Storage uses the site for their moving and indoor self-storage business. Past Use of the Site: The site has been used for nearly 100 years for automotive, electrical, and refrigeration supplies manufacturing. Chlorinated VOCs, SVOCs, metals, and PCBs have been identified in the soil and storm sewer sediment at the site, while metals and VOCs have also been identified in the groundwater at the site. The soil and storm sewer sediment contamination resulted from various manufacturing processes that are known to have occurred at the site, including metal finishing, heat treating, and degreasing. Site Geology and Hydrogeology: Site soils generally consist of 0 to 3 feet of sand or sand and gravel fill material, followed by poorly sorted sand grading to silty sand down to approximately 68 feet below the ground surface (bgs), all of which is underlain by at least 10 feet of hard clay. The shallow water bearing zone is located approximately 15 to 20 feet bgs. Groundwater flows in a westerly direction across the site area.
Env Problem:	Nature and Extent of Contamination: Based upon investigations conducted to date, the primary contaminants of concern include chlorinated VOCs, namely trichloroethene (TCE) and tetrachloroethene (PCE). Soil - Numerous soil borings were installed on-site from 2002

HUCK INTL INC (Continued) **1000266777**

to 2008 to delineate the horizontal and vertical extent of VOCs in the soil. Based on the results of these investigations, the primary VOCs detected in the on-site soils were TCE, PCE and cis-1,2-dichloroethene (cis-1,2-DCE). They were found at several locations in shallow and deeper soils at concentrations above the soil cleanup objectives (SCOs) established for these compounds. Groundwater - Several groundwater investigations have been performed in relation to this site from 2002 through 2011. These investigations found the highest VOC concentrations in groundwater in two areas located under the former manufacturing building. VOCs detected in the groundwater include PCE, TCE, and their breakdown products. Quarterly groundwater monitoring was initiated in late 2012, at which time total VOCs were found at one on-site location in excess of 10,150 ppb. Since 2012 total VOC levels found in off-site wells located downgradient from the site ranged from non-detect to approximately 160 ppb. Evaluation of the vertical extent of VOCs in the groundwater indicated VOC levels above the New York State ambient water quality standards were confined mainly to the upper ten feet of the groundwater table. Soil Vapor and Indoor Air Soil vapor was found to be impacted by site-related contamination. A soil vapor extraction (SVE) system and a sub-slab depressurization system (SSDS) were installed and brought on-line during 2004-2005 to address shallow soil vapor impacts in the on-site parking areas located adjacent to Grand Street and indoor air impacts to an on-site office building. In addition, SSDSs have been installed in 17 off-site locations to address off-site indoor air impacts.

Health Problem: Information submitted with the BCP application regarding the conditions at the site are currently under review and will be revised as additional information becomes available.

Recognized Trader Exporter: No
Spent Lead Acid Battery Importer: No
Spent Lead Acid Battery Exporter: No
Current Record: No
Non Storage Recycler Activity: Not reported
Electronic Manifest Broker: Not reported

Receive Date: 20070101
Handler Name: HUCK INTL INC
Federal Waste Generator Description: Not a generator, verified
State District Owner: Ny
Large Quantity Handler of Universal Waste: No
Recognized Trader Importer: No
Recognized Trader Exporter: No
Spent Lead Acid Battery Importer: No
Spent Lead Acid Battery Exporter: No
Current Record: Yes
Non Storage Recycler Activity: Not reported
Electronic Manifest Broker: Not reported

Receive Date: 19920807
Handler Name: HUCK INTL INC
Federal Waste Generator Description: Large Quantity Generator
State District Owner: Ny
Large Quantity Handler of Universal Waste: No
Recognized Trader Importer: No
Recognized Trader Exporter: No
Spent Lead Acid Battery Importer: No
Spent Lead Acid Battery Exporter: No
Current Record: No
Non Storage Recycler Activity: Not reported
Electronic Manifest Broker: Not reported

Receive Date: 19900301
Handler Name: HUCK MANUFACTURING COMPANY
Federal Waste Generator Description: Large Quantity Generator
State District Owner: Ny
Large Quantity Handler of Universal Waste: No
Recognized Trader Importer: No
Recognized Trader Exporter: No
Spent Lead Acid Battery Importer: No
Spent Lead Acid Battery Exporter: No
Current Record: No
Non Storage Recycler Activity: Not reported
Electronic Manifest Broker: Not reported

Receive Date: 19920416
Handler Name: HUCK INTLINC

Updated By:	RDBENDEL

Site Description: Site Location: The site is located at 77 Cornell Street in the City of Kingston, Ulster County, New York, on a 0.88-acre lot that is bounded on the north by Smith Ave and on the east by Cornell St. The site tax map identifier is 56.25-4-8. Site Features: The site, also known as the Shirt Factory, is improved with a 4 story building occupied by 62 tenant spaces for commercial use. On site operations consist of artist loft/studios, professional offices, storage, and associated property maintenance. A partial basement is located along the southern portion of the site structure. Areas surrounding the building include asphalt paved parking surfaces, concrete walkways and landscaped spaces. Past Use of the Site: Historical site usage included dry cleaning from 1968 to 1979 (Gant Shirt Makers under the New York Drycleaners database Facility ID 3 5108 00012). Additionally, former tenants included Not Fade Away Tie Die and QDP Electronics, which utilized hazardous wastes at the site including benzene, ignitable wastes and tetrachloroethylene (PCE) from 1982 through 1999. Site Geology and Hydrogeology: The overburden materials encountered at the site can be characterized as asphalt and concrete, underlain by brown, coarse native sands to depths of 10 to 12 feet below ground surface (bgs) followed by finer brown sands from 12 to 20 feet bgs. Groundwater was encountered at around 16 feet bgs and groundwater flow is assumed at this time to be to the west towards the Esopus Creek.

Env Problem: Soil, groundwater, and soil vapor samples were analyzed for volatile organic compounds (VOCs). Based on investigations conducted to date, the primary contaminants of concern include VOCs in groundwater and soil vapor. Soil: Six soil samples were taken at six locations at the groundwater interface (around 16 feet bgs). Trichloroethylene (TCE) was detected in one soil sample (8.1 parts per billion (ppb)), but no samples had VOCs at concentrations that exceeded their unrestricted

Q D P ELECTRONICS ASSEMBLY (Continued) **1000390606**

soil cleanup objectives (USCOs). Groundwater: Three temporary groundwater wells were installed and sampled. Several VOCs were detected above their groundwater standards at the following maximum concentration: tetrachloroethylene (PCE) at 12 ppb vs 5 ppb and TCE at 30 ppb vs 5 ppb. Soil Vapor: Seven soil gas and three indoor air samples were taken at the site. Elevated levels of VOCs were found in the subsurface soil gas samples at the following maximum concentrations: PCE at 154 micrograms per meter cubed (ug/m^3) and TCE at 455 ug/m^3. Elevated levels of chlorinated solvents were found in the indoor air samples at the following maximum concentrations: TCE at 2.57 ug/m^3.

Health Problem:	As information for this site becomes available, it will be reviewed by the NYSDOH to determine if site contamination presents public health exposure concerns.

Environmental Interest/Information System:
The New York Department of Environmental Conservation Facility Information System (FIS) database houses all information about facilities that are regulated or of environmental interest to the state of New York.
The Resource Conservation and Recovery Act Information System (RCRAInfo) is EPA's comprehensive information system in support of the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. It tracks many types of information about generators, transporters, treaters, storers, and disposers of hazardous waste.

Click this hyperlink while viewing on your computer to access additional FINDS: detail in the EDR Site Report.

Updated By:	KATHOMPS
Site Description:	Location: The Site is in an urban area located at 25 Cornell Street, Kingston. Site Features: The approx. 1.35-acre site consists of 3 parcels and is presently developed with a one-story vacant warehouse/manufacturing building surrounded by asphalt paved parking, a concrete walkway, and grass. Railroad tracks ran parallel to the northern border of the site. Current Zoning and Land Use: The site is currently inactive and is zoned for commercial use. The surrounding parcels are currently used for commercial, light manufacturing, two family residence, and limited office space. The nearest residential

WONDERLY'S (Continued) **S129982663**

property is 350 feet northeast of the property. Past Use: Historic use at the site included a drapery and blind production company known as Wonerly s and a bowling alley. Site Geology and Hydrogeology: Site soils consist of mixed fill (sandy loam) in the first two feet, underlain by sand. Groundwater is present approximately 18 feet below grade surface and flows southwest.

Env Problem:	Nature and Extent of Contamination: Groundwater: Ground water samples were analyzed for VOCs and SVOCs. Based upon investigations conducted to date, the primary contaminants of concern for OU 1 include tetrachloroethene (PCE) and trichloroethene (TCE). Exceedances of TOGS-Class GA Standard for PCE ranged from 130ppb to 197ppb. Exceedances of TOGS-Class GA Standard for TCE ranged from 7.64ppb to 126ppb. Soil Vapor: Soil vapor, indoor air, and outdoor air samples were analyzed for VOCs. Based upon investigations conducted to date, the primary contaminants of concern for OU 1 include PCE and TCE. TCE was detected in soil vapor at elevated concentrations and was also detected in indoor air at concentration up to 18 micrograms per cubic meter. PCE was detected in soil vapor at elevated concentrations and was also detected in indoor air at concentrations up to 63 micrograms per cubic meter. Soil: Soil samples were analyzed for VOCs, SVOCs, and metals. Based on investigations conducted to date, no contaminants of concern were identified.
Health Problem:	As information for this site becomes available, it will be reviewed by the NYSDOH to determine if site contamination presents public health exposure concerns.

Updated By: GWCROSS
Site Description: Location: The Former Kingston Laundry site is located in an urban area at 38 Post Street, Kingston, NY 12401, between Spring Street and Hunter Street. It is bordered on the north against the back sides of the commercial buildings facing Broadway, bordered east and west with multi-unit residential structures, and Cornell Park to the south. Site Features: The main site feature is an abandoned, vacant industrial structure with a cylindrical roof. Current Zoning and Land Use: The site is currently inactive, and is in the Rondout District zoning area. The nearest residential area is adjacent to the site, located at 36 Post Street. Past Use of the Site: The site served as the boiler house of the historic Kingston Laundry. The boiler has been removed, and reportedly, two fuel oil USTs for the boiler were closed in-place in 1997. Subsequently, the structure has been used for storage of building supplies and personal belongings. In 2005, a leaky 1,500 gallon UST was discovered at 38 Post Street containing oil with ~2% PCE. The oil was pumped out and disposed as hazardous waste at the Norlite incinerator in Cohoes. The tank was then filled with cement mix and abandoned in place. Various pipeline runs beneath the slab were exposed and removed as well. Site Geology and Hydrogeology: The site sits within the prehistoric Lake Albany footprint. As much as 8 feet of fill materials were encountered, comprising of fine to medium sand, and silt with occasional brick and coal fragments. The natural soil below is fine sand and silt grading downward to silt then silty clay. Groundwater was encountered at approximately 9 to 10 feet bgs on the site. Groundwater was perched on the silty clay with some movement of water within silt seams in the clay. Groundwater is assumed to flow to the east-southeast toward Rondout Creek, but there is a component of flow northward due to elevation differences between Post St and Broadway. The elevation of the Post St sidewalk is 20 feet higher than the Broadway sidewalk.
Env Problem: Nature and Extent of Contamination: Based upon investigations conducted to date, the primary contaminant of concern is tetrachloroethylene (PCE). Soil: A soil sample immediately below the basement slab at 38 Post Street contained PCE at 790 ppm. TCLP analysis of soil disposed from 38 Post Street showed PCE at 0.17 ppm. A soil sample from soil boring B-4, 6-7 ft below grade, between 38 and 36 Post Street, contained PCE at 0.017 ppm. A composite sample from 2 test pits 20 feet north of the excavation limit at 81 Broadway contained PCE at 0.02 ppm and trichloroethylene (TCE) at 0.034 ppm. TCLP analysis of the excavated soil and excavation endpoint sampling

FORMER KINGSTON LAUNDRY (Continued) **S117667765**

from 81 Broadway were non-detect for PCE. Groundwater: Groundwater samples from soil borings on 38 Post Street were non-detect for PCE. Excavation water from 81 Broadway contained 74 ppb cis-1,2-dichloroethylene (DCE). Soil Vapor and Indoor Air: Soil vapor impacts have not yet been evaluated.

Health Problem:	As information for this site becomes available, it will be reviewed by the NYSDOH to determine if site contamination presents public health exposure concerns.

25 FIELD COURT (Continued) **S121933863**

Updated By: KATHOMPS

Site Description: Location: 25 Field Ct is an approximately 0.85 acre site in a mixed commercial and residential area in Kingston NY, Ulster County. Tax Map Identifier: SBL: 56.25 3 35 Location Description: The Site has frontage on two roads, Field Court and O Neil Street and contains a 12,289 square foot single story brick building that was constructed in 1966. The structure is built on a slab and the building is surrounded by paved parking lots. The nearest residential property is approximately 100 feet to the west. The site relief is nearly flat. Current Zoning and Land Use: The Site is zoned as General Commercial, and uses include but not limited to retail stores, warehouses, professional buildings and manufacturing buildings. Property uses in the area include woodworking shop to the south, window treatment manufacturer to the east and residential properties to the west. A former railroad maintenance yard and spur is adjacent to site to the north. Past Use(s) of the site: Based upon information provided by the City of Kingston, various Sanborn Maps and the Kingston Directory the past uses of the site include, a previous building existed and housed various mechanic uses including a tire shop and Welding and lawnmower repair shop from 1950 1957. The current building housed, auto repair and various office uses, from 1960s 1990's. The site is currently vacant. Site Geology and Hydrology: The surface of the Site is predominantly fill to a depth of 2 3 ft. underlain by sand and clay layers interpreted as lacustrine delta deposits overlying bedrock. Specifically, the mapping units present in the vicinity of the Site are identified as the Glenerie formation, which is described as Devonian in age and consists of limestone and chert. Information regarding depth to bedrock was not readily available and was not encountered in soil borings at a depth of 60 ft. Groundwater was encountered at 18 feet below the surface. Confining clay layer was encountered at a depth of approximately 60 feet.

Env Problem: Soil and groundwater samples were analyzed for volatile organic compounds (VOCs), semi-volatile organic compounds (SVOCs), polychlorinated biphenyls (PCBs), pesticides, metals, and the emerging contaminants per- and polyfluorinated substances (PFAS) and 1,4-dioxane. Soil vapor samples were also analyzed for VOCs. Based on investigations conducted, the primary contaminants of concern include VOCs in soil, groundwater, and soil vapor. Soil: Sampling results indicated that all targeted SVOCs, pesticides and PCBs, were either non-detect or detected below the unrestricted use soil cleanup objectives in all on-site soil samples. VOCs were detected in shallow soil samples above unrestricted SCOs and protection of groundwater SCOs. Metals were detected in one sample above unrestricted SCOs. Off-site samples detected SVOCs above commercial SCOs and one sample exceeded the metals unrestricted SCO for copper. Groundwater: Sampling results indicated that all targeted SVOCs, pesticides and PCBs and TCL metals were either non-detect or detected below the class GA guidance standard. VOCs were detected in all groundwater samples above the class GA guidance standard. VOCs exceeding groundwater standards were PCE ,TCE and Cis-1.2 DCE. TCE concentrations ranged from a low of 5.5 ug/l to a high of 17 ug/l. Concentrations of PCE ranged from a low of 97 ug/l to a high of 370 ug/l. Cis 1.2 DCE was found in one sample at 12 ug/l. PFAS analysis showed perfluorooctanoic acid (PFOA) was detected in one monitoring well at a concentration of 14.2 parts per trillion (ppt), which exceeds the Maximum Contaminant Level (MCL) of 10 ppt in groundwater. All other results for PFAS analysis were either non-detect or

25 FIELD COURT (Continued) **S121933863**

reported as estimated below the MCL. Soil Vapor and Indoor Air: Soil gas samples indicated VOCs are present. PCE and TCE were detected within the soil vapor and sub-slab soil vapor samples at multiple orders of magnitude higher than their concentrations in ambient and indoor air samples, indicating mitigation is needed based on comparison to the DOH SVI matrices. Sub-slab PCE sample concentrations ranged from 6,800 to 38,000 ug/m3 and TCE concentrations ranged from 46 to 430 ug/m3. Soil gas PCE sample concentrations ranged from 1,300 to 54,000 ug/m3 and TCE concentrations ranged from 69 to 640 ug/m3. Off-site primary COCs are were benzo(a)anthracene, benzo(a)pyrene, benzo(b)fluoranthene, benzo(k)fluoranthene, benzo(a)pyrene, and chrysene. This site was reclassified as a Class II Inactive Hazardous Waste Site in August 2021.

Health Problem: Access to the site is unrestricted. However, contact with contaminated soil or groundwater is unlikely unless persons dig below the ground surface. People are not drinking the contaminated groundwater because the area is served by a public water supply that is not affected by this contamination. Volatile organic compounds in the groundwater and/or soil may move into the soil vapor (air spaces within the soil), which in turn may move into overlying buildings and affect the indoor air quality. This process, which is similar to the movement of radon gas from the subsurface into the indoor air of buildings, is referred to as soil vapor intrusion. Because the on-site building is currently unoccupied, inhalation of site contaminants in indoor air due to soil vapor intrusion does not represent a concern for the site in its current condition. However, the potential exists for the inhalation of site contaminants due to soil vapor intrusion for any future site redevelopment. An evaluation is needed to determine if soil vapor intrusion is a potential concern for off-site buildings.

GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

To maintain currency of the following federal and state databases, EDR contacts the appropriate governmental agency on a monthly or quarterly basis, as required.

Number of Days to Update: Provides confirmation that EDR is reporting records that have been updated within 90 days from the date the government agency made the information available to the public.

STANDARD ENVIRONMENTAL RECORDS

Lists of Federal NPL (Superfund) sites

NPL: National Priority List

National Priorities List (Superfund). The NPL is a subset of CERCLIS and identifies over 1,200 sites for priority cleanup under the Superfund Program. NPL sites may encompass relatively large areas. As such, EDR provides polygon coverage for over 1,000 NPL site boundaries produced by EPA's Environmental Photographic Interpretation Center (EPIC) and regional EPA offices.

Proposed NPL: Proposed National Priority List Sites

A site that has been proposed for listing on the National Priorities List through the issuance of a proposed rule in the Federal Register. EPA then accepts public comments on the site, responds to the comments, and places on the NPL those sites that continue to meet the requirements for listing.

NPL LIENS: Federal Superfund Liens

Federal Superfund Liens. Under the authority granted the USEPA by CERCLA of 1980, the USEPA has the authority to file liens against real property in order to recover remedial action expenditures or when the property owner received notification of potential liability. USEPA compiles a listing of filed notices of Superfund Liens.

Lists of Federal Delisted NPL sites

Delisted NPL: National Priority List Deletions

The National Oil and Hazardous Substances Pollution Contingency Plan (NCP) establishes the criteria that the EPA uses to delete sites from the NPL. In accordance with 40 CFR 300.425.(e), sites may be deleted from the NPL where no further response is appropriate.

SEMS: Superfund Enterprise Management System

SEMS (Superfund Enterprise Management System) tracks hazardous waste sites, potentially hazardous waste sites, and remedial activities performed in support of EPA's Superfund Program across the United States. The list was formerly know as CERCLIS, renamed to SEMS by the EPA in 2015. The list contains data on potentially hazardous waste sites that have been reported to the USEPA by states, municipalities, private companies and private persons, pursuant to Section 103 of the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA). This dataset also contains sites which are either proposed to or on the National Priorities List (NPL) and the sites which are in the screening and assessment phase for possible inclusion on the NPL.

Lists of Federal CERCLA sites with NFRAP

SEMS-ARCHIVE: Superfund Enterprise Management System Archive

SEMS-ARCHIVE (Superfund Enterprise Management System Archive) tracks sites that have no further interest under the Federal Superfund Program based on available information. The list was formerly known as the CERCLIS-NFRAP, renamed to SEMS ARCHIVE by the EPA in 2015. EPA may perform a minimal level of assessment work at a site while it is archived if site conditions change and/or new information becomes available. Archived sites have been removed and archived from the inventory of SEMS sites. Archived status indicates that, to the best of EPA's knowledge, assessment at a site has been completed and that EPA has determined no further steps will be taken to list the site on the National Priorities List (NPL), unless information indicates this decision was not appropriate or other considerations require a recommendation for listing at a later time. The decision does not necessarily mean that there is no hazard associated with a given site; it only means that. based upon available information, the location is not judged to be potential NPL site.

Lists of Federal RCRA TSD facilities

RCRA-TSDF: RCRA - Treatment, Storage and Disposal

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Transporters are individuals or entities that move hazardous waste from the generator offsite to a facility that can recycle, treat, store, or dispose of the waste. TSDFs treat, store, or dispose of the waste.

Lists of Federal RCRA generators

RCRA-LQG: RCRA - Large Quantity Generators

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Large quantity generators (LQGs) generate over 1,000 kilograms (kg) of hazardous waste, or over 1 kg of acutely hazardous waste per month.

Lists of state and tribal voluntary cleanup sites

VCP: Voluntary Cleanup Agreements

New York established its Voluntary Cleanup Program (VCP) to address the environmental, legal and financial barriers that often hinder the redevelopment and reuse of contaminated properties. The Voluntary Cleanup Program was developed to enhance private sector cleanup of brownfields by enabling parties to remediate sites using private rather than public funds and to reduce the development pressures on "greenfield" sites.

ERP: Environmental Restoration Program Listing
In an effort to spur the cleanup and redevelopment of brownfields, New Yorkers approved a $200 million Environmental Restoration or Brownfields Fund as part of the $1.75 billion Clean Water/Clean Air Bond Act of 1996 (1996 Bond Act). Enhancements to the program were enacted on October 7, 2003. Under the Environmental Restoration Program, the State provides grants to municipalities to reimburse up to 90 percent of on-site eligible costs and 100% of off-site eligible costs for site investigation and remediation activities. Once remediated, the property may then be reused for commercial, industrial, residential or public use.

ADDITIONAL ENVIRONMENTAL RECORDS

Local Brownfield lists

US BROWNFIELDS: A Listing of Brownfields Sites

Brownfields are real property, the expansion, redevelopment, or reuse of which may be complicated by the presence or potential presence of a hazardous substance, pollutant, or contaminant. Cleaning up and reinvesting in these properties takes development pressures off of undeveloped, open land, and both improves and protects the environment. Assessment, Cleanup and Redevelopment Exchange System (ACRES) stores information reported by EPA Brownfields grant recipients on brownfields properties assessed or cleaned up with grant funding as well as information on Targeted Brownfields Assessments performed by EPA Regions. A listing of ACRES Brownfield sites is obtained from Cleanups in My Community. Cleanups in My Community provides information on Brownfields properties for which information is reported back to EPA, as well as areas served by Brownfields grant programs.

US CDL: Clandestine Drug Labs

A listing of clandestine drug lab locations. The U.S. Department of Justice ("the Department") provides this web site as a public service. It contains addresses of some locations where law enforcement agencies reported they found chemicals or other items that indicated the presence of either clandestine drug laboratories or dumpsites. In most cases, the source of the entries is not the Department, and the Department has not verified the entry and does not guarantee its accuracy. Members of the public must verify the accuracy of all entries by, for example, contacting local law enforcement and local health departments.

LIENS 2: CERCLA Lien Information

A Federal CERCLA ('Superfund') lien can exist by operation of law at any site or property at which EPA has spent Superfund monies. These monies are spent to investigate and address releases and threatened releases of contamination. CERCLIS provides information as to the identity of these sites and properties.

HIST SPILLS: SPILLS Database

This database contains records of chemical and petroleum spill incidents. Under State law, petroleum and hazardous chemical spills that can impact the waters of the state must be reported by the spiller (and, in some cases, by anyone who has knowledge of the spills). In 2002, the Department of Environmental Conservation stopped providing updates to its original Spills Information Database. This database includes fields that are no longer available from the NYDEC as of January 1, 2002. Current information may be found in the NY SPILLS database. Department of Environmental Conservation.

Other Ascertainable Records

RCRA NonGen / NLR: RCRA - Non Generators / No Longer Regulated

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Non-Generators do not presently generate hazardous waste.

EPA WATCH LIST: EPA WATCH LIST

EPA maintains a "Watch List" to facilitate dialogue between EPA, state and local environmental agencies on enforcement matters relating to facilities with alleged violations identified as either significant or high priority. Being on the Watch List does not mean that the facility has actually violated the law only that an investigation by EPA or a state or local environmental agency has led those organizations to allege that an unproven violation has in fact occurred. Being on the Watch List does not represent a higher level of concern regarding the alleged violations that were detected, but instead indicates cases requiring additional dialogue between EPA, state and local agencies - primarily because of the length of time the alleged violation has gone unaddressed or unresolved.

2020 COR ACTION: 2020 Corrective Action Program List

The EPA has set ambitious goals for the RCRA Corrective Action program by creating the 2020 Corrective Action Universe. This RCRA cleanup baseline includes facilities expected to need corrective action. The 2020 universe contains a wide variety of sites. Some properties are heavily contaminated while others were contaminated but have since been cleaned up. Still others have not been fully investigated yet, and may require little or no remediation. Inclusion in the 2020 Universe does not necessarily imply failure on the part of a facility to meet its RCRA obligations.

RMP: Risk Management Plans

When Congress passed the Clean Air Act Amendments of 1990, it required EPA to publish regulations and guidance for chemical accident prevention at facilities using extremely hazardous substances. The Risk Management Program Rule (RMP Rule) was written to implement Section 112(r) of these amendments. The rule, which built upon existing industry codes and standards, requires companies of all sizes that use certain flammable and toxic substances to develop a Risk Management Program, which includes a(n): Hazard assessment that details the potential effects of an accidental release, an accident history of the last five years, and an evaluation of worst-case and alternative accidental releases; Prevention program that includes safety precautions and maintenance, monitoring, and employee training measures; and Emergency response program that spells out emergency health care, employee training measures and procedures for informing the public and response agencies (e.g the fire department) should an accident occur.

RAATS: RCRA Administrative Action Tracking System

RCRA Administration Action Tracking System. RAATS contains records based on enforcement actions issued under RCRA pertaining to major violators and includes administrative and civil actions brought by the EPA. For administration actions after September 30, 1995, data entry in the RAATS database was discontinued. EPA will retain a copy of the database for historical records. It was necessary to terminate RAATS because a decrease in agency resources made it impossible to continue to update the information contained in the database.

UMTRA: Uranium Mill Tailings Sites

Uranium ore was mined by private companies for federal government use in national defense programs. When the mills shut down, large piles of the sand-like material (mill tailings) remain after uranium has been extracted from the ore. Levels of human exposure to radioactive materials from the piles are low; however, in some cases tailings were used as construction materials before the potential health hazards of the tailings were recognized.

US AIRS (AFS): Aerometric Information Retrieval System Facility Subsystem (AFS)

The database is a sub-system of Aerometric Information Retrieval System (AIRS). AFS contains compliance data on air pollution point sources regulated by the U.S. EPA and/or state and local air regulatory agencies. This information comes from source reports by various stationary sources of air pollution, such as electric power plants, steel mills, factories, and universities, and provides information about the air pollutants they produce. Action, air program, air program pollutant, and general level plant data. It is used to track emissions and compliance data from industrial plants.

GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

ABANDONED MINES: Abandoned Mines

An inventory of land and water impacted by past mining (primarily coal mining) is maintained by OSMRE to provide information needed to implement the Surface Mining Control and Reclamation Act of 1977 (SMCRA). The inventory contains information on the location, type, and extent of AML impacts, as well as, information on the cost associated with the reclamation of those problems. The inventory is based upon field surveys by State, Tribal, and OSMRE program officials. It is dynamic to the extent that it is modified as new problems are identified and existing problems are reclaimed.

PFAS RCRA MANIFEST: PFAS Transfers Identified In the RCRA Database Listing

To work around the lack of PFAS waste codes in the RCRA database, EPA developed the PFAS Transfers dataset by mining e-Manifest records containing at least one of these common PFAS keywords: PFAS, PFOA, PFOS, PERFL, AFFF, GENX, GEN-X (plus the VT waste codes). These keywords were searched for in the following text fields: Manifest handling instructions (MANIFEST_HANDLING_INSTR), Non-hazardous waste description (NON_HAZ_WASTE_DESCRIPTION), DOT printed information (DOT_PRINTED_INFORMATION), Waste line handling instructions (WASTE_LINE_HANDLING_INSTR), Waste residue comments (WASTE_RESIDUE_COMMENTS).

PFAS NPDES: Clean Water Act Discharge Monitoring Information

Any discharger of pollutants to waters of the United States from a point source must have a National Pollutant Discharge Elimination System (NPDES) permit. The process for obtaining limits involves the regulated entity (permittee) disclosing releases in a NPDES permit application and the permitting authority (typically the state but sometimes EPA) deciding whether to require monitoring or monitoring with limits. Caveats and Limitations: Less than half of states have required PFAS monitoring for at least one of their permittees and fewer states have established PFAS effluent limits for permittees. New rulemakings have been initiated that may increase the number of facilities monitoring for PFAS in the future.

PFAS ECHO FIRE TRAINING: Facilities in Industries that May Be Handling PFAS Listing

A list of fire training sites was added to the Industry Sectors dataset using a keyword search on the permitted facilitys name to identify sites where fire-fighting foam may have been used in training exercises. Additionally, you may view an example spreadsheet of the subset of fire training facility data, as well as the keywords used in selecting or deselecting a facility for the subset. as well as the keywords used in selecting or deselecting a facility for the subset. These keywords were tested to maximize accuracy in selecting facilities that may use fire-fighting foam in training exercises, however, due to the lack of a required reporting field in the data systems for designating fire training sites, this methodology may not identify all fire training sites or may potentially misidentify them.

PFAS PART 139 AIRPORT: All Certified Part 139 Airports PFAS Information Listing

Since July 1, 2006, all certified part 139 airports are required to have fire-fighting foam onsite that meet military specifications (MIL-F-24385) (14 CFR 139.317). To date, these military specification fire-fighting foams are fluorinated and have been historically used for training and extinguishing. The 2018 FAA Reauthorization Act has a provision stating that no later than October 2021, FAA shall not require the use of fluorinated AFFF. This provision does not prohibit the use of fluorinated AFFF at Part 139 civilian airports; it only prohibits FAA from mandating its use. The Federal Aviation Administration?s document AC 150/5210-6D - Aircraft Fire Extinguishing Agents provides guidance on Aircraft Fire Extinguishing Agents, which includes Aqueous Film Forming Foam (AFFF).

HSWDS: Hazardous Substance Waste Disposal Site Inventory

The list includes any known or suspected hazardous substance waste disposal sites. Also included are sites delisted from the Registry of Inactive Hazardous Waste Disposal Sites and non-Registry sites that U.S. EPA Preliminary Assessment (PA) reports or Site Investigation (SI) reports were prepared. Hazardous Substance Waste Disposal Sites are eligible to be Superfund sites now that the New York State Superfund has been refinanced and changed. This means that the study inventory has served its purpose and will no longer be maintained as a separate entity. The last version of the study inventory is frozen in time. The sites on the study will not automatically be made Superfund sites, rather each site will be further evaluated for listing on the Registry. So overtime they will be added to the registry or not.

NYC LEAD 2: Recent Lead Paint Violations

Pursuant to New York City?s Housing Maintenance Code, the Department of Housing Preservation and Development (HPD) issues violations against conditions in rental dwelling units that have been verified to violate the New York City Housing Maintenance Code (HMC) or the New York State Multiple Dwelling Law (MDL). Violations are issued when an inspection verifies that a violation of the HMC or MDL exists. It is closed when the violation is corrected, as observed/verified by HPD or as certified by the landlord.

SPDES: State Pollutant Discharge Elimination System

New York State has a state program which has been approved by the United States Environmental Protection Agency for the control of wastewater and stormwater discharges in accordance with the Clean Water Act. Under New York State law the program is known as the State Pollutant Discharge Elimination System (SPDES) and is broader in scope than that required by the Clean Water Act in that it controls point source discharges to groundwaters as well as surface waters.

UST FINDER: UST Finder Database

EPA developed UST Finder, a web map application containing a comprehensive, state-sourced national map of underground storage tank (UST) and leaking UST (LUST) data. It provides the attributes and locations of active and closed USTs, UST facilities, and LUST sites from states and from Tribal lands and US territories . UST Finder contains information about proximity of UST facilities and LUST sites to: surface and groundwater public drinking water protection areas; estimated number of private domestic wells and number of people living nearby; and flooding and wildfires.

EDR HIGH RISK HISTORICAL RECORDS

EDR Exclusive Records

EDR MGP: EDR Proprietary Manufactured Gas Plants

The EDR Proprietary Manufactured Gas Plant Database includes records of coal gas plants (manufactured gas plants) compiled by EDR's researchers. Manufactured gas sites were used in the United States from the 1800's to 1950's to produce a gas that could be distributed and used as fuel. These plants used whale oil, rosin, coal, or a mixture of coal, oil, and water that also produced a significant amount of waste. Many of the byproducts of the gas production, such as coal tar (oily waste containing volatile and non-volatile chemicals), sludges, oils and other compounds are potentially hazardous to human health and the environment. The byproduct from this process was frequently disposed of directly at the plant site and can remain or spread slowly, serving as a continuous source of soil and groundwater contamination.

EDR Hist Auto: EDR Exclusive Historical Auto Stations

EDR has searched selected national collections of business directories and has collected listings of potential gas station/filling station/service station sites that were available to EDR researchers. EDR's review was limited to those categories of sources that might, in EDR's opinion, include gas station/filling station/service station establishments. The categories reviewed included, but were not limited to gas, gas station, gasoline station, filling station, auto, automobile repair, auto service station, service station, etc. This database falls within a category of information EDR classifies as "High Risk Historical Records", or HRHR. EDR's HRHR effort presents unique and sometimes proprietary data about past sites and operations that typically create environmental concerns, but may not show up in current government records searches.

OTHER DATABASE(S)

Depending on the geographic area covered by this report, the data provided in these specialty databases may or may not be complete. For example, the existence of wetlands information data in a specific report does not mean that all wetlands in the area covered by the report are included. Moreover, the absence of any reported wetlands information does not necessarily mean that wetlands do not exist in the area covered by the report.

GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

Sensitive Receptors: There are individuals deemed sensitive receptors due to their fragile immune systems and special sensitivity to environmental discharges. These sensitive receptors typically include the elderly, the sick, and children. While the location of all sensitive receptors cannot be determined, EDR indicates those buildings and facilities - schools, daycares, hospitals, medical centers, and nursing homes - where individuals who are sensitive receptors are likely to be located.

AHA Hospitals:
Source: American Hospital Association, Inc.
Telephone: 312-280-5991
The database includes a listing of hospitals based on the American Hospital Association's annual survey of hospitals.

Medical Centers: Provider of Services Listing
Source: Centers for Medicare & Medicaid Services
Telephone: 410-786-3000
A listing of hospitals with Medicare provider number, produced by Centers of Medicare & Medicaid Services, a federal agency within the U.S. Department of Health and Human Services.

Nursing Homes
Source: National Institutes of Health

West Map:	14106058 KINGSTON WEST, NY
Version Date:	2019

EDR's GeoCheck Physical Setting Source Addendum is provided to assist the environmental professional in forming an opinion about the impact of potential contaminant migration.

Assessment of the impact of contaminant migration generally has two principle investigative components:

1. Groundwater flow direction, and
2. Groundwater flow velocity.

Groundwater flow direction may be impacted by surface topography, hydrology, hydrogeology, characteristics of the soil, and nearby wells. Groundwater flow velocity is generally impacted by the nature of the geologic strata.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

GROUNDWATER FLOW DIRECTION INFORMATION

Groundwater flow direction for a particular site is best determined by a qualified environmental professional using site-specific well data. If such data is not reasonably ascertainable, it may be necessary to rely on other sources of information, such as surface topographic information, hydrologic information, hydrogeologic data collected on nearby properties, and regional groundwater flow information (from deep aquifers).

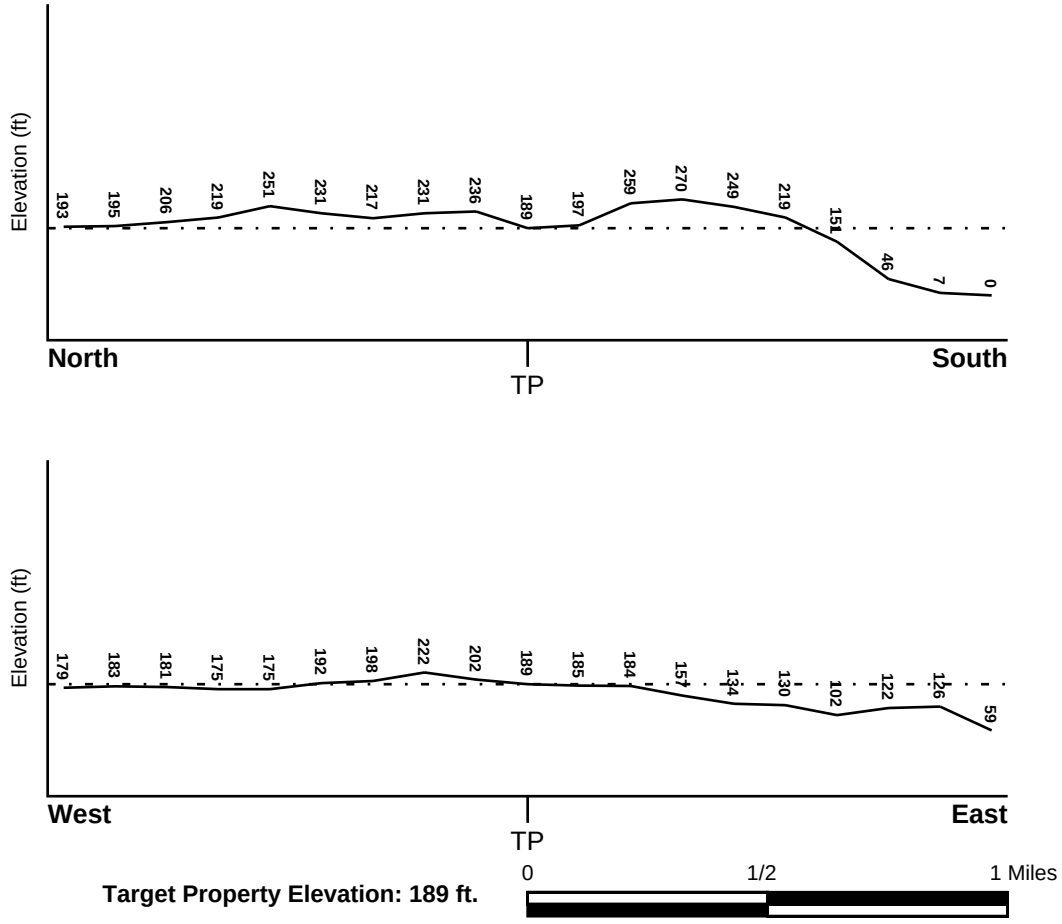

TOPOGRAPHIC INFORMATION

Surface topography may be indicative of the direction of surficial groundwater flow. This information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

TARGET PROPERTY TOPOGRAPHY

General Topographic Gradient: General NE

SURROUNDING TOPOGRAPHY: ELEVATION PROFILES

Source: Topography has been determined from the USGS 7.5' Digital Elevation Model and should be evaluated on a relative (not an absolute) basis. Relative elevation information between sites of close proximity should be field verified.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

HYDROLOGIC INFORMATION

Surface water can act as a hydrologic barrier to groundwater flow. Such hydrologic information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

Refer to the Physical Setting Source Map following this summary for hydrologic information (major waterways and bodies of water).

FEMA FLOOD ZONE

Flood Plain Panel at Target Property	FEMA Source Type
36111C0490E	FEMA FIRM Flood data

36111C0470E	FEMA FIRM Flood data

NATIONAL WETLAND INVENTORY

NWI Quad at Target Property	NWI Electronic Data Coverage
KINGSTON EAST	YES - refer to the Overview Map and Detail Map

HYDROGEOLOGIC INFORMATION

Hydrogeologic information obtained by installation of wells on a specific site can often be an indicator of groundwater flow direction in the immediate area. Such hydrogeologic information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

Site-Specific Hydrogeological Data*:

Search Radius:	1.25 miles
Status:	Not found

AQUIFLOW®

Search Radius: 1.000 Mile.

EDR has developed the AQUIFLOW Information System to provide data on the general direction of groundwater flow at specific points. EDR has reviewed reports submitted by environmental professionals to regulatory authorities at select sites and has extracted the date of the report, groundwater flow direction as determined hydrogeologically, and the depth to water table.

MAP ID	LOCATION FROM TP	GENERAL DIRECTION GROUNDWATER FLOW
Not Reported		

* ©1996 Site−specific hydrogeological data gathered by CERCLIS Alerts, Inc., Bainbridge Island, WA. All rights reserved. All of the information and opinions presented are those of the cited EPA report(s), which were completed under a Comprehensive Environmental Response Compensation and Liability Information System (CERCLIS) investigation.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

GROUNDWATER FLOW VELOCITY INFORMATION

Groundwater flow velocity information for a particular site is best determined by a qualified environmental professional using site specific geologic and soil strata data. If such data are not reasonably ascertainable, it may be necessary to rely on other sources of information, including geologic age identification, rock stratigraphic unit and soil characteristics data collected on nearby properties and regional soil information. In general, contaminant plumes move more quickly through sandy-gravelly types of soils than silty-clayey types of soils.

GEOLOGIC INFORMATION IN GENERAL AREA OF TARGET PROPERTY

Geologic information can be used by the environmental professional in forming an opinion about the relative speed at which contaminant migration may be occurring.

ROCK STRATIGRAPHIC UNIT

Era:	Paleozoic
System:	Silurian
Series:	Silurian
Code:	S *(decoded above as Era, System & Series)*

GEOLOGIC AGE IDENTIFICATION

Category: Stratifed Sequence

Geologic Age and Rock Stratigraphic Unit Source: P.G. Schruben, R.E. Arndt and W.J. Bawiec, Geology of the Conterminous U.S. at 1:2,500,000 Scale - a digital representation of the 1974 P.B. King and H.M. Beikman Map, USGS Digital Data Series DDS - 11 (1994).

DOMINANT SOIL COMPOSITION IN GENERAL AREA OF TARGET PROPERTY

The U.S. Department of Agriculture's (USDA) Soil Conservation Service (SCS) leads the National Cooperative Soil Survey (NCSS) and is responsible for collecting, storing, maintaining and distributing soil survey information for privately owned lands in the United States. A soil map in a soil survey is a representation of soil patterns in a landscape. Soil maps for STATSGO are compiled by generalizing more detailed (SSURGO) soil survey maps. The following information is based on Soil Conservation Service STATSGO data.

Soil Component Name: URBAN LAND

Soil Surface Texture: variable

Hydrologic Group: Not reported

Soil Drainage Class: Not reported

Hydric Status: Soil does not meet the requirements for a hydric soil.

Corrosion Potential - Uncoated Steel: Not Reported

Depth to Bedrock Min: > 10 inches

Depth to Bedrock Max: > 10 inches

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

Soil Layer Information							
	Boundary			Classification			
Layer	Upper	Lower	Soil Texture Class	AASHTO Group	Unified Soil	Permeability Rate (in/hr)	Soil Reaction (pH)
1	0 inches	6 inches	variable	Not reported	Not reported	Max: 0.00 Min: 0.00	Max: 0.00 Min: 0.00

OTHER SOIL TYPES IN AREA

Based on Soil Conservation Service STATSGO data, the following additional subordinant soil types may appear within the general area of target property.

Soil Surface Textures: silt loam
loamy fine sand
channery - silt loam

Surficial Soil Types: silt loam
loamy fine sand
channery - silt loam

Shallow Soil Types: loam
silt loam
channery - silt loam

Deeper Soil Types: silt loam
fine sand
unweathered bedrock
silty clay
gravelly - loam
very channery - loam

LOCAL / REGIONAL WATER AGENCY RECORDS

EDR Local/Regional Water Agency records provide water well information to assist the environmental professional in assessing sources that may impact ground water flow direction, and in forming an opinion about the impact of contaminant migration on nearby drinking water wells.

PHYSICAL SETTING SOURCE RECORDS SEARCHED

TOPOGRAPHIC INFORMATION

USGS 7.5' Digital Elevation Model (DEM)
Source: United States Geologic Survey
EDR acquired the USGS 7.5' Digital Elevation Model in 2002 and updated it in 2006. The 7.5 minute DEM corresponds to the USGS 1:24,000- and 1:25,000-scale topographic quadrangle maps. The DEM provides elevation data with consistent elevation units and projection.

Current USGS 7.5 Minute Topographic Map
Source: U.S. Geological Survey

HYDROLOGIC INFORMATION

Flood Zone Data: This data was obtained from the Federal Emergency Management Agency (FEMA). It depicts 100-year and 500-year flood zones as defined by FEMA. It includes the National Flood Hazard Layer (NFHL) which incorporates Flood Insurance Rate Map (FIRM) data and Q3 data from FEMA in areas not covered by NFHL.
Source: FEMA
Telephone: 877-336-2627
Date of Government Version: 2003, 2015

NWI: National Wetlands Inventory. This data, available in select counties across the country, was obtained by EDR in 2002, 2005, 2010 and 2015 from the U.S. Fish and Wildlife Service.

State Wetlands Data: Freshwater Wetlands

Telephone: 518-402-8961

HYDROGEOLOGIC INFORMATION

AQUIFLOW^{R} Information System
Source: EDR proprietary database of groundwater flow information
EDR has developed the AQUIFLOW Information System (AIS) to provide data on the general direction of groundwater flow at specific points. EDR has reviewed reports submitted to regulatory authorities at select sites and has extracted the date of the report, hydrogeologically determined groundwater flow direction and depth to water table information.

GEOLOGIC INFORMATION

Geologic Age and Rock Stratigraphic Unit
Source: P.G. Schruben, R.E. Arndt and W.J. Bawiec, Geology of the Conterminous U.S. at 1:2,500,000 Scale - A digital representation of the 1974 P.B. King and H.M. Beikman Map, USGS Digital Data Series DDS - 11 (1994).

STATSGO: State Soil Geographic Database
Source: Department of Agriculture, Natural Resources Conservation Service (NRCS)
The U.S. Department of Agriculture's (USDA) Natural Resources Conservation Service (NRCS) leads the national Conservation Soil Survey (NCSS) and is responsible for collecting, storing, maintaining and distributing soil survey information for privately owned lands in the United States. A soil map in a soil survey is a representation of soil patterns in a landscape. Soil maps for STATSGO are compiled by generalizing more detailed (SSURGO) soil survey maps.

SSURGO: Soil Survey Geographic Database
Source: Department of Agriculture, Natural Resources Conservation Service (NRCS)
Telephone: 800-672-5559
SSURGO is the most detailed level of mapping done by the Natural Resources Conservation Service, mapping scales generally range from 1:12,000 to 1:63,360. Field mapping methods using national standards are used to construct the soil maps in the Soil Survey Geographic (SSURGO) database. SSURGO digitizing duplicates the original soil survey maps. This level of mapping is designed for use by landowners, townships and county natural resource planning and management.

EXECUTIVE SUMMARY

DESCRIPTION

Environmental Data Resources, Inc.'s (EDR) City Directory Report is a screening tool designed to assist environmental professionals in evaluating potential liability on a target property resulting from past activities. EDR's City Directory Report includes a search of available business directory data at approximately five year intervals.

RECORD SOURCES

The EDR City Directory Report accesses a variety of business directory sources, including Haines, InfoUSA, Polk, Cole, Bresser, and Stewart. Listings marked as EDR Digital Archive access Cole and InfoUSA records. The various directory sources enhance and complement each other to provide a more thorough and accurate report.

EDR is licensed to reproduce certain City Directory works by the copyright holders of those works. The purchaser of this EDR City Directory Report may include it in report(s) delivered to a customer.

RESEARCH SUMMARY

The following research sources were consulted in the preparation of this report. A check mark indicates where information was identified in the source and provided in this report.
