RE: *Site Characterization and Sub-Slab Depressurization System Pilot Test Report*
65 Albany Avenue
Kingston, Ulster County, New York
Site No.: 356060

Dear Mr. Kilmer:

DT Consulting Services, Inc. (DTCS) and Bellucci Engineering, PLLC are pleased to present this *Site Characterization and Sub-Slab Depressurization System Pilot Test Report* for the above referenced property. This report documents the additional Site characterization and SSDS pilot testing work conducted at the Site as outlined in the February 11, 2022, *Site Characterization/ Interim Remedial Measure Work Plan*. If you should have any questions or require additional information, please contact our office.

Respectfully submitted,

Daniel Bellucci, P.E.
Bellucci Engineering, PLLC

Deborah Thompson, Senior Geologist
DT Consulting Services, Inc.

1.0 INTRODUCTION AND BACKGROUND

The Subject Property is located at 65 Albany Avenue in the City of Kingston, Ulster County, New York (heretofore referenced as the Site or Subject Property). Refer to Figures 1 & 2 for a Site Location and Surrounding Land Use maps, respectively. The Site is not currently listed in the Registry of Inactive Hazardous Waste Disposal Sites in New York State (the Registry). Prior investigation activities have been conducted on the Site and the results of those investigations were submitted to the Department. Based upon these results, the Department has designated the Site as Site Number 356060 with a Classification of "P" pursuant to ECL 27-1305.

The Subject Property contains an irregular shaped lot which encompasses an area of approximately 1.90 acres. The Site is identified as Parcel ID 48.80-1-10.100 by the City of Kingston and is improved with a partial two-story slab-on-grade +/- 21,216-ft² structure. Records indicate that the commercial use of the Site dates back to the 1920s. Areas surrounding the building include asphalt paved parking surfaces, concrete walkways and landscape spaces. The current use of the Subject Property includes the rental of professional office spaces in two buildings designated as follows:

Designated Tenant Space	Occupant
<i>Building 1 – Ground Floor</i>	
Suite A	Allstate Insurance Company
Suite B	Spectrum Behavioral Health
Suite C	Mainly Pilates
Suite D/E	New York State Department of Building Standards and Codes
<i>Building 1 – Second Floor</i>	
Suite G	Landmark Development
<i>Building 2</i>	
51 Albany Avenue	New York Blood Center
53 Albany Avenue	Tri-County Care
55 Albany Avenue	Rose & Kieman, Inc.

The area surrounding the Subject Property is primarily characterized by commercial development. The following table lists the abutting properties:

Location	Occupant
North	Undeveloped land, NYS Interstate 587, and a residence (67 Albany Avenue)
South	Albany Avenue and residences

East	Commercial retail spaces, residential property, First Baptist Church
West	Commercial property: WMC Heath Alliance – Dialysis Center/Diabetes Center

Site topography is generally level and at grade with surrounding roadway, with a moderate slope to the north within the northern section of the parcel. There resides an unnamed pond, which borders the Subject Property to the north, while the Esopus Creek is located approximately 1,700 feet north of the Site. Electric and gas services is supplied by Central Hudson Gas & Electric, while potable water and sanitary services are supplied by The City of Kingston (Municipal). No groundwater supply wells were observed by representatives of this office during site inspections and no groundwater supply wells are known to be present or used on adjoining or nearby properties. Surface water runoff enters catch basins located throughout the property which appear to be dry well systems.

Several environmental assessments were conducted by various contractors on behalf of historical and current property owners of the Site in 2020. As a result of a Phase I Environmental Site Assessment (ESA) performed by Team Environmental Consultants (TEAM) of Monroe, New York, the following areas of potential environmental concern and/or "recognized environmental conditions (REC)" were identified and are associated with the subject property:

1. The historic operation of a dry cleaner and the on-Site use of dry-cleaning solvents represent a REC. City directory records list Pride Cleaners at 51 Albany Avenue from 1964 - 1986. Other historical documentation reflects that a commercial dry cleaning establishment existed in the western most tenant space of the current building in 1957.

Two Site characterization field studies have also been performed on the Subject Property to investigate the REC identified during the Phase I ESA. These include the following:

1. Site Investigation, January 31, 2020.
Northeastern Environmental Technologies Corp. (NETC)

The NETC subsurface investigation included collection of soil, groundwater, ambient air and sub-slab soil gas samples. Pertinent findings documented in the NETC's field study include the following:

- Low concentrations of cVOCs were detected in each of the soil samples collected during the Limited Phase II ESA. The relative concentrations indicated higher detections of the parent dry cleaning chemical tetrachloroethylene (PCE) were present at the rear services entrance of the tenant space historically occupied by Pride Cleaners. Of note, PCE was detected in one soil sample at a concentration of 5.1 micrograms per kilogram ($\mu\text{g}/\text{kg}$) above the New York State Department of Environmental Conservation (NYSDEC) Unrestricted Use Soil Cleanup Objective (SCO) of 1.3 $\mu\text{g}/\text{kg}$. However, the concentration of PCE in soil did not exceed the

Commercial SCO of 150 µg/kg. Additional cVOCs detected in subsurface soil did not surpass Unrestricted Use or Commercial Use SCOs;

- Dissolved phase chlorinated volatile organic compounds (cVOCs) cVOCs were also reported by the laboratory in each groundwater sample provided. Of note, concentrations of PCE detected (15 – 110 ug/L) were found to exceed the NYSDEC groundwater quality standard of 5 ug/L as denoted in Technical and Operational Guidance Series (TOGS) 1.1.1; and
- Reportable values of PCE were documented in a sub-slab soil gas samples ranging in concentrations from 148 – 7,460 micrograms per cubic meter ($\mu\text{g}/\text{m}^3$) throughout the study area. These detections are above the New York State Department of Environmental Health (NYSDOH) mitigation threshold when compared to Matrix B, as appropriate. Lower concentrations of cVOCs were detected in soil gas samples collected on-Site, however when compared to NYSDOH Matrices, none required further action based upon the comparison contaminant concentration and reported indoor air quality.

2. Subsurface Site Characterization Report, September 9, 2020.

DT Consulting Services, Inc. (DTCS)

The DTCS Site Characterization Report included collection of soil, groundwater, ambient air and sub-slab soil gas samples. Pertinent findings documented in the DTCS's field study include the following:

- To provide additional data on current subsurface soil conditions, a total of four soil borings were advanced at the Subject Property. Upon review of analytical testing, DTCS concluded that most all soil boring locations were returned with either non-detectable concentrations of VOCs or with reported values which met unrestricted use SCOs;
- A total of four groundwater samples were obtained to characterize groundwater quality. Analysis of Site wells revealed minimal exceedances for PCE when compared to regulatory standards in two of the four wells sampled. The two remaining wells were either returned with non-detect or with low level dissolved phase cVOC concentrations which met or were below groundwater quality standards as referenced in TOGS 1.1.1.; and
- The results of soil vapor sampling indicate concentrations of cVOCs are present in each of the five soil gas and the two air samples collected from the Site. Concentrations of cVOCs including, but not limited to Trichloroethylene (TCE), 1,1-Dichloroethene (1-1 DCE), Carbon Tetrachloride and PCE were

reported in sub-slab soil gas samples collected on-Site. When compared with indoor air concentrations, the sub-slab PCE soil gas concentrations warrant “Mitigation” based on evaluation of the applicable NYSDOH Final Guidance on Soil Vapor Intrusion matrices.

This report summarizes the additional Site characterization field study and the SSDS pilot testing procedures conducted at the Site between April 1 and April 3, 2022. The purpose of the RI and IRM at the Site is to confirm groundwater quality within existing on-Site monitoring wells, confirm that there are no potential off-Site soil vapor impacts, and to collect sufficient data to design the appropriate SSDS to mitigate any vapor intrusion beneath the footprint of the Site structure.

2.0 ADDITIONAL SITE CHARACTERIZATION

2.1 SOIL BORINGS

In an effort to determine potential for offsite contamination, a total of five soil borings were advanced along the property boundary to the north and east of the building. See **Figure 3** for the soil boring locations.

On April 1, 2022, DTCS oversaw advancement of the investigative borings on the Site. The on-Site geologist/engineer screened the soil samples for environmental impacts and collected samples for laboratory analysis. All field work associated with the soil sampling program complied with the safety guidelines outlined in the Community Air Monitoring Program or (CAMP). The investigative borings were advanced to a depth of 30-feet below ground surface (bgs) using direct push Geoprobe drill rigs advancing four or five foot macro core sample tooling systems. Soil was collected continuously to the boring termination depth using disposable acetate sleeves. Each sample was screened for organic vapors with a photo-ionization detector (PID) and evaluated for visual and olfactory indications of environmental impacts. Soil descriptions and PID readings were recorded in boring logs included as **Appendix A**.

One shallow soil sample and one deep soil sample from the groundwater interface were collected from each soil boring. Table 2.1 below summarizes the soil sample designation and collection depths.

Table 2.1

Soil Sample Designation	Soil Sample Depth (Feet bgs)
SB-1A	1-3
SB-1B	23-27
SB-2A	1-3
SB-2B	23-27
SB-3A	1-3
SB-3B	23-27
SB-4A	1-3
SB-4B	23-27
SB-5A	1-3
SB-5B ¹	23-27

¹ Duplicate sample collected for SB-5B

Elevated PID headspace readings were not detected above background in soil screened from each of the five soil borings. Similarly, olfactory and visual evidence of contamination was not documented. Refer to soil boring logs in **Appendix A** for additional details.

Particulate and VOC monitoring was conducted continuously during ground intrusive work associated with the installation of each soil boring as per the NYSDEC/NYSDOH approved CAMP. No exceedances of the thresholds for VOCs and/or particulate set forth in the CAMP were observed. Field data sheets associated with the CAMP are included in **Appendix B**.

Each sample was collected for laboratory analysis of VOCs, Semi-volatile organic compounds (SVOCs), Target Analyte List (TAL) Metals, Pesticides, Polychlorinated Biphenyl's or PCBs, and

Per- And Polyfluoroalkyl Substances or PFAs, Cyanide, and 1, 4-Dioxane via USEPA test methods 8260, 8270, 3050B/7473, 8081, 8082, and 537.1 respectively. Field quality control measures including duplicate, trip and field blanks were also collected and submitted to the laboratory for analysis.

2.1.1 Soil Sampling Results

A total of eleven soil samples were collected from the five soil boring locations (including one duplicate sample). The soil sample results are summarized in **Table 1** and are compared with NYSDEC 6 NYCRR Part 375-8.8(a) Unrestricted Use and NYCRR Part 375-8.8(b) Commercial Use SCOs. Soil samples collected during a subsurface investigation conducted in August 2020 are also presented in **Table 1**. The complete laboratory analytical reports are included in **Appendix C**.

VOCs

Methylene chloride was detected in each soil sample (August 2020 and April 2022) at concentrations ranging from 0.0140 to 0.0990 mg/kg. Five of the detected concentrations (April 2022 samples only) exceed the Unrestricted Use SCO (0.050 mg/kg). The detected concentrations were well below the Commercial Use SCO (500 mg/kg). Acetone was detected in a soil sample collected in August 2020 above the Unrestricted Use SCO (0.05 mg/kg) but well below the Commercial Use SCO (500 mg/kg). Acetone is known common laboratory cross contaminant. Low levels of PCE were detected in both soil samples collected from SB-5 at concentrations ranging from 0.007 to 0.0081 mg/kg. Both detected concentrations are well below the Unrestricted Use Soil Cleanup Objective (SCO) of 1.3 mg/kg. Both detections were flagged by the laboratory with the following qualification, "*this LCS analyte is outside Laboratory Recovery limits due the analyte behavior using the referenced method. The reference method has certain limitations with respect to analytes of this nature.*" PCE was not detected in the remaining soil samples collected from the Site. Ethanol was detected in a soil sample below the Unrestricted Use SCO.

SVOCs

Low levels of SVOCs. including benzo(a)anthracene, benzo(a)pyrene, benzo(b)fluoranthene, benzo(g,h,i)perylene, benzo(k)fluoranthene, bis(2-ethylhexyl)phthalate, chrysene, fluoranthene, indeno(1,2,3-cd)pyrene, phenanthrene and pyrene, were detected in several shallow soil samples collected from the Site. The detected concentrations were below the Unrestricted and Commercial Use SCOs. SVOCs were not detected in the deep soil samples collected from the Site.

Pesticides

Low levels of pesticides including alpha-Chlordane, dieldrin, gamma-chlordane and heptachlor were detected in one shallow soil sample (SB-2A). The concentrations of alpha-chlordane and dieldrin (0.260 and 0.0140 mg/kg, respectively) exceed the Unrestricted Use SCOs (0.094 and 0.005 mg/kg, respectively). The remaining concentrations were below the Unrestricted Use SCOs. It should be noted that each detection was flagged by the laboratory with the following qualification, "*result is from an analysis that required a dilution.*" Pesticides were not detected in the remaining shallow and deep soil samples collected from the Site.

Metals

Lead was detected in three of the five shallow soil samples at concentrations ranging from 84.7 to 104 mg/kg, above the Unrestricted Use SCO (63 mg/kg) but well below the Commercial Use SCO (1,000 mg/kg). Additional metals detected in shallow and deep soil were below both Unrestricted and Commercial Use SCOs.

PCBs

PCBs were not detected in any of the soil samples collected from the Site.

PFAs

Perfluorooctanesulfonic acid (PFOS) was detected in three soil samples (two shallow and one deep) above the NYSDEC October 2020 Part 375 Unrestricted Use guidance value (0.88 µg/kg). The detected concentrations were well below the NYSDEC October 2020 Part 375 Commercial Use guidance value (440 µg/kg). No additional PFAS were detected in soil samples collected from the Site.

2.2 GROUNDWATER SAMPLING

Groundwater samples were collected from four existing Site monitoring wells (MW-1 through MW-4) installed in September 2020 during a prior subsurface investigation (See **Figure 3**) Prior to sampling, water level measurements were recorded to the nearest 0.01 foot prior sampling and a minimum of 3 well volumes were purged from each. Note, a minimum of 3 well volumes could not be purged from MW-1 based on slow recharge of water in this location. Table 2.2 includes groundwater sampling/ gauging data and observations:

Table 2.2

Well ID	Depth to Water (TOC ¹)	Total Depth (TOC ¹)	Purge Volume (gal)	Tubing Sample Depth (Feet bgs)	Odor (Y/N)	Sheen (Y/N)
MW-1	24.60	29.32	0.5 ²	28	N	N
MW-2 ³	24.71	30.39	1.5	28	N	N
MW-3	22.00	29.42	1.5	27	N	N
MW-4	24.90	29.40	1	27	N	N

TOC¹ – Depth to water and total depths measure to top of PVC casing.

² – Slow recharge at MW-1

³ Duplicate sample collected for MW-2

Groundwater samples were collected from the existing monitoring wells. The sampling was conducted in accordance with field sampling procedures outlined in Section 6.4 of the February 11, 2022, *Site Characterization Work Plan/ IRM Work Plan (Revised)*. Each sample was, analyzed for VOCs, SVOCs, TAL Metals, Pesticides, PCBs, PFAs, Cyanide, and 1, 4-Dioxane via USEPA test methods 8260, 8270, 3050B/7473, 8081, 8082, and 537.1 respectively. Field quality control measures including trip and field blanks, along with a duplicate sample from MW-2, were collected and submitted to the chemical laboratory for analysis

2.2.1 Groundwater Sampling Results

The groundwater sample results are summarized in **Table 2** and compared with the NYSDEC Division of Water Technical and Operational Guidance Series 1.1.1, Ambient Water Quality Standards and Guidance Values (AWQS). Groundwater samples collected during a sampling event conducted in August 2020 are also presented in **Table 2**. The complete laboratory analytical reports are included in **Appendix C**.

VOCs

PCE was detected in the groundwater samples collected from MW-3 and MW-4 at concentrations of 1.77 and 7.56 microgram per liter ($\mu\text{g}/\text{L}$), respectively. PCE was detected in these wells during a sampling event conducted in August 2020 at concentrations of 5.4 and 13 $\mu\text{g}/\text{L}$, respectively. The concentration detected during the April 2022 sampling event in MW-4 exceeds the AWQS (5 $\mu\text{g}/\text{L}$). The detected concentration of PCE in MW-2 and MW-4 are lower than the concentrations in August 2020 (5.4 and 13 $\mu\text{g}/\text{L}$). Similarly, PCE was detected in MW-1 at a concentration of 2.4 $\mu\text{g}/\text{L}$ during the August 2020 sampling event. PCE was non-detect in MW-1 during the April 2022 Site characterization event. PCE was not detected in MW-2 during either sampling event. Low concentrations of chloroform detected in MW-4 during both sampling events are below the AWQS. No additional VOCs were detected in the on-Site wells sampled.

SVOCs

One low level SVOC [bis(2-ethylhexyl)phthalate] was detected in each of the four wells at concentrations ranging from 0.830 $\mu\text{g}/\text{L}$ to 1.18 $\mu\text{g}/\text{L}$. All detections were flagged by the laboratory with the following qualifier, “*Analyte is found in the associated analysis batch blank.*” The concentrations detected are below the AWQS (5 $\mu\text{g}/\text{L}$). No additional SVOCs were detected in the on-Site wells sampled.

Pesticides

Pesticides were not detected in the groundwater samples collected from the Site.

Metals

Low concentrations of TAL metals were detected in each of the Site wells. Sodium was detected in excess of the AWQS (20,000 $\mu\text{g}/\text{L}$) at concentrations ranging from 147,000 to 1,810,000 $\mu\text{g}/\text{L}$ in each of the wells. Antimony was detected in excess of the AWQS (3 $\mu\text{g}/\text{L}$) in two wells ranging from 10.6 to 39 $\mu\text{g}/\text{L}$. None of these compounds were detected in soil samples above the Unrestricted Use SCO, suggesting these impacts are likely to be due to local groundwater quality.

PCBs

PCBs were not detected in the groundwater samples collected from the Site.

PFAs

Perfluorooctanesulfonic acid (PFOS) and perfluorooctanoic acid (PFOA) were detected in each of the Site wells. The concentrations of PFOS in MW-3 and MW-4 (16.8 to 75.1 ng/L) exceed the NYDEC Part 375 PFAS Remedial Program Water, October 2020 Guidance Value (10 nanograms per liter (ng/L)). The concentration of PFOA in MW-4 (20.1 ng/L) exceeds the NYDEC Part 375 PFAS Remedial Program Water, October 2020 Guidance Value (10 ng/L). Additional PFAS detected in groundwater were below applicable guidance values.

2.3 EXTERIOR SOIL GAS POINT INSTALLATION

A total of three temporary exterior soil gas sampling points, designated ESG-1, ESG-2 and ESG-3, were installed along the property boundaries to the northeast, northwest and west of the Site structure (see **Figure 3**). The soil gas points were installed by advancing 1.25-inch solid stem direct push sample rods to a depth of 5-feet bgs. A dedicated soil vapor implant was installed at the base of the borehole and connected to the surface with dedicated high density polyethylene tubing. The annulus around the vapor implant will be filled with No. 2 filter sand to approximately 2 to 3-feet bgs. The remaining annulus was sealed with hydrated bentonite to the surface. Following installation, a MiniRae photoionization detector (which registers airflow below 0.2 liters per minute) was attached to the high-density polyethylene tubing and a minimum of three sample volumes was purged from each point. The maximum VOC readings recorded for each soil gas point during purging are presented in Table 2.3 below:

Table 2.3

Soil Gas Point	PID Reading in PPM (max)
ESG-1	0.1
ESG-2	0.5
ESG-3	0.1

The soil gas samples were collected for analysis in batch clean SUMMA canisters equipped with a laboratory calibrated flow control device to facilitate the collection of the samples for a 2-hour sample duration. As a quality assurance/quality control measure, an inert tracer gas (helium) test was completed before and after sampling to document that the soil vapor sampling points were properly sealed preventing subsurface infiltration of ambient air into the sample chain.

Following sampling, the pressure of the SUMMA canister was recorded, and each soil gas point was removed from the ground, plugged with bentonite chips, and sealed at the surface with asphalt. The soil vapor samples were analyzed for VOCs (USEPA Method TO-15) by a NYSDOH-approved laboratory.

2.3.1 Exterior Soil Gas Sampling Results

PCE was detected in each of the three samples at concentrations ranging from 29 to 490 µg/m³. The highest PCE concentration was detected at ESG-3, located along the western portion of the property and in proximity to MW-4, where peak PCE groundwater concentrations have been detected. TCE (2.0 µg/m³) and cis-1,2-DCE (0.25 µg/m³) were detected in ESG-3. Cis-1,2-DCE and TCE were detected in the remaining samples. Vinyl chloride was not detected in the samples collected.

Additional low-level exterior soil vapor contamination, typical of well-developed urban settings, has been identified at the Site; detected concentrations, however, are not likely to be indicative of grossly-contaminated on-Site soil or groundwater, or be a source of significant offsite migration.

2.4 SUB-SLAB SOIL GAS AND AIR SAMPLING

A total of five permanent interior sub-slab soil gas monitoring points (SG-1 through SG-5) were installed at the Site in December 2019 (see **Figure 3**). Each of these locations were re-sampled during this April 2022 Site characterization. Co-located indoor air samples were also collected from locations proximal to each soil gas point. One outdoor ambient air sample was collected from an upwind location to quantify potential background VOC concentrations.

Prior to sampling, a minimum of three sample volumes was purged from each point using a PID. The maximum VOC readings recorded for each soil gas point during purging are presented in Table 2.3 below:

Table 2.4

Soil Gas Point	PID Reading in PPM (max)
SG-1	0.0
SG-2	0.7
SG-3	0.3
SG-4	0.0
SG-5	0.0

The soil gas and air samples were collected for analysis in batch clean SUMMA canisters equipped with a laboratory calibrated flow control device to facilitate the collection of the samples for a 2-hour sample duration. As a quality assurance/quality control measure, an inert tracer gas (helium) test was completed before and after sampling to document that the soil vapor sampling points were properly sealed preventing subsurface infiltration of ambient air into the sample chain.

The soil vapor and indoor/ outdoor air samples were analyzed for VOCs (USEPA Method TO-15) by a NYSDOH-approved laboratory.

2.4.1 Sub-slab Soil Gas and Air Sampling Results

The sub-slab soil gas sample results (August 2020 and April 2022) are summarized in **Table 4**. The indoor and outdoor air sample results (August 2020 and April 2022) are summarized in **Table 5**. The complete laboratory analytical reports are included in **Appendix C**.

The sub-slab soil gas samples were analyzed for VOCs (USEPA Method TO-15). PCE was detected in each of the samples at concentrations ranging from 200 to 5,600 µg/m³. The highest concentration of PCE was detected at SG-2, located along the eastern/ central portion of the Site structure. Methylene chloride was detected in several locations at concentrations ranging from non-detect to 190 µg/m³. Lower level TCE (Non-detect to 1.4 µg/m³) and carbon tetrachloride (Non-detect to 0.69 µg/m³) were reported in several sub-slab soil gas sample points. Cis-1,2-DCE, 1,1,1-TCA and vinyl chloride were not detected in sub-slab soil gas. Generally, the cVOC concentrations detected during the April 2022 sampling event were lower than the concentrations detected in August 2020.

Additional low-level sub-slab soil gas contamination, typical of well-developed urban settings, has been identified at the Site. Although reported, said laboratory reported parameters are not likely

to be indicative of grossly-contaminated on-Site subsurface medium, or be a source of significant offsite migration.

PCE was detected in indoor air at concentrations ranging from 8.4 to 180 $\mu\text{g}/\text{m}^3$. The highest PCE concentration was detected at SG-4, where PCE was detected in sub-slab soil gas at 2,500 $\mu\text{g}/\text{m}^3$. Methylene chloride was detected in indoor air at concentrations ranging from non-detect to 490 $\mu\text{g}/\text{m}^3$. The peak methylene chloride concentration (490 $\mu\text{g}/\text{m}^3$) was detected in the sample co-located with SG-1, where methylene chloride was detected in sub-slab soil gas at a concentration of 11 $\mu\text{g}/\text{m}^3$. The elevated indoor air concentration as compared to the soil gas suggests a possible indoor air source of methylene chloride within the tenanted space. Low-level TCE, carbon tetrachloride and vinyl chloride were detected in several indoor air samples.

A comparison of the sub-slab soil gas and indoor air data (April 2022) with the New York State Department of Health May 2017 Decision Matrices is provided in **Table 6**. The DOH Matrices include select cVOC compounds, including 1,1-DCE, cis-1,2-DCE, carbon tetrachloride, TCE (Matrix A), PCE, 1,1,1-TCA, methylene chloride (Matrix B) and vinyl chloride (Matrix C). A comparison of the data indicates mitigation of the building is warranted based on elevated PCE and methylene chloride in soil gas and indoor air. Identification of potential indoor air sources is recommended for the concentration of methylene chloride in the location of SG-1.

2.5 CAMP FIELD DATA

CAMP field data sheets are included in **Appendix B**. PM10 and PID readings were recorded approximately every 15-minutes during SC IRM field activities in accordance with the CAMP.

PID readings greater than background levels were not recorded during the field activities. PID readings did not exceed the Action Level specified within the CAMP (5 ppm).

PM10 readings significantly above background levels were not recorded during the field activities. PM10 readings did not exceed the Action Level specified within the CAMP (100 $\mu\text{g}/\text{m}^3$).

3.0 SSDS PILOT TEST FIELD ACTIVITIES

The purpose of the pilot test was to evaluate the effectiveness of a SSDS as a potential mitigation measure for cVOCs in soil vapor identified beneath the building. Field activities were conducted on April 2 and 3, 2022. **Tables 7, 8 and 9** include the tabulated data collected during the pilot test. **Figure 3** depicts the locations of the extraction wells and soil gas/vacuum monitoring points utilized during the pilot test program. **Figure 4** shows the estimated radius of influence generated during each of the 9 tests conducted at the Site. A description of the SSDS extraction well installation, vacuum monitoring point installation and other pilot/diagnostic test work is presented in the following sections.

3.1 EXTRACTION WELL AND VACUUM MONITORING POINT INSTALLATION

A total of five extraction wells were placed throughout the various floor tenant spaces. The wells were installed by wet core drilling a 4 and 5/8-inch diameter core through the existing concrete slab. In two locations, existing slab cores from a previous pilot test were utilized for pilot testing. The slab thickness varied in each location ranging from 5 to 6 -inches. Soils were removed from each extraction well to the extent feasible and the cavity was backfilled with 1 to 1.5-inch diameter gravel. Table 3.1 below summarizes the extraction well designations, slab thickness, sub-grade material description, approximate soil volume removed and the corresponding tenant spaces:

Table 3.1

Extraction Well Designation	Slab Thickness (inches)	Soil/ Sub-grade Description	Approximate Volume of Soil Removed (Gallons)	Location
EW-1	5	Gravel, underlain by fine sand and silt	5	Entrance @ southeast building corner off of Albany Avenue
EW-2	6	Gravel, underlain by fine sand and silt	5	Rose & Kiernan, southwest corner of building
EW-3	6	Gravel, underlain by fine sand and silt	5	NY Blood Center, northwest corner of building
EW-4	5-6	N/A ¹	N/A ¹	Rear hallway, Northeast corner of building
EW-5	5-6	N/A ¹	N/A ¹	Central hallway, central portion of building

N/A¹ – Cavity created by prior consultant

The SSDS extraction wells were constructed with a 4-inch PVC coupler sealed in the cored hole and connected to either 3or 4-inch schedule 40 PVC riser pipe. The space between the cored slab and PVC coupler was sealed with RadonAway® Pro Hybrid sealant. Note that all investigative/well installation derived waste was properly containerized in DOT-approved 55-gallon steel drums for characterization and off-Site disposal.

A total of five permanent Vapor Pin® sub-slab soil gas/vacuum monitoring points (SG-1 to SG-5) were previously installed at the Site during investigative work conducted in August 2020. Five additional permanent Vapor Pin® sub-slab soil gas/vacuum monitoring points (SG-6 through SG-10) were installed during the pilot test to assist in vacuum field extension analysis. Two temporary stickup Vapor Pin® sub-slab soil gas/ vacuum monitoring points (herein TSG-1 and TSG-2) were discovered during pilot testing and utilized as vacuum monitoring points. All extraction well and vacuum monitoring point locations are depicted in **Figure 3**. New vacuum monitoring points were installed by drilling a 5/8-inch hole inside of a 1.5-inch hole (~2-inches deep). The 5/8-inch hole was drilled completely through the slab. Each point was recessed below the top of the slab and covered with a threaded 1.5-inch stainless steel flush-mount protective cover.

All extraction wells and vacuum monitoring point locations were selected in consultation with building ownership.

3.2 PILOT/ DIAGNOSTIC TESTING

Pilot/diagnostic testing was conducted on April 3, 2022. A total of nine tests were conducted by extracting vapor from each of the five extraction wells. The two types of SSDS blowers/fans used during testing include:

- Obar® GBR89HA high flow fan
- RadonAway® HS5000 high vacuum fan

The fans were tested at various locations based on the discretion of the field staff conducting the test and the real time interpretation of the data. Generally, in locations where tight/densely packed soils requiring high vacuum for pressure field extension were encountered, use of the RadonAway® HS5000 was favored for data collection. Conversely, in locations where lower density/higher porosity material requiring high air flow for pressure field extension were encountered, use of the Obar® GBR89HA was favored for data collection.

During each test, vacuum monitoring points SG-1 through SG-10 and TSG-1 and TSG-2 were utilized as observation points. Extracted sub-slab vapors were routed through a 30-gallon granular activated carbon (GAC) drum for VOC removal. The treated discharge was subsequently channeled (via temporary piping) to the exterior of the building; a minimum 10-feet away from building intakes/openings and neighboring structures.

3.2.1 Equipment and Monitoring

During the pilot tests, a number of parameters were monitored and recorded to evaluate performance-related measurements. Velocity, recorded in feet per minute (FPM) and temperature documented in Degrees Fahrenheit were measured using a Dwyer® Air Velocity Meter. The velocity was converted to a flow rate in cubic feet per minute (CFM) using the inner diameter of a 3 or 4-inch schedule 40 PVC pipe, as appropriate¹. The velocity/flow readings were collected

¹ The Obar® GBR 89HA utilizes a 4-inch air intake
The RadonAway® HS5000 utilizes a 3-inch air intake

from an appropriately sized sample port, centered on the PVC pipe; a minimum of 2-feet from any bend/elbow or intake. Extracted vapor vacuum readings were collected in inches of water (in-H₂O) using a Dwyer Magnehelic® differential pressure gage and converted to inches of mercury (in-Hg). Sub-slab vacuum readings were also collected in in-H₂O using an Infiltec® DM1 micromanometer.

In summary, the following performance indicators shown in Table 3.2.1 were monitored during the pilot test:

Table 3.2.1

Monitored Parameter	Unit of Measure	Monitoring Location
Velocity/ Flow rate	Feet per minute (fpm) [converted to cubic feet per minute (cfm)]	Extraction Wells
Temperature	Degrees Fahrenheit (°F)	Extraction Wells
Vacuum	Inches of Water (in-H ₂ O) [converted to inches of mercury (in-Hg)]	Extraction Wells & Vacuum Monitoring Points
Total VOCs	Parts Per Million (ppm)	Extraction Wells (pre and post carbon)

3.3 ANALYTICAL TESTING

Analytical testing was performed to establish projected effluent concentrations and mass removal. One effluent sample was collected from each of the extraction wells. The grab samples were collected in batch cleaned 6-liter laboratory supplied summa canisters. The samples were collected at the end of each approximate 30-minute diagnostic test prior to effluent polishing with the GAC drum. The extracted vapor samples were submitted to York Analytical Laboratories, Inc. for VOC analysis using EPA Method TO-15. A copy of the technical reports have been placed in **Appendix C** for your reference.

3.4 CAMP FIELD DATA

CAMP field data sheets are included in **Appendix B**. PM10 and PID readings were recorded approximately every 15-minutes during SC IRM field activities in accordance with the CAMP.

PID readings greater than background levels were not recorded during the field activities. PID readings did not exceed the Action Level specified within the CAMP (5 ppm).

PM10 readings significantly above background levels were not recorded during the field activities. PM10 readings did not exceed the Action Level specified within the CAMP (100 µg/m³).

During Pilot Testing, extraction wells not being tested were sealed with an airtight expansion plug. It should be noted that tenants were not present in any of the spaces during implementation of the field activities.

4.0 PILOT/ DIAGNOSTIC TEST RESULTS

The findings of the pilot/diagnostic testing are presented in the following sub-sections. A vacuum was applied to each of five extraction wells during each diagnostic test. The wells not being tested were capped to minimize vacuum loss. A sampling/monitoring port installed in the temporary extraction piping before the carbon drum and fan allowed for collection of the system flow, vacuum, temperature and PID readings during each test. Each test was run for approximately 30-minutes, with system data collected approximately every 10-minutes.

Post-carbon treatment effluent readings were collected from the end of the exhaust pipe, outside of the building. These diagnostic results are summarized in **Table 7**.

4.1 EXTRACTION WELL AIR FLOW

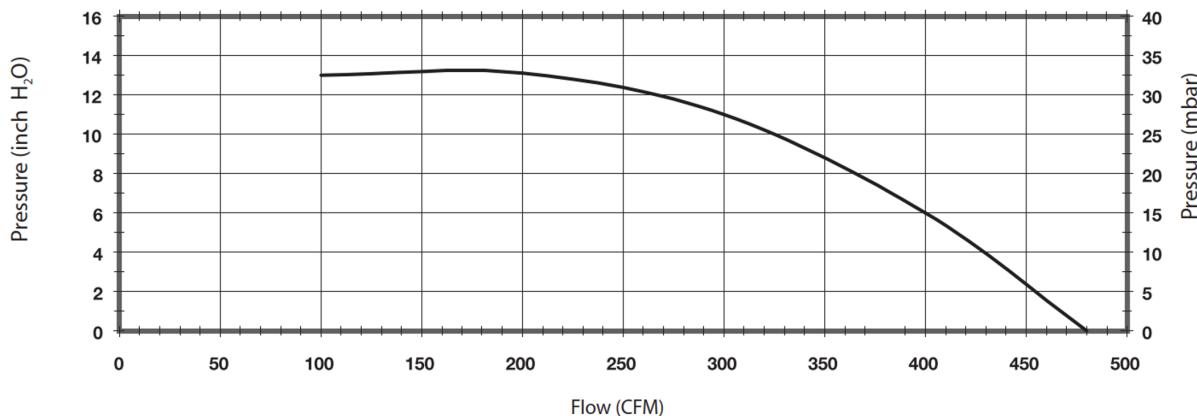

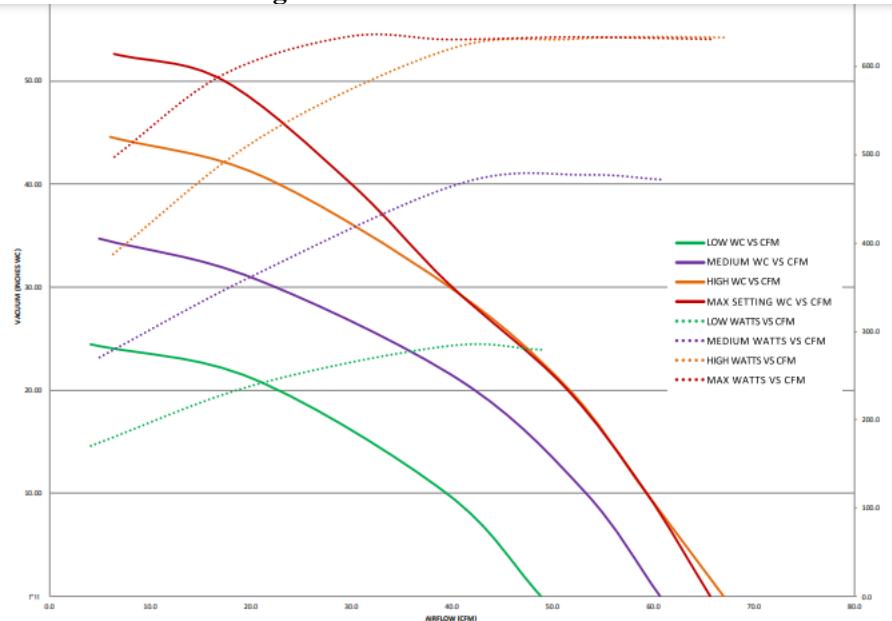

The system removed soil vapor at average flow rates ranging from 23.3 to 90.4 CFM. Low air flow rates were observed in EW-1, EW-2, EW-3 and EW-4 ranging from 23.3 to 43 CFM. The low air flow rates are attributable to more densely packed soils observed in these locations, and other possible subsurface obstructions not observed. Dense/low permeability soils limit the amount of air flow to the extraction well, thus decreasing the radius of influence that can be established. Such soils require blowers capable of high vacuum at low air flow rates for pressure field extension.

High air flow was observed in EW-5 in the central portion of the building. The presence of subsurface utilities known to be location in the central portion of the building are likely a contributing factor to the high air flow observed during pilot testing.

The RadonAway® HS5000 fan can only be run at one constant output, whereas the Obar® GBR89HA fan has a potentiometer allowing for control of the fan output. The various outputs tested are included in **Table 7**. The final installed system will include optimization of air flow rates to balance the measured vacuum response created by the system.

4.2 EXTRACTION WELL VACUUM

Average vacuum readings ranging from 10.3 to 36.3 in-H₂O were recording during the tests. The vacuum readings correspond with the measured air flow rates with the highest vacuum observed in the wells with the lowest measured flow (EW-1, EW-2, EW-3 and EW-4). The lowest vacuum was observed in EW-5, where the highest air flow measurements were generally recorded. The measured vacuum and air flow readings generally correlate with the fan curves depicted below.

Figure 4.2.1 – GBR89HA Fan Curve (120V)**Figure 4.2.2 - HS5000 Fan Curve**

4.3 EXTRACTION WELL TEMPERATURE

Average temperature readings ranged from 53.9 to 76.2 degrees Fahrenheit. The lowest temperature was recorded at EW-1 in the vacant hallway where no indoor air heating source is present. The temperature readings were incorporated into the mass removal calculations included in **Table 9**.

4.4 PRE-CARBON TREATMENT PID READINGS

PID readings were collected both pre- and post-carbon treatment during each test using a PID calibrated with an isobutylene standard gas. Low-level average VOC readings ranging from 0.1 to 2.7 ppm were recorded in effluent prior to carbon treatment. The highest concentrations were detected in EW-3 which is located in the location of the former dry cleaner tenant space. The highest PCE concentration was detected in the laboratory sample collected from EW-3 (See Section 4.7).

4.5 POST-CARBON TREATMENT PID READINGS

Post-carbon treatment average VOC readings were all recorded as 0.0 ppm. The post-treatment PID readings indicate the carbon was effective in removing the contaminants from the extracted vapor prior to the recovered air stream being discharged to exterior ambient air.

4.6 SUB-SLAB VACUUM RESPONSE

Vacuum response data for the vacuum monitoring points is summarized on **Table 8**. The vacuum response for each extraction well is depicted on **Figure 4** - Pilot Test Radius of Influence Map. The readings were used to calculate an average vacuum created at each point during testing. Updated U.S. EPA guidance for vapor intrusion assessment and mitigation was released on June 15, 2015. The U.S. EPA has not issued a definite value for SSDS design; however, achieving a pressure differential of -0.004 in-H₂O across the slab is generally considered sufficient to mitigate vapor intrusion based on available industry guidance.

During each test, certain vacuum monitoring points were selected based on their proximity to the anticipated radius of influence for each extraction well. Testing was not conducted at vacuum monitoring points located far from the extraction well and/or where vacuum points proximal to the test well did not yield measurable vacuum.

Average vacuum readings greater -0.004 in-H₂O were recorded in eight of the twelve vacuum monitoring points. The measured average vacuum in these locations ranged from -0.005 to -0.127 in-H₂O. It should be noted the SG-5 could not be tested during one of Test #'s 3 & 4 because the tenant space was not accessible (locked).

4.7 EXTRACTION WELL LABORATORY TESTING RESULTS

One effluent sample was collected before carbon treatment from each of the extraction wells. Elevated concentrations of PCE were detected in each of the effluent samples ranging from 1,000 to 71,000 µg/m³. The highest concentration was detected in EW-3 installed in the approximate location of the former dry cleaner tenant space. The next highest concentration of PCE was an order of magnitude lower (4,300 µg/m³) at EW-5. Relatively elevated methylene chloride was detected in EW-1 (270 µg/m³) and EW-5 (42 µg/m³). Low level TCE was detected in four of the five effluent samples.

Other low-level VOCs not included in the NYSDOH VI Matrices were detected in the extracted vapor samples.

The complete analytical reports including the chain of custody are included in **Appendix C**.

4.8 MASS REMOVAL

Table 9 presents the data and calculations used to determine the approximate mass of cVOCs removed from the vapor phase during each test. The mass removed from soil vapor was calculated using the laboratory analytical data, average vacuum, flow and temperature readings collected during pilot testing procedures. The mass removed during the analytical test was calculated using the following equation:

Volume of extracted gas was corrected for pressure and temperature using the following equation:

$$V=nRT/p$$

Where: V = volume of the gas

P = pressure of the gas

n = 1 lb-mole

R = ideal gas constant = 0.7302

T = absolute temperature ($^{\circ}\text{F} + 460$)

The corrected volume of gas was used to calculate the mass removal using the following equation:

$$\text{Mass Removed} = [(1 / \text{Volume of gas corrected}) \times (\text{time elapsed}) \times (\text{Flow}) \times (\text{Concentration } c\text{VOC}) \times (\text{molecular weight } c\text{VOC})] / 1 \times 10^6$$

Empirically:

$$\text{lbs} = [(1 / V (\text{ft}^3 / \text{lb-mole})) \times (\text{minutes}) \times (\text{ft}^3 / \text{minute}) \times (c\text{VOC}_{\text{ppm}}) \times (165.83^{\text{PCE}} \text{ g/mole})] / 1 \times 10^6$$

where:

lbs = pounds

ppm = parts per million

time elapsed = minutes

molecular weight PCE = 165.83 g/mole

molecular weight TCE = 131.39 g/mole

molecular weight methylene chloride = 84.93 g/mole

The primary contaminant being removed is PCE, with some lower levels of TCE and methylene chloride. Other low-level VOCs detected are considered insignificant in the mass removal calculations and are not included in the calculation set.

The results of the mass removal calculations using the laboratory analytical data indicated a total of approximately 4.99×10^{-3} pounds of total mass (PCE, TCE and methylene chloride) were cumulatively removed during the pilot testing. The projected average removal rate for PCE, TCE and methylene chloride was calculated as 4.79×10^{-2} pounds per day if influent concentrations were to remain consistent with reported concentrations as measured during pilot testing.

4.9 AERSCREEN EVALUATION

The sub-slab samples collected during pilot testing from each extraction well were analyzed for VOCs to evaluate the toxicity and impacts on the receptors downwind using a dispersion model (AERSCREEN). AERSCREEN is a screening model based on the U.S. EPA AERMOD air quality dispersion model to predict ambient air concentrations attributed to a single source. The input parameters including total VOC concentrations, effluent loading rates, stack height, flow rates, temperature, velocity and the distance to the receptor (Estimated at 10 feet) were compared to the NYSDEC DAR Air Guidance (DAR-1) Guidelines for the Control of Toxic Ambient Air Contaminants, AERSCREEN computer program (**Table 10**). The average flow for each extraction

well during pilot testing was used in the AERSCREEN model. The generated concentrations were compared with Short-term Guideline Concentrations (SGCs) and Average-Annual Guidance Criteria (AGCs). A scenario was run for combined effluent assuming use of each of the five pilot test extraction wells. The model's predicted results for PCE, TCE and methylene chloride, did not exceed the concentration values for contaminants of concern listed within the SGC and AGC values. The pilot testing laboratory analytical data utilized in the AERSCREEN Model is included in **Appendix C**. The raw data inputs for the AERSCREEN model are included in **Appendix D**.

Accordingly, the results of pilot testing and the AERSCREEN model indicate that the levels to be discharged from the Site are acceptable for direct discharge to the atmosphere without vapor control during the full-scale SSD system operation. It should be noted that the pilot testing data used for the model are considered conservative as they were collected only 30 minutes after each pump test occurred. Effluent concentrations typically decrease significantly after the first month of operation in the absence of a significant groundwater plume or soil source areas. Effluent concentrations are expected to decrease with time based on the following factors:

- Cessation of on-Site dry-cleaning operations;
- The absence of a significant soil or groundwater source of cVOCs;

If additional testing indicates exceedance of ACGs/ SCGs, emissions controls will be considered for the Site.

5.0 SITE CHARACTERIZATION AND SSDS PILOT TEST FINDINGS

The objective of the Site Characterization was to provide documentation of soil and soil gas quality along the perimeter of the Site, to document local groundwater quality conditions via sampling of existing groundwater wells and to perform pilot testing for a SSDS proposed to mitigate vapor intrusion in the Site building.

5.1 SOIL

Low level VOCs, SVOCs, metals, pesticides and PFAS were detected in several soil samples collected from soil borings advanced along the property boundaries. The concentrations detected were all below Commercial Use SCOs. Source areas of elevated cVOCs in soil were not identified at the Site. PCBs were not detected in Site soils.

5.2 GROUNDWATER

A slightly elevated PCE concentration was detected in MW-3 (7.56 µg/L) above the AWQS of 5 µg/L. The concentration decreased from the detected concentration in August 2020 (13 µg/L). Similarly, the concentration of PCE in MW-3 decreased from 5.4 µg/L in August 2020 to 1.77 µg/L in April 2022. No other VOCs were detected above their respective AWQS value. Low level SVOC, metals and PFAS detected in groundwater were below their respective AWQS value. Pesticides and PCBs were not detected in groundwater samples collected from the Site.

5.3 EXTERIOR SOIL GAS

PCE was detected in each of the three exterior soil gas samples at concentrations ranging from 29 to 490 µg/m³. The highest PCE concentration of PCE was detected at ESG-3, located along the western portion of the property and in proximity to MW-4 where peak PCE groundwater concentrations have been detected. TCE (2.0 µg/m³) and cis-1,2-DCE (0.25 µg/m³) were also detected in ESG-3. Cis-1,2-DCE and TCE were detected in the remaining samples. Vinyl chloride was not detected in the samples collected

Additional low-level exterior soil vapor contamination, typical of well-developed urban settings, has been identified at the Site; detected concentrations, however, are not likely to be indicative of grossly-contaminated on-Site soil or groundwater, or be a source of significant offsite migration.

5.4 INTERIOR SUB-SLAB SOIL GAS AND INDOOR AIR

Elevated PCE and methylene chloride were detected in sub-slab soil gas samples collected throughout the building. These cVOCs were also found at elevated concentrations in co-located indoor air samples. A comparison of the sub-slab soil gas and indoor air data with the NYSDOH VI Matrices indicates mitigation of the building is warranted based on elevated PCE and methylene chloride in soil gas and indoor air.

5.5 SSDS PILOT TESTING

SSDS pilot testing indicates the majority of building is underlain by low permeability soils which require high vacuum, low air flow blowers to extend the radius of influence from each extraction well. Average vacuum readings greater -0.004 in-H₂O were recorded in eight of the twelve vacuum monitoring points. The measured average vacuum in these locations ranged from -0.005 to -0.127 in-H₂O. At least two new extraction wells, in addition to the five existing extractions, will be required to mitigate vapor intrusion beneath the space.

Elevated concentrations of PCE were detected in each of the effluent samples ranging from 1,000 to 71,000 µg/m³. The highest concentration was detected in EW-3 installed in the approximate location of the former dry cleaner tenant space. The concentrations of PCE, TCE and predicted results for PCE, TCE and methylene chloride, did not exceed the concentration values for contaminants of concern listed within the SGC and AGC values. Accordingly, effluent concentrations that will be generated by the SSDS should not require treatment prior to atmospheric discharge.

6.0 RECOMMENDATIONS

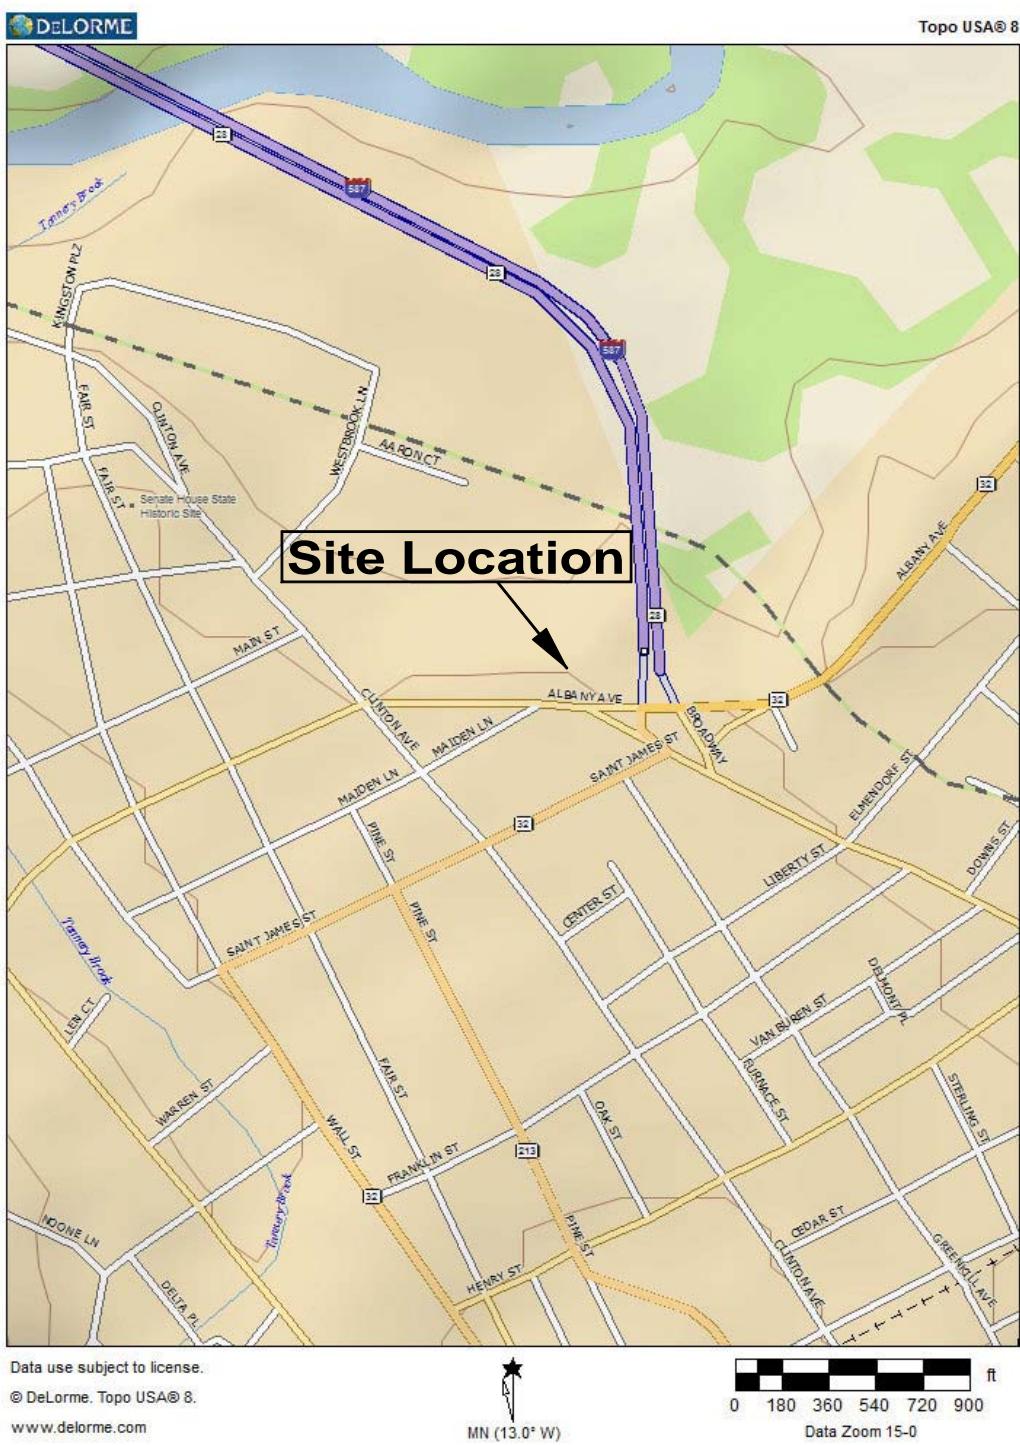

Off-Site Soil Gas & Indoor Air

Based on the elevated PCE detected in ESG-3, additional sampling along the western property boundary should be conducted. A Work Plan will be prepared and submitted to NYSDEC and DOH detailing the proposed property boundary sampling plan.

SSDS Design & Installation

As of the date of this report, a thorough evaluation of the SSDS design is currently underway. Considerations for system design include the number and sizing of blowers/fans, evaluation of the need for new extraction wells, evaluation of system effluent treatment, local permitting, and ongoing discussions with the NYSDEC and NYSDOH. A formal SSDS Design Document will be prepared for approval by the NYSDEC and NYSDOH prior to system installation.

Concentration Detected

Concentration Above AWQS

ITALICS indicate laboratory detection limit above AWQS

Q is the Qualifier Column with definitions as follows:

D=result is from an analysis that required a dilution

J=analyte detected at or above the MDL (method detection limit) but below the RL (Reporting Limit) - data is estimated

U=analyte not detected at or above the level indicated

B=analyte found in the analysis batch blank

ANALYTE DETECTED

Q is the Qualifier Column with definitions as follows:

D=result is from an analysis that required a dilution

U=analyte not detected at or above the level indicated

SSSV= Sub-slab soil vapor

ANALYTE DETECTED

Q is the Qualifier Column with definitions as follows:

D=result is from an analysis that required a dilution

U=analyte not detected at or above the level indicated

E=result is estimated and cannot be accurately reported due to levels encountered or interferences

Notes:

in-Hg = inches of mercury

in-H₂O = Inches of water

CFM = cubic feet per minute

ppm = parts per million

¹Test #10 - A 3rd round of data could not be collected as the tenant required the field staff to leave the space as a meeting was taking place at 9:00 am

²Test #11 - Conducted to determine if vacuum was present at SG-14. No additional data was collected as Test #4 included all testing parameters for EW-6.

Notes:

in-H₂O = Inches of water

Vacuum monitoring point measurements taken with Infiltec DMI Micro Manometer with a detection limit of 0.001
 NT - Not tested. Only selected points were tested during each pilot test based on anticipated ROI and the building layout.

NT¹ - Cannot test SG-5 during Test #3 & 4 because space is locked.

 Average vacuum greater than target value of -0.004 in-H₂O

 Average vacuum less than target value of -0.004 in-H₂O but greater than 0.000 in-H₂O

Mass Removal Rate (lbs/day)																			4.79E-02

Notes:

Where: $V = \text{volume of the gas}$; $P = \text{pressure of the gas}$; $n = 1 \text{ lb-mole}$; $R = \text{Ideal Gas Constant (0.7302)}$; $T = \text{Absolute Temperature (}^{\circ}\text{F+460)}$

Mass Removed = $[(1 / \text{Volume of gas}) \times (\text{time elapsed}) \times (\text{Flow}) \times (\text{Concentration CVOC}) \times (\text{molecular weight CVOC})] / 1 \times 10^6$

Molecular weights (g/mole): PCE 165.83, TCE 131.39, Methylene Chloride 84.93

CFM = cubic foot per minute

ppmv = parts per million by volume

lbs = pounds

1-in-Hg = 0.033421 atm

TABLE 10
AERSCREEN Model Input and Output Data
65 Albany Avenue, Kingston, NY
Site # 356060

Compound	Projected System Flow (CFM)	Average Temp. (°F)	Pilot Test Mass Removed (lbs/Hr)	Maximum 1-Hour Concentration (AERSCREEN Model Output)				Exceeds ACG/SCG ?
				ACG	SCG	ACG/SCG		
PCE	320	65.6	9.93E-03	0.832	3.8	300	No	
TCE	320	65.6	3.42E-06	0.00286	0.21	20	No	
Methylene Chloride	320	65.6	5.52E-05	0.0463	46	1400	No	

Notes

Projected flow rates based on pilot testing data.

Temperature readings are an average of pilot testing extracted vapor temperatures

Mass removed is based on laboratory analytical data.

Each pilot test was run for an approximate 30 minute duration. Table 10 includes the projected mass removal during each 30 minute pilot test. Those values were multiplied by 2 for AERSCREEN modeling in lbs/hour.

Purpose and Results

This report contains the analytical data for the sample(s) identified on the attached chain-of-custody received in our laboratory on April 04, 2022 and listed below. The project was identified as your project: **356060 65 Albany Avenue Kingston, New York**.

The analyses were conducted utilizing appropriate EPA, Standard Methods, and ASTM methods as detailed in the data summary tables.

All samples were received in proper condition meeting the customary acceptance requirements for environmental samples except those indicated under the Sample and Analysis Qualifiers section of this report.

All analyses met the method and laboratory standard operating procedure requirements except as indicated by any data flags, the meaning of which are explained in the Sample and Data Qualifiers Relating to This Work Order section of this report and case narrative if applicable.

The results of the analyses, which are all reported on dry weight basis (soils) unless otherwise noted, are detailed in the following pages.

Please contact Client Services at 203.325.1371 with any questions regarding this report.

General Notes for York Project (SDG) No.: 22D0075

1. The RLs and MDLs (Reporting Limit and Method Detection Limit respectively) reported are adjusted for any dilution necessary due to the levels of target and/or non-target analytes and matrix interference. The RL(REPORTING LIMIT) is based upon the lowest standard utilized for the calibration where applicable.
2. Samples are retained for a period of thirty days after submittal of report, unless other arrangements are made.
3. York's liability for the above data is limited to the dollar value paid to York for the referenced project.
4. This report shall not be reproduced without the written approval of York Analytical Laboratories, Inc.
5. All analyses conducted met method or Laboratory SOP requirements. See the Sample and Data Qualifiers Section for further information.
6. It is noted that no analyses reported herein were subcontracted to another laboratory, unless noted in the report.
7. This report reflects results that relate only to the samples submitted on the attached chain-of-custody form(s) received by York.
8. Analyses conducted at York Analytical Laboratories, Inc. Stratford, CT are indicated by NY Cert. No. 10854; those conducted at York Analytical Laboratories, Inc., Richmond Hill, NY are indicated by NY Cert. No. 12058.

Approved By: 

Date: 04/12/2022

Cassie L. Mosher
Laboratory Manager

Sample and Data Qualifiers Relating to This Work Order

S-GC	Two surrogates are used for this analysis. One surrogate recovered within control limits therefore the analysis is acceptable.
S-D	The surrogates were spiked at twice the normal concentration and recovery is within limits.
S-08	The recovery of this surrogate was outside of QC limits.
QR-03	The RPD value for the sample duplicate or MS/MSD was outside of QC acceptance limits due to matrix interference. QC batch accepted based on LCS and/or LCSD recovery and/or RPD values.
QM-07	The spike recovery was outside acceptance limits for the MS and/or MSD. The batch was accepted based on acceptable LCS recovery.
QM-05	The spike recovery was outside acceptance limits for the MS and/or MSD due to matrix interference. The LCS and/or LCSD were within acceptance limits showing that the laboratory is in control and the data are acceptable.
QM-01	The spike recovery for this QC sample is outside of established control limits due to sample matrix interference.
QL-02	This LCS analyte is outside Laboratory Recovery limits due the analyte behavior using the referenced method. The reference method has certain limitations with respect to analytes of this nature.
QC-LCS	LCS/LCS Dup recovery was above laboratory control limits. Sample does not contain any target compounds; therefore sample results are acceptable.
PFSu-H	The isotopically labeled surrogate recovered above lab control limits due to a matrix effect. Isotope Dilution was applied.
M-SPKM	The spike recovery is not within acceptance windows due to sample non-homogeneity, or matrix interference.
M-DUPS	The RPD between the native sample and the duplicate is outside of limits due to sample non-homogeneity
J	Detected below the Reporting Limit but greater than or equal to the Method Detection Limit (MDL/LOD) or in the case of a TIC, the result is an estimated concentration.
CCV-E	The value reported is ESTIMATED. The value is estimated due to its behavior during continuing calibration verification (>20% Difference for average Rf or >20% Drift for quadratic fit).

Definitions and Other Explanations

*	Analyte is not certified or the state of the samples origination does not offer certification for the Analyte.
ND	NOT DETECTED - the analyte is not detected at the Reported to level (LOQ/RL or LOD/MDL)
RL	REPORTING LIMIT - the minimum reportable value based upon the lowest point in the analyte calibration curve.
LOQ	LIMIT OF QUANTITATION - the minimum concentration of a target analyte that can be reported within a specified degree of confidence . This is the lowest point in an analyte calibration curve that has been subjected to all steps of the processing/analysis and verified to meet defined criteria. This is based upon NELAC 2009 Standards and applies to all analyses.
LOD	LIMIT OF DETECTION - a verified estimate of the minimum concentration of a substance in a given matrix that an analytical process can reliably detect. This is based upon NELAC 2009 Standards and applies to all analyses conducted under the auspices of EPA SW-846.
MDL	METHOD DETECTION LIMIT - a statistically derived estimate of the minimum amount of a substance an analytical system can reliably detect with a 99% confidence that the concentration of the substance is greater than zero. This is based upon 40 CFR Part 136 Appendix B and applies only to EPA 600 and 200 series methods.
Reported to	This indicates that the data for a particular analysis is reported to either the LOD/MDL, or the LOQ/RL. In cases where the "Reported to" is located above the LOD/MDL, any value between this and the LOQ represents an estimated value which is "J" flagged accordingly. This applies to volatile and semi-volatile target compounds only.
NR	Not reported
RPD	Relative Percent Difference
Wet	The data has been reported on an as-received (wet weight) basis

Low Bias	Low Bias flag indicates that the recovery of the flagged analyte is below the laboratory or regulatory lower control limit. The data user should take note that this analyte may be biased low but should evaluate multiple lines of evidence including the LCS and site-specific MS/MSD data to draw bias conclusions. In cases where no site-specific MS/MSD was requested, only the LCS data can be used to evaluate such bias.
High Bias	High Bias flag indicates that the recovery of the flagged analyte is above the laboratory or regulatory upper control limit. The data user should take note that this analyte may be biased high but should evaluate multiple lines of evidence including the LCS and site-specific MS/MSD data to draw bias conclusions. In cases where no site-specific MS/MSD was requested, only the LCS data can be used to evaluate such bias.
Non-Dir.	Non-dir. flag (Non-Directional Bias) indicates that the Relative Percent Difference (RPD) (a measure of precision) among the MS and MSD data is outside the laboratory or regulatory control limit. This alerts the data user where the MS and MSD are from site-specific samples that the RPD is high due to either non-homogeneous distribution of target analyte between the MS/MSD or indicates poor reproducibility for other reasons.

If EPA SW-846 method 8270 is included herein it is noted that the target compound N-nitrosodiphenylamine (NDPA) decomposes in the gas chromatographic inlet and cannot be separated from diphenylamine (DPA). These results could actually represent 100% DPA, 100% NDPA or some combination of the two. For this reason, York reports the combined result for n-nitrosodiphenylamine and diphenylamine for either of these compounds as a combined concentration as Diphenylamine.

If Total PCBs are detected and the target aroclors reported are "Not detected", the Total PCB value is reported due to the presence of either or both Aroclors 1262 and 1268 which are non-target aroclors for some regulatory lists.

2-chloroethylvinyl ether readily breaks down under acidic conditions. Samples that are acid preserved, including standards will exhibit breakdown. The data user should take note.

Certification for pH is no longer offered by NYDOH ELAP.

Semi-Volatile and Volatile analyses are reported down to the LOD/MDL, with values between the LOD/MDL and the LOQ being "J" flagged as estimated results.

For analyses by EPA SW-846-8270D, the Limit of Quantitation (LOQ) reported for benzidine is based upon the lowest standard used for calibration and is not a verified LOQ due to this compound's propensity for oxidative losses during extraction/concentration procedures and non-reproducible chromatographic performance.

Purpose and Results

This report contains the analytical data for the sample(s) identified on the attached chain-of-custody received in our laboratory on April 04, 2022 and listed below. The project was identified as your project: **356060 65 Albany Avenue Kingston, New York**.

The analyses were conducted utilizing appropriate EPA, Standard Methods, and ASTM methods as detailed in the data summary tables.

All samples were received in proper condition meeting the customary acceptance requirements for environmental samples except those indicated under the Sample and Analysis Qualifiers section of this report.

All analyses met the method and laboratory standard operating procedure requirements except as indicated by any data flags, the meaning of which are explained in the Sample and Data Qualifiers Relating to This Work Order section of this report and case narrative if applicable.

The results of the analyses, which are all reported on dry weight basis (soils) unless otherwise noted, are detailed in the following pages.

Please contact Client Services at 203.325.1371 with any questions regarding this report.

General Notes for York Project (SDG) No.: 22D0074

1. The RLs and MDLs (Reporting Limit and Method Detection Limit respectively) reported are adjusted for any dilution necessary due to the levels of target and/or non-target analytes and matrix interference. The RL(REPORTING LIMIT) is based upon the lowest standard utilized for the calibration where applicable.
2. Samples are retained for a period of thirty days after submittal of report, unless other arrangements are made.
3. York's liability for the above data is limited to the dollar value paid to York for the referenced project.
4. This report shall not be reproduced without the written approval of York Analytical Laboratories, Inc.
5. All analyses conducted met method or Laboratory SOP requirements. See the Sample and Data Qualifiers Section for further information.
6. It is noted that no analyses reported herein were subcontracted to another laboratory, unless noted in the report.
7. This report reflects results that relate only to the samples submitted on the attached chain-of-custody form(s) received by York.
8. Analyses conducted at York Analytical Laboratories, Inc. Stratford, CT are indicated by NY Cert. No. 10854; those conducted at York Analytical Laboratories, Inc., Richmond Hill, NY are indicated by NY Cert. No. 12058.

Sample and Data Qualifiers Relating to This Work Order

S-GC	Two surrogates are used for this analysis. One surrogate recovered within control limits therefore the analysis is acceptable.
QR-02	The RPD result exceeded the QC control limits; however, both percent recoveries were acceptable. Sample results for the QC batch were accepted based on percent recoveries and completeness of QC data.
QM-07	The spike recovery was outside acceptance limits for the MS and/or MSD. The batch was accepted based on acceptable LCS recovery.
QL-02	This LCS analyte is outside Laboratory Recovery limits due the analyte behavior using the referenced method. The reference method has certain limitations with respect to analytes of this nature.
PFSu-L	The isotopically labeled surrogate recovered below lab control limits due to a matrix effect. Isotope Dilution was applied.
M-SPKM	The spike recovery is not within acceptance windows due to sample non-homogeneity, or matrix interference.
M-DUPS	The RPD between the native sample and the duplicate is outside of limits due to sample non-homogeneity
M-BS	The recovery for this element in the batch blank spike recovered slightly outside of control limits
M-BLK	The target analyte was detected above the RL in the batch method blank. All samples showed >10x the concentration in the blank for this analyte. Data are reported.
J	Detected below the Reporting Limit but greater than or equal to the Method Detection Limit (MDL/LOD) or in the case of a TIC, the result is an estimated concentration.
B	Analyte is found in the associated analysis batch blank. For volatiles, methylene chloride and acetone are common lab contaminants.

Definitions and Other Explanations

*	Analyte is not certified or the state of the samples origination does not offer certification for the Analyte.
ND	NOT DETECTED - the analyte is not detected at the Reported to level (LOQ/RL or LOD/MDL)
RL	REPORTING LIMIT - the minimum reportable value based upon the lowest point in the analyte calibration curve.
LOQ	LIMIT OF QUANTITATION - the minimum concentration of a target analyte that can be reported within a specified degree of confidence . This is the lowest point in an analyte calibration curve that has been subjected to all steps of the processing/analysis and verified to meet defined criteria. This is based upon NELAC 2009 Standards and applies to all analyses.
LOD	LIMIT OF DETECTION - a verified estimate of the minimum concentration of a substance in a given matrix that an analytical process can reliably detect. This is based upon NELAC 2009 Standards and applies to all analyses conducted under the auspices of EPA SW-846.
MDL	METHOD DETECTION LIMIT - a statistically derived estimate of the minimum amount of a substance an analytical system can reliably detect with a 99% confidence that the concentration of the substance is greater than zero. This is based upon 40 CFR Part 136 Appendix B and applies only to EPA 600 and 200 series methods.
Reported to	This indicates that the data for a particular analysis is reported to either the LOD/MDL, or the LOQ/RL. In cases where the "Reported to" is located above the LOD/MDL, any value between this and the LOQ represents an estimated value which is "J" flagged accordingly. This applies to volatile and semi-volatile target compounds only.
NR	Not reported
RPD	Relative Percent Difference
Wet	The data has been reported on an as-received (wet weight) basis
Low Bias	Low Bias flag indicates that the recovery of the flagged analyte is below the laboratory or regulatory lower control limit. The data user should take note that this analyte may be biased low but should evaluate multiple lines of evidence including the LCS and site-specific MS/MSD data to draw bias conclusions. In cases where no site-specific MS/MSD was requested, only the LCS data can be used to evaluate such bias.
High Bias	High Bias flag indicates that the recovery of the flagged analyte is above the laboratory or regulatory upper control limit. The data user should take note that this analyte may be biased high but should evaluate multiple lines of evidence including the LCS and site-specific MS/MSD data to draw bias conclusions. In cases where no site-specific MS/MSD was requested, only the LCS data can be used to evaluate such bias.

Non-Dir. Non-dir. flag (Non-Directional Bias) indicates that the Relative Percent Difference (RPD) (a measure of precision) among the MS and MSD data is outside the laboratory or regulatory control limit. This alerts the data user where the MS and MSD are from site-specific samples that the RPD is high due to either non-homogeneous distribution of target analyte between the MS/MSD or indicates poor reproducibility for other reasons.

If EPA SW-846 method 8270 is included herein it is noted that the target compound N-nitrosodiphenylamine (NDPA) decomposes in the gas chromatographic inlet and cannot be separated from diphenylamine (DPA). These results could actually represent 100% DPA, 100% NDPA or some combination of the two. For this reason, York reports the combined result for n-nitrosodiphenylamine and diphenylamine for either of these compounds as a combined concentration as Diphenylamine.

If Total PCBs are detected and the target aroclors reported are "Not detected", the Total PCB value is reported due to the presence of either or both Aroclors 1262 and 1268 which are non-target aroclors for some regulatory lists.

2-chloroethylvinyl ether readily breaks down under acidic conditions. Samples that are acid preserved, including standards will exhibit breakdown. The data user should take note.

Certification for pH is no longer offered by NYDOH ELAP.

Semi-Volatile and Volatile analyses are reported down to the LOD/MDL, with values between the LOD/MDL and the LOQ being "J" flagged as estimated results.

For analyses by EPA SW-846-8270D, the Limit of Quantitation (LOQ) reported for benzidine is based upon the lowest standard used for calibration and is not a verified LOQ due to this compound's propensity for oxidative losses during extraction/concentration procedures and non-reproducible chromatographic performance.

Purpose and Results

This report contains the analytical data for the sample(s) identified on the attached chain-of-custody received in our laboratory on April 04, 2022 and listed below. The project was identified as your project: **356060 65 Albany Avenue Kingston, New York**.

The analyses were conducted utilizing appropriate EPA, Standard Methods, and ASTM methods as detailed in the data summary tables.

All samples were received in proper condition meeting the customary acceptance requirements for environmental samples except those indicated under the Sample and Analysis Qualifiers section of this report.

All analyses met the method and laboratory standard operating procedure requirements except as indicated by any data flags, the meaning of which are explained in the Sample and Data Qualifiers Relating to This Work Order section of this report and case narrative if applicable.

The results of the analyses, which are all reported on dry weight basis (soils) unless otherwise noted, are detailed in the following pages.

Please contact Client Services at 203.325.1371 with any questions regarding this report.

General Notes for York Project (SDG) No.: 22D0084

1. The RLs and MDLs (Reporting Limit and Method Detection Limit respectively) reported are adjusted for any dilution necessary due to the levels of target and/or non-target analytes and matrix interference. The RL(REPORTING LIMIT) is based upon the lowest standard utilized for the calibration where applicable.
2. Samples are retained for a period of thirty days after submittal of report, unless other arrangements are made.
3. York's liability for the above data is limited to the dollar value paid to York for the referenced project.
4. This report shall not be reproduced without the written approval of York Analytical Laboratories, Inc.
5. All analyses conducted met method or Laboratory SOP requirements. See the Sample and Data Qualifiers Section for further information.
6. It is noted that no analyses reported herein were subcontracted to another laboratory, unless noted in the report.
7. This report reflects results that relate only to the samples submitted on the attached chain-of-custody form(s) received by York.
8. Analyses conducted at York Analytical Laboratories, Inc. Stratford, CT are indicated by NY Cert. No. 10854; those conducted at York Analytical Laboratories, Inc., Richmond Hill, NY are indicated by NY Cert. No. 12058.

Sample and Data Qualifiers Relating to This Work Order

TO-CCV The value reported is ESTIMATED for this compound due to its behavior during continuing calibration verification (>30% Difference from initial calibration).

QR-01 Analyses are not controlled on RPD values from sample concentrations less than 10 times the reporting limit. QC batch accepted based on LCS and/or LCSD QC results.

Definitions and Other Explanations

* Analyte is not certified or the state of the samples origination does not offer certification for the Analyte.

ND NOT DETECTED - the analyte is not detected at the Reported to level (LOQ/RL or LOD/MDL)

RL REPORTING LIMIT - the minimum reportable value based upon the lowest point in the analyte calibration curve.

LOQ LIMIT OF QUANTITATION - the minimum concentration of a target analyte that can be reported within a specified degree of confidence . This is the lowest point in an analyte calibration curve that has been subjected to all steps of the processing/analysis and verified to meet defined criteria. This is based upon NELAC 2009 Standards and applies to all analyses.

LOD LIMIT OF DETECTION - a verified estimate of the minimum concentration of a substance in a given matrix that an analytical process can reliably detect. This is based upon NELAC 2009 Standards and applies to all analyses conducted under the auspices of EPA SW-846.

MDL METHOD DETECTION LIMIT - a statistically derived estimate of the minimum amount of a substance an analytical system can reliably detect with a 99% confidence that the concentration of the substance is greater than zero. This is based upon 40 CFR Part 136 Appendix B and applies only to EPA 600 and 200 series methods.

Reported to This indicates that the data for a particular analysis is reported to either the LOD/MDL, or the LOQ/RL. In cases where the "Reported to" is located above the LOD/MDL, any value between this and the LOQ represents an estimated value which is "J" flagged accordingly. This applies to volatile and semi-volatile target compounds only.

NR Not reported

RPD Relative Percent Difference

Wet The data has been reported on an as-received (wet weight) basis

Low Bias Low Bias flag indicates that the recovery of the flagged analyte is below the laboratory or regulatory lower control limit. The data user should take note that this analyte may be biased low but should evaluate multiple lines of evidence including the LCS and site-specific MS/MSD data to draw bias conclusions. In cases where no site-specific MS/MSD was requested, only the LCS data can be used to evaluate such bias.

High Bias High Bias flag indicates that the recovery of the flagged analyte is above the laboratory or regulatory upper control limit. The data user should take note that this analyte may be biased high but should evaluate multiple lines of evidence including the LCS and site-specific MS/MSD data to draw bias conclusions. In cases where no site-specific MS/MSD was requested, only the LCS data can be used to evaluate such bias.

Non-Dir. Non-dir. flag (Non-Directional Bias) indicates that the Relative Percent Difference (RPD) (a measure of precision) among the MS and MSD data is outside the laboratory or regulatory control limit. This alerts the data user where the MS and MSD are from site-specific samples that the RPD is high due to either non-homogeneous distribution of target analyte between the MS/MSD or indicates poor reproducibility for other reasons.

If EPA SW-846 method 8270 is included herein it is noted that the target compound N-nitrosodiphenylamine (NDPA) decomposes in the gas chromatographic inlet and cannot be separated from diphenylamine (DPA). These results could actually represent 100% DPA, 100% NDPA or some combination of the two. For this reason, York reports the combined result for n-nitrosodiphenylamine and diphenylamine for either of these compounds as a combined concentration as Diphenylamine.

If Total PCBs are detected and the target aroclors reported are "Not detected", the Total PCB value is reported due to the presence of either or both Aroclors 1262 and 1268 which are non-target aroclors for some regulatory lists.

2-chloroethylvinyl ether readily breaks down under acidic conditions. Samples that are acid preserved, including standards will exhibit breakdown. The data user should take note.

Certification for pH is no longer offered by NYDOH ELAP.

Semi-Volatile and Volatile analyses are reported down to the LOD/MDL, with values between the LOD/MDL and the LOQ being "J" flagged as estimated results.

For analyses by EPA SW-846-8270D, the Limit of Quantitation (LOQ) reported for benzidine is based upon the lowest standard used for calibration and is not a verified LOQ due to this compound's propensity for oxidative losses during extraction/concentration procedures and non-reproducible chromatographic performance.

Purpose and Results

This report contains the analytical data for the sample(s) identified on the attached chain-of-custody received in our laboratory on April 04, 2022 and listed below. The project was identified as your project: **356060 65 Albany Avenue Kingston, New York**.

The analyses were conducted utilizing appropriate EPA, Standard Methods, and ASTM methods as detailed in the data summary tables.

All samples were received in proper condition meeting the customary acceptance requirements for environmental samples except those indicated under the Sample and Analysis Qualifiers section of this report.

All analyses met the method and laboratory standard operating procedure requirements except as indicated by any data flags, the meaning of which are explained in the Sample and Data Qualifiers Relating to This Work Order section of this report and case narrative if applicable.

The results of the analyses, which are all reported on dry weight basis (soils) unless otherwise noted, are detailed in the following pages.

Please contact Client Services at 203.325.1371 with any questions regarding this report.

General Notes for York Project (SDG) No.: 22D0085

1. The RLs and MDLs (Reporting Limit and Method Detection Limit respectively) reported are adjusted for any dilution necessary due to the levels of target and/or non-target analytes and matrix interference. The RL(REPORTING LIMIT) is based upon the lowest standard utilized for the calibration where applicable.
2. Samples are retained for a period of thirty days after submittal of report, unless other arrangements are made.
3. York's liability for the above data is limited to the dollar value paid to York for the referenced project.
4. This report shall not be reproduced without the written approval of York Analytical Laboratories, Inc.
5. All analyses conducted met method or Laboratory SOP requirements. See the Sample and Data Qualifiers Section for further information.
6. It is noted that no analyses reported herein were subcontracted to another laboratory, unless noted in the report.
7. This report reflects results that relate only to the samples submitted on the attached chain-of-custody form(s) received by York.
8. Analyses conducted at York Analytical Laboratories, Inc. Stratford, CT are indicated by NY Cert. No. 10854; those conducted at York Analytical Laboratories, Inc., Richmond Hill, NY are indicated by NY Cert. No. 12058.

Sample and Data Qualifiers Relating to This Work Order

- TO-VAC The final vacuum in the canister was less than -2 inches Hg vacuum. The time integrated sampling may be affected and not reflect proper sampling over the time period. The data user should take note.
- TO-LCS-H The result reported for this compound may be biased high due to its behavior in the analysis batch LCS where it recovered greater than 130% of the expected value.
- TO-IPA The value for isopropanol is estimated. Dilutions are not conducted for this species as not to preclude actionable analytes by dilution.
- TO-CCV The value reported is ESTIMATED for this compound due to its behavior during continuing calibration verification (>30% Difference from initial calibration).
- IS-LO The internal std associated with this target compound did not meet acceptance criteria (area <50% CCV) at the stated dilution due to matrix effects. Sample was rerun to confirm matrix effects.
- E The concentration indicated for this analyte is an estimated value above the calibration range of the instrument. This value is considered an estimate.

Definitions and Other Explanations

- * Analyte is not certified or the state of the samples origination does not offer certification for the Analyte.
- ND NOT DETECTED - the analyte is not detected at the Reported to level (LOQ/RL or LOD/MDL)
- RL REPORTING LIMIT - the minimum reportable value based upon the lowest point in the analyte calibration curve.
- LOQ LIMIT OF QUANTITATION - the minimum concentration of a target analyte that can be reported within a specified degree of confidence . This is the lowest point in an analyte calibration curve that has been subjected to all steps of the processing/analysis and verified to meet defined criteria. This is based upon NELAC 2009 Standards and applies to all analyses.
- LOD LIMIT OF DETECTION - a verified estimate of the minimum concentration of a substance in a given matrix that an analytical process can reliably detect. This is based upon NELAC 2009 Standards and applies to all analyses conducted under the auspices of EPA SW-846.
- MDL METHOD DETECTION LIMIT - a statistically derived estimate of the minimum amount of a substance an analytical system can reliably detect with a 99% confidence that the concentration of the substance is greater than zero. This is based upon 40 CFR Part 136 Appendix B and applies only to EPA 600 and 200 series methods.
- Reported to This indicates that the data for a particular analysis is reported to either the LOD/MDL, or the LOQ/RL. In cases where the "Reported to" is located above the LOD/MDL, any value between this and the LOQ represents an estimated value which is "J" flagged accordingly. This applies to volatile and semi-volatile target compounds only.
- NR Not reported
- RPD Relative Percent Difference
- Wet The data has been reported on an as-received (wet weight) basis
- Low Bias Low Bias flag indicates that the recovery of the flagged analyte is below the laboratory or regulatory lower control limit. The data user should take note that this analyte may be biased low but should evaluate multiple lines of evidence including the LCS and site-specific MS/MSD data to draw bias conclusions. In cases where no site-specific MS/MSD was requested, only the LCS data can be used to evaluate such bias.
- High Bias High Bias flag indicates that the recovery of the flagged analyte is above the laboratory or regulatory upper control limit. The data user should take note that this analyte may be biased high but should evaluate multiple lines of evidence including the LCS and site-specific MS/MSD data to draw bias conclusions. In cases where no site-specific MS/MSD was requested, only the LCS data can be used to evaluate such bias.
- Non-Dir. Non-dir. flag (Non-Directional Bias) indicates that the Relative Percent Difference (RPD) (a measure of precision) among the MS and MSD data is outside the laboratory or regulatory control limit. This alerts the data user where the MS and MSD are from site-specific samples that the RPD is high due to either non-homogeneous distribution of target analyte between the MS/MSD or indicates poor reproducibility for other reasons.

If EPA SW-846 method 8270 is included herein it is noted that the target compound N-nitrosodiphenylamine (NDPA) decomposes in the gas chromatographic inlet and cannot be separated from diphenylamine (DPA). These results could actually represent 100% DPA, 100% NDPA or some combination of the two. For this reason, York reports the combined result for n-nitrosodiphenylamine and diphenylamine for either of these compounds as a combined concentration as Diphenylamine.

If Total PCBs are detected and the target aroclors reported are "Not detected", the Total PCB value is reported due to the presence of either or both Aroclors 1262 and 1268 which are non-target aroclors for some regulatory lists.

2-chloroethylvinyl ether readily breaks down under acidic conditions. Samples that are acid preserved, including standards will exhibit breakdown. The data user should take note.

Certification for pH is no longer offered by NYDOH ELAP.

Semi-Volatile and Volatile analyses are reported down to the LOD/MDL, with values between the LOD/MDL and the LOQ being "J" flagged as estimated results.

For analyses by EPA SW-846-8270D, the Limit of Quantitation (LOQ) reported for benzidine is based upon the lowest standard used for calibration and is not a verified LOQ due to this compound's propensity for oxidative losses during extraction/concentration procedures and non-reproducible chromatographic performance.

Purpose and Results

This report contains the analytical data for the sample(s) identified on the attached chain-of-custody received in our laboratory on April 04, 2022 and listed below. The project was identified as your project: **356060 65 Albany Avenue Kingston, New York**.

The analyses were conducted utilizing appropriate EPA, Standard Methods, and ASTM methods as detailed in the data summary tables.

All samples were received in proper condition meeting the customary acceptance requirements for environmental samples except those indicated under the Sample and Analysis Qualifiers section of this report.

All analyses met the method and laboratory standard operating procedure requirements except as indicated by any data flags, the meaning of which are explained in the Sample and Data Qualifiers Relating to This Work Order section of this report and case narrative if applicable.

The results of the analyses, which are all reported on dry weight basis (soils) unless otherwise noted, are detailed in the following pages.

Please contact Client Services at 203.325.1371 with any questions regarding this report.

General Notes for York Project (SDG) No.: 22D0083

1. The RLs and MDLs (Reporting Limit and Method Detection Limit respectively) reported are adjusted for any dilution necessary due to the levels of target and/or non-target analytes and matrix interference. The RL(REPORTING LIMIT) is based upon the lowest standard utilized for the calibration where applicable.
2. Samples are retained for a period of thirty days after submittal of report, unless other arrangements are made.
3. York's liability for the above data is limited to the dollar value paid to York for the referenced project.
4. This report shall not be reproduced without the written approval of York Analytical Laboratories, Inc.
5. All analyses conducted met method or Laboratory SOP requirements. See the Sample and Data Qualifiers Section for further information.
6. It is noted that no analyses reported herein were subcontracted to another laboratory, unless noted in the report.
7. This report reflects results that relate only to the samples submitted on the attached chain-of-custody form(s) received by York.
8. Analyses conducted at York Analytical Laboratories, Inc. Stratford, CT are indicated by NY Cert. No. 10854; those conducted at York Analytical Laboratories, Inc., Richmond Hill, NY are indicated by NY Cert. No. 12058.

Sample and Data Qualifiers Relating to This Work Order

- TO-CCV The value reported is ESTIMATED for this compound due to its behavior during continuing calibration verification (>30% Difference from initial calibration).
- QR-02 The RPD result exceeded the QC control limits; however, both percent recoveries were acceptable. Sample results for the QC batch were accepted based on percent recoveries and completeness of QC data.
- QR-01 Analyses are not controlled on RPD values from sample concentrations less than 10 times the reporting limit. QC batch accepted based on LCS and/or LCSD QC results.

Definitions and Other Explanations

*	Analyte is not certified or the state of the samples origination does not offer certification for the Analyte.
ND	NOT DETECTED - the analyte is not detected at the Reported to level (LOQ/RL or LOD/MDL)
RL	REPORTING LIMIT - the minimum reportable value based upon the lowest point in the analyte calibration curve.
LOQ	LIMIT OF QUANTITATION - the minimum concentration of a target analyte that can be reported within a specified degree of confidence . This is the lowest point in an analyte calibration curve that has been subjected to all steps of the processing/analysis and verified to meet defined criteria. This is based upon NELAC 2009 Standards and applies to all analyses.
LOD	LIMIT OF DETECTION - a verified estimate of the minimum concentration of a substance in a given matrix that an analytical process can reliably detect. This is based upon NELAC 2009 Standards and applies to all analyses conducted under the auspices of EPA SW-846.
MDL	METHOD DETECTION LIMIT - a statistically derived estimate of the minimum amount of a substance an analytical system can reliably detect with a 99% confidence that the concentration of the substance is greater than zero. This is based upon 40 CFR Part 136 Appendix B and applies only to EPA 600 and 200 series methods.
Reported to	This indicates that the data for a particular analysis is reported to either the LOD/MDL, or the LOQ/RL. In cases where the "Reported to" is located above the LOD/MDL, any value between this and the LOQ represents an estimated value which is "J" flagged accordingly. This applies to volatile and semi-volatile target compounds only.
NR	Not reported
RPD	Relative Percent Difference
Wet	The data has been reported on an as-received (wet weight) basis
Low Bias	Low Bias flag indicates that the recovery of the flagged analyte is below the laboratory or regulatory lower control limit. The data user should take note that this analyte may be biased low but should evaluate multiple lines of evidence including the LCS and site-specific MS/MSD data to draw bias conclusions. In cases where no site-specific MS/MSD was requested, only the LCS data can be used to evaluate such bias.
High Bias	High Bias flag indicates that the recovery of the flagged analyte is above the laboratory or regulatory upper control limit. The data user should take note that this analyte may be biased high but should evaluate multiple lines of evidence including the LCS and site-specific MS/MSD data to draw bias conclusions. In cases where no site-specific MS/MSD was requested, only the LCS data can be used to evaluate such bias.
Non-Dir.	Non-dir. flag (Non-Directional Bias) indicates that the Relative Percent Difference (RPD) (a measure of precision) among the MS and MSD data is outside the laboratory or regulatory control limit. This alerts the data user where the MS and MSD are from site-specific samples that the RPD is high due to either non-homogeneous distribution of target analyte between the MS/MSD or indicates poor reproducibility for other reasons.

If EPA SW-846 method 8270 is included herein it is noted that the target compound N-nitrosodiphenylamine (NDPA) decomposes in the gas chromatographic inlet and cannot be separated from diphenylamine (DPA). These results could actually represent 100% DPA, 100% NDPA or some combination of the two. For this reason, York reports the combined result for n-nitrosodiphenylamine and diphenylamine for either of these compounds as a combined concentration as Diphenylamine.

If Total PCBs are detected and the target aroclors reported are "Not detected", the Total PCB value is reported due to the presence of either or both Aroclors 1262 and 1268 which are non-target aroclors for some regulatory lists.

2-chloroethylvinyl ether readily breaks down under acidic conditions. Samples that are acid preserved, including standards will exhibit breakdown. The data user should take note.

Certification for pH is no longer offered by NYDOH ELAP.

Semi-Volatile and Volatile analyses are reported down to the LOD/MDL, with values between the LOD/MDL and the LOQ being "J" flagged as estimated results.

For analyses by EPA SW-846-8270D, the Limit of Quantitation (LOQ) reported for benzidine is based upon the lowest standard used for calibration and is not a verified LOQ due to this compound's propensity for oxidative losses during extraction/concentration procedures and non-reproducible chromatographic performance.

Revision Description: This report has been revised to correct sample results.

Attention: Deborah Thompson

Purpose and Results

This report contains the analytical data for the sample(s) identified on the attached chain-of-custody received in our laboratory on April 04, 2022 and listed below. The project was identified as your project: **356060 65 Albany Avenue Kingston, New York**.

The analyses were conducted utilizing appropriate EPA, Standard Methods, and ASTM methods as detailed in the data summary tables.

All samples were received in proper condition meeting the customary acceptance requirements for environmental samples except those indicated under the Sample and Analysis Qualifiers section of this report.

All analyses met the method and laboratory standard operating procedure requirements except as indicated by any data flags, the meaning of which are explained in the Sample and Data Qualifiers Relating to This Work Order section of this report and case narrative if applicable.

The results of the analyses, which are all reported on dry weight basis (soils) unless otherwise noted, are detailed in the following pages.

Please contact Client Services at 203.325.1371 with any questions regarding this report.

General Notes for York Project (SDG) No.: 22D0083

1. The RLs and MDLs (Reporting Limit and Method Detection Limit respectively) reported are adjusted for any dilution necessary due to the levels of target and/or non-target analytes and matrix interference. The RL(REPORTING LIMIT) is based upon the lowest standard utilized for the calibration where applicable.
2. Samples are retained for a period of thirty days after submittal of report, unless other arrangements are made.
3. York's liability for the above data is limited to the dollar value paid to York for the referenced project.
4. This report shall not be reproduced without the written approval of York Analytical Laboratories, Inc.
5. All analyses conducted met method or Laboratory SOP requirements. See the Sample and Data Qualifiers Section for further information.
6. It is noted that no analyses reported herein were subcontracted to another laboratory, unless noted in the report.
7. This report reflects results that relate only to the samples submitted on the attached chain-of-custody form(s) received by York.
8. Analyses conducted at York Analytical Laboratories, Inc. Stratford, CT are indicated by NY Cert. No. 10854; those conducted at York Analytical Laboratories, Inc., Richmond Hill, NY are indicated by NY Cert. No. 12058.

Sample and Data Qualifiers Relating to This Work Order

QR-02 The RPD result exceeded the QC control limits; however, both percent recoveries were acceptable. Sample results for the QC batch were accepted based on percent recoveries and completeness of QC data.

QR-01 Analyses are not controlled on RPD values from sample concentrations less than 10 times the reporting limit. QC batch accepted based on LCS and/or LCSD QC results.

Definitions and Other Explanations

* Analyte is not certified or the state of the samples origination does not offer certification for the Analyte.

ND NOT DETECTED - the analyte is not detected at the Reported to level (LOQ/RL or LOD/MDL)

RL REPORTING LIMIT - the minimum reportable value based upon the lowest point in the analyte calibration curve.

LOQ LIMIT OF QUANTITATION - the minimum concentration of a target analyte that can be reported within a specified degree of confidence . This is the lowest point in an analyte calibration curve that has been subjected to all steps of the processing/analysis and verified to meet defined criteria. This is based upon NELAC 2009 Standards and applies to all analyses.

LOD LIMIT OF DETECTION - a verified estimate of the minimum concentration of a substance in a given matrix that an analytical process can reliably detect. This is based upon NELAC 2009 Standards and applies to all analyses conducted under the auspices of EPA SW-846.

MDL METHOD DETECTION LIMIT - a statistically derived estimate of the minimum amount of a substance an analytical system can reliably detect with a 99% confidence that the concentration of the substance is greater than zero. This is based upon 40 CFR Part 136 Appendix B and applies only to EPA 600 and 200 series methods.

Reported to This indicates that the data for a particular analysis is reported to either the LOD/MDL, or the LOQ/RL. In cases where the "Reported to" is located above the LOD/MDL, any value between this and the LOQ represents an estimated value which is "J" flagged accordingly. This applies to volatile and semi-volatile target compounds only.

NR Not reported

RPD Relative Percent Difference

Wet The data has been reported on an as-received (wet weight) basis

Low Bias Low Bias flag indicates that the recovery of the flagged analyte is below the laboratory or regulatory lower control limit. The data user should take note that this analyte may be biased low but should evaluate multiple lines of evidence including the LCS and site-specific MS/MSD data to draw bias conclusions. In cases where no site-specific MS/MSD was requested, only the LCS data can be used to evaluate such bias.

High Bias High Bias flag indicates that the recovery of the flagged analyte is above the laboratory or regulatory upper control limit. The data user should take note that this analyte may be biased high but should evaluate multiple lines of evidence including the LCS and site-specific MS/MSD data to draw bias conclusions. In cases where no site-specific MS/MSD was requested, only the LCS data can be used to evaluate such bias.

Non-Dir. Non-dir. flag (Non-Directional Bias) indicates that the Relative Percent Difference (RPD) (a measure of precision) among the MS and MSD data is outside the laboratory or regulatory control limit. This alerts the data user where the MS and MSD are from site-specific samples that the RPD is high due to either non-homogeneous distribution of target analyte between the MS/MSD or indicates poor reproducibility for other reasons.

If EPA SW-846 method 8270 is included herein it is noted that the target compound N-nitrosodiphenylamine (NDPA) decomposes in the gas chromatographic inlet and cannot be separated from diphenylamine (DPA). These results could actually represent 100% DPA, 100% NDPA or some combination of the two. For this reason, York reports the combined result for n-nitrosodiphenylamine and diphenylamine for either of these compounds as a combined concentration as Diphenylamine.

If Total PCBs are detected and the target aroclors reported are "Not detected", the Total PCB value is reported due to the presence of either or both Aroclors 1262 and 1268 which are non-target aroclors for some regulatory lists.

2-chloroethylvinyl ether readily breaks down under acidic conditions. Samples that are acid preserved, including standards will exhibit breakdown. The data user should take note.

Certification for pH is no longer offered by NYDOH ELAP.

Semi-Volatile and Volatile analyses are reported down to the LOD/MDL, with values between the LOD/MDL and the LOQ being "J" flagged as estimated results.

For analyses by EPA SW-846-8270D, the Limit of Quantitation (LOQ) reported for benzidine is based upon the lowest standard used for calibration and is not a verified LOQ due to this compound's propensity for oxidative losses during extraction/concentration procedures and non-reproducible chromatographic performance.

Purpose and Results

This report contains the analytical data for the sample(s) identified on the attached chain-of-custody received in our laboratory on August 14, 2020 with a temperature of 3.0 C. The project was identified as your project: **65 Albany Avenue Kingston, New York.**

The analyses were conducted utilizing appropriate EPA, Standard Methods, and ASTM methods as detailed in the data summary tables.

All samples were received in proper condition meeting the customary acceptance requirements for environmental samples except those indicated under the Sample and Analysis Qualifiers section of this report.

All analyses met the method and laboratory standard operating procedure requirements except as indicated by any data flags, the meaning of which are explained in the Sample and Data Qualifiers Relating to This Work Order section of this report and case narrative if applicable.

The results of the analyses, which are all reported on dry weight basis (soils) unless otherwise noted, are detailed in the following pages.

Please contact Client Services at 203.325.1371 with any questions regarding this report.

General Notes for York Project (SDG) No.: 20H0558

1. The RLs and MDLs (Reporting Limit and Method Detection Limit respectively) reported are adjusted for any dilution necessary due to the levels of target and/or non-target analytes and matrix interference. The RL(REPORTING LIMIT) is based upon the lowest standard utilized for the calibration where applicable.
2. Samples are retained for a period of thirty days after submittal of report, unless other arrangements are made.
3. York's liability for the above data is limited to the dollar value paid to York for the referenced project.
4. This report shall not be reproduced without the written approval of York Analytical Laboratories, Inc.
5. All analyses conducted met method or Laboratory SOP requirements. See the Sample and Data Qualifiers Section for further information.
6. It is noted that no analyses reported herein were subcontracted to another laboratory, unless noted in the report.
7. This report reflects results that relate only to the samples submitted on the attached chain-of-custody form(s) received by York.
8. Analyses conducted at York Analytical Laboratories, Inc. Stratford, CT are indicated by NY Cert. No. 10854; those conducted at York Analytical Laboratories, Inc., Richmond Hill, NY are indicated by NY Cert. No. 12058.

Sample and Data Qualifiers Relating to This Work Order

- QR-04 The RPD exceeded control limits for the LCS/LCSD QC.
- QL-02 This LCS analyte is outside Laboratory Recovery limits due the analyte behavior using the referenced method. The reference method has certain limitations with respect to analytes of this nature.
- J Detected below the Reporting Limit but greater than or equal to the Method Detection Limit (MDL/LOD) or in the case of a TIC, the result is an estimated concentration.
- CCV-E The value reported is ESTIMATED. The value is estimated due to its behavior during continuing calibration verification (>20% Difference for average Rf or >20% Drift for quadratic fit).

Definitions and Other Explanations

*	Analyte is not certified or the state of the samples origination does not offer certification for the Analyte.
ND	NOT DETECTED - the analyte is not detected at the Reported to level (LOQ/RL or LOD/MDL)
RL	REPORTING LIMIT - the minimum reportable value based upon the lowest point in the analyte calibration curve.
LOQ	LIMIT OF QUANTITATION - the minimum concentration of a target analyte that can be reported within a specified degree of confidence . This is the lowest point in an analyte calibration curve that has been subjected to all steps of the processing/analysis and verified to meet defined criteria. This is based upon NELAC 2009 Standards and applies to all analyses.
LOD	LIMIT OF DETECTION - a verified estimate of the minimum concentration of a substance in a given matrix that an analytical process can reliably detect. This is based upon NELAC 2009 Standards and applies to all analyses conducted under the auspices of EPA SW-846.
MDL	METHOD DETECTION LIMIT - a statistically derived estimate of the minimum amount of a substance an analytical system can reliably detect with a 99% confidence that the concentration of the substance is greater than zero. This is based upon 40 CFR Part 136 Appendix B and applies only to EPA 600 and 200 series methods.
Reported to	This indicates that the data for a particular analysis is reported to either the LOD/MDL, or the LOQ/RL. In cases where the "Reported to" is located above the LOD/MDL, any value between this and the LOQ represents an estimated value which is "J" flagged accordingly. This applies to volatile and semi-volatile target compounds only.
NR	Not reported
RPD	Relative Percent Difference
Wet	The data has been reported on an as-received (wet weight) basis
Low Bias	Low Bias flag indicates that the recovery of the flagged analyte is below the laboratory or regulatory lower control limit. The data user should take note that this analyte may be biased low but should evaluate multiple lines of evidence including the LCS and site-specific MS/MSD data to draw bias conclusions. In cases where no site-specific MS/MSD was requested, only the LCS data can be used to evaluate such bias.
High Bias	High Bias flag indicates that the recovery of the flagged analyte is above the laboratory or regulatory upper control limit. The data user should take note that this analyte may be biased high but should evaluate multiple lines of evidence including the LCS and site-specific MS/MSD data to draw bias conclusions. In cases where no site-specific MS/MSD was requested, only the LCS data can be used to evaluate such bias.
Non-Dir.	Non-dir. flag (Non-Directional Bias) indicates that the Relative Percent Difference (RPD) (a measure of precision) among the MS and MSD data is outside the laboratory or regulatory control limit. This alerts the data user where the MS and MSD are from site-specific samples that the RPD is high due to either non-homogeneous distribution of target analyte between the MS/MSD or indicates poor reproducibility for other reasons.

If EPA SW-846 method 8270 is included herein it is noted that the target compound N-nitrosodiphenylamine (NDPA) decomposes in the gas chromatographic inlet and cannot be separated from diphenylamine (DPA). These results could actually represent 100% DPA, 100% NDPA or some combination of the two. For this reason, York reports the combined result for n-nitrosodiphenylamine and diphenylamine for either of these compounds as a combined concentration as Diphenylamine.

If Total PCBs are detected and the target aroclors reported are "Not detected", the Total PCB value is reported due to the presence of either or both Aroclors 1262 and 1268 which are non-target aroclors for some regulatory lists.

2-chloroethylvinyl ether readily breaks down under acidic conditions. Samples that are acid preserved, including standards will exhibit breakdown. The data user should take note.

Certification for pH is no longer offered by NYDOH ELAP.

Semi-Volatile and Volatile analyses are reported down to the LOD/MDL, with values between the LOD/MDL and the LOQ being "J" flagged as estimated results.

For analyses by EPA SW-846-8270D, the Limit of Quantitation (LOQ) reported for benzidine is based upon the lowest standard used for calibration and is not a verified LOQ due to this compound's propensity for oxidative losses during extraction/concentration procedures and non-reproducible chromatographic performance.

Purpose and Results

This report contains the analytical data for the sample(s) identified on the attached chain-of-custody received in our laboratory on August 14, 2020 with a temperature of C. The project was identified as your project: **65 Albany Avenue Kingston, New York**.

The analyses were conducted utilizing appropriate EPA, Standard Methods, and ASTM methods as detailed in the data summary tables.

All samples were received in proper condition meeting the customary acceptance requirements for environmental samples except those indicated under the Sample and Analysis Qualifiers section of this report.

All analyses met the method and laboratory standard operating procedure requirements except as indicated by any data flags, the meaning of which are explained in the Sample and Data Qualifiers Relating to This Work Order section of this report and case narrative if applicable.

The results of the analyses, which are all reported on dry weight basis (soils) unless otherwise noted, are detailed in the following pages.

Please contact Client Services at 203.325.1371 with any questions regarding this report.

General Notes for York Project (SDG) No.: 20H0572

1. The RLs and MDLs (Reporting Limit and Method Detection Limit respectively) reported are adjusted for any dilution necessary due to the levels of target and/or non-target analytes and matrix interference. The RL(REPORTING LIMIT) is based upon the lowest standard utilized for the calibration where applicable.
2. Samples are retained for a period of thirty days after submittal of report, unless other arrangements are made.
3. York's liability for the above data is limited to the dollar value paid to York for the referenced project.
4. This report shall not be reproduced without the written approval of York Analytical Laboratories, Inc.
5. All analyses conducted met method or Laboratory SOP requirements. See the Sample and Data Qualifiers Section for further information.
6. It is noted that no analyses reported herein were subcontracted to another laboratory, unless noted in the report.
7. This report reflects results that relate only to the samples submitted on the attached chain-of-custody form(s) received by York.
8. Analyses conducted at York Analytical Laboratories, Inc. Stratford, CT are indicated by NY Cert. No. 10854; those conducted at York Analytical Laboratories, Inc., Richmond Hill, NY are indicated by NY Cert. No. 12058.

Volatile Organics, EPA TO15 Full List

Log-in Notes:

Sample Notes: TO-VAC

Sample Prepared by Method: EPA TO15 PREP

CAS No.	Parameter	Result	Flag	Units	Reported to LOQ	Dilution	Reference Method	Date/Time Prepared	Date/Time Analyzed	Analyst
460-00-4	<i>Surrogate: SURR: p-Bromofluorobenzene</i>	117 %			70-130					

Sample and Data Qualifiers Relating to This Work Order

- TO-VAC The final vacuum in the canister was less than -2 inches Hg vacuum. The time integrated sampling may be affected and not reflect proper sampling over the time period. The data user should take note.
- TO-LCS-L The result reported for this compound may be biased low due to its behavior in the analysis batch LCS where it recovered less 70% of the expected value.
- TO-IPA The value for isopropanol is estimated. Dilutions are not conducted for this species as not to preclude actionable analytes by dilution.
- TO-CCV The value reported is ESTIMATED for this compound due to its behavior during continuing calibration verification (>30% Difference from initial calibration).
- E The concentration indicated for this analyte is an estimated value above the calibration range of the instrument. This value is considered an estimate.

Definitions and Other Explanations

*	Analyte is not certified or the state of the samples origination does not offer certification for the Analyte.
ND	NOT DETECTED - the analyte is not detected at the Reported to level (LOQ/RL or LOD/MDL)
RL	REPORTING LIMIT - the minimum reportable value based upon the lowest point in the analyte calibration curve.
LOQ	LIMIT OF QUANTITATION - the minimum concentration of a target analyte that can be reported within a specified degree of confidence . This is the lowest point in an analyte calibration curve that has been subjected to all steps of the processing/analysis and verified to meet defined criteria. This is based upon NELAC 2009 Standards and applies to all analyses.
LOD	LIMIT OF DETECTION - a verified estimate of the minimum concentration of a substance in a given matrix that an analytical process can reliably detect. This is based upon NELAC 2009 Standards and applies to all analyses conducted under the auspices of EPA SW-846.
MDL	METHOD DETECTION LIMIT - a statistically derived estimate of the minimum amount of a substance an analytical system can reliably detect with a 99% confidence that the concentration of the substance is greater than zero. This is based upon 40 CFR Part 136 Appendix B and applies only to EPA 600 and 200 series methods.
Reported to	This indicates that the data for a particular analysis is reported to either the LOD/MDL, or the LOQ/RL. In cases where the "Reported to" is located above the LOD/MDL, any value between this and the LOQ represents an estimated value which is "J" flagged accordingly. This applies to volatile and semi-volatile target compounds only.
NR	Not reported
RPD	Relative Percent Difference
Wet	The data has been reported on an as-received (wet weight) basis
Low Bias	Low Bias flag indicates that the recovery of the flagged analyte is below the laboratory or regulatory lower control limit. The data user should take note that this analyte may be biased low but should evaluate multiple lines of evidence including the LCS and site-specific MS/MSD data to draw bias conclusions. In cases where no site-specific MS/MSD was requested, only the LCS data can be used to evaluate such bias.
High Bias	High Bias flag indicates that the recovery of the flagged analyte is above the laboratory or regulatory upper control limit. The data user should take note that this analyte may be biased high but should evaluate multiple lines of evidence including the LCS and site-specific MS/MSD data to draw bias conclusions. In cases where no site-specific MS/MSD was requested, only the LCS data can be used to evaluate such bias.
Non-Dir.	Non-dir. flag (Non-Directional Bias) indicates that the Relative Percent Difference (RPD) (a measure of precision) among the MS and MSD data is outside the laboratory or regulatory control limit. This alerts the data user where the MS and MSD are from site-specific samples that the RPD is high due to either non-homogeneous distribution of target analyte between the MS/MSD or indicates poor reproducibility for other reasons.

If EPA SW-846 method 8270 is included herein it is noted that the target compound N-nitrosodiphenylamine (NDPA) decomposes in the gas chromatographic inlet and cannot be separated from diphenylamine (DPA). These results could actually represent 100% DPA, 100% NDPA or some combination of the two. For this reason, York reports the combined result for n-nitrosodiphenylamine and diphenylamine for either of these compounds as a combined concentration as Diphenylamine.

If Total PCBs are detected and the target aroclors reported are "Not detected", the Total PCB value is reported due to the presence of either or both Aroclors 1262 and 1268 which are non-target aroclors for some regulatory lists.

2-chloroethylvinyl ether readily breaks down under acidic conditions. Samples that are acid preserved, including standards will exhibit breakdown. The data user should take note.

Certification for pH is no longer offered by NYDOH ELAP.

Semi-Volatile and Volatile analyses are reported down to the LOD/MDL, with values between the LOD/MDL and the LOQ being "J" flagged as estimated results.

For analyses by EPA SW-846-8270D, the Limit of Quantitation (LOQ) reported for benzidine is based upon the lowest standard used for calibration and is not a verified LOQ due to this compound's propensity for oxidative losses during extraction/concentration procedures and non-reproducible chromatographic performance.
