1.0 INTRODUCTION

The Former EMCA Site occupies 0.3 acres of land in a mixed residential/industrial area in the Village of Mamaroneck, New York (see Figure 1). The site was formerly owned and operated by a subsidiary of the Rohm and Haas Company (Rohm and Haas) who manufactured high conductivity precious metal paste at the site. Manufacturing was discontinued in 1988 and the current site owner is Cablevision of Westchester.

Environmental site investigations revealed that groundwater beneath the site was contaminated with 1,1,2-trichloro-1,2,2 trifluoroethane (Freon 113, CAS No. 76-13-1). The site was listed on the New York Registry of Inactive Hazardous Waste Disposal Sites and a Consent Order was signed between the New York State Department of Environmental Conservation (NYSDEC) and Rohm and Haas in March 1999. Rohm and Haas implemented remediation to address impacted groundwater at the site. The remedial technology consisted of anaerobic biodegradation and reductive dechlorination of Freon 113 through injection of food-grade emulsified soybean oil, sodium lactate, and specialized bacteria into the groundwater aquifer. Remedial actions were conducted during the following events:

- Pilot program conducted in June 2003
 - Interim remedial measure in November 2004
 - Supplemental injection in August 2007
 - Supplemental injection in September 2009
 - Supplemental injection in October 2012
 - Supplemental injection in June 2013
 - Supplemental injection in October 2014

The original release was thought to be in the vicinity of monitoring well MW-03 and the pilot program injections were focused on that area. As additional data were obtained, injection areas included the area of groundwater monitoring wells MW-02, MW-06, and MW-07/MW-07R and piezometer GZ-06. The 2012, 2013, and 2014 supplemental injections also included the KB-1 Plus® bacteria culture, developed by SiREM Laboratory in Guelph, Ontario, Canada, as a biological amendment to the emulsified soybean oil and sodium lactate injections. The KB-1 Plus® bacteria culture contains a proprietary mixture of dehalobacter and dehalococcoides strains formulated by the laboratory to stimulate biological dechlorination of Freon.

This report presents the results of semi-annual groundwater monitoring conducted in April 2017 at the site pursuant to the approved Site Management Plan ([SMP], URS, 2010). The groundwater monitoring program generates data used to monitor the effectiveness of remedial actions performed at the site between 2003 and 2014. The April 2017 groundwater sampling event was the twenty-fifth site-wide sampling event since the interim remedial measure (IRM) began in November 2004 and the sixth site-wide sampling event following the October 2014 remedial injections.

2.0 GROUNDWATER SAMPLING AND ANALYSIS

On April 18, 2017, AECOM collected groundwater samples from monitoring wells MW-02, MW-03, MW-04, MW-06 and MW-07R (see Figure 3 for well locations). The samples were collected using low-flow sampling procedures.

The depth to groundwater and water quality parameter measurements of ferrous iron, dissolved oxygen, oxidation-reduction potential, pH, specific conductance, temperature, and turbidity were recorded prior to and during purging/sampling. The field purging/sampling logs are presented in Appendix A.

The sample chain-of-custody (COC) was initiated immediately after the groundwater samples were collected and was maintained through shipment to the laboratory. Laboratory analyses were performed for the following parameters:

Parameter	Analytical Method
Freon 113, Freon 123a, Freon 1113	SW8260B
Methane	RSK-175
Sulfate	ASTM D516-90, 02

In addition, the following analyses were performed on samples collected from all five monitoring wells in order to generate additional natural attenuation groundwater data and to evaluate bacteria concentrations:

Parameter	Analytical Method
Total Iron	200.7
Ferrous Iron	Field Parameter
Nitrate	SM 4500-NO ₃ F
Nitrite	SM 4500-NO ₂ F
Hardness	SM 2340 C
Alkalinity (Total, HCO ₃ ⁻ , CO ₃ ⁻ , OH ⁻)	SM 2320 B
Total Organic Carbon	SM 5310 B
Dehalococcoides (MW-02 only)	SiREM - Gene-Trac® Dhc
Dehalobacter	SiREM - Gene-Trac® Dhb

A round of groundwater levels were recorded on April 18, 2017. The data are presented in Table 1 and Figure 3. Typically, general groundwater flow is to the north. The resulting groundwater contours for the April 18, 2017 data as shown in Figure 3 are consistent with this flow pattern. Monitoring of the Sheldrake River water surface level was discontinued in 2015 due to traffic safety concerns for the field personnel taking the measurements.

3.0 RESULTS

The analytical results for the April 2017 sampling event, along with the previous April and October 2016 sampling data, are provided in Table 2. Historical groundwater analytical results are presented in Appendix B. Laboratory data sheets and a data usability summary report (DUSR) for the April 2017 samples are provided in Appendix C.

The analytical results presented in Table 2 are compared to groundwater standards and guidance values presented in New York State Department of Environmental Conservation's (NYSDEC's) Technical and Operational Guidance Series Memo 1.1.1 (TOGS 1.1.1). It is noted that there are no TOGS 1.1.1 groundwater standards or guidance values for Freon 1113 or Freon 123a. However, consistent with TOGS 1.1.1, the Freon 1113 and Freon 123a results are compared to the "principal organic contaminant" standard for groundwater of 5 micrograms per liter ($\mu\text{g}/\text{L}$).

The April 2017 results presented in Table 2 and Figure 4 show that only the samples from wells MW-02, MW-03, and MW-06 contained Freon 113 at concentrations above the 5 $\mu\text{g}/\text{L}$ guidance value for this compound. The Freon 113 concentration in these samples was 2,200 $\mu\text{g}/\text{L}$ in well MW-02, 140 $\mu\text{g}/\text{L}$ in well MW-03, and 5.5 $\mu\text{g}/\text{L}$ in well MW-06.

The April 2017 results show that only the samples from wells MW-02, MW-03, and MW-06 contained Freon 123a at a concentration above the 5 $\mu\text{g}/\text{L}$ guidance value for this compound. The Freon 123a concentration in these samples was 170 $\mu\text{g}/\text{L}$ in well MW-02, 52 $\mu\text{g}/\text{L}$ in well MW-03, and 13 $\mu\text{g}/\text{L}$ in well MW-06.

The April 2017 results show that only the samples from wells MW-02, MW-03, and MW-06 contained Freon 1113 at a concentration above the 5 $\mu\text{g}/\text{L}$ guidance value for this compound. The Freon 1113 concentration in these samples was 1,300 $\mu\text{g}/\text{L}$ in well MW-02, 230 $\mu\text{g}/\text{L}$ in well MW-03, and 60 $\mu\text{g}/\text{L}$ in well MW-06.

The groundwater samples collected in April 2017 were analyzed for dehalobacter and the sample from MW-02 was also analyzed for dehalococcoides. The analytical results, presented in Table 2, indicate that in April 2017 dehalobacter was only detected in wells MW-03 [6 gene copies per milliliter (GC/mL)] and MW-07R (3 GC/mL).

The dehalococcoides concentration in MW-02 was 400 colony equivalents per milliliter (CEQ/mL) in April 2017, which is an increase from October 2016 (90 CEQ/mL).

In general, the results of the semi-annual groundwater sampling event completed in April 2017 showed that concentrations of Freon 113, Freon 123a, and Freon 1113 have increased. Freon 113 concentrations increased in wells MW-02 and MW-03; Freon 123A concentrations increased in wells MW-02, MW-03, MW-06, and MW-07R; Freon 1113 concentrations increased in well MW-02 and decreased in wells MW-03, MW-04, MW-06, and MW-07R. The highest total Freon concentrations are in MW-02.

4.0 DATA ASSESSMENT

The groundwater analytical data for April 2017 is the sixth site-wide set of data collected following the October 2014 supplemental injection. The previous round of site-wide groundwater sampling occurred in October 2016.

Appendix B presents the historical groundwater analytical data dating back to the pilot program in 2003. Using this data, Freon 113, 123a, and 1113 concentrations are shown in plan view in Figure 4 for the period between 2006 and 2017. The historical data were also used to create trend plots for the following parameters:

- Freon 113 - Figures 5 and 6
 - Freon 123a - Figure 7
 - Freon 1113 - Figure 8
 - Sulfate - Figure 9
 - Methane - Figure 10
 - Dissolved Oxygen - Figure 11
 - Dissolved Oxygen vs. Temperature in MW-02 – Figure 12
 - Oxidation-Reduction Potential - Figure 13

The text below presents a discussion of the October 2016 data compared to the April 2017 data followed by an assessment of the historical results over time. Table 3 presents a summary comparison of October 2016 and April 2017 parameter concentration trends.

Freon 113

In comparison with the October 2016 results, the analytical results for the April 2017 sampling events (Figures 5 and 6) indicate that Freon 113:

- Increased in MW-02 from 940 µg/L in October 2016 to 2,200 µg/L in April 2017;
 - Increased in MW-03 from 11 µg/L in October 2016 to 140 µg/L in April 2017;
 - Remained non-detect in MW-04 in October 2016 and April 2017;
 - Increased in MW-06 from non-detect in October 2016 to 5.5 µg/L in April 2017; and
 - Remained non-detect in MW-07R in October 2016 and April 2017.

In well MW-02, the Freon 113 concentration has generally decreased over the course of the treatment program. The highest concentration of 2,400 µg/L occurred in July 2001 prior to the treatment

program. Between November 2012 and October 2015, Freon 113 concentrations steadily decreased and were not detected above the groundwater criteria in 8 of the 14 sampling events performed during this period (Freon 113 was above the criteria in November 2012, April 2013, July 2014, March 2015, April 2015, and October 2015). Freon 113 concentrations detected at well MW-02 during the three most recent sampling events (April and October 2016 and April 2017) were significantly higher than levels detected since 2012 (960 µg/L, 940 µg/L, and 2,200 µg/L, respectively).

Wells MW-03 and MW-07R had the highest Freon 113 concentrations prior to the treatment program and showed the greatest reduction as a result of the treatment. The Freon 113 concentration of 0.81 µg/L (October 2014) in MW-03 was below TOGS 1.1.1 criteria and was non-detect in November and December 2014. A rebound of Freon 113 at MW-03 in March and April 2015, in April and October 2016, and again in April 2017 coincides with increases in the concentration of the Freon 123a and Freon 1113 daughter products, indicating ongoing reduction of Freon 113. The relatively low-level Freon 113 concentration in MW-07R (15 µg/L) in October 2014 decreased to non-detect in March, April, and October 2015, April and October 2016, and April 2017.

Freon 113 has not been detected in well MW-04 since April 2015. Freon 113 was not detected in MW-06 in the July and October 2014 sampling events, increased slightly to 1.6 µg/L in April 2015, and decreased to non-detect in October 2015 and April and October 2016. In April 2017, the concentration of Freon 113 increased slightly to 5.5 µg/L.

Freon 123a

Freon 123a and Freon 1113 are the expected reductive dechlorination daughter products of Freon 113. Freon 123a holds one less chlorine than Freon 113, while Freon 1113 holds two less chlorines than Freon 113. With the reductive dechlorination of Freon 113, the concentrations of these daughter compounds are expected to increase and then eventually decline over time as reductive dechlorination continues and the residual source diminishes. The following text presents a discussion of the April 2017 Freon 123a results in comparison with the October 2016 results.

Compared to the October 2016 data, the analytical results for the April 2017 sampling event (Figure 7) indicate that Freon 123a:

- Increased in MW-02 from 37 µg/L in October 2016 to 170 µg/L in April 2017;
- Increased in MW-03 from 3.3 µg/L in October 2016 to 52 µg/L in April 2017;
- Remained non-detect in MW-04 in October 2016 and April 2017;

- Increased in MW-06 from 0.28 µg/L in October 2016 to 13 µg/L in April 2017; and
 - Increased in MW-07R from non-detect in October 2016 to 0.32 µg/L in April 2017.

In well MW-02, the Freon 123a concentration has remained variable over the course of the treatment program. The highest concentration was 220 µg/L in April 2016, indicating increased reductive dechlorination of Freon 113.

Between October 2014 and December 2014, Freon 123a concentrations in well MW-03 remained below TOGS 1.1.1 criteria. The concentration increased to 17 µg/L in March 2015 and 25 µg/L in April 2015, then decreased to 1.7 µg/L in October 2015. Concentrations increased again in April 2016 to 30 µg/L then decreased to 3.3 µg/L in October 2016. Concentrations increased again in April 2017 to 52 µg/L. Freon 123a concentrations in well MW-07R have remained well below TOGS 1.1.1 criteria since September 2012.

Freon 123a was not detected in well MW-06 in the October 2014 sampling event, increased to 8.1 µg/L in April 2015, decreased to non-detect in October 2015, increased slightly to 1.1 µg/L in April 2016, decreased to 0.28 µg/L in October 2016, and increased to 13 µg/L in April 2017. Freon 123a has never been detected in well MW-04.

Freon 1113

Compared to the October 2016 data, the analytical results for the April 2017 sampling event (Figure 8) indicate that Freon 1113:

- Increased in MW-02 from a concentration of 1,000 µg/L in October 2016 to 1,300 µg/L in April 2017;
 - Decreased in MW-03 from a concentration of 290 µg/L in October 2016 to 230 µg/L in April 2017;
 - Decreased in MW-04 from 4.3 µg/L in October 2016 to non-detect in April 2017;
 - Decreased in MW-06 from 68 µg/L in October 2016 to 60 µg/L in April 2017; and
 - Decreased in MW-07R from a concentration of 65 µg/L in October 2016 to 3.6 µg/L in April 2017.

Prior to and at the beginning of the treatment program, Freon 1113 was either not detected or was present at very low concentrations. As the treatment program progressed, Freon 1113 concentrations increased, indicating the successful reduction of Freon 113. The October 2016 and April 2017

concentrations of Freon 1113 in wells MW-02 and MW-03 were the highest levels detected in those wells.

Sulfate

In comparison with the October 2016 data, the April 2017 sulfate concentrations increased in MW-02, MW-03, and MW-07R and decreased in MW-04 and MW-06 (Figure 9).

Studies have shown that the presence of sulfate in anaerobic environments above 200 mg/L slows the rates of dehalogenation reactions because sulfate competes with the halogenated compounds as electron acceptors (USGS, 2009). The recent sulfate concentrations in groundwater at the site are well below 200 mg/L.

Methane

In comparison with the October 2016 data, the April 2017 methane concentrations (Figure 10) decreased in wells MW-03, MW-04, and MW-07R and increased in wells MW-02 and MW-06.

Degradation of Freon is likely due to sulfate-reducing or methane-forming microbes (Horneman, 2007). Historical site data shows increased methane concentrations during the treatment programs, suggesting that reduction of Freon concentrations may be due to contaminant degradation through methanogenesis, a process that was successfully stimulated as a result of the treatment injection program. Methane concentrations following injection events rose to levels of 5,000 µg/L or more. The methane concentrations in wells MW-03, MW-04, and MW-07R have been considerably lower (e.g., less than 3,000 µg/L) since April 2016, suggesting that conditions are becoming less favorable for methanogenesis. However, methane concentrations increased to above 3,000 µg/L in wells MW-02 and MW-06 in April 2017.

Dissolved Oxygen

In comparison with the October 2016 data, the April 2017 dissolved oxygen concentrations (Figure 11) decreased in all five wells to below the detection limit. Historically, dissolved oxygen concentrations have fluctuated significantly, from highs as much as 9 mg/L down to below detection limits. Overall, levels are generally low, reflecting anaerobic conditions.

Temperature

Comparison of the April 2017 data with historical measurements shows an apparent correlation of groundwater temperature with seasonal weather conditions; groundwater is cooler in the winter/spring and warmer in the summer/fall. As an example, Figure 12 presents a graphical presentation of temperature data for well MW-02 dating back to February 2008. The April 2017 temperature measurements were as much as 7 degrees Celsius lower than measurements recorded in October 2016. The temperature data suggests that groundwater at the site area is influenced by changes in seasonal weather conditions/precipitation infiltration. The graph also shows dissolved oxygen concentrations in MW-02.

Oxidation-Reduction Potential

In comparison with the October 2016 data, the April 2017 oxidation-reduction potential values (Figure 13) increased significantly. The April 2017 values were all positive, ranging from 11 millivolts (mV) to 26 mV, except in well MW-02 with a value of -6.0 mV. Oxidation-reduction potential values have typically been negative throughout most of the treatment program.

Dehalococcoides

Since December 2014, only well MW-02 has been analyzed for dehalococcoides (see Table 2). The dehalococcoides concentration detected in October 2016 was 90 CEQ/mL, and increased in April 2017 to 400 CEQ/mL. Since the October 2014 injection event, the dehalococcoides concentration in MW-02 has not increased to a significant level, unlike after previous injection events. Dehalococcoides concentration can be as high as 2,000 CEQ/mL following injection.

Dehalobacter

Dehalobacter concentrations can be as high as 40,000 GC/mL following remedial injection. The October 2016 data showed a dehalobacter concentration in MW-02 at 30 GC/mL and a concentration in MW-03 at 10 GC/mL. The April 2017 results showed a decrease in dehalobacter concentration in MW-02 to non-detect and a decrease in MW-03 to 6 GC/mL. Well MW-07R showed an increase from 3 GC/mL in October 2014 to 300 GC/mL in March 2015, and reduction to 90 GC/mL in April 2015. MW-07R showed further reduction in dehalobacter concentrations in October 2015 (20 GC/mL), April 2016 (7 GC/mL), October 2016 (5 GC/mL), and April 2017 (3 GC/mL). MW-04 showed a reduction of dehalobacter concentration from 3 GC/mL in October 2014 to non-detect since April 2015. MW-06 showed a reduction of dehalobacter concentrations from 80 GC/mL in October 2014 to non-detect in

April 2015, followed by a slight increase to 1 GC/mL in October 2015, 3 GC/mL in April 2016, and 4 GC/mL in October 2016 before decreasing to non-detect in April 2017.

5.0 CONCLUSIONS

The majority of the original Freon 113 release has been remediated over the past 14 years through anaerobic bioremediation. With the exception of MW-02, the Freon 113 concentrations detected during the April 2017 sampling event remain orders of magnitude below initial contaminant concentrations documented prior to initiating remedial activities. In addition, the elevated concentrations of Freon 123A and Freon 1113 at well MW-02 and other wells are evidence that reductive dechlorination of Freon 113 is continuing.

The residual groundwater impacts remain localized to the original release area (i.e., MW-02). Low Freon concentrations have been found in MW-03 while limited to no impacts have been found in MW-04, MW-06, and MW-07R. The absence of impacts in these wells demonstrates that there are no unacceptable impacts to surface water or other potential receptors.

6.0 CONTINGENCY TRIGGER EVALUATION AND NEXT STEPS

In response to increasing levels of Freon 113, particularly in well MW-02, AECOM will implement additional remedial injections in 2017. AECOM will work with Rohm and Haas technical staff to prepare a work plan for the remedial injections. The work plan will include the type and concentration of remedial amendments and the injection locations.

In accordance with the SMP, the groundwater sampling program will continue on the five long-term monitoring wells (i.e., MW-02, MW-03, MW-04, MW-06 and MW-07R). Following a discussion with Rohm and Haas, AECOM, and the NYSDEC in January 2017, the frequency of groundwater sampling has been increased from semi-annual to quarterly. The next sampling event will be in July 2017. Each groundwater sample will be analyzed for Freon-113, Freon-123a, and Freon-1113, as well as other water quality and natural attenuation parameters as listed in Table 4.

Notes:

- 1) All of the monitoring well and benchmark locations were resurveyed on 6/25/2010.
- 2) Water elevations for all wells and benchmarks were collected on 10/08/2015.
- 3) Monitoring well GZ-03 was modified from a stick-up well to a flush-mount well on 6/24/2010.
- 4) Benchmark C could not be calculated because of a safety issue at Benchmark B.
- 5) Benchmark D water surface elevation was taken from culvert approximately 10 feet from concrete support of North bridge.

 Location ID Groundwater Elevation
 (based upon AECOM survey datum)

NOTES:

- (1) Well MW-07 was replaced by well MW-07R on September 3, 2009.
- (2) Benchmark C was originally established as a temporary benchmark off a tree branch overhanging the Sheldrake River between the north and south bridges. The approximate water surface elevation for this benchmark was calculated by taking the average water surface elevation of Benchmark B and Benchmark D until 2015 when measurements at Benchmark B were no longer taken due to safety concerns.
- (3) NM - Not Measured

80 0 80 Feet

**NOTES:**

All analytical results are reported in $\mu\text{g/L}$.
 Well, MW-07, was replaced by well, MW-07R, on September 3, 2009.
 ND = Not Detected
 J = Estimated Value
 Freon-113 = 1,1,2-Trichloro-1,2,2-trifluoroethane
 Freon-123A = 1,2-Dichloro-1,1,2-trifluoroethane
 Freon-1113 = Chlorotrifluoroethene

LOW FLOW GROUNDWATER PURGING/SAMPLING LOG

Project: Dow/Rohm&Haas, former EMCA Site: Mamaroneck, NY Well I.D.: MW-06

Site: Mamaroneck, NY

Well I.D.: MW-06

Date: 4/18/2017 Sampling Personnel: Megan Dascoli Company: URS Corporation

Company: URS Corporation

Purging/
Sampling Pump/Tubing
Device: Low Flow/ Peristaltic Pump- Geopump Inlet
Tubing Type: HDPE & Silicone Location: 17.5

Measuring Point: Below Top of Riser Initial Depth to Water: 5.55 Depth to Well Bottom: 13.45 Well Diameter: 1" Screen Length: 10'

Casing Type:	PVC	Volume in 1 Well Casing (liters):	_____	Estimated Purge Volume (liters):	_____
--------------	-----	-----------------------------------	-------	----------------------------------	-------

Sample ID: 20170418 M1J-06 Sample Time: 1010 QA/QC: TB 20180418

Sample Parameters: Freon 113, 123a, 1113; Methane; Sulfate, alkalinity, hardness, nitrogen-nitrate, TOC, total iron- TestAmerica, Edison, NJ
Dehalobacter (and Dehalococcoides for MW-02 only) - sent to SIREM in Ontario, Canada

PURGE PARAMETERS

Information: WATER VOLUMES—0.75 inch diameter well = 87 ml/ft; 1 inch diameter well = 154 ml/ft; 2 inch diameter well = 617 ml/ft;

4 inch diameter well $\equiv 2470 \text{ ml/ft}^2$ (vol) $\equiv \pi r^2 h$

Remarks:

water is clear, no odor

LOW FLOW GROUNDWATER PURGING/SAMPLING LOG

*Criteria- NYSDEC TOGS (1.1.1), Ambient Water Quality Standards and Guidance Values and Groundwater Effluent Limitations, Class GA, Revised April 2000.

Flags assigned during chemistry validation are shown.

Concentration Exceeds Criteria

J - Analyte is reported below the PQL at an estimated concentration. (J-) - Estimated result biased low.

U - Non-Detect J - Estimated Result NA - Not Analyzed. R - Rejected.

UG/L - Micrograms per Liter; MG/L - Milligrams per Liter; CEQ/mL - Count Equivalents per milliliter; GC/mL - Gene Copies per milliliter

S.U. - Standard Units; MS/CM - Microsiemens per Centimeter; DEG C - Degrees Celsius; NTU - Nephelometric Turbidity Units; mV - Millivolts

Detection Limits shown are PQL

*Criteria- NYSDEC TOGS (1.1.1), Ambient Water Quality Standards and Guidance Values and Groundwater Effluent Limitations, Class GA, Revised April 2000.

Flags assigned during chemistry validation are shown.

Concentration Exceeds Criteria

J - Analyte is reported below the PQL at an estimated concentration. (J-) - Estimated result biased low.

U - Non-Detect J - Estimated Result NA - Not Analyzed. R - Rejected.

UG/L - Micrograms per Liter; MG/L - Milligrams per Liter; CEQ/mL - Count Equivalents per milliliter; GC/mL - Gene Copies per milliliter

S.U. - Standard Units; MS/CM - Microsiemens per Centimeter; DEG C - Degrees Celsius; NTU - Nephelometric Turbidity Units; mV - Millivolts

*Criteria- NYSDEC TOGS (1.1.1), Ambient Water Quality Standards and Guidance Values and Groundwater Effluent Limitations, Class GA, Revised April 2000.

Flags assigned during chemistry validation are shown.

Concentration Exceeds Criteria

J - Analyte is reported below the PQL at an estimated concentration. (J-) - Estimated result biased low.

U - Non-Detect J - Estimated Result NA - Not Analyzed. R - Rejected.

UG/L - Micrograms per Liter; MG/L - Milligrams per Liter; CEQ/mL - Count Equivalents per milliliter; GC/mL - Gene Copies per milliliter

S.U. - Standard Units; MS/CM - Microsiemens per Centimeter; DEG C - Degrees Celsius; NTU - Nephelometric Turbidity Units; mV - Millivolts

Detection Limits shown are PQL

*Criteria- NYSDEC TOGS (1.1.1), Ambient Water Quality Standards and Guidance Values and Groundwater Effluent Limitations, Class GA, Revised April 2000.

Flags assigned during chemistry validation are shown.

Concentration Exceeds Criteria

J - Analyte is reported below the PQL at an estimated concentration. (J-) - Estimated result biased low.

U - Non-Detect J - Estimated Result NA - Not Analyzed. R - Rejected.

UG/L - Micrograms per Liter; MG/L - Milligrams per Liter; CEQ/mL - Count Equivalents per milliliter; GC/mL - Gene Copies per milliliter

S.U. - Standard Units; MS/cm - Microsiemens per Centimeter; DEG C - Degrees Celsius; NTU - Nephelometric Turbidity Units; mV - Millivolts

Detection Limits shown are PQL

*Criteria- NYSDEC TOGS (1.1.1), Ambient Water Quality Standards and Guidance Values and Groundwater Effluent Limitations, Class GA, Revised April 2000.

Flags assigned during chemistry validation are shown.

Concentration Exceeds Criteria

J - Analyte is reported below the PQL at an estimated concentration. (J-) - Estimated result biased low.

U - Non-Detect J - Estimated Result NA - Not Analyzed. R - Rejected.

UG/L - Micrograms per Liter; MG/L - Milligrams per Liter; CEQ/mL - Count Equivalents per milliliter; GC/mL - Gene Copies per milliliter

S.U. - Standard Units; MS/CM - Microsiemens per Centimeter; DEG C - Degrees Celsius; NTU - Nephelometric Turbidity Units; mV - Millivolts

Detection Limits shown are PQL

*Criteria- NYSDEC TOGS (1.1.1), Ambient Water Quality Standards and Guidance Values and Groundwater Effluent Limitations, Class GA, Revised April 2000.

Flags assigned during chemistry validation are shown.

Concentration Exceeds Criteria

J - Analyte is reported below the PQL at an estimated concentration. (J-) - Estimated result biased low.

U - Non-Detect J - Estimated Result NA - Not Analyzed. R - Rejected.

UG/L - Micrograms per Liter; MG/L - Milligrams per Liter; CEQ/mL - Count Equivalents per milliliter; GC/mL - Gene Copies per milliliter

S.U. - Standard Units; MS/CM - Microsiemens per Centimeter; DEG C - Degrees Celsius; NTU - Nephelometric Turbidity Units; mV - Millivolts

Detection Limits shown are PQL

Attachment B – Support Documentation

I. INTRODUCTION

This Data Usability Summary Report (DUSR) has been prepared following the guidelines provided in New York State Department of Environmental Conservation (NYSDEC) Division of Environmental Remediation *DER-10, Technical Guidance for Site Investigation and Remediation, Appendix 2B - Guidance for Data Deliverables and the Development of Data Usability Summary Reports*, May 2010. This DUSR discusses the analytical data for five (5) groundwater samples, and one trip blank collected on April 18, 2017, as summarized on Table C-1. The April 2017 samples were collected as part of the semi-annual groundwater monitoring event.

II. ANALYTICAL METHODOLOGIES

The groundwater samples were analyzed for the following parameters by TestAmerica Laboratories, Inc., (TA) located in Edison, New Jersey and Amherst, New York; and SiREM Laboratory located in Guelph, Ontario, Canada. Note, not all groundwater samples were analyzed for all parameters, as shown on Table C-1.

Parameter	Method No.	References
Volatile Organic Compounds (VOCs)*	SW8260C	1
Methane	RSK-175	2
Sulfate	ASTM D516-90, 02	3
Alkalinity (total, bicarbonate, carbonate, hydroxide)	SM 2320 B	4
Hardness	SM 2340 C	4
Total Iron	200.7	5
Ferrous Iron (Fe^{+2})	Field Parameter	6
Nitrate	SM 4500-NO ₃	4
Nitrite	SM 4500-NO ₂	4
Total Organic Carbon (TOC)	SM 5310 B	4
Bacteria [<i>Dehalococcoides ethenogenes</i> (<i>Dhc</i>) and <i>Dehalobacter</i> (<i>Dhb</i>)]	QPCR**	SiREM SOP

Notes:

* - VOCs include 1,1,2-trichloro-1,2,2-trifluoroethane (Freon-113), 1,2-dichloro-1,1,2-trifluoroethane (Freon-123A), and chlorotrifluoroethene (Freon-1113).

** - Quantitative Polymerase Chain Reaction.

III. DATA VALIDATION PROCEDURES

A limited data validation was performed in accordance with the following USEPA Region II guidelines:

- *Validating Volatile Organic Compounds by Gas Chromatography/Mass Spectrometry SW-846 Method 8260B & 8260C, SOP No. HW-24, Rev. #4, September 2014;*
 - *ICP-AES Data Validation, SOP No. HW-2a, Revision 15, December 2012; and*
 - *Mercury and Cyanide Data Validation, SOP No. HW-2c, Revision 15, December 2012.*

The validated groundwater and field quality control (QC) analytical results are presented in Tables C-2 and C-3, respectively. Copies of the validated laboratory results (i.e., Form 1's) are presented in Attachment A. Copies of the case narrative, chain-of-custody, and documentation supporting the qualification of data are presented in Attachment B. Only problems affecting data usability are discussed in this report.

IV. DATA DELIVERABLE COMPLETENESS

The laboratory deliverable data packages were in accordance with NYSDEC Analytical Services Protocol (ASP) Category B requirements.

V. SAMPLE RECEIPT/PRESERVATION/HOLDING TIMES

All samples were received by the laboratory intact, properly preserved, and under proper chain-of-custody (COC).

All sample analyses were performed within method holding times, except for the nitrate and nitrite analyses for sample MW-02, which were performed 13 minutes outside the 48-hour holding time. The nitrate and nitrite results for this sample were qualified 'UJ' and 'J-', respectively.

VI. NONCONFORMANCES

Blank Contamination

The TOC initial calibration blank associated with all groundwater samples exhibited contamination below the reporting limit (RL). Since the TOC results for groundwater samples are 10 times the blank concentration, no data qualification was necessary.

Laboratory Control Samples

The *Dehalococcoides* (*Dhc*) low-level laboratory control sample (LCS) associated with sample MW-02 was slightly above QC limits. The detected *Dhc* result for this sample was qualified 'J'.

VII. SUMMARY

All sample analyses were found to be compliant with the method and validation criteria, except where previously noted. Those results qualified 'J' (estimated), 'J-' (estimated biased low) or 'UJ' (non-detect, estimated quantitation limit) during the data validation are considered conditionally usable.

DEFINITIONS OF USEPA REGION II DATA QUALIFIERS

- U – The analyte was analyzed for, but was not detected above the reported sample quantitation limit.
 - J – The analyte was positively identified; the associated numerical value is the approximate concentration of the analyte in the sample.
 - UJ – The analyte was not detected above the reported sample quantitation limit. However, the reported quantitation limit is approximate and may or may not represent the actual limit of quantitation necessary to accurately and precisely measure the analyte in the sample.
 - R – The sample results are rejected due to serious deficiencies in the ability to analyze the sample and meet quality control criteria. The presence or absence of the analyte cannot be verified.
 - D – The sample results are reported from a separate secondary dilution analysis.

CASE NARRATIVE

Client: URS Corporation

Project: DOW Former EMCA Site, Mamaroneck

Report Number: 460-131878-1

This case narrative is in the form of an exception report, where only the anomalies related to this report, method specific performance and/or QA/QC issues are discussed. If there are no issues to report, this narrative will include a statement that documents that there are no relevant data issues.

It should be noted that samples with elevated Reporting Limits (RLs) as a result of a dilution may not be able to satisfy customer reporting limits in some cases. Such increases in the RLs are unavoidable but acceptable consequence of sample dilution that enables quantification of target analytes or interferences which exceed the calibration range of the instrument.

Calculations are performed before rounding to avoid round-off errors in calculated results.

All holding times were met and proper preservation noted for the methods performed on these samples, unless otherwise detailed in the individual sections below.

RECEIPT

The samples were received on 4/19/2017 6:00 PM; the samples arrived in good condition, properly preserved and, where required, on ice. The temperature of the cooler at receipt was 2.2° C.

Receipt Exceptions

The following samples were canceled by the client on 4/20/2017 for ferrous iron analysis.: 20170418MW-02 (460-131878-1), 20170418MW-06 (460-131878-2), 20170418MW-03 (460-131878-3) and 20170418MW-07R (460-131878-4).

Note: All samples which require thermal preservation are considered acceptable if the arrival temperature is within 2C of the required temperature or method specified range. For samples with a specified temperature of 4C, samples with a temperature ranging from just above freezing temperature of water to 6C shall be acceptable. Samples that are hand delivered immediately following collection may not meet these criteria, however they will be deemed acceptable according to NELAC standards, if there is evidence that the chilling process has begun, such as arrival on ice, etc.

VOLATILE ORGANIC COMPOUNDS (GC-MS)

Samples 20170418MW-02 (460-131878-1), 20170418MW-06 (460-131878-2), 20170418MW-03 (460-131878-3), 20170418MW-07R (460-131878-4), 20170418MW-04 (460-131878-5) and TB20170418 (460-131878-6) were analyzed for Volatile organic compounds (GC-MS) in accordance with EPA SW-846 Methods 8260C. The samples were analyzed on 04/30/2017 and 05/01/2017.

Sample 20170418MW-02 (460-131878-1)[5X] required dilution prior to analysis. The reporting limits have been adjusted accordingly.

No difficulties were encountered during the volatiles analysis.

All quality control parameters were within the acceptance limits.

DISSOLVED GASES

Samples 20170418MW-02 (460-131878-1), 20170418MW-06 (460-131878-2), 20170418MW-03 (460-131878-3), 20170418MW-07R (460-131878-4), 20170418MW-04 (460-131878-5) and TB20170418 (460-131878-6) were analyzed for dissolved gases in accordance with RSK_175. The samples were analyzed on 04/22/2017.

The following samples were diluted to bring the concentration of target analytes within the calibration range: 20170418MW-03 (460-131878-3), 20170418MW-07R (460-131878-4) and 20170418MW-04 (460-131878-5). Elevated reporting limits (RLs) are provided.

The following sample was diluted to bring the concentration of target analytes within the calibration range: 20170418MW-02 (460-131878-1) and 20170418MW-06 (460-131878-2). Elevated reporting limits (RLs) are provided.

No difficulties were encountered during the dissolved gases analysis.

All quality control parameters were within the acceptance limits.

TOTAL RECOVERABLE METALS

Samples 20170418MW-02 (460-131878-1), 20170418MW-06 (460-131878-2), 20170418MW-03 (460-131878-3), 20170418MW-07R (460-131878-4) and 20170418MW-04 (460-131878-5) were analyzed for total recoverable metals in accordance with EPA Method 200.7 (ICP). The samples were prepared on 04/27/2017 and analyzed on 04/28/2017.

No difficulties were encountered during the metals analysis.

All quality control parameters were within the acceptance limits.

ALKALINITY

Samples 20170418MW-02 (460-131878-1), 20170418MW-06 (460-131878-2), 20170418MW-03 (460-131878-3), 20170418MW-07R (460-131878-4) and 20170418MW-04 (460-131878-5) were analyzed for alkalinity in accordance with SM 2320B. The samples were analyzed on 04/21/2017.

No difficulties were encountered during the alkalinity analysis.

All quality control parameters were within the acceptance limits.

HARDNESS

Samples 20170418MW-02 (460-131878-1), 20170418MW-06 (460-131878-2), 20170418MW-03 (460-131878-3), 20170418MW-07R (460-131878-4) and 20170418MW-04 (460-131878-5) were analyzed for hardness in accordance with SM 2340C. The samples were analyzed on 04/28/2017.

No difficulties were encountered during the hardness analysis.

All quality control parameters were within the acceptance limits.

SULFATE

Samples 20170418MW-02 (460-131878-1), 20170418MW-06 (460-131878-2), 20170418MW-03 (460-131878-3), 20170418MW-07R (460-131878-4) and 20170418MW-04 (460-131878-5) were analyzed for sulfate in accordance with ASTM Method D516-90. The samples were analyzed on 04/24/2017.

Sample 20170418MW-03 (460-131878-3)[2X] required dilution prior to analysis. The reporting limits have been adjusted accordingly.

No difficulties were encountered during the sulfate analysis.

All quality control parameters were within the acceptance limits.

NITROGEN-NITRATE

Samples 20170418MW-02 (460-131878-1), 20170418MW-06 (460-131878-2), 20170418MW-03 (460-131878-3), 20170418MW-07R (460-131878-4) and 20170418MW-04 (460-131878-5) were analyzed for Nitrogen-Nitrate in accordance with SM 4500 NO₃ F. The samples were analyzed on 04/20/2017.

The following sample(s) was received with less than 2 days remaining on the holding time or less than one shift (8 hours) remaining on a test with a holding time of 48 hours or less. As such, the laboratory had insufficient time remaining to perform the analysis within holding time: 20170418MW-02 (460-131878-1).

No difficulties were encountered during the Nitrate analysis.

All quality control parameters were within the acceptance limits.

TOTAL ORGANIC CARBON

Samples 20170418MW-02 (460-131878-1), 20170418MW-06 (460-131878-2), 20170418MW-03 (460-131878-3), 20170418MW-07R (460-131878-4) and 20170418MW-04 (460-131878-5) were analyzed for total organic carbon in accordance with SM 5310B. The samples were analyzed on 04/20/2017.

No difficulties were encountered during the TOC analysis.

All quality control parameters were within the acceptance limits.

Table 3: Gene-Trac Dhc Control Results, Test Reference S-4300

Laboratory Control	Analysis Date	Control Description	Dhc 16S rRNA		Comments
			Spiked Gene Copies per Liter	Recovered Gene Copies per Liter	
Positive Control Low Concentration	25-Apr-17	Genomic DNA (CSLD-1067)	1.3 x 10 ⁷	2.0 x 10 ⁷ ⁽⁴⁾	See Note 4
Positive Control High Concentration	25-Apr-17	Genomic DNA (CSHD-1067)	2.2 x 10 ⁹	2.4 x 10 ⁹	Passed
Extraction Control	25-Apr-17	Extraction Control (KB-0545)	2.6 x 10 ¹¹	2.7 x 10 ¹¹	Passed
DNA Extraction Blank	25-Apr-17	Sterile Water (FB-2805)	0	2.6 x 10 ³ U	Passed
Negative Control	25-Apr-17	Reagent Blank (TBD-1026)	0	2.6 x 10 ³ U	Passed
