## 1.0 INTRODUCTION

The Former EMCA site occupies 0.3 acres of land in a mixed residential/industrial area in the Village of Mamaroneck, New York (see Figures 1 and 2). The site was formerly owned and operated by a subsidiary of Rohm and Haas Company (Rohm and Haas) who manufactured high conductivity precious metal paste at the site. Manufacturing was discontinued in 1988 and the current site owner is Altice – USA.

Environmental site investigations performed by URS Corporation (URS), an AECOM company, revealed that groundwater beneath the site was contaminated with 1,1,2-trichloro-1,2,2-trifluoroethane (Freon 113, CAS No. 76-13-1). The site was listed on the New York Registry of Inactive Hazardous Waste Disposal Sites and a Consent Order was signed between the New York State Department of Environmental Conservation (NYSDEC) and Rohm and Haas in March 1999. Rohm and Haas implemented remediation to address impacted groundwater at the site. The initial remedial technology consisted of anaerobic biodegradation and reductive dechlorination of Freon 113 through injection of food-grade emulsified soybean oil, sodium lactate, and specialized bacteria into the subsurface. Remedial actions using this technology were conducted during the following events:

- Pilot program in June 2003
  - Interim remedial measure in November 2004
  - Supplemental injection in August 2007
  - Supplemental injection in September 2009
  - Supplemental injection in October 2012
  - Supplemental injection in June 2013
  - Supplemental injection in October 2014

The original release was thought to be in the vicinity of monitoring well MW-03 and the pilot program injections were focused on that area. As additional data were obtained, injection areas included the area of groundwater monitoring wells MW-02, MW-06, and MW-07/MW-07R and piezometer GZ-06. The 2012, 2013, and 2014 supplemental injections also included the KB-1 Plus® bacteria culture, developed by SiREM Laboratory in Guelph, Ontario, Canada, as a biological amendment to the emulsified soybean oil and sodium lactate injections. The KB-1 Plus® bacteria culture contains a

proprietary mixture of dehalobacter and dehalococcoides strains formulated by the laboratory to stimulate biological dechlorination of Freon.

Additional remedial injections were performed in October and November 2017 using PlumeStop® Liquid Activated Carbon™ (PlumeStop). PlumeStop is a remediation amendment manufactured by Regenesis Corporation (Regenesis) composed of very fine activated carbon particles that adsorb contaminants and promote bioremediation processes. The injections were conducted between October 23 and November 3, 2017. Details of the PlumeStop injections are presented in Groundwater Sampling and Analysis Report for the October and December 2017 Sampling Events and Summary of 2017 Supplemental Injection Event (AECOM, 2018).

The groundwater monitoring program generates data used to monitor the effectiveness of remedial actions performed at the site. The frequency of groundwater sampling was temporarily increased from semi-annually to quarterly following a discussion with Rohm and Haas, AECOM, and the NYSDEC in January 2017. The July 2018 groundwater sampling event was the thirtieth site-wide sampling event since the interim remedial measure (IRM) began in November 2004 and the third site-wide sampling event following the October/November 2017 PlumeStop injections.

## 2.0 GROUNDWATER SAMPLING AND ANALYSIS

On July 10, 2018, AECOM collected groundwater samples from monitoring wells MW-02, MW-03, MW-04, MW-06 and MW-07R (see Figure 2 for well locations). The samples were collected from passive diffusion bags (PDBs) installed in each well for analysis of Freon compounds and methane. The PDBs were installed in the wells immediately following sampling on January 30, 2018. Low-flow sampling procedures were used for the collection of samples for all other parameters listed below.

The sample chain-of-custody (COC) was initiated immediately after the groundwater samples were collected and maintained through shipment to the laboratory. Laboratory analyses were performed for the following parameters:

Parameter	Analytical Method
Freon 113, Freon 123a, Freon 1113	SW8260B
Methane	RSK-175
Sulfate	ASTM D516-90, 02

In addition, the following analyses were performed on samples collected in order to generate additional natural attenuation groundwater data:

Parameter	Analytical Method
Total Iron	200.7
Ferrous Iron	Field Parameter
Nitrate	SM 4500-NO <sub>3</sub> F
Nitrite	SM 4500-NO <sub>2</sub> F
Hardness	SM 2340 C
Alkalinity (Total, HCO <sub>3</sub> <sup>-</sup> , CO <sub>3</sub> <sup>-</sup> , OH <sup>-</sup> )	SM 2320 B
Total Organic Carbon	SM 5310 B

During the July 2018 sampling event, the depth to groundwater and water quality parameter measurements of ferrous iron, dissolved oxygen, oxidation-reduction potential, pH, specific conductance, temperature, and turbidity were recorded during the purging process. The field purge logs are presented in Appendix A.

Groundwater levels were recorded from site wells on July 10, 2018. The data are presented in Table 1. Groundwater elevation contours for the July 10, 2018 sampling event are shown on Figure 3.

Typically, general groundwater flow is to the north. The groundwater contours for the July 2018 data as shown in Figure 3 show flow from the south to a low point in the vicinity of wells MW-03 and MW-07R, which is somewhat typical for the site. Regional groundwater flow is expected to be to the north toward the Sheldrake River. Monitoring of the Sheldrake River water surface level from the Benchmark B location was discontinued in 2015 due to traffic safety concerns for the field personnel taking the measurements. A surface water measurement was recorded from the Benchmark D location.

### 3.0 RESULTS

The analytical results for the July 2018 sampling event are provided in Table 2. Historical groundwater analytical results are presented in Appendix B. Laboratory data sheets and a data usability summary report (DUSR) for the July 2018 samples are provided in Appendix C.

The analytical results presented in Table 2 are compared to groundwater standards and guidance values presented in the New York State Department of Environmental Conservation (NYSDEC) Technical and Operational Guidance Series Memo 1.1.1 (TOGS 1.1.1). It is noted that there are no TOGS 1.1.1 groundwater standards or guidance values specifically for Freon 113, Freon 123a, or Freon 1113. However, consistent with TOGS 1.1.1, the Freon results are compared to the "principal organic contaminant" standard for groundwater of 5 micrograms per liter ( $\mu\text{g}/\text{L}$ ).

There are no criteria for most of the natural attenuation parameters. Evaluation of the results for those parameters generally consists of comparing the new results to historical data to evaluate whether conditions in the formation remain favorable to biodegradation/natural attenuation.

The sampling results for all parameters are presented in Table 2. Figure 4 presents only the Freon 113, 123a, and 1113 results. None of the samples contained Freon 113 or Freon 123a. Freon 1113 was only detected in the samples collected from wells MW-02 and MW-07R, at concentrations of 2.3  $\mu\text{g}/\text{L}$  and 3.7  $\mu\text{g}/\text{L}$ , respectively, which are below the 5  $\mu\text{g}/\text{L}$  NYSDEC standard.

## 4.0 DATA ASSESSMENT

Appendix B presents the historical groundwater analytical data dating back to the pilot program in 2003. Using this data, Freon 113, Freon 123a, and Freon 1113 concentrations are shown in plan view in Figure 4 for the 10-year period between 2008 and 2018. The historical data were also used to create trend plots for the following parameters:

- Freon 113 - Figures 5 and 6
  - Freon 123a - Figure 7
  - Freon 1113 - Figure 8
  - Sulfate - Figure 9
  - Methane - Figure 10
  - Dissolved Oxygen - Figure 11
  - Dissolved Oxygen vs. Temperature in MW-02 – Figure 12
  - Oxidation-Reduction Potential - Figure 13

The text below presents a discussion of the July 2018 data compared to the December 2017 data, followed by an assessment of the historical results over time. Table 3 presents a summary comparison of January and July 2018 parameter concentration trends.

Freon 113

In comparison with the January 2018 results, the analytical results for the July 2018 sampling event (Table 2 and Figures 5 and 6) indicate that Freon 113:

- Remained non-detect in MW-02 in January and July 2018;
  - Remained non-detect in MW-03 in January and July 2018;
  - Remained non-detect in MW-04 in January and July 2018;
  - Remained non-detect in MW-06 in January and July 2018; and
  - Remained non-detect in MW-07R in January and July 2018.

In well MW-02, the Freon 113 concentration has decreased over the course of the treatment program. As shown in Appendix B, the highest concentration of 2,400 µg/L occurred in July 2001 prior to the treatment program. Freon 113 concentrations in well MW-02 varied greatly since the start of the treatment program in 2003 until the concentrations began decreasing in April 2012. During the period

between the June 2003 pilot injection and April 2012, Freon 113 concentrations in MW-02 varied between 12 µg/L and 1,300 µg/L. During the six sampling events between November 2012 and October 2015, the Freon 113 concentrations in MW-02 were below 100 µg/L. However, Freon 113 concentrations rebounded starting in April 2016. Because Freon is no longer used at the site, that increase did not indicate a new release, but was likely due to groundwater impacts from a residual source. The samples collected following PlumeStop treatment have shown no Freon 113.

Wells MW-03 and MW-07R had the highest Freon 113 concentrations prior to the remediation program and showed the greatest reduction as a result of the treatment program. The Freon 113 concentration of 0.81 µg/L (October 2014) in MW-03 was below TOGS 1.1.1 criteria and was non-detect in November and December 2014. An increase of Freon 113 at MW-03 in March and April 2015, in April and October 2016, and April and July 2017 coincides with increases in the concentration of the Freon 123a and Freon 1113 daughter products, indicating ongoing reduction of Freon 113. The relatively low-level Freon 113 concentration in MW-07R (15 µg/L) in October 2014 decreased to non-detect in the 11 subsequent sampling events.

Freon 113 has not been detected in well MW-04 since April 2015.

Freon 113 was not detected in MW-06 in the July and October 2014 sampling events, increased slightly to 1.6 µg/L in April 2015, and decreased to non-detect in October 2015 and April and October 2016. The concentration of Freon 113 increased slightly to 5.5 µg/L in April 2017 then decreased to 4.4 µg/L in July 2017. The Freon 113 concentration increased in October 2017 to 18 µg/L, then decreased to below the detection limit in December 2017 and January and July 2018.

#### Freon 123a

Freon 123a and Freon 1113 are the expected reductive dechlorination daughter products of Freon 113. Freon 123a holds one less chlorine than Freon 113, while Freon 1113 holds two less chlorines than Freon 113. With the reductive dechlorination of Freon 113, the concentrations of these daughter compounds are expected to increase and then eventually decline over time as reductive dechlorination continues and the residual source diminishes. The following text presents a discussion of the July 2018 Freon 123a results in comparison with the January 2018 results.

Compared to the January 2018 data, the analytical results for the July 2018 sampling event (Figure 7) indicate that Freon 123a:

- Remained non-detect in MW-02 in January and July 2018;
- Remained non-detect in MW-03 in January and July 2018;
- Remained non-detect in MW-04 in January and July 2018;
- Remained non-detect in MW-06 in January and July 2018; and
- Remained non-detect in MW-07R in January and July 2018.

In well MW-02, the Freon 123a concentration has been variable over the course of the treatment program, ranging from non-detect to 220 µg/L (April 2016). The results show a significant decrease since April 2017 to below criterion in December 2017 and non-detect in January and July 2018.

The highest Freon 123a concentration in well MW-03 (140 µg/L) was detected in April 2017; concentrations have steadily decreased since that time to non-detect since December 2017.

Freon 123a has never been detected in well MW-04.

Freon 123a was detected above the groundwater criteria in well MW-06 in seven sampling events, with the two most recent exceedances occurring in April and October 2017. Freon 123a in MW-06 has been non-detected since December 2017.

Freon 123a concentrations in well MW-07R have remained well below TOGS 1.1.1 criteria since September 2012.

#### Freon 1113

Compared to the January 2018 data, the analytical results for the July 2018 sampling event (Figure 8) indicate that Freon 1113:

- Increased in MW-02 from a concentration of 1.6 µg/L in January 2018 to 2.3 µg/L in July 2018;
- Remained non-detect in MW-03 in January and July 2018;
- Remained non-detect in MW-04 in January and July 2018;
- Remained non-detect in MW-06 in January and July 2018; and

- Decreased in MW-07R from a concentration of 5.1 µg/L in January 2018 to 3.7 µg/L in July 2018.

Prior to and at the beginning of the treatment program, Freon 1113 was either not detected or was present at very low concentrations. As the treatment program progressed, Freon 1113 concentrations increased, indicating the successful reduction of Freon 113. The October 2016 and April 2017 concentrations of Freon 1113 in wells MW-02 and MW-03 were the highest levels ever detected in those wells.

#### Sulfate

In comparison with the January 2018 data, the July 2018 sulfate concentrations decreased in all wells except MW-02 (Figure 9).

Studies have shown that the presence of sulfate in anaerobic environments above 200 mg/L slows the rates of dehalogenation reactions because sulfate competes with the halogenated compounds as electron acceptors (USGS, 2009). Sulfate concentrations in groundwater at the site have remained well below 200 mg/L.

#### Methane

Degradation of Freon is likely due to sulfate-reducing or methane-forming microbes (Horneman, 2007). Historical site data shows increased methane concentrations during the treatment programs, suggesting that reduction of Freon concentrations may be due to contaminant degradation through methanogenesis, a process that was successfully stimulated as a result of the treatment injection program. In the treatment areas, methane concentrations following injection events generally rose to levels well above 5,000 µg/L, compared to a maximum concentration of 740 µg/L prior to the start of the treatment program.

Methane concentrations were above 3,000 µg/L in wells MW-02 and MW-06 in April 2017, suggesting increased methanogenesis. The concentrations in these wells decreased significantly in July 2017. In October 2017, methane concentrations increased to above 3,000 µg/L in wells MW-02, MW-03, MW-06, and MW-07R; methane concentrations decreased to below 3,000 µg/L in MW-02, MW-06, and MW-07R but remained above 3,000 µg/L in MW-03 in December 2017. In January 2018, methane concentrations were considerably lower in wells MW-03 and MW-04, but increased to above 3,000 µg/L

in wells MW-02, MW-06, and MW-07. In July 2018, the methane concentration decreased to well below 3,000 µg/L in well MW-02 and remained below 3,000 µg/L in well MW-04. Methane concentrations were above 3,000 µg/L in wells MW-03, MW-06, and MW-07R (Figure 10).

## Dissolved Oxygen

The dissolved oxygen levels have been below detection limits in all of the wells since December 2017 (Figure 11). Historically, dissolved oxygen concentrations have fluctuated significantly, from highs as much as 9 mg/L down to below detection limits. Overall, levels are generally low, reflecting anaerobic conditions.

## Temperature

Historical temperature measurements show an apparent correlation of groundwater temperature with seasonal weather conditions; groundwater is cooler in the winter/spring and warmer in the summer/fall. As an example, Figure 12 presents a graphical presentation of temperature data for well MW-02 dating back to February 2008. The July 2018 temperature measurements were approximately 11 degrees Celsius higher than measurements recorded in January 2018. The temperature data suggests that groundwater at the site area is influenced by changes in seasonal weather conditions/precipitation infiltration. Figure 12 also shows dissolved oxygen concentrations in MW-02; dissolved oxygen is typically inversely proportional to temperature.

## Oxidation-Reduction Potential

In comparison with the January 2018 data, the July 2018 oxidation-reduction potential values increased in wells MW-02, MW-03, and MW-07R and decreased in wells MW-04 and MW-06; the oxidation-reduction potential values remain negative in all five wells (Figure 13). Oxidation-reduction potential values have typically been negative throughout most of the treatment program.

## Dehalococcoides and Dehalobacter

Between 2012 and 2017, select wells were periodically sampled for dehalococcoides and dehalobacter to better understand microbial populations necessary for Freon degradation (see Table 2). No samples were analyzed for dehalococcoides or dehalobacter during the July 2018 event.

## 5.0 CONCLUSIONS

In October and November 2017, a total of 9,600 pounds of PlumeStop was injected at the site to adsorb residual Freon compounds and promote bioremediation processes. The treatment area focused on the vicinity of wells MW-02, MW-03, and MW-06. After the last PlumeStop injection (November 2017) PDBs have been used to obtain groundwater samples without PlumeStop constituents (e.g., carbon).

The absence of Freon 113 and Freon 123a in the groundwater demonstrates the success of the PlumeStop treatment program. Although the July 2018 results show the presence of Freon 1113, detected in wells MW-02 and MW-07R (at concentrations of 2.3 µg/L and 3.7 µg/L), those concentrations are below the criterion (5 µg/L) and should continue to decrease as the parent products are no longer present.

## 6.0 CONTINGENCY TRIGGER EVALUATION AND NEXT STEPS

In response to increasing levels of Freon 113, particularly in well MW-02, AECOM implemented PlumeStop injections in October and November 2017. Section 4.0 of the Site Management Plan (SMP) (URS, 2010) specifies criteria that would trigger additional remediation measures. Based on the groundwater sampling data collected in July 2018, no additional remediation is required.

Section 2.2.2 of the SMP specifies criteria to terminate groundwater monitoring activities. In order to achieve these criteria, Freon 113, Freon 123a, and Freon 1113 concentrations must be at or below 5 µg/L for three consecutive sampling events. Groundwater sampling data from wells MW-02, MW-03, MW-04, and MW-06 have achieved these criteria. The MW-07R Freon 113 and 123a results from the last two sampling events have also met these criteria. The Freon 1113 in the sample collected from well MW-07R in December 2017 was slightly above the criterion (13 µg/L), just above the criterion in January 2018, and below the criterion in July 2018.

AECOM recommends discontinuing the Freon remediation and groundwater sampling activities and delisting the site because the intent of the Consent Order remediation program has been met; all of the wells have achieved the goal of contaminant concentrations below the groundwater criterion of 5 µg/L. While Freon 1113 was detected in well MW-07R at concentrations slightly above the groundwater criterion in December 2017 and January 2018, it can be expected that concentrations will continue to decrease because the parent products (Freon 113 and Freon 123a) are no longer present. Furthermore, the minimal residual Freon 1113 present in well MW-07R does not pose a potential risk to human health as the area is supplied with public drinking water.

It is noted that NYSDEC is compiling data for emerging contaminants 1,4-dioxane and per- and polyfluoroalkyl substances (PFAS) from sites across New York State. In accordance with NYSDEC's letter request dated April 6, 2018, AECOM will sample upgradient well GZ-06 and downgradient wells MW-04 and MW-05 for 1,4-dioxane and PFAS analyses.

## Notes:

- 1) All of the monitoring well and benchmark locations were resurveyed on 6/25/2010.
  - 2) Monitoring well GZ-03 was modified from a stick-up well to a flush-mount well on 6/24/2010 and resurveyed.
  - 3) Benchmark C could not be calculated because of a safety issue at Benchmark B.
  - 4) Benchmark D water surface elevation was taken from culvert approximately 10 feet from concrete support of North bridge.

# LOW FLOW GROUNDWATER PURGING/SAMPLING LOG

Project: Dow/ Rohm & Haas, former EMCA

Site: Mamaroneck, NY

Well I.D.: MW-0X

Date: 7/10/18

Sampling Personnel: Megan Dascoli + John Crespo

Company: AECOM/URS

Purging/  
Sampling

Device: Low Flow/ Peristaltic Pump- Geopump

Tubing Type: HDPE & Silicone

Pump/Tubing  
Inlet  
Location:

10'

Measuring Point: Below Top of Riser

Initial Depth to Water:

5.57

Depth to Well Bottom:

11.61

Well Diameter:

1"

Screen Length:

10'

Casing  
Type:

PVC

Volume in 1  
Well Casing  
(liters):

Estimated  
Purge  
Volume  
(liters):

Sample ID: 2018 0710 MW-0X

Sample Time:

10:55 - Methane + Freon  
12:05 - REST

QA/QC:

Sample Parameters: Freon 113, 123a, 1113; Methane; Sulfate, alkalinity, hardness, nitrogen-nitrate, TOC, total iron- TestAmerica, Edis Ferrous Iron is field test only, don't put on CoC

## PURGE PARAMETERS

**Estimated  
Purge  
Volume  
(liters):**

Sample ID: 20180710 MW - 06

Sample 1305 Front Method  
Time: 14:00 Remarks QA/QC:

Sample Parameters: Freon 113, 123a, 1113; Methane; Sulfate, alkalinity, hardness, nitrogen-nitrate, TOC, total iron- TestAmerica, Edis Ferrous Iron is field test only, don't put on CoC

## PURGE PARAMETERS

**Information:** WATER VOLUMES--0.75 inch diameter well = 87 ml/ft; 1 inch diameter well = 154 ml/ft; 2 inch diameter well = 617 ml/ft;  
4 inch diameter well = 2470 ml/ft ( $\text{vol.} = \pi r^2 h$ )

**Remarks:**

Bottom - clear; no odor 10 min. into practice  
End - " as in

## **LOW FLOW GROUNDWATER PURGING/SAMPLING LOG**

Project: Dow/ Rohm& Haas, former EMCA

**Site:** Mamaroneck, NY

Well I.D.: MW-07R

Date: 7/10/18

Sampling Personnel: Megan Dascoli + John Green

Company: AECOM/JRS

## Purging/ Sampling

Device: Low Flow/ Peristaltic Pump- Geopump

Tubing Type: HDPE & Silicone

Pump/Tubing  
Inlet

18

Measuring Below Top of Initial Depth  
Point: Riser to Water: 6, 11

Depth to Well Bottom: 19.72 Well Diameter:

Casing  
Type:

PVC

Volume in 1  
Well Casing  
(liters):

Estimated  
Purge  
Volume  
(liters):

Sample ID: 20180710 MW-07R

Sample Time:

Q. 35 - From methanol (5 total)

10:35 - Remashal QA/QC

Sample Parameters: Freon 113, 123a, 1113; Methane; Sulfate, alkalinity, hardness, nitrogen-nitrate, TOC, total iron- TestAmerica, Edis Ferrous Iron is field test only, don't put on CoC

#### **PURGE PARAMETERS**

**Information:** WATER VOLUMES--0.75 inch diameter well = 87 ml/ft; 1 inch diameter well = 154 ml/ft; 2 inch diameter well = 617 ml/ft

4 inch diameter well = 2470 ml/ft. ( $\pi \times 1^2 \times h$ )

**Remarks:**

MES--0.75 inch diameter well = 87 ml/ft; 1 inch diameter well = 154 ml/ft; 2 inch diameter well = 617 ml/ft;  
4 inch diameter well = 2470 ml/ft (vol<sub>cyl</sub> =  $\pi r^2 h$ )  
**NOTE:** AT Start water was clear, FAINT ODOR (SWEET). REWON  
NO SUSPENDED PARTICLES  
AT END - CLEAR, NO ODOR

## APPENDIX B

## I. INTRODUCTION

This Data Usability Summary Report (DUSR) has been prepared following the guidelines provided in New York State Department of Environmental Conservation (NYSDEC) Division of Environmental Remediation *DER-10, Technical Guidance for Site Investigation and Remediation, Appendix 2B - Guidance for Data Deliverables and the Development of Data Usability Summary Reports*, May 2010. This DUSR discusses the analytical data for five (5) groundwater samples and one (1) trip blank collected on July 10, 2018, as summarized on Table C-1. The sample aliquots for volatile organic compounds (VOCs) and methane were collected using passive diffusion bags. The aliquots for the remaining parameters were collected using a low-flow peristaltic pump sampling method.

## II. ANALYTICAL METHODOLOGIES

The groundwater samples were analyzed for the following parameters by TestAmerica Laboratories, Inc., (TA) located in Edison, New Jersey and Amherst, New York, as shown on Table C-1. The trip blank was analyzed for VOCs and methane only.

Parameter	Method No.	References
Volatile Organic Compounds *	SW8260C	1
Methane	RSK-175	2
Sulfate	ASTM D516-90, 02	3
Alkalinity (total, bicarbonate, carbonate, hydroxide)	SM 2320 B	4
Hardness	SM 2340 C	4
Total Iron	200.7	5
Nitrate	SM 4500-NO <sub>3</sub>	4
Nitrite	SM 4500-NO <sub>2</sub>	4
Total Organic Carbon (TOC)	SM 5310 B	4

### Notes:

\* - VOCs include 1,1,2-trichloro-1,2,2-trifluoroethane (Freon-113), 1,2-dichloro-1,1,2-trifluoroethane (Freon-123A), and chlorotrifluoroethene (Freon-1113).

### References:

- 3 ASTM International, most recent version.
- 4 Standard Methods of Examination of Water and Wastewater, 20<sup>th</sup> Edition, 1998.
- 5 40 CFR Part 136, most recent version.

### III. DATA VALIDATION PROCEDURES

A limited data validation was performed in accordance with the following USEPA Region II guidelines:

- *Validating Volatile Organic Compounds by Gas Chromatography/Mass Spectrometry SW-846 Method 8260B & 8260C, SOP No. HW-24, Rev. #4, October 2014;*
  - *ICP-AES Data Validation, SOP No. HW-3a, Revision 1, September 2016; and*
  - *Mercury and Cyanide Data Validation, SOP No. HW-3c, Revision 1, September 2016.*

The validated groundwater and field quality control (QC) analytical results are presented in Tables C-2 and C-3, respectively. Field parameters collected during this sampling event are also presented on Table C-2. Copies of the validated laboratory results (i.e., Form 1's) are presented in Attachment A. Copies of the case narrative, chain-of-custody, and documentation supporting the qualification of data are presented in Attachment B. Only problems affecting data usability are discussed in this report.

#### IV. DATA DELIVERABLE COMPLETENESS

The laboratory deliverable data package was in accordance with NYSDEC Analytical Services Protocol (ASP) Category B requirements.

## V. SAMPLE RECEIPT/PRESERVATION/HOLDING TIMES

All samples were received by the laboratory intact, properly preserved, and under proper chain-of-custody (COC).

## **VI. NONCONFORMANCES**

Sulfate was detected in the laboratory initial calibration blank at a concentration below the reporting limit (RL). Since the associated sample results were either above the RL or non-detect, no qualification of the data was necessary.

The nitrate matrix spike/matrix spike duplicate (MS/MSD) performed on sample MW-06 exhibited slightly low percent recoveries. The result for sulfate in this sample has been qualified 'J-'.

## VII. SAMPLE RESULTS AND REPORTING

All results and quantitation/detection limits were reported in accordance with method requirements and were adjusted for sample volume and dilution factors (where applicable). Results greater than the method detection limits but less than the RLs were qualified 'J' by the laboratory.

All groundwater samples were analyzed at dilutions for methane due to high concentrations. Two groundwater samples were analyzed at dilutions for sulfate.

## VII. SUMMARY

All sample analyses were found to be compliant with the method and validation criteria, except where previously noted. Those results qualified 'J-' are considered estimated with a low bias. AECOM does not recommend the recollection of any samples at this time.

**Prepared By:** Peter R. Fairbanks, Senior Chemist *PF*      **Date:** 7/31/18

**Reviewed By:** George E. Kisluk, Senior Chemist *Gek*      **Date:** 7/31/18

## **DEFINITIONS OF USEPA REGION II DATA QUALIFIERS**

- U – The analyte was analyzed for, but was not detected above the reported sample quantitation limit.
  - J – The analyte was positively identified; the associated numerical value is the approximate concentration of the analyte in the sample.
  - J- – The result is an estimated quantity, but the result may be biased low.
  - UJ – The analyte was not detected above the reported sample quantitation limit. However, the reported quantitation limit is approximate and may or may not represent the actual limit of quantitation necessary to accurately and precisely measure the analyte in the sample.
  - R – The sample results are rejected due to serious deficiencies in the ability to analyze the sample and meet quality control criteria. The presence or absence of the analyte cannot be verified.
  - D – The sample results are reported from a separate secondary dilution analysis.

**TABLE C-1**  
**SAMPLE AND ANALYSIS SUMMARY - JULY 10, 2018**  
**FORMER EMCA SITE, MAMARONECK, NEW YORK**

## Notes:

\* - Volatile Organic Compounds (VOCs) include 1,1,2-trichloro-1,2,2-trifluoroethane (Freon-113); 1,2-dichloro-1,1,2-trifluoroethane (Freon-123a); and chlorotrifluoroethylene (Freon-1113).

X - Parameter requested.

--- - Parameter not requested/analyzed or no comment.

GW - Groundwater

## TOC - Total Organic Carbon

<b>Dissolved Gases</b>							
Methane	UG/L	-	1,400	3,700	2,000	15,000	4,500
<b>Total Metals</b>							
Iron	UG/L	300	50,500	15,400	30,600	13,900	30,700
<b>Miscellaneous Parameters</b>							
Alkalinity, Total (as CaCO <sub>3</sub> )	MG/L	-	246	233	382	261	372
Alkalinity, Bicarbonate (as CaCO <sub>3</sub> )	MG/L	-	246	233	382	261	372
Alkalinity, Carbonate (as CaCO <sub>3</sub> )	MG/L	-	5.0 U				
Alkalinity, Hydroxide	MG/L	-	5.0 U				
Hardness (as CaCO <sub>3</sub> )	MG/L	-	402	284	774	314	608
Nitrogen, Nitrate	MG/L	10	0.040 J	0.026 J	0.025 J	0.016 J-	0.037 J
Nitrogen, Nitrite	MG/L	1	0.042 J	0.025 J	0.024 J	0.022 J	0.039 J
Sulfate	MG/L	250	44.4	22.7	5.0 U	47.9	5.0 U
Total Organic Carbon	MG/L	-	5.1	1.6	16.5	1.7	8.8
<b>Field Parameter</b>							
Dissolved Oxygen	MG/L	-	0 U	0 U	0 U	0 U	0 U
Oxidation-Reduction Potential	mV	-	-77	-75	-62	-74	-47
pH	S.U.	-	6.89	6.94	6.86	7.04	6.71
Specific Conductance	MS/CM	-	2.51	1.05	3.76	1.14	3.05

\*Criteria- NYSDEC TOGS (1.1.1), Ambient Water Quality Standards and Guidance Values and Groundwater Effluent Limitations, Class GA, Revised April 2000.

Flags assigned during chemistry validation are shown.

Concentration Exceeds Criteria

J - Analyte is reported below the PQL at an estimated concentration. (J-) - Estimated result biased low.

U - Not Detect; UG/L - Micrograms per Liter; MG/L - Milligrams per Liter

S.U. - Standard Units; MS/CM - Microsiemens per Centimeter; DEG C - Degrees Celsius; NTU - Nephelometric Turbidity Units; mV - Millivolts

MADE BY: \_\_PRF\_07/30/18\_\_ CHKD BY: \_\_AMK\_07/30/18\_\_

# CASE NARRATIVE

**Client: URS Corporation**

**Project: DOW Former EMCA, Mamaroneck**

**Report Number: 460-160263-1**  
**Revision #1**

This case narrative is in the form of an exception report, where only the anomalies related to this report, method specific performance and/or QA/QC issues are discussed. If there are no issues to report, this narrative will include a statement that documents that there are no relevant data issues.

It should be noted that samples with elevated Reporting Limits (RLs) as a result of a dilution may not be able to satisfy customer reporting limits in some cases. Such increases in the RLs are unavoidable but acceptable consequence of sample dilution that enables quantification of target analytes or interferences which exceed the calibration range of the instrument.

Calculations are performed before rounding to avoid round-off errors in calculated results.

All holding times were met and proper preservation noted for the methods performed on these samples, unless otherwise detailed in the individual sections below.

## **REVISION #1**

The following report required a revision: 460-160263-1. Details are as follows: The TOC batch MS/MSD (159911-1) was incorrectly calculated and reported as missing input in the original report.

## **RECEIPT**

The samples were received on 7/11/2018 7:50 PM; the samples arrived in good condition, properly preserved and, where required, on ice. The temperature of the cooler at receipt was 2.5° C.

## **Receipt Exceptions**

Limited sample volume was provided for the following samples for the Methane/VOC analysis: 20180710 MW-02 (460-160263-1), 20180710 MW-03 (460-160263-2), 20180710 MW-04 (460-160263-3), 20180710 MW-06 (460-160263-4) and 20180710 MW-07R (460-160263-5).

Note: All samples which require thermal preservation are considered acceptable if the arrival temperature is within 2C of the required temperature or method specified range. For samples with a specified temperature of 4C, samples with a temperature ranging from just above freezing temperature of water to 6C shall be acceptable. Samples that are hand delivered immediately following collection may not meet these criteria, however they will be deemed acceptable according to NELAC standards, if there is evidence that the chilling process has begun, such as arrival on ice, etc.

## **VOLATILE ORGANIC COMPOUNDS (GC-MS)**

Samples 20180710 MW-02 (460-160263-1), 20180710 MW-03 (460-160263-2), 20180710 MW-04 (460-160263-3), 20180710 MW-06 (460-160263-4), 20180710 MW-07R (460-160263-5) and TB20180710 (460-160263-6) were analyzed for Volatile organic compounds (GC-MS) in accordance with EPA SW-846 Methods 8260C. The samples were analyzed on 07/20/2018.

No difficulties were encountered during the volatiles analysis.

All quality control parameters were within the acceptance limits.

## **DISSOLVED GASES**

Samples 20180710 MW-02 (460-160263-1), 20180710 MW-03 (460-160263-2), 20180710 MW-04 (460-160263-3), 20180710 MW-06 (460-160263-4), 20180710 MW-07R (460-160263-5) and TB20180710 (460-160263-6) were analyzed for dissolved gases in accordance with RSK\_175. The samples were analyzed on 07/15/2018.

Methane failed the recovery criteria low for the MSD of sample 460-160271-4 in batch 480-424508.

Refer to the QC report for details.

Samples 20180710 MW-02 (460-160263-1)[88X], 20180710 MW-03 (460-160263-2)[88X], 20180710 MW-04 (460-160263-3)[22X], 20180710 MW-06 (460-160263-4)[88X] and 20180710 MW-07R (460-160263-5)[22X] required dilution prior to analysis. The reporting limits have been adjusted accordingly.

No other difficulties were encountered during the dissolved gases analysis.

All other quality control parameters were within the acceptance limits.

#### **TOTAL RECOVERABLE METALS**

Samples 20180710 MW-02 (460-160263-7), 20180710 MW-03 (460-160263-8), 20180710 MW-04 (460-160263-9), 20180710 MW-06 (460-160263-10) and 20180710 MW-07R (460-160263-11) were analyzed for total recoverable metals in accordance with EPA Method 200.7 (ICP). The samples were prepared on 07/13/2018 and analyzed on 07/14/2018.

No difficulties were encountered during the metals analysis.

All quality control parameters were within the acceptance limits.

#### **ALKALINITY**

Samples 20180710 MW-02 (460-160263-7), 20180710 MW-03 (460-160263-8), 20180710 MW-04 (460-160263-9), 20180710 MW-06 (460-160263-10) and 20180710 MW-07R (460-160263-11) were analyzed for alkalinity in accordance with SM 2320B. The samples were analyzed on 07/12/2018.

No difficulties were encountered during the alkalinity analysis.

All quality control parameters were within the acceptance limits.

#### **HARDNESS**

Samples 20180710 MW-02 (460-160263-7), 20180710 MW-03 (460-160263-8), 20180710 MW-04 (460-160263-9), 20180710 MW-06 (460-160263-10) and 20180710 MW-07R (460-160263-11) were analyzed for hardness in accordance with SM 2340C. The samples were analyzed on 07/17/2018.

No difficulties were encountered during the hardness analysis.

All quality control parameters were within the acceptance limits.

#### **SULFATE**

Samples 20180710 MW-02 (460-160263-7), 20180710 MW-03 (460-160263-8), 20180710 MW-04 (460-160263-9), 20180710 MW-06 (460-160263-10) and 20180710 MW-07R (460-160263-11) were analyzed for sulfate in accordance with ASTM Method D516-90. The samples were analyzed on 07/18/2018 and 07/23/2018.

Sulfate failed the recovery criteria low for the MSD of sample 460-160396-1 in batch 460-537578.

Refer to the QC report for details.

Samples 20180710 MW-02 (460-160263-7)[2X] and 20180710 MW-06 (460-160263-10)[2X] required dilution prior to analysis. The reporting limits have been adjusted accordingly.

No other difficulties were encountered during the sulfate analysis.

All other quality control parameters were within the acceptance limits.

#### **NITROGEN-NITRATE**

Samples 20180710 MW-02 (460-160263-7), 20180710 MW-03 (460-160263-8), 20180710 MW-04 (460-160263-9), 20180710 MW-06 (460-160263-10) and 20180710 MW-07R (460-160263-11) were analyzed for Nitrogen-Nitrate in accordance with SM 4500 NO<sub>3</sub> F. The samples were analyzed on 07/12/2018.

Nitrate as N failed the recovery criteria low for the MS/MSD of sample 20180710 MW-06 (460-160263-10) in batch 460-535690.

The presence of the '4' qualifier in the data indicates analytes where the concentration in the unspiked sample exceeded four times the spiking amount.

Refer to the QC report for details.

No other difficulties were encountered during the nitrate analysis.

All other quality control parameters were within the acceptance limits.

#### **TOTAL ORGANIC CARBON**

Samples 20180710 MW-02 (460-160263-7), 20180710 MW-03 (460-160263-8), 20180710 MW-04 (460-160263-9), 20180710 MW-06 (460-160263-10) and 20180710 MW-07R (460-160263-11) were analyzed for total organic carbon in accordance with SM 5310B. The samples were analyzed on 07/13/2018 and 07/16/2018.

No difficulties were encountered during the TOC analysis.

**All quality control parameters were within the acceptance limits.**
