Re: Letter Report for Recent Site Field Work
Hangar D, Bay 1, Westchester County Airport, White Plains, NY
XDD Project No. 28034

Dear Mr. Pergadia:

The purpose of the following letter report is to summarize the recent field work conducted at the above referenced site (Site), which included the installation of three additional monitoring wells (MWs), collection of soil samples in the vicinity of MW-2 (former source area), and groundwater sampling at all of the site monitoring wells. The work was performed in accordance with the Workplan for Monitor Well Installation and Soil and Groundwater Sampling, submitted to the New York State Department of Environmental Conservation (NYSDEC) and dated October 12, 1999. The workplan was revised to reflect the action items identified in the September 24, 1999 meeting between NYSDEC, Mobil (now ExxonMobil) and XDD.

1.0 OBJECTIVES

The objectives of the additional monitoring well installations and soil and groundwater sampling were to:

- Investigate the possible presence of an upgradient VOC source that may be impacting groundwater under the former Mobil hangar (specifically in the vicinity of MW-1);
- Obtain background (i.e., non-impacted) water quality data if no source is found upgradient of MW-1;
- Evaluate possible impacted groundwater flow from the source area towards the East;
- Evaluate whether the source of VOCs in the soil within the "hot spot" area have been reduced, through the action of SVE and natural attenuation, to within TAGM standards (and to levels generally representative of the level of VOCs measured in the soil gas and groundwater in that area);

- Evaluate the degree of VOC impact in shallow bedrock downgradient of the apparent source area; and
- Collect an additional round of groundwater samples to further evaluate ongoing natural attenuation processes at the site.

This report will discuss the monitoring well installations, and the soil and groundwater sampling locations, procedures and results.

2.0 MONITORING WELL INSTALLATION

2.1 Overburden Wells

Overburden monitoring wells MW-5 and MW-6 were installed to evaluate upgradient and sidegradient groundwater quality, respectively. The well locations are indicated on Figure 1. Boring logs and well installation reports are attached as Appendix A.

MW-5 was installed upgradient of MW-1 (approximately 60 feet northeast of Hanger D Bay 1) to determine if there is an upgradient source for VOC contamination and/or to provide a location for uncontaminated (background) water quality data for the Site. MW-5 was drilled to a depth of 15 feet below grade (bg) using a solid stem auger method. Ten feet of 10-slot, 2-inch inner diameter (ID) PVC wellscreen was installed from 15 to 5 feet bg in a filter pack followed by a bentonite seal. The well was finished with a locking well cap and a 6-inch flushmount road box.

MW-6 was installed approximately 18 feet east of the front office wall of Hanger D (approximately 95 feet to the north of MW-3) to evaluate the potential existence of a groundwater flow component in the easterly direction across the site, and to evaluate possible contamination that may have migrated along the bedrock-overburden interface. MW-6 was drilled to a depth coincident with the bedrock interface, approximately 20 feet bg, using a solid stem auger method. Five feet of 10-slot, 2-inch ID PVC wellscreen was installed from 20 to 15 feet bg in a filter pack followed by a bentonite seal. The well was finished with a locking well cap and a 6-inch flushmount road box.

During the installation of both wells, soil samples were collected at approximately 5-foot intervals, beginning at 3 to 5 feet bg, using split spoon sampling techniques. The soil samples were visually classified and screened with a PID for total VOCs using the jar headspace method. The results of the field screening are presented on the boring logs in Appendix A..

Immediately after installation both wells were developed using a submersible pump until discharge from the wells was visually clear. The development water was drummed, labeled and stored on site for later disposal by ExxonMobil.

2.2 Bedrock Well

One bedrock monitoring well (MW-7) was installed to evaluate potential VOC impact in the shallow bedrock downgradient of the apparent source area. The well location is indicated on Figure 1. The boring log and well installation report is attached as Appendix A.

MW-7 was installed inside the Phillip Morris bay approximately 55 feet downgradient of MW-2 to a final depth of 25 feet bg using a casing and coring drilling method. First, a solid stem 4-inch auger was drilled to 12 feet bg, coincident with the bedrock interface (groundwater was not encountered above bedrock). A permanent 3-inch casing was then spun inside of the borehole to a depth of approximately 14.5 feet bg and was grouted in place (approximately 2-2.5 feet into bedrock). Once the grout was set, the hole was cored with a 2-inch ID core barrel to depth. Ten feet of 10-slot, 2-inch ID PVC wellscreen was installed from 25 to 15 feet bg in a filter pack followed by a bentonite seal. The well was finished with a locking well cap and a 6-inch flushmount road box.

During the installation of MW-7, two soil samples were collected in the overburden using split spoon sampling techniques. The soil samples were visually classified and screened with a PID for total VOCs using a jar headspace method. . The results of the field screening are presented on the boring logs in Appendix A. The bedrock cores were collected and placed in a sample box for inspection. The upper portion of the cores indicated that the shallow bedrock was more fractured (approximately 4 fractures/foot) than the lower portion (approximately 1 fracture/foot).

Immediately after installation, the well was developed using a submersible pump until discharge from the well was visually clear. Developed water was drummed, labeled and stored on site for later disposal by ExxonMobil.

3.0 MW-2 AREA SOIL SAMPLING

In order to evaluate the current status of the VOC concentrations in the soil in the "hot spot" area, one soil boring (SB-101) was drilled adjacent to MW-2. Continuous split spoon sampling was conducted from the surface to bedrock (refusal at 16.5 feet bg). The soil samples were visually classified and screened with a PID for total VOCs using the jar headspace method. The results of the field screening are presented on the boring logs in Appendix A.

In addition, a composite soil sample was taken from each of the eight split spoon samples for laboratory analysis, which included VOCs (EPA Method 8260) and total petroleum hydrocarbons (TPH, EPA Method 418.1 via GC). Samples were labeled, packed in ice and shipped to Lancaster Laboratories in Lancaster, PA.

Low levels (below TAGM standards) of tetrachloroethene (PCE) were detected in 6 of the 8 samples. Other compounds, mainly degradation daughter products of PCE, were detected in 4 of the 8 samples. There was one compound in one of the samples that exceeded the NYSDEC TAGM Guidelines: 1,1-dichloroethane (11DCA) at a sampling interval of 10.5 to 12.5 feet bg (in the capillary fringe, just above the water table) was measured at 340 micrograms per Kilogram (ug/Kg); the Guideline for this compound is 200 ug/Kg. In general, the highest concentrations were detected at the groundwater table interface. TPH was not detected in any of the samples. The results of the soil sampling are presented in Table 1. The laboratory report is presented in Appendix B.

Because the highest concentration of 11DCA in the soil is in the capillary fringe just above the water table, it is possible that this detection results from the observed groundwater concentration of 11DCA at MW-2. To evaluate this possibility, the soil concentration that would result from the current groundwater concentration was calculated using the fraction of organic carbon (foc) content in the soil. The foc was estimated based on organic carbon analyses conducted during the RI in 1996. The calculation (presented in Appendix C) estimated that for a 11DCA groundwater concentration of 2,700 micrograms per Liter (ug/L) (current 11DCA concentration at MW-2) and a foc of 0.01 (1%), the corresponding 11DCA soil concentration would be approximately 1,215 ug/Kg. Therefore, the observed concentration of 340 ug/Kg can be fully explained by partitioning from the groundwater to the soil.

4.0 GROUNDWATER SAMPLING

Groundwater sampling was conducted at all of the Site monitoring wells on November 22-23, 1999 to evaluate ongoing natural attenuation processes at the Site. The sampling was conducted using low flow sampling techniques (as described in the Workplan) ten days after the installation and development of MW-5, -6 and -7. Following the stabilization of the field parameters, groundwater samples were collected for laboratory analysis, which included dissolved gases (EPA Method 8010/8020 for methane, ethane and ethene) and VOCs (EPA Method 8260). Samples were labeled, packed in ice and shipped to Lancaster Laboratories in Lancaster, PA.

During this sampling event, dissolved oxygen (DO) levels were less than 1 milligram per liter (mg/L) and oxidation-reduction potential (ORP) ranged from -105 to -251 millivolts (mV), indicating a reduced geochemistry state, which is amenable to anaerobic reductive dechlorination processes. The field measurements are presented in Table 2.

VOC concentrations (including historical data) are presented in Table 3. VOC concentrations were relatively consistent with previous sampling events with respect to compounds detected and their corresponding concentrations, with the exception of MW-4.

A primary line of evidence in support of effective natural attenuation processes is a stable or shrinking VOC plume. At MW-4, the most downgradient well, VOC concentrations continue to decrease, suggesting that the plume is receding. In addition, the VOC concentrations at MW-4 are within NYSDEC standards, indicating that these natural attenuation processes are providing mitigation of significant migration of VOCs from the source area.

VOCs were not detected in MW-5 and MW-6, thereby providing plume delineation in the upgradient and sidegradient (easterly) directions. VOCs, similar to those detected at MW-2, were detected in MW-7, including degradation breakdown products, which are indicative of ongoing reductive dechlorination processes. The laboratory report is presented in Appendix B.

On January 29, 2000, MW-7 was resampled to confirm the previous results and to investigate any obvious changes in VOC concentrations with depth (particularly with regard to the potential for higher concentrations at the lower portion of the well)¹.

All sampling was conducted using low flow sampling techniques with the objective of minimizing water table drawdown during the sampling (flowrates ranged between 150 and 250 milliliters per minute, mL/min). First, the pump inlet was placed at approximately 1 foot above the bottom of the well (24 feet bg) and sampled until the field parameters stabilized. Once the field parameters stabilized, laboratory samples for dissolved gases and VOC analyses were collected. The pump was removed and a clean pump was placed in the upper portion of the well (approximately 17 feet bg), and the same sampling process was conducted. Next, the well was purged at a higher flowrate (approximately 1,500 mL/min) for approximately 3 well volumes. Following the purge, the well was allowed to stabilize with respect to water table elevation, and then the sampling at the two depths was repeated as described above.

The field measurements were relatively similar between the four samples; DO levels were less than 1 mg/L and ORP ranged from +4 to -9 mV. With the exception of ORP and pH, the values were also similar to the previous sampling at MW-7. The MW-7 field measurements, including a comparison to the previous sampling, are presented in Table 4.

VOC concentrations were consistent between the four samples, with the previous sampling at MW-7. The MW-7 laboratory results, including a comparison to the previous sampling, are presented in Table 5. The laboratory report is presented in Appendix B.

An analysis was performed to determine if the VOC contamination in MW-7 was consistent with what would be expected in an overburden monitoring well the same distance downgradient from the source area (such an overburden well does not exist). Because the major VOC detected in the groundwater samples was 1,1-dichloroethane (11DCA), it was

¹ Note that Mobil and XDD understand that the use of this data is limited in that this bedrock well is installed with a filter pack that extends the entire length of the wellscreen.

selected as the parameter to be modeled for this analysis. As presented in the "Supplemental Data Collection Report", dated October 7, 1997, the Bioscreen half-life result for 11DCA is 1 year. Using the same values as the previous modeling for the required parameters, Bioscreen was utilized to predict the 11DCA concentration versus distance from the source. The results were then compared to current 11DCA concentrations at MW-2 and MW-4 to verify that the half-life is representative of the current site conditions.

Results of the current Bioscreen modeling indicate that at a distance of 55 feet downgradient of MW-2 (which is the approximate location of MW-7), the 11DCA concentration would be expected to be approximately 1,200 ug/L in the overburden. The 11DCA concentration at MW-7 (bedrock) was detected at approximately 1,300 ug/L, which is in general agreement with the Bioscreen projection. The Bioscreen output for this evaluation is presented in Appendix D.

The combination of the physical condition of the shallow bedrock (e.g., significant shallow fractures) and the similar concentrations between the projected overburden and the measured bedrock suggest that the shallow bedrock is behaving similar to the overburden with respect to VOC migration and natural attenuation. The results of this analysis do not suggest that a VOC source (i.e., dense non-aqueous phase liquid or DNAPL) exists in the bedrock.

5.0 CONCLUSIONS

Several conclusions were made with respect to the program objectives, based on the results of the most recent field work at the Site.

- Investigation upgradient of MW-1 (specifically in the vicinity of MW-5) did not locate the presence of a VOC source that is impacting groundwater under the former Mobil hangar.
- The laboratory results at MW-5 and MW-6 indicate non-detectable levels of VOCs (i.e., not impacted); therefore the wells provide upgradient and sidegradient plume delineation.
- The VOC results indicate the lack of any contaminant migration in the overburden from the source area in an easterly direction.
- Results of soil sampling in hot spot area indicate that soil VOC levels are below TAGM standards with the exception of one constituent in one sample.
- The one sample above TAGM standards was collected within the capillary fringe; however, an analysis of the soil concentrations shows that the VOCs likely result from partitioning from the impacted groundwater.

- VOCs were detected in the shallow bedrock (MW-7), 55 feet downgradient of MW-2. Based on the Bioscreen modeling, the VOC concentrations detected in the shallow bedrock are similar to that which would be expected in the overburden therefore indicating that no significant source of VOCs are present in the shallow bedrock in the source area. In conjunction with the fractured condition of the shallow bedrock, it appears that the overburden and the shallow bedrock are behaving similarly with respect to VOCs and natural attenuation processes.
- Results of the most recent groundwater sampling event indicate that reductive dechlorination is ongoing and the redox conditions of the groundwater environment are suitable to sustain further natural attenuation processes at the Site.
- Additionally, the consistent decrease in VOC concentrations at MW-4 (now below TAGM standards) indicates that the plume continues to recede, as would be expected in the presence of effective ongoing natural attenuation processes.

Should you have any questions regarding the contents of this submittal, please feel free to contact Greg Hill of ExxonMobil Remediation at (908) 474-2546.

Methane	-	9,600	14,000	1,500

Notes:

(1)

Positive detections are in **BOLD**.

Samples were analyzed for all VOCs as per EPA Method 8260. Only those compounds with detections are listed. All concentrations are reported in ug/L.

U

not detected (# preceding U indicates laboratory detection limits)

J

estimated concentration

-

no published standard

NA

not analyzed

*

Total VOCs do not include methylene chloride, which is presumed to be present due to laboratory procedures

**

Minimum detection limits for chloroethane, 1,1-dichloroethane, 1,1,1-trichloroethane and cis-1,2-dichloroethene were 100 ug/l for the sample collected at MW-2 on 12/16/97.

CAT NO.	ANALYSIS NAME	AS RECEIVED			DRY WEIGHT		
		RESULTS	METHOD	DETECTION LIMIT UNITS	RESULTS	METHOD	DETECTION LIMIT
5256 TPH by GC-FID (Soils)							
5257	Mineral Spirits	N.D.	3.	mg/kg	N.D.	3.	
4704	Gasoline	N.D.	3.	mg/kg	N.D.	3.	
4705	Kerosene	N.D.	3.	mg/kg	N.D.	3.	
4706	Diesel/#2 Fuel	N.D.	3.	mg/kg	N.D.	3.	
5258	#6 Fuel Oil	N.D.	10.	mg/kg	N.D.	10.	
5259	10W-40 Motor Oil	10.	J	10.	mg/kg	10.	J
TPH quantitation is based on peak area comparison of the sample pattern to that of a hydrocarbon component mix calibration in a range that includes C8 (n-octane) through C40 (n-tetracontane) normal hydrocarbons.							
The GC Fingerprint for this sample consists of a weak area of unresolved peaks eluting in the general range of our 10W 40 motor oil reference standard. Differences in relative area ratios suggest that the product present in the sample may be a heavier weight lubricating oil fraction than our reference standard.

CAT NO.	ANALYSIS NAME	AS RECEIVED			DRY WEIGHT		
		RESULTS	METHOD	DETECTION LIMIT UNITS	RESULTS	METHOD	DETECTION LIMIT
5256	TPH by GC-FID (Soils)						
5257	Mineral Spirits	N.D.	3.	mg/kg	N.D.	4.	
4704	Gasoline	N.D.	3.	mg/kg	N.D.	4.	
4705	Kerosene	N.D.	3.	mg/kg	N.D.	4.	
4706	Diesel/#2 Fuel	N.D.	3.	mg/kg	N.D.	4.	
5258	#6 Fuel Oil	N.D.	10.	mg/kg	N.D.	10.	
5259	10W-40 Motor Oil	N.D.	30.	mg/kg	N.D.	40.	
TPH quantitation is based on peak area comparison of the sample pattern to that of a hydrocarbon component mix calibration in a range that includes C8 (n-octane) through C40 (n-tetracontane) normal hydrocarbons.							
The GC Fingerprint for this sample is a pattern of partially resolved component peaks eluting in the range C18 (n-octadecane) through C40 (n-tetracontane) normal hydrocarbons. The overall sample pattern is unlike any of our petroleum distillate/product reference patterns and suggests the presence of nonpetroleum organic (hydrocarbon) material. If we calculate total sample area as petroleum distillate/product, it would be present at 24 mg/kg in the sample.							
The limit of quantitation for 10W 40 motor oil was increased due to the nature of the material present in the sample.

CAT NO.	ANALYSIS NAME	AS RECEIVED			DRY WEIGHT		
		RESULTS	METHOD	DETECTION LIMIT	RESULTS	METHOD	DETECTION LIMIT
5256	TPH by GC-FID (Soils)						
5257	Mineral Spirits	N.D.	3.	mg/kg	N.D.	3.	
4704	Gasoline	N.D.	3.	mg/kg	N.D.	3.	
4705	Kerosene	N.D.	3.	mg/kg	N.D.	3.	
4706	Diesel/#2 Fuel	N.D.	3.	mg/kg	N.D.	3.	
5258	#6 Fuel Oil	N.D.	10.	mg/kg	N.D.	10.	
5259	10W-40 Motor Oil	N.D.	30.	mg/kg	N.D.	30.	
TPH quantitation is based on peak area comparison of the sample pattern to that of a hydrocarbon component mix calibration in a range that includes C8 (n-octane) through C40 (n-tetracontane) normal hydrocarbons.							
The GC Fingerprint for this sample is a pattern of partially resolved component peaks eluting in the range C18 (n-octadecane) through C40 (n-tetracontane) normal hydrocarbons. The overall sample pattern is unlike any of our petroleum distillate/product reference patterns and suggests the presence of nonpetroleum organic (hydrocarbon) material. If we calculate total sample area as petroleum distillate/product, it would be present at 19 mg/kg in the sample.							
The limit of quantitation for 10W 40 motor oil was increased due to the nature of the material present in the sample.

5392	trans-1,2-Dichloroethene	N.D.	2.	ug/l
5393	1,1-Dichloroethane	1,300.	20.	ug/l
5395	cis-1,2-Dichloroethene	600.	20.	ug/l
.96	Chloroform	N.D.	1.	ug/l
5402	1,2-Dichloroethane	3.	J 2.	ug/l
5398	1,1,1-Trichloroethane	840.	10.	ug/l
5399	Carbon Tetrachloride	N.D.	1.	ug/l
5401	Benzene	N.D.	1.	ug/l
5403	Trichloroethene	290.	10.	ug/l
5404	1,2-Dichloropropane	N.D.	1.	ug/l
5406	Bromodichloromethane	N.D.	1.	ug/l
7583	2-Chloroethyl Vinyl Ether	N.D.	2.	ug/l
6307	cis-1,3-Dichloropropene	N.D.	1.	ug/l
6306	trans-1,3-Dichloropropene	N.D.	1.	ug/l
5408	1,1,2-Trichloroethane	N.D.	2.	ug/l
5411	Dibromochloromethane	N.D.	2.	ug/l
5419	Bromoform	N.D.	1.	ug/l
5407	Toluene	N.D.	2.	ug/l
5409	Tetrachloroethene	110.	1.	ug/l
5413	Chlorobenzene	N.D.	1.	ug/l
5415	Ethylbenzene	N.D.	2.	ug/l
6310	Xylene (Total)	N.D.	1.	ug/l
5421	1,1,2,2-Tetrachloroethane	N.D.	2.	ug/l

Poor surrogate recoveries were observed for the GC/MS volatile fraction.
The analysis was repeated and poor surrogate recoveries were again observed
indicating a significant matrix effect.

7105 Volatile Headspace Hydrocarbon

VOC Partitioning Calculation

COMPUTATION SHEET

Client Mobil

Site Westchester Co. Airport

Description Partitioning Calc.

Page 1 of 1

Job # 28034

Computed by A. Lee Date 3/3/00

Checked by S. CRAWFORD Date 3/8/00

OBJECTIVE:

Determine whether 1,1-dichloroethane (11DCA) soil contamination in the vicinity of MW-2/SB-101 is resulting from or contributing to the VOC concentrations in the groundwater.

ASSUMPTIONS:

1. Use organic carbon content value from previous investigation (RI report, 1996). At MW-2, organic carbon ~ 0.8%. For this calculation, a more conservative value of 1% was used, since 0.8% was the lowest value.
2. Partitioning coefficient, K_d (unitless) = $K_{oc} \times foc$,
where K_{oc} (unitless) = octanol-carbon coefficient = 45.0 for 11DCA¹
 $foc = 1\% = 0.01$, as above.

$$\text{Therefore, } K_d = 45.0 \times 0.01 = 0.45$$

APPROACH:

1. Estimate soil concentration based on groundwater concentration in the vicinity of MW-2. Soil concentration, C_s (ug/Kg), = $C_{aq} \times K_d$
where C_{aq} (ug/L) = groundwater concentration = 2,700 ug/L (as of 11/99)
 $K_d = 0.45$, as above.

$$\text{Therefore, } C_s = 2,700 \times 0.45 = 1,215 \text{ ug/Kg}$$

2. Compare calculated C_s (1,215 ug/Kg) to actual 11DCA soil concentration at SB-101. Maximum concentration was detected in the capillary fringe at a concentration of 340 ug/Kg. The actual concentration is 3.5 times less than would be expected if the soil VOC concentration was contributing to the groundwater concentration.

CONCLUSION:

11DCA soil contamination in the vicinity of MW-2/SB-101 is a result of the VOC-impacted groundwater.
