1. INTRODUCTION

1.1 PROJECT BACKGROUND

The New York State Department of Environmental Conservation (NYSDEC) tasked EA Engineering, P.C. and its affiliate EA Science and Technology (EA) to perform site management activities at the Roxy Cleaners site (NYSDEC Site Number [No.] 442024), which include groundwater sampling and oversight of the groundwater treatment plant by an investigation and response (I&R) contractor. The area is located in a suburban portion of Rensselaer County in North Greenbush, New York (**Figure 1**).

This Work Assignment (WA) is being conducted under the NYSDEC State Superfund Standby Contract (WA No. D009806-06). This site management report/groundwater sampling event includes activities completed by I&R contractor (LaBella Associates, formerly known as Aztech Environmental, Inc.) and EA from January 2019 through December 2020.

1.2 SITE HISTORY

From 1959 to 1998, Roxy Cleaners, Inc. operated a dry-cleaning establishment at this site and allegedly spilled dry-cleaning solvents, which resulted in contamination of the site's soil and groundwater. In 1990, NYSDEC initiated a remedial investigation (RI)/feasibility study (FS) to determine the extent of the contamination. Contaminants were found to be tetrachloroethene (PCE), trichloroethene (TCE), and 1,2-dichloroethene (DCE).

In January 1992, a vacuum extraction system was installed at the site as an interim remedial measure to remediate the on-site source of contamination. Approximately 350 pounds (lb) of PCE were extracted from the soil above the saturated zone using this system which operated from March through November 1992.

In March 1994, a Record of Decision (ROD) was completed for the site (NYSDEC 1994). According to the ROD, the remedy includes a groundwater extraction system consisting of three pumping wells. The collected water is treated by air stripping the volatile organic compounds (VOCs) prior to discharging to the Wynantskill Creek. Vapor emissions are treated by a vapor-phase, carbon adsorption system.

A water district was formed to serve residences in the impacted area of contamination. A waterline was extended to serve the impacted area from the City of Troy along Route 66 and Main Street to the site. Waterlines were also installed along Dodge Street, Ashcroft Street, Bellmeade Street, Orchard Terrace, and Lenox Avenue. Granular activated carbon filters were installed on private water supplies and were monitored until the new waterlines were installed. After completion of the remedial work described in the Phase I RI Report (Metcalf and Eddy 1992), some contamination was left in groundwater at the site, which is hereafter referred to as "remaining contamination". In June 1995, a Long-Term Monitoring Plan was prepared for the site (Malcolm Pirnie, Inc. 1995). Subsequently, in December 2004, a Monitoring Plan for Roxy Cleaners was instituted (Malcolm Pirnie, Inc. 2004). Routine groundwater sampling has been

performed on a five-quarter basis (every 15 months) since May 2008 to capture seasonal changes in groundwater elevation. Groundwater samples were collected during 19 sampling events conducted from October 1989 to February 2016 by several contractors, and analytical results indicate that the primary contaminants of concern are PCE, TCE, and cis-1,2-DCE.

A vapor intrusion evaluation investigation was completed in April 2006 to assess if soil vapor contamination existed in the vicinity of the site. The assessment evaluated the extent to which vapors, if detected, posed a threat to human health or the environment. As a result, three sub-slab depressurization systems were installed in January 2008 (one on-site and two on properties off-site).

A Site Management Plan (SMP) (EA 2013) was prepared to manage remaining groundwater contamination at the site until the site meets remedial goals. An update to the SMP (EA 2020a) was prepared under the current WA No. D009806-06 to include any changes made to the site and sampling program throughout the previous WA (D007624-14). A Remedial Site Optimization Report (EA 2016) was prepared to address the recommendation for remedial action optimization at the site. The most recent Periodic Review Report (EA 2020b) was prepared in 2020 to document the ongoing performance, effectiveness, and protectiveness of the selected remedy at the site.

1.3 OBJECTIVES

Site activities are being performed until such time as the periodic review establishes that the ROD (NYSDEC 1994) requirements have been met, or another basis for discontinuing system operations exists. Site activities currently include the following:

- Treatment system operations and maintenance (O&M)
- Groundwater sampling
- Groundwater level monitoring.

The purpose of the treatment system O&M is to evaluate the inspection and monitoring data, and to confirm that the remedy is performing properly, remain effective, and the Monitoring Plan (Malcolm Pirnie, Inc. 2004) is being implemented. The purpose of groundwater sampling at the site is to obtain samples that are representative of the aquifer in the vicinity of the wells and to determine the concentration of contaminants in the groundwater. This ensures that analytical results reflect the composition of the groundwater as accurately as possible. Groundwater analytical results will be used to modify the SMP (EA 2020a), as necessary. Treatment system sampling and groundwater sampling will be used to monitor the effects of the pump and treat system (e.g., mass removal and hydraulic containment). The sampling program consists of collecting monthly influent and effluent samples from the treatment system and collecting groundwater samples from monitoring wells throughout the target area (up to 13 overburden and 13 bedrock monitoring wells, and 1 temporary monitoring well) every 15 months (**Figure 2**).

This report was completed to discuss the weekly treatment system O&M inspections completed during the period from January 2019 to December 2020, to summarize the groundwater sampling completed in 2020, and to discuss the results of Remedial System Optimization (RSO) activities.

1.4 REPORT ORGANIZATION

Groundwater treatment system oversight details are provided in Section 2. Groundwater sampling methods and results are presented in Section 3. Results from the sampling of private residences are presented in Section 4. A discussion of the RSO work, including trend analysis, is presented in Section 5. Conclusions and recommendations are discussed in Section 6. References are provided in Section 7.

2. GROUNDWATER TREATMENT SYSTEM OVERSIGHT

2.1 TREATMENT SYSTEM OPERATIONS AND MAINTENANCE ACTIVITIES

The groundwater recovery and treatment system consists of three recovery wells and a shallow tray air stripper system. VOCs stripped from the groundwater are removed from the stripper exhaust air stream by granular activated carbon filters. The Roxy Cleaners treatment building is located on the north side of the former Roxy Cleaners building. Access to the treatment building is from Orchard Terrace, a local street which runs north from New York State (NYS) Route 66 west (**Figure 2**).

The three recovery wells are identified below:

- Recovery well RW-1 is a bedrock well located on the west side of the Roxy Cleaners building.

- Recovery well RW-2 is located adjacent to RW-1. This well withdraws water from the shallow aquifer in the overburden.

- Recovery well RW-3 is a bedrock well located on the south side of NYS 66 approximately 750 feet (ft) west of the Roxy Cleaners site, and about 75 ft southeast of the intersection of NYS Route 66 and Dodge Street.

Each of the recovery wells is equipped with a submersible well pump driven by a variable speed motor. The power and controls for these pumps originate at panels mounted in the treatment building located on the north side of the former Roxy Cleaners building. The electric power and control wiring are carried by conduits installed in the pipe trenches from the wells to the building.

Water pumped from the three recovery wells enters the treatment building in three separate pipelines. After passing through cartridge type water filters and individual flow meters, the flow from the three wells is combined in a single pipe, which leads to the top of the air stripper.

The air stripper consists of six trays mounted one above the other. The bottom of each tray contains a large number of small holes. Air is blown into the bottom of the air stripper and passes upward through these holes as the water flows over the trays in a thin layer and down through the air stripper unit. VOCs in the water are transferred into the air as it bubbles upward through the water. This air, with its accompanying VOCs, exits through the top of the air stripper and is carried in a duct to granular activated carbon filters which adsorb the contaminants. The purified air then passes out of the building through an exhaust stack. The water flows down through the trays to a compartment at the bottom of the air stripper and exits the building in a drainpipe.

Treated groundwater is discharged to the Wynantskill Creek on the south side of NYS Route 66 via a storm drain located on Orchard Terrace and is managed by a NYS SPDES permit equivalent. Treated groundwater samples are collected and sent to the NYSDEC laboratory for analysis of VOCs, metals, total suspended solids, and total dissolved solids. Analytical results are

compared to the effluent limitations and monitoring requirements established for the system (**Appendix A**) to ensure the treatment system is running effectively.

Procedures for operating and maintaining the groundwater pump and treat system are documented in the O&M Plan (Section 4 of the SMP [EA 2020a]). Weekly site inspections were conducted by Labella Associates, the I&R contractor. A site inspection form is completed as part of each inspection. Operating conditions at the site and any routine maintenance conducted are recorded on this form. Quarterly O&M activities are summarized in Quarterly Treatment System Site O&M Reports.

O&M activities included in this summary report were completed from 4 January 2019 to 31 December 2020. A summary of all the weekly inspections, maintenance, and monitoring activities is presented in the site inspection forms included in **Appendix B**. The following sections discuss the treatment system O&M for the period covered in this report.

2.2 TREATMENT SYSTEM MAINTENANCE

The treatment system was operational with minimal interruption from 4 January 2019 to 14 August 2020. Due to power outages, the system was down for periods of time during the weeks of 8 February and 9 August 2019. The system was restarted after each power outage. System down on arrival on 28 June 2019; the knock-out tank was drained, and the system was restarted. A new stripper blower was installed on 8 February 2019. The pump for recovery well RW-3 was observed to be in thermal overload during visits on 15 and 22 February 2019; however, the system was running. The pump could not be pulled on 15 February 2019 due to snow piles covering the well. On 22 February 2019, the pump's variable frequency drive was reset, and the pump was restarted. The pump was not observed to be in thermal overload following this restart.

The system was down from 14 through 28 August 2020 due to overfill and pressure issues with the air stripper. The air stripper was cleaned and restarted on 25 August 2020. On 28 August 2020, the system was down due to low air pressure in the air stripper, likely resulting from the clean and only running one of the three recovery wells. The discharge value was closed slightly to increase pressure within the system, which resolved the issue. The system continued to run uninterrupted through the beginning of December, when the system was down upon arrival on both 4 December and 11 December 2020 due to sump overfill. After restarting the system on 11 December 2020, it ran uninterrupted through the end of the monitoring period on 31 December 2020.

There were several intervals during this reporting period where one or more recovery wells were shut off, but the system continued to operate. The connection between the treatment system and the RW-1 transducer was accidentally cut during installation of the injection well INJ-2 on 15 March 2019. The connection was later restored in June 2019. Following the August 2019 pilot study injections, the overburden recovery wells were shut off to allow the injectate to propagate. RW-1 and RW-2 were shut off on 17 January and 15 May 2020, respectively. Both recovery wells RW-1 and RW-2 are still shutdown for this reason.

2.3 TREATMENT SYSTEM OPERATIONS

A total of 3,686,372 gallons (gals) of water were treated during the period from 4 January 2019 to 4 December 2020 and discharged to the Wynantskill Creek. The breakdown of treated volumes from each recovery well included 3,126,387 gal from RW-3 (84.81 percent of total), 555,055 gal from RW-2 (15.06 percent of total), and 4,930 gal from RW-1 (0.13 percent of total). The average discharge flow rate was 6,332 gal per day, or 4.40 gal per minute (gpm).

2.4 MONITORING ACTIVITIES

Aqueous samples (system influent and effluent) were collected on a monthly basis from January 2019 to December 2020.

2.4.1 State Pollutant Discharge Elimination System Monitoring

State Pollutant Discharge Elimination System effluent samples were collected from the air stripper discharge and submitted to the NYSDEC Division of Environmental Remediation Laboratory, Albany, New York, for the analysis of VOCs by U.S. Environmental Protection Agency (EPA) Method 601.

The contaminant values for the effluent sample were less than the stated discharge limitations for all analyzed chemicals.

2.4.2 Treatment System Influent Sampling and Analysis

Influent samples provide a basis for determining the mass of contaminants recovered from groundwater at the wells and are also used in determining the removal efficiency of the air stripper system. Influent samples were collected from the three individual recovery wells (RW-01, RW-02, and RW-03). Samples were collected from the influent lines from each of the three extraction wells in conjunction with the treatment system effluent samples. The results of these analyses are included in **Appendix C** and summarized in **Table 1A**. Samples have not been analyzed for metals since March 2012 (**Table 1B**).

2.4.3 Treatment System Sample Results

Analytical results for the recovery well samples were evaluated to determine the amount of contaminants removed from groundwater and to graph the trends in the recovery well contaminant concentrations. During the 2019 – 2020 reporting period, cis-1,2,-DCE removal ranged from 0.0001 lb/day to 0.0011 lb/day, PCE ranged from 0.0019 lb/day to 0.0373 lb/day, and TCE removal ranged from 0.0001 lb/day to 0.0004 lb/day. For comparison, during the 2018 reporting period, removals for each of these analytes was about the same as the combined 2019 and 2020 period. The lower removal rates in 2019 – 2020 are the result of recovery wells RW-1 and RW-2 being shut off in early 2020. The total contaminants removed during the period of this report are summarized in **Table 2**. Trend graphs for recovery well contaminant concentrations are included as **Figure 3**.

Analytical results from the influent and effluent samples demonstrate that the system is effectively removing the contaminants from the treated groundwater.

3. LONG-TERM GROUNDWATER MONITORING

In order to provide the data for compliance monitoring, groundwater sampling is performed on a five-quarter basis (every 15 months) to capture seasonal changes in groundwater elevation. The site includes a network overburden and bedrock groundwater monitoring wells that are currently used to monitor plume migration and provide a line of evidence necessary to demonstrate the effectiveness of the groundwater remediation. A total of 26 groundwater wells were included in the 2020 groundwater monitoring event, including the 23 monitoring wells included in the program, per the 2020 SMP update (EA 2020a), and three injection wells (INJ-1, INJ-2, and INJ-3) installed in April 2019 as part of RSO activities at the site. Two monitoring wells have had obstructions since at least 2013 and are no longer sampled (MW-5B and MW-102). Both wells are near other wells with similarly screened intervals that are currently included in the sampling program.

The groundwater sampling event completed in August 2020 is discussed below.

3.1 MONITORING WELL INSPECTIONS

Monitoring wells were inspected prior to gauging and sampling, and their condition was noted on the groundwater purge forms. During the August 2020 well inspections, 23 monitoring wells were located and inspected. As in the past, two monitoring wells (MW-101 and MW-102A) were not located. Location MW-101 has not been found since it was last sampled in 2014 and MW-102A has not been found since it was last sampled in 2016. Inspection results are provided in **Table 3**.

3.2 GROUNDWATER GAUGING

Groundwater levels were recorded at each monitoring well in August 2020, prior to the initiation of groundwater sampling to determine groundwater flow patterns in the overburden and bedrock and evaluate cones of influence created by the treatment system recovery wells. Depth to groundwater was measured from the top of the inner polyvinyl chloride casing using a water-level indicator. Groundwater depths and calculated groundwater elevations for each monitoring well location are provided in **Table 3**.

3.2.1 Overburden Monitoring Recovery Well Capture Zone

Groundwater elevations ranged from a high of 350.41 ft above mean sea level (amsl) (MW-1) to a low of 340.02 ft amsl (MW-105A). An interpreted overburden groundwater potentiometric surface map illustrating the direction of groundwater flow is shown on **Figure 4A**. Groundwater flow in overburden mimics topography, with flow in a westerly direction and a calculated horizontal gradient of 0.0125 ft/ft across the site.

3.2.2 Bedrock Monitoring Recovery Well Capture Zone

Groundwater elevations ranged from a high of 350.54 ft amsl (MW-1B) to a low of 338.56 ft amsl (MW-109). The interpreted groundwater flow pattern in bedrock is shown on **Figure 4B**. Groundwater flow in bedrock mimics topography, with flow in a westerly direction and a calculated horizontal gradient of 0.0125 ft/ft across the site. Interpolated bedrock groundwater contours indicate that there is a slight depression in groundwater elevations near RW-3 resulting from groundwater extraction.

3.3 GROUNDWATER SAMPLING

A total of 24 groundwater samples (plus two duplicate samples) were collected from the monitoring well network on 10 and 11 August 2020. Two monitoring wells (MW-101 and MW-102A) were not located. Monitoring wells were purged using a peristaltic pump, with a flow rate of approximately 0.3 liters per minute. Dedicated polyethylene tubing was used at each monitoring well location. Non-dedicated sampling equipment (i.e., the water-level indicator) was decontaminated between well locations to prevent cross-contamination.

Water quality parameters including temperature, potential hydrogen (pH), oxidation-reduction potential (ORP), conductivity, dissolved oxygen, and turbidity were monitored during purging using a Horiba U-52 water quality monitoring system with flow-through cell. In addition, the depth to water was measured throughout purging using a water level indicator. Water quality parameters and water levels were recorded on groundwater sampling purge forms provided in **Appendix D**.

Wells were purged until the field parameters stabilized at which time groundwater samples were collected for analysis of VOCs. Field parameters were considered stable when the following conditions were met for three consecutive readings:

- pH readings within ± 0.1 pH units
- ORP within ± 10 mV
- Dissolved oxygen within 0.3 milligrams per liter
- Specific conductance within ± 3 percent
- Turbidity measurements less than 50 nephelometric turbidity unit.

Due to rust from the steel casing, turbidity readings did not drop below 50 nephelometric turbidity units at MW-1B. The presence of rust has been an ongoing issue in MW-1B for the last three sampling efforts. Turbidity readings also did not drop below 50 nephelometric turbidity units at injection wells INJ-2 and INJ-3. Water at INJ-2 and INJ-3 contained excessive air bubbles as a result of the bioremediation reactions, which interfered with the optical turbidity sensor in the water quality meter. Groundwater samples were collected from these locations after all other parameters had stabilized.

Groundwater samples were collected using clean nitrile gloves and placed in laboratory supplied bottle ware containing appropriate preservatives. Samples were placed on ice in sample coolers immediately after collection to ensure proper preservation. Pertinent sample information was recorded on the associated chain-of-custody, and samples were shipped offsite under secure chain-of-custody protocol. VOC samples were shipped to Eurofins TestAmerica in Amherst, New York. Groundwater samples were analyzed for VOCs by EPA Method 8260B.

3.4 GROUNDWATER ANALYTICAL RESULTS

3.4.1 Overburden Monitoring Wells

Twelve overburden monitoring wells were sampled during the August 2020 sampling event (MW-1, MW-2, MW-3, MW-4, MW-101A, MW-103A, MW-105A, MW-106A, MW-107A, MW-108A, MW-111, and temporary well TW-5). Cis-1,2-DCE and PCE were the only analytes of concern detected at concentrations greater than its respective Ambient Water Quality Standards (AWQS). Groundwater analytical data for the August 2020 sampling event are summarized in **Table 4** and shown on **Figure 5**. Isopleths for PCE in the overburden wells are depicted on **Figure 6**. A summary of analytical results for the overburden monitoring well network is provided below. The analytical laboratory report is included as **Appendix E.**

PCE was detected in five overburden wells (MW-2, MW-103A, MW-107A, MW-111, and TW-5) with concentrations ranging from an estimated 4.2 micrograms per liter (μg/L) (MW-111) to 81 μg/L (MW-103A). In addition to MW-103A, concentrations were greater than the AWQS at three other locations: MW-2 with a concentration of 43 μg/L, MW-107A with a concentration of 13 μg/L, and TW-5 with a concentration of 28 μg/L.

TCE was detected at three overburden wells (MW-103A, MW-107A, and TW-5) at concentrations ranging from 1.4 to 4.2 μg/L. None of the TCE concentrations exceeded the AWQS of 5 μg/L.

Cis-1,2-DCE was detected at five overburden wells (MW-2, MW-101A, MW-103A, MW-107A, and TW-5) at concentrations ranging from 1.2 μg/L at TW-5 to 9.4 μg/L at MW-103A, where it exceeded the AWQS of 5 μg/L. In addition to MW-103A, concentrations were greater than the AWQS at two other locations: MW-2 with a concentration of 5.2 μg/L and MW-101A with a concentration of 8.0 μg/L.

Vinyl chloride was detected only at MW-101A, at a concentration of 1.6 μg/L.

3.4.2 Bedrock Monitoring Wells

Nine bedrock monitoring wells were sampled during the August 2020 sampling event (MW-1B, MW-2B, MW-3B, MW-4B, MW-104, MW-105, MW-106, MW-108, and MW-109). No analytes of concern were detected at concentrations greater than their respective

AWQS. Groundwater analytical data are summarized in **Table 4** and detailed in **Figure 5**. A summary of analytical results for the bedrock monitoring well network is provided below.

TCE, cis-1,2-DCE, and vinyl chloride were not detected in groundwater samples collected from any of the bedrock wells sampled in August 2020. PCE was detected at one location, MW-108, with a concentration of 1.1 μg/L, which is below the AWQS of 5 μg/L.

3.4.3 Bedrock Injection Wells

The three bedrock injection wells were sampled during the August 2020 sampling event (INJ-1, INJ-2, and INJ-3). Groundwater analytical data are summarized in **Table 4** and detailed in **Figure 5**. A summary of analytical results for the bedrock injection well network is provided below.

PCE was detected in two of the injection wells at concentrations above the AWQS: 14 μg/L at INJ-1 and 120 μg/L at INJ-3. TCE was detected in all three injection wells at concentrations above the AWQS ranging from 20 to 32 μg/L. Cis-1,2-DCE was detected in two of the injection wells at concentrations above the AWQS: 44 μg/L at INJ-1 and 190 μg/L at INJ-2. Vinyl chloride was detected only at INJ-1, at a concentration of 10 μg/L above the AWQS.

3.5 HISTORICAL GROUNDWATER RESULTS

Available historical data, as supplied by the NYSDEC, were tabulated and reviewed as part of the work assignment for this site and are presented in **Table 5**. Only the contaminants of concern (i.e., PCE, TCE, and cis-1,2-DCE) were tabulated as determined from past investigations and present data. The available data for the Roxy Cleaners site includes 21 groundwater sampling events completed from October 1989 to August 2020. Trend graphs for available historical analytical data at monitoring wells with contaminant of concern concentrations greater than the AWQS are provided in **Appendix F**.

Historical data reveal that eleven monitoring wells (MW-2, MW-101, MW-101A, MW-103, MW-103A, MW-105A, MW-107, MW-107A, MW-108, MW-111, and TW-5) have had concentrations of one or more analytes (PCE, TCE, and cis-1,2-DCE) greater than the AWQS standard of 5 μg/L, and ten additional wells (MW-2B, MW-3B, MW-108, MW-108A, MW-3, MW-102, MW-102A, MW-104, MW-105, MW-106) have had detections of one or more analytes below the AWQS.

3.5.1 Emerging Contaminants

Previously, on 3 December 2018, EA performed groundwater sampling for PFAS and 1,4-Dioxane in accordance with EPA Method 537 at six site monitoring wells (MW-1, MW-1B, MW-2, MW-2B, MW-111, and MW-107A). Sampling results were reported in a memorandum dated 2 April 2019. The samples collected from monitoring wells MW-111, MW-2, and MW-107A had concentrations exceeding the NYS Department of Health MCL of 10 ppt for PFOS (74 ppt, 20

ppt, and 13 ppt, respectively). No samples exceeded the NYS Department of Health MCL of 10 ppt for PFOA or the 1,4-dioxane guidance value of 0.35 ppb.

3.6 SUMMARY OF ANALYTICAL RESULTS

Both present and available historical data (**Tables 4** and **6**) were reviewed to analyze notable trends in CVOC concentrations, with the primary focus on the contaminants of concern: PCE, TCE, and cis-1,2-DCE. Historical analytical trend graphs (**Appendix F**) indicate that the overall concentrations of PCE, TCE, and cis-1,2-DCE have decreased in monitoring wells, particularly in the vicinity of the site where injections of CarBstrate™ occurred in August 2019 (discussed further in Section 4). As PCE and TCE are being reduced, several wells are displaying increases in concentrations of daughter products (cis-1,2-DCE and vinyl chloride), as expected when reducing conditions are present in the groundwater.

4. RESIDENTIAL WATER SAMPLING

The NYSDEC collected water samples from four downgradient residential properties along Main Avenue ([redacted]) in December 2019 to be analyzed for per- and polyfluoroalkyl substances (PFAS) via method ISO 25101:2009 (list of six analytes). These properties were selected for sampling given that they are downgradient of the site outside of the plume and on private wells. Samples from [redacted], and [redacted] Main Ave. were collected from water taps in the kitchen and the sample from [redacted] Main Ave was collected from a sampling port off of the water tank. Analytical results from the PFAS sampling event are presented in **Table 6** and analytical reports are included in **Appendix E**.

On May 19, 2016, EPA issued a lifetime health advisory of 70 parts per trillion (ppt) for long-term exposure to perfluorooctanoic acid (PFOA) and perfluorooctane sulfonate (PFOS) in drinking water. In 2020, the New York State Department of Health established a maximum contaminant level (MCL) of 10 ppt for both PFOA and PFOS separately in 2020. All PFAS results from the residential sampling were significantly below applicable standards.

Additional residential sampling occurred on 5 November 2020 from three properties on Main Avenue ([redacted]). The samples from [redacted] and [redacted] Main Ave were collected via an outdoor spigot. The sample from [redacted] Main Ave was once again collected from the sampling port off of the water tank. Samples were analyzed for VOCs via drinking water method EPA 524.2. There were no VOCs detected in any of the three samples collected indicating that the properties are indeed outside of the influence of the dissolved phase CVOC plume. Analytical reports are included in **Appendix E**.

5. REMEDIAL SYSTEM OPTIMIZATION EVALUATION

This section describes activities which were implemented in order to help decrease the treatment time necessary to meet closure requirements at the site. After evaluation of the existing remedial system effectiveness, the groundwater pump and treat system appeared to be controlling migration of the groundwater contamination and reducing concentrations of contaminants of concern (COCs) in groundwater, however it was recommended that additional remedial alternatives be considered to improve and/or accelerate the reduction of COC concentrations. The Remedial Site Optimization Report recommended in situ biological injections to advance the site to remedial goals (EA 2016).

5.1 REMEDIAL SYSTEM OPTIMIZATION ACTIVITIES

Based on the approved Remedial Site Optimization Report (EA 2016) and Pre-Design Investigation and In Situ Biological Injection Work Plan Memorandum (EA 2019), EA completed the subsurface injection of an organic substrate (CarBstrate™) to stimulate direct anaerobic reductive dechlorination of chlorinated VOCs (CVOCs) present in groundwater at the site.

EA injected CarBstrate™ into both the overburden and bedrock aquifers at the site from 14 through 21 August 2019 as part of a pilot study. A total of 10,000 lb of CarBstrate™ was injected into the subsurface, 4,000 lb into the overburden via injection trenches and 6,000 lb into the bedrock via injection wells. A total of three bedrock wells (INJ-1, INJ-2, and INJ-3) and two overburden trenches (T-1 and T-2) were used for the CarBstrate™ injections (**Figure 2**). The original target injectate amount was 2,000 lb of CarBstrate™ per well/trench, however, due to a lower than anticipated flow rate at INJ-3, only 1,000 lb was injected into INJ-3. Therefore, an additional 500 lb were added to INJ-1 and INJ-2.

The existing pump and treat system continued to operate during and after injection activities to contain the CVOC plume and to facilitate the mobilization of the CarBstrate™ within the subsurface and through the treatment area. EA monitored the recovery wells closest to the injection locations, RW-1 and RW-2, on a weekly basis by collecting conductivity, dissolved oxygen, oxidation reduction potential and pH readings until the presence of CarBstrate™ was observed at the extraction wells. Once water quality data, including total organic carbon (TOC) measurements, indicated that CarBstrate™ had reached RW-1 and RW-2, they were shut off to allow the CarBstrate™ to propagate further in the aquifer. RW-3 continued to operate during and after the pilot study as there was no indication that CarBstrate™ had reached the well.

5.2 PERFORMANCE MONITORING

5.2.1 Performance Monitoring Sampling

Influent treatment system samples from recovery wells RW-1 (overburden), RW-2 (bedrock), and RW-3 (downgradient) were used to monitor the effectiveness of the bioremediation pilot study. As discussed in Section 2.4.2 of this report, these samples are collected from the influent lines

from each of the extraction wells on a monthly basis. The results of these analyses are included in **Appendix C** and summarized in **Table 1A**.

From October 2019 through December 2020, samples collected from the recovery wells were also analyzed for TOC to help evaluate biodegradation occurring as a result of the pilot study injection. General chemistry parameters (ammonia, total kjeldahl nitrogen, total dissolved solids, biochemical oxygen demand, total suspended solids, and pH) were collected from all three recovery wells as part of the August 2020 sampling effort. TOC concentrations and general chemistry parameter results are shown on **Table 7**. TOC is a measurement of organic carbon which is important in sustaining the microbial populations necessary for the bioremediation of organic contaminants. While there is not pre-injection TOC data available, the results presented in **Table 7** suggest that the injections were successful in altering the TOC concentrations in the treatment area and treatment zone depths surrounding RW-1 through January 2020, given that after a period of time TOC concentrations fluctuated and began trending downward for the remainder of 2020, likely back toward what the concentrations were prior to injection.

5.2.2 Trends

Analytical results from RW-1, RW-2, and RW-3 collected on a monthly basis from November 2010 through November 2020 are shown on **Table 1A**. PCE, TCE, DCE, and vinyl chloride analytical results from April 2019 through November 2020 from each recovery well were plotted to evaluate trends in CVOC concentrations immediately before and after the CarBstrate™ injections. **Figure 7A** shows trends in influent analytical results from RW-1, **Figure 7B** shows trends in RW-2, and **Figure 7C** shows trends in RW-3.

Depletion of PCE and TCE concentrations coupled with substantial increase in DCE (a daughter product of PCE and TCE dechlorination) and emergence of vinyl chloride (another daughter product) indicates active dechlorination of PCE and TCE in response to CarBstrate™ injections. This pattern of results emerges in results for RW-1 in September 2019 and continues to be seen through November 2020 results (**Figure 7A**). This indicates that dechlorination is occurring in the overburden aquifer. Concentrations of PCE and TCE were below groundwater AWQS from April 2020 through the end of the reporting period (December 2020). Daughter products DCE and vinyl chloride increased after injection and then began to decrease in the following months; with concentrations fluctuating between non-detect and just above AWQS between April and December 2020.

CVOC concentrations in the shallow bedrock initially increased following the injections (**Figure 7B**). The pressure injections performed at the three bedrock injection wells may have redistributed contaminants in the vicinity of the plume. Concentrations of PCE and TCE at RW-2 began to decrease in November 2019. This was followed by a corresponding increase in DCE in June 2020, and emergence of vinyl chloride in also in June 2020. These results indicate that dechlorination is also occurring in the bedrock. Overall, concentrations of CVOCs at RW-2 have decreased, but continue to fluctuate between being above and below the AWQS.

Concentrations of CVOCs at RW-3 remain consistent with historical results (**Figure 7C**), with PCE consistently above the AWQS of 5 µg/l. TCE and DCE continue to be detected, with some exceedances of the AWQS. Vinyl chloride has not been detected in RW-3 since monitoring began in November 2010. RW-3 is located northwest of the site and is operated to contain the most downgradient portion of the CVOC plume. Being outside the 2019 targeted treatment area, this area was not influenced by the CarBstrate™ application.

5.2.3 Molar Concentration

In addition to evaluating groundwater concentration trends, molar concentrations were evaluated to determine in situ changes in CVOC parent/dechlorination products. The molecular weights of primary CVOCs (PCE and TCE) and dechlorination products (cis-1,2-DCE and VC) differ from each other, with dechlorination products having progressively lower molecular weights. Because of molecular weight variability, the reductive transformation of a mass of PCE, will not yield an identical mass of TCE (e.g., anaerobic dechlorination of 100 µg/L of PCE would produce 84 µg/L of TCE). Conversion of conventional groundwater concentrations (e.g., µg/L) to molar concentrations (micromoles per liter) enables assessment of the degree to which reductive transformation is occurring, because transformation of 1 mole of PCE yields 1 mole of TCE and so forth throughout the daughter compounds. The conversion is calculated by dividing the reported conventional groundwater concentration by the molecular weight of the compound. Decreases in the molar concentration of total CVOCs indicate that chlorinated mass is being lost and that significant transformation of these compounds to non-toxic end products (ethene/ethane) is occurring.

Figure 8 presents a summary of the molar concentration of total chlorinated ethene (PCE, TCE, cis-1,2-DCE, and vinyl chloride) at recovery wells RW-1, RW-2, and RW-3. Decreases in molar concentration had been observed at both RW-1 and RW-2 following the August 2019 injection, which suggests that contaminant mass had been converted to innocuous end products (e.g., ethene). During the monitoring period, it was observed that total molar concentrations (predominantly cis-1,2-DCE and VC) increased at monitoring wells RW-1 and RW-2, then decreased to concentrations below those observed prior to the injection. It is likely that the bulk of the CarBstrate™ injected during the pilot study has been consumed at this time and that going forward, decreases in the CVOC concentrations are likely the result of natural attenuation. This will be discussed further in the forthcoming Periodic Review Report for 2021 after the next site-wide sampling effort is complete. As noted above, molar concentrations of CVOCs at RW-3 remain consistent throughout the post-injection monitoring period, to be expected given that the well is outside of the treatment area.

5.3 PILOT STUDY CONCLUSIONS

During the pilot study performance monitoring period, concentrations of CVOCs were reported in locations west and southwest of the treatment area. Results from post-injection groundwater sampling indicated that concentrations of PCE and TCE were reduced within the treatment area suggesting that the pilot study injection created favorable geochemical conditions in the groundwater to promote degradation. PCE and CVOC concentrations at wells outside of the

treatment area remained similar to historical concentrations; suggesting the substrate injection process did not displace impacted groundwater to areas inside or outside of the target treatment area.

While reduction was noted in the target treatment area, groundwater analytical results from the August 2020 sampling event and the monthly recovery well sampling did indicate that site COCs at several overburden locations within the plume, including MW-2, TW-5, MW-101A, MW-103A, and MW-107A remained at concentrations greater than their respective AWQS. Daughter compounds commonly produced during the anaerobic reductive dechlorination process were consistently detected at site monitoring wells during post-injection monitoring indicating that contaminant breakdown is occurring and may have been stimulated by the injection. Overall, favorable results were observed in the targeted treatment zone during the pilot study suggesting a full-scale plume-wide application of CarBstrate^{TM} could be implemented to significantly reduce the remedial timeframe for the Site. As an alternate to a full-scale plume-wide application, a passive reactive barrier could be installed at the plume toe to contain the plume and prevent further contaminant migration.

6. CONCLUSIONS AND RECOMMENDATIONS

This section describes activities which are recommended in order to improve overall site management.

6.1 GROUNDWATER TRENDS AND INJECTION PILOT STUDY

Analytical trend graphs indicate that the overall concentrations of PCE, TCE, and cis-1,2-DCE have decreased in monitoring wells, particularly in the vicinity of the site where injections of CarBstrate™ occurred in August 2019. As PCE and TCE are being reduced, several of the wells showing decreases in PCE and TCE are also displaying increases in concentrations of daughter products (cis-1,2-DCE and vinyl chloride), as expected when reducing conditions are present in the groundwater. Injections appear to have been effective in the targeted pilot study treatment zone as evidenced by this breakdown of PCE into daughter products and overall reductions in CVOC mass both in the recovery wells monitored monthly and in the wells sampled every 15 months. CVOC concentrations in MW-103A, near the contamination point of origin at the Roxy site, showed a marked decrease from the 2018 to the 2020 sampling event.

Though they have decreased over time, concentrations of PCE in downgradient monitoring wells MW-2, TW-5, and MW-107A have consistently remained above the AWQS throughout the site sampling history. Based on the reduction of COCs in the pilot study treatment area following the CarBstrate™ injections, additional injection downgradient may be warranted in order to stimulate reducing conditions in the area of RW-3 (the leading edge of the plume) where PCE concentrations remain fairly unchanged over the past ten years (**Tables 1A** and **5**).

6.2 TREATMENT SYSTEM

As described in the ROD (NYSDEC 1994), the primary goals of the groundwater pump and treat system are:

- Reduce the mass and concentration of contaminants in the groundwater.
- Control migration of the groundwater contamination.

Based on historical analytical trend graphs (**Appendix F**), analytical data suggest that the groundwater treatment system is not efficient in reducing contaminant mass at the site. At this time, the treatment system is primarily providing plume containment. Overall concentrations of chlorinated VOCs in the vicinity of the site are being reduced, however this is attributed to the pilot study injection that was completed in August 2019 that were successful in stimulating the reducing conditions in the targeted treatment area.

Downgradient of the source area, wells in the dissolved plume between the site and RW-3 continue to show detections of PCE above the AWQS. Wells located hydraulically downgradient of RW-3 did not show detections of CVOCs during the August 2020 sampling effort. While reductions of CVOC concentrations in the dissolved plume have been noted, Additional remedial

action in the area in the form of a full-scale injection could supplement the plume containment work that RW-3 continues to perform. Continued groundwater sampling is necessary to evaluate the effectiveness of RW-3 on the downgradient portion of PCE impacts.

6.3 RESIDENTIAL WATER SAMPLING

Water samples collected from downgradient residential properties along Main Avenue (including [redacted] Main Ave) in December 2019 were analyzed for PFAS and in November 2020 were analyzed for VOCs. All PFAS results from residential properties were significantly below applicable standards. There were no detections in any of the residential samples collected for VOC analysis indicating that the properties are outside of the influence of the dissolved phase CVOC plume. It is recommended that all four properties be connected to public water supply to remove them as potential receptors from upgradient contaminated groundwater.

NOTE: NYSDEC = New State Department of Environmental Conservation

AWQS = Ambient Water Quality Standard

NS = Not sampled

ND = Non-detect

All samples are reported in micrograms per liter (µg/L).

All samples analyzed by U.S. Environmental Protection Agency Method 624

Bold values indicate that the analyte was detected greater than the NYSDEC AWQS.

Analytical data results provided by New York State Department of Environmental Conservation Laboratories.

1. (O) indicates overburden well; (B) indicates bedrock well.
ug/L = Microgram(s) per liter
NYSDEC = New York State Department of Environmental Conservation
AWQS = Ambient Water Quality Standard
U = Analyte was analyzed for but not detected below the laboratory reporting limit.
J = Analyte detected between the Reported Detection Limit and the Method Detection Limit, concentration estimated.
(g) = NYSDEC Ambient Water Quality Standards guidance value
NS = No Standard
Analytical data results provided by Eurofins/Spectrum Analytical.
Bold values indicate the analyte was detected greater than the NYSDEC AWQS.

SUBJECT: SPDES Permit Equivalent: Roxy Cleaners, DER Site ID# 4-42-024

DRAINAGE BASIN: 13 / 01

DATE: September 28, 2020

In response to your request dated September 21, 2020, attached please find the effluent limitations and monitoring requirements for the above noted remediation discharge.

The discharge consists of treated water from a groundwater remediation of a former dry cleaning site. The treatment system consists of a shallow tray air-stripper system.

The DOW does not have any regulatory authority over a discharge from a State, PRP, or Federal Superfund Site. DER will be responsible for ensuring compliance with the attached effluent limitations and monitoring requirements, and approval of all engineering submissions. Footnote 1 identifies the appropriate DER contact person who will receive all effluent results, engineering submissions, and modification requests. The Regional Water Engineer should be kept appraised of the status of this discharge and, in accordance with the attached criteria, receive a copy of the effluent results for informational purposes.

If you have any questions, please call Carol Lamb-LaFay at 518-402-8132.

Receipt
The samples were received on 8/24/2019 9:00 AM; the samples arrived in good condition, properly preserved and, where required, on ice. The temperature of the cooler at receipt was 2.6º C.

GC/MS VOA
Method(s) 8260C: The laboratory control sample (LCS) for analytical batch 480-489137 recovered outside control limits for the following analytes: Dichlorodifluoromethane. These analytes were biased high in the LCS and were not detected in the associated samples; therefore, the data have been reported. The following samples are impacted: RW-1 (480-158104-1), RW-2 (480-158104-2), RW-3 (480-158104-3), DUP (480-158104-4), EFFLUENT (480-158104-5) and TRIP BLANK (480-158104-6).

Method(s) 8260C: The following samples was diluted to bring the concentration of target analytes within the calibration range: RW-1 (480-158104-1), RW-2 (480-158104-2) and RW-3 (480-158104-3). Elevated reporting limits (RLs) are provided.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

Receipt
The samples were received on 9/21/2019 8:00 AM; the samples arrived in good condition, properly preserved and, where required, on ice. The temperature of the cooler at receipt was 3.0º C.

GC/MS VOA
Method(s) 8260C: The following samples were diluted to bring the concentration of target analytes within the calibration range: RW-3 (480-159577-3), DUP (480-159577-4), (480-159577-A-3 MS) and (480-159577-A-3 MSD). Elevated reporting limits (RLs) are provided.

Method(s) 8260C: The continuing calibration verification (CCV) associated with batch 480-494977 recovered above the upper control limit for 1,1,2-Trichloro-1,2,2-trifluoroethane, 2-Butanone (MEK), Carbon disulfide, Cyclohexane, Methylene Chloride and Tetrachloroethene. The samples associated with this CCV were non-detects for the affected analytes; therefore, the data have been reported. The following samples are impacted: EFFLUENT (480-159577-5) and TRIP BLANK (480-159577-6).

Method(s) 8260C: The continuing calibration verification (CCV) associated with batch 480-494977 recovered above the upper control limit for 1,1,2-Trichloro-1,2,2-trifluoroethane, 2-Butanone (MEK), Carbon disulfide, Cyclohexane and Methylene Chloride. The samples associated with this CCV were non-detects above the reporting limit (RL) for the affected analytes; therefore, the data have been reported. The following samples are impacted: RW-3 (480-159577-3) and DUP (480-159577-4).

Method(s) 8260C: The continuing calibration verification (CCV) analyzed in 480-494977 was outside the method criteria, high bias, for the following analyte: Tetrachloroethene. As indicated in the reference method, sample analysis may proceed; however, any detection for the affected analyte(s) is considered estimated. Due to holding time limitations the samples were not reanalyzed. The following samples are impacted: RW-3 (480-159577-3) and DUP (480-159577-4).

Method(s) 8260C: The continuing calibration verification (CCV) associated with batch 480-494834 recovered above the upper control limit for 2-Butanone (MEK). The samples associated with this CCV were non-detects for the affected analytes; therefore, the data have been reported. The following sample is impacted: RW-1 (480-159577-1).

Method(s) 8260C: The laboratory control sample (LCS) for analytical batch 480-494834 recovered outside control limits for the following analyte: Dichlorodifluoromethane. This analyte has been identified as a poor performing analyte when analyzed using this method; therefore, re-extraction/re-analysis was not performed. The following samples are impacted: RW-1 (480-159577-1).

Method(s) 8260C: The following sample was diluted to bring the concentration of target analytes within the calibration range: RW-1 (480-159577-1). Elevated reporting limits (RLs) are provided.

Method(s) 8260C: The continuing calibration verification (CCV) associated with batch 480-495134 recovered above the upper control limit for 2-Butanone (MEK). The samples associated with this CCV were non-detects for the affected analytes; therefore, the data have been reported. The following samples are impacted: RW-1 (480-159577-1) and RW-2 (480-159577-2).

Method(s) 8260C: The following samples were diluted to bring the concentration of target analytes within the calibration range: RW-1 (480-159577-1) and RW-2 (480-159577-2). Elevated reporting limits (RLs) are provided.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

Receipt
The samples were received on 10/12/2019 8:00 AM; the samples arrived in good condition, properly preserved and, where required, on ice. The temperature of the cooler at receipt was 2.9º C.

GC/MS VOA
Method 8260C: The following samples were diluted to bring the concentration of target analytes within the calibration range: RW-1 (480-160867-1) and RW-2 (480-160867-2). Elevated reporting limits (RLs) are provided.

Method 8260C: Surrogate recovery for the following sample was outside the upper control limit: TRIP BLANK (480-160867-6). This sample did not contain any target analytes; therefore, re-extraction and/or re-analysis was not performed.

Method 8260C: The following samples were diluted to bring the concentration of target analytes within the calibration range: RW-3 (480-160867-3), (480-160867-C-3 MS) and (480-160867-C-3 MSD). Elevated reporting limits (RLs) are provided.

Method 8260C: The following sample was diluted to bring the concentration of target analytes within the calibration range: DUP (480-160867-4). Elevated reporting limits (RLs) are provided.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

General Chemistry
Method SM 5310C: The following sample needed additional concentrated hydrochloric acid to be added in order to meet method requirement of pH below two prior to analysis.
RW-1 (480-160867-1)

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

Receipt
The samples were received on 11/2/2019 8:00 AM; the samples arrived in good condition, properly preserved and, where required, on ice. The temperature of the cooler at receipt was 2.6° C.

GC/MS VOA
Method 8260C: The following sample was collected in a properly preserved vial; however, the pH was outside the required criteria when verified by the laboratory. The sample was analyzed outside the 7-day holding time specified for unpreserved samples but within the 14-day holding time specified for preserved samples: RW-1 (480-162004-1). Sample pH is 4.

Method 8260C: The following samples were diluted to bring the concentration of target analytes within the calibration range: RW-1 (480-162004-1), RW-2 (480-162004-2) and RW-3 (480-162004-3). Elevated reporting limits (RLs) are provided.

Method 8260C: The following volatiles sample was diluted due to foaming at the time of purging during the original sample analysis: EFFLUENT (480-162004-5). Elevated reporting limits (RLs) are provided.

Method 8260C: The continuing calibration verification (CCV) associated with batch 480-503526 recovered outside acceptance criteria, low biased, for Chloromethane. A reporting limit (RL) standard was analyzed, and the target analyte was detected. Since the associated samples were non-detect for this analyte, the data have been reported. The following sample is impacted:DUP (480-162004-4).

Method 8260C: The Laboratory Control Sample (LCS 480-503526/6) associated with analytical batch 503526 was outside laboratory/project quality control limits for the following analyte: Chloromethane. All other spike recoveries and quality control indicators, including sample specific surrogate recoveries, were acceptable. A reporting limit (RL) standard was analyzed, and the target analyte was detected. These analytes were not detected in the associated samples; therefore, the data have been reported. The following sample is impacted: DUP (480-162004-4).

Method 8260C: The following volatiles sample was diluted due to foaming at the time of purging during the original sample analysis: DUP (480-162004-4). Elevated reporting limits (RLs) are provided.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

General Chemistry
Methods SM 5310C, SM 5310D: The following sample needed additional concentrated hydrochloric acid to be introduced in order to meet method requirement of pH greater than two prior to analysis.

RW-1 (480-162004-1)

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

Receipt
The samples were received on 12/7/2019 9:00 AM; the samples arrived in good condition, properly preserved and, where required, on ice. The temperature of the cooler at receipt was 2.2º C.

GC/MS VOA
Method 8260C: The following samples were diluted to bring the concentration of target analytes within the calibration range: RW- 2 (480-163862-2) and RW- 3 (480-163862-3). Elevated reporting limits (RLs) are provided.

Method 8260C: The following volatiles sample was diluted due to foaming at the time of purging during the original sample analysis: RW-1 (480-163862-1). Elevated reporting limits (RLs) are provided.

Method 8260C: The following sample was collected in a properly preserved vial; however, the pH was outside the required criteria when verified by the laboratory. The sample was analyzed within the 7-day holding time specified for unpreserved samples: RW- 1 (480-163862-1). Sample pH is 3.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

General Chemistry
No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

Receipt
The samples were received on 1/4/2020 11:10 AM; the samples arrived in good condition, properly preserved and, where required, on ice. The temperature of the cooler at receipt was 2.5º C.

GC/MS VOA
Method 8260C: The following volatiles sample was diluted due to foaming at the time of purging during the original sample analysis: RW-1 (480-164784-1). Elevated reporting limits (RLs) are provided.

Method 8260C: The following samples were diluted to bring the concentration of target analytes within the calibration range: RW-2 (480-164784-2) and RW-3 (480-164784-3). Elevated reporting limits (RLs) are provided.

Method 8260C: The continuing calibration verification (CCV) associated with batch 480-512586 recovered above the upper control limit for Tetrachloroethene, 1,1,2-Trichloro-1,2,2-trifluoroethane, Trichlorofluoromethane, and 2-Butanone (MEK). The sample associated with this CCV was non-detect for the affected analytes; therefore, the data have been reported. The following sample is impacted: EFFLUENT (480-164784-5).

Method 8260C: Due to the coelution of Ethyl Acetate with 2-Butanone in the full spike solution, these analytes exceeded control limits in the laboratory control sample (LCS) and/or laboratory control sample duplicate (LCSD) associated with batch 512748. The following sample was affected : DUP (480-164784-4).

Method 8260C: The following sample was diluted to bring the concentration of target analytes within the calibration range: DUP (480-164784-4). Elevated reporting limits (RLs) are provided.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

Receipt
The samples were received on 2/8/2020 8:00 AM; the samples arrived in good condition, properly preserved and, where required, on ice. The temperature of the cooler at receipt was 3.3º C.

GC/MS VOA
Method 8260C: The continuing calibration verification (CCV) associated with batch 480-517279 recovered outside acceptance criteria, low biased, for Carbon disulfide. A reporting limit (RL) standard was analyzed, and the target analyte was detected. Since the associated samples were non-detect and/or below the RL for this analyte, the data have been reported. The following samples are impacted: RW-2 (480-166129-2), RW-3 (480-166129-3), DUP (480-166129-4) and EFFLUENT (480-166129-5).

Method 8260C: The Laboratory Control Sample (LCS) was outside laboratory/project quality control limits by 2% for the following analyte: 1,2,4-Trichlorobenzene. All other spike recoveries and quality control indicators, including sample specific surrogate recoveries, were acceptable. A reporting limit (RL) standard was analyzed, and the target analyte was detected. The following samples are impacted: RW-2 (480-166129-2), RW-3 (480-166129-3), DUP (480-166129-4) and EFFLUENT (480-166129-5).

Method 8260C: The continuing calibration verification (CCV) associated with batch 480-517279 recovered above the upper control limit for 4-Methyl-2-pentanone, 2-Butanone, and 2-Hexanone. The samples associated with this CCV were non-detects for the affected analytes; therefore, the data have been reported. The following samples are impacted: RW-2 (480-166129-2), RW-3 (480-166129-3), DUP (480-166129-4) and EFFLUENT (480-166129-5).

Method 8260C: The following samples were diluted to bring the concentration of target analytes within the calibration range: RW-2 (480-166129-2), RW-3 (480-166129-3) and DUP (480-166129-4). Elevated reporting limits (RLs) are provided.

Method 8260C: The continuing calibration verification (CCV) associated with batch 480-517370 recovered outside acceptance criteria, low biased, for 1,2-Dichloroethane, Chloromethane and Trichlorofluoromethane. A reporting limit (RL) standard was analyzed, and the target analyte was detected. Since the associated samples were non-detect for this analyte, the data have been reported.

Method 8260C: The following sample was diluted to bring the concentration of target analytes within the calibration range: RW-1 (480-166129-1). Elevated reporting limits (RLs) are provided.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

General Chemistry
No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

Receipt
The samples were received on 3/6/2020 8:00 AM; the samples arrived in good condition, properly preserved and, where required, on ice. The temperature of the cooler at receipt was 2.4° C.

GC/MS VOA
Method 8260C: The continuing calibration verification (CCV) associated with batch 480-520696 recovered outside acceptance criteria, low biased, for 1,2-Dichloroethane. A reporting limit (RL) standard was analyzed, and the target analyte was detected. Since the associated samples were non-detect for this analyte, the data have been reported. The following samples are impacted: RW-1 (480-167088-1), RW-3 (480-167088-3), DUP (480-167088-4), EFFLUENT (480-167088-5) and TRIP BLANK (480-167088-6).

Method 8260C: The following sample was diluted to bring the concentration of target analytes within the calibration range: RW-3 (480-167088-3). Elevated reporting limits (RLs) are provided.

Method 8260C: The following volatiles samples were diluted due to foaming at the time of purging during the original sample analysis: RW-1 (480-167088-1) and DUP (480-167088-4). Elevated reporting limits (RLs) are provided.

Method 8260C: The continuing calibration verification (CCV) associated with batch 480-521067 recovered above the upper control limit for Methylcyclohexane. The sample associated with this CCV was non-detect for the affected analyte; therefore, the data have been reported. The following sample is impacted: RW-2 (480-167088-2).

Method 8260C: The following sample was diluted to bring the concentration of target analytes within the calibration range: RW-2 (480-167088-2). Elevated reporting limits (RLs) are provided.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

General Chemistry
No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.
