1. Introduction

1.1. Objective

This report has been prepared by O'Brien & Gere Engineers, Inc. (O'Brien & Gere) for General Electric Company (GE) and Von Roll Isola USA, Inc. (VRI). Numerous environmental studies, investigations, assessments and remedial actions have been undertaken by GE, VRI and Insulating Materials, Inc. (IMI) at the Riverview facility. The objective of this report is to assimilate the information from the previous studies into a concise report which summarizes the environmental conditions at the Riverview facility. Available site information from New York State Department of Environmental Conservation (NYSDEC) central office files, and files supplied by VRI off-site files supplied by GE Power Systems of Schenectady were examined to identify the source, nature and extent of contamination at the site and to identify significant data gaps in the existing information which must be filled to address environmental concerns at the facility.

1.2. Facility description

The Riverview facility is located off the north side of West Campbell Road in the Town of Rotterdam near the border of the City of Schenectady. The property consists of approximately 52 acres, with 25 acres in active use as a liquid and solid insulation manufacturing facility. The active facility area is fenced as shown on the attached Plate 1. The facility is bounded on the north by a steep embankment and the Delaware and Hudson (D&H) Railroad, the D&H Railroad and Rotterdam Square Mall to the west, Campbell Road and the Town of Rotterdam publicly owned treatment works (POTW) and Campbell Plastics to the south, and residential areas to the east.

The Riverview facility is situated on a high, flat plateau about 80 feet above the Mohawk River Valley. The ground surface drops off quickly to the north-northeast toward the Mohawk River and more gently to the west and south. Soils underlying the site are composed primarily of medium to fine grained silty sand and are characterized as deep, coarse textured and well drained.

A broad line of insulating materials and composites for electrical insulating systems are produced at the Riverview facility. The liquids manufacturing line at the facility involves production of polyester, polyesteramide and blocked polyisocyanate resins in reactors. The facility also produces solid tapes which are composed of various substrates such as polyester-glass, paper, mica and polyester. The tapes are laminated with varnishes including polyester, epoxy, acrylate, latex and silicone. Following lamination, the tapes are cured in ovens, slit to correct widths and packaged.

Large quantities of liquid and solid raw materials, products and intermediates are stored on site. As identified by Wagner, Heindel and Noyes (WH&N) (1995), these chemicals are listed in Appendix A. Under Resource Conservation and Recovery Act (RCRA), the site is currently operating as less than 90 day storage facility for hazardous wastes generated on site. Hazardous wastes are stored in tote tanks and 55-gallon drums in building RV-42 and are hauled by an outside contractor to a hazardous waste disposal facility.

Thirteen buildings are currently used for manufacturing, storage, research and administration activities on the site (RV-12, RV-13, RV-13a, RV-14, RV-16, RV-17, RV-28, RV-30, RV-31, RV-32, RV-33, RV-37 and RV-42). In addition, several chemical and petroleum bulk storage tanks are located on the premises. An aboveground 10,000 gallon toluene tank is located in the east of RV-33. An empty 25,000 gallon aboveground tank containing two 12,500 gallon sections is located to the west of RV-42. This tank formerly contained chemicals used in the mine bolt resin process. Aboveground and underground piping connects many of these tanks to the process buildings. There are also a 500 and a 1,000-gallon No. 2 fuel oil aboveground storage tank located adjacent to buildings RV-12 and RV-28, respectively. These tanks are fuel sources for building heaters.

1.3. Site history

Prior to GE purchasing the site in the early 1940s, the site was occupied by a harness racing track and also used for agricultural purposes. GE purchased the site in 1942 and constructed radar development and testing facilities. GE operated the facility as a radar development plant until GE Insulating Materials group moved into the Riverview facility and began operating in 1959 or 1960. In March 1988, GE sold the facility and it was renamed Insulating Materials Incorporated (IMI). Following the purchase of the facility, IMI continued to produce electrical insulation products and the operations generally remained consistent with GE operations. The

facility was subsequently purchased by VRI in 1995. A table summarizing the construction and usage history for buildings at the Riverview site taken from WH&N (1995) is located in Appendix A.

In the course of operations, numerous spills have occurred at the facility. A chronology of Spills at the Riverview site, taken from the WH&N (1995) is located in Appendix A. A brief discussion of the most significant spills is presented below.

In 1978, the loss of approximately 4,000 gallons of trimethylphenol occurred in the tank farm area near building RV-33. Available records indicate that cleanup of the spilled material and visually impacted soil was conducted at that time. In 1986, additional soils contaminated with trimethylphenol were discovered when GE was excavating the diked area to reshape it. The additional contaminated soil was excavated in 1986 and disposed off site.

In May of 1985, approximately 250 pounds of Formalin (37% formaldehyde, 6-9% methanol, and 55-58% water) was spilled on the ground in the area east of RV-33. The contaminated soil was excavated and placed in 55-gallon drums for disposal. The soil was subsequently replaced with clean fill.

In March 1987, a RCRA-permitted waste solvent tank located approximately 75 feet south of building RV-33 was overfilled which resulted in a release of approximately 50 gallons of mixed solvents (cyclohexane, xylene, cresylic acid, phenols, tri-methylbenzene and naphtha) to the environment. Contaminated soil was removed by Clean Harbors and Associates (Clean Harbors) and an assessment of soil and ground water conditions in the vicinity of the RCRA tank was conducted by Groundwater Technology, Inc. (GTI). GTI installed and sampled two ground water monitoring wells adjacent to the tank. The results indicated subsurface contamination of soils and ground water from various organic compounds in the parts per million (ppm) range (toluene, ethyl benzene and xylenes).

The Riverview site is currently designated as a Class 2 Inactive Hazardous Waste Disposal Site (Site Code 447005) indicating that NYSDEC considers there to be a significant threat to the public health or the environment warranting further investigation. The site was originally classified as a "2A" (additional data necessary to fully classify the site) based primarily on a 1979 report of a hillside seep north of the facility that was described as a reddish oxidated iron leachate with a light oily sheen. In January of 1988, the NYSDEC notified GE that the status of the Riverview site had been upgraded to a Class 2 designation.

Based on the September 1989 Assessment of Environmental Conditions Report , NYSDEC requested that GE develop a work scope to complete an additional subsurface assessment of the site. GE compiled with the request, and a work scope for additional field investigation was compiled, and approved by the NYSDEC for implementation. The approved work scope was prepared by Groundwater Technology, Inc. (GTI) and is titled "Field Investigation Work Scope," dated December 5, 1991. Subsequently Order-on-Consent, Index #A4-0240-90-07 between GE and NYSDEC was executed on March 23, 1992. That scope of work was implemented by GTI and reported in the January 23, 1993 Report.

2. Scope of work

The scope of work for this project consists of assimilating technical information from numerous previous environmental studies into a concise report that illustrates the environmental conditions at the Riverview facility and presents recommendations for additional work to complete the site characterization. Four tasks were completed as part of this assimilation: file review; field reconnaissance; monitoring well network inspection; and, data analysis and report preparation. A description of each task follows.

2.1. File review

This task consisted of the review of available VRI and NYSDEC files. Selected VRI files were made available to O'Brien & Gere on May 4, 1998. The files were reviewed at the O'Brien & Gere, Albany, New York office and key documents and correspondence copied. NYSDEC files were reviewed by O'Brien & Gere on May 18, 1998 at the NYSDEC Central Office on Wolf Road. Copies of selected NYSDEC documents were ordered and copied by NYSDEC for O'Brien & Gere. In addition, files at GE Power Systems in Schenectady were reviewed.

2.2. Field reconnaissance

O'Brien & Gere performed a field reconnaissance to check the location and condition of monitoring wells and to visually inspect areas of potential past environmental concern. The initial reconnaissance was conducted on May 28, 1998. A follow-up site visit was conducted on June 17, 1998 to examine the former north tank farm area and the westernmost portion of the property beyond the western fence line.

2.3. Monitoring well network inspection

O'Brien & Gere performed a monitoring well network inspection of accessible monitoring wells at the site on May 28, 1998. The network inspection included the following:

- Visual inspection of above-grade monitoring well components for overall integrity and verification of each well location and identification on the site map provided by CT Male;

- Obtain water level measurements from each assessable ground water monitoring well; and

- Measure the depth of each well to determine amount of sediment buildup.

The above-grade monitoring well components of each accessible monitoring well at the site were visually inspected to determine their condition. The condition of exposed well casings and locks and caps were checked and items requiring repair were recorded on a field data sheet and/or site map.

Water level measurements from accessible ground water monitoring wells at the facility were obtained on May 28, 1998. Water level measurements were obtained with an electronic water level indicator. The depth to water was measured to the nearest 0.01 feet and, where present, the fiberglass reinforced resin riser pipe was used as the measuring point. The depth to water data were recorded on a field data sheet with the approximate times of measurement. Depths to water were converted to water level elevations with respect to mean sea level using the surveyed elevations reported in the GTI Field Investigation Report, dated January 26, 1993. The water level elevation data are presented in Table 2-1.

In addition to water level measurements, the total depth of each accessible monitoring well was measured on May 28, 1998. Measured total depths were also recorded on the field data sheet. Measured total depths and the amount of sediment buildup for each well screen is provided on Table 2-1.

2.4. Data analysis and summary report preparation

Using the information collected in the file review, this task consisted of the analysis of the data and preparation of this report summarizing the analysis and interpretation of site conditions. Available information and data on the facility background, including information on buildings, underground tanks, utilities, known past and present hazardous waste treatment or disposal areas are summarized. Available information on the nature and extent of chemicals at the facility have been assembled along with available information on geology, hydrogeology and sampling information for the

site. Remedial measures undertaken at and in the vicinity of the facility are documented.

The report briefly addresses the site history and layout and also presents a description of the site environmental setting. Maps, drawings and tables from previous reports are utilized to illustrate the site wide environmental settings.

For each area of past environmental concern, a synopsis of current conditions, in the context of an industrial site, has been prepared and is included in Section 4 of this report.

3. Environmental setting

3.1. Site geology

The Riverview facility is located within the Hudson-Mohawk Lowlands physiographic province of New York State. The general topography of the Mohawk Lowlands is the result of erosion along an outcrop belt of weak rocks lying between the Adirondack Mountains to the north and the Heldeberg Escarpment to the south. Bedrock underlying the Riverview facility consist of black and gray shales and sandstones belonging to the Schenectady Formation. The Schenectady Formation consists of gray to black interbedded shales and graywackes of Middle Ordovician Age. The bedrock dips gently to the west-southwest at an angle of generally less than five degrees.

The bedrock in the area is overlain by a thick mantle of unconsolidated deposits of glacial origin. Unconsolidated deposits underlying the Riverview facility consist primarily of a glaciolacustrine deltaic sand deposit. The glaciolacustrine deposit is best described as a light to medium brown fine to medium sand with a trace of silt. Based on site borings, the percentage of silt appears to increase with depth. As shown on the geologic cross-sections located in Appendix C, the texture of the sand deposit fines downward to clayey sands and silts at a depth of approximately 70 feet. The specific nature of unconsolidated deposits below approximately 80 feet in depth is unknown. However, given the glacial history of this area, it is believed that the unconsolidated deposits will continue to fine downward to a silty or silty clay deposit representative of deeper water, lower energy glaciolacustrine deposition. It is also likely that the shale bedrock is directly overlain by some thickness of dense glacial till. Typically, the bedrock is overlain by low permeability blanket like glacial till deposits consisting of a mixture of sand, gravel and clay.

The glaciolacustrine sand observed at the Riverview site was deposited by sediment laden discharge of the Ancestral Mohawk (Iromohawk) River into glacial Lake Albany (LaFleur, 1983). Lake Albany was a large glacial lake that occupied the Hudson Valley during the Late Pleistocene deglaciation of the area. The northern extent of Lake Albany consistently expanded with the receding of the Hudson Lobe of the Laurentide ice sheet some 15,000 years ago. The Schenectady delta was built out into Lake Albany

by the discharge of sediment laden glacial meltwater from the west into the lake basin. Dissection at the Fonda wash plain and Lake Amsterdam clays to the west of the study area provided fine grained sand, silt and clay for the construction of the Schenectady Delta to an elevation of approximately 340 feet above sea level. Continued northward recession of the Hudson Lobe toward Glens Falls was accompanied by lowering of Lake Albany through a series of lower lake stages (Lake Quaker Springs, Lake Coveville and Lake Fort Ann). During this period, the Schenectady deltaic sediments were dissected and reworked along the course of the present day Mohawk River. Episodic, high volume discharge events, eroded the deltaic sediment and deposited the coarse sands and gravels that comprise the Schenectady or Great Lakes aquifer located in the Mohawk River Valley to the north and east of the site. These highly permeable deposits were subsequently overlain by floodplain and channel deposits of sand, silt and clay.

3.2. Hydrogeology

3.2.1. Site ground water flow

At the Riverview facility, ground water is observed in unconsolidated deposits under unconfined or water table conditions. The water table is free to rise and fall in response to ground water recharge and discharge. The measured depth to ground water varies from approximately 60 to 70 feet below ground surface across the site. Recharge to the ground water is principally through infiltration of precipitation in permeable non-paved portions of the site.

As shown on ground water contour maps developed by GTI and WH&N (Appendix C), ground water levels at the facility are highest in the southwestern portion of the facility. Ground water flow in the eastern and northern portions of the facility is predominantly to the north and northeast, toward the escarpment bordering the facility on the north. In the western portion of the facility, a roughly east-west trending ground water divide has been mapped by both GTI and WH&N. The divide is defined by the relatively high ground water elevations measured in wells GT-1 and GT-10. As a result, there is a component of ground water flow to the south in the extreme southwestern portion of the facility near wells GT-11 and GT-12. Ground water level measurements collected by O'Brien & Gere on May 28, 1998 confirm the previous interpretations of ground water flow.

Hydraulic gradients vary widely across the facility. The highest hydraulic gradient at the facility is observed in the northeastern portion of the facility

(0.05 ft/ft) in the vicinity of GT-7 and GT-16. The hydraulic gradient in the north western portion of the site are a more typical (0.015 ft/ft).

In order to assess the hydraulic conductivity of saturated unconsolidated deposits at the Riverview site, GTI conducted in-situ permeability tests in six monitoring wells at the Riverview facility (GT-1, GT-2, GT-3, GT-4, GT-8 and GT-9). Methods and a detailed review of the results are contained in the May 16, 1988 assessment prepared by GTI. Results of the testing yielded a range of hydraulic conductivities from 4.05×10^{-4} to 1.25×10^{-2} cm/sec. The calculated geometric mean of hydraulic conductivity values is approximately 1.6×10^{-3} cm/sec.

3.2.2. Regional ground water flow

As detailed in the January 26, 1993 GTI Field Investigation Report, observation wells located on-site and downgradient of the Riverview facility were gauged by both GTI and Terran Research, Inc. personnel on November 30 and December 1, 1992. Water levels were measured in the Riverview facility observation wells, GE Power Systems Main Plant property observation wells, and Schenectady/Rotterdam well field observation wells. The purpose of the water level monitoring was to prepare a regional ground water contour map for the area.

As shown on the regional ground water contour map (Appendix C), ground water flow from the Riverview site is principally towards the north-northeast in the direction of the ground water seeps on the D&H Railroad property and the GE Power Systems Main Plant. Ground water flow in the northern portion of the Riverview site is toward the GE Power Systems Main Plant and is relegated to the area east of the roughly north-south ground water divide located just west of the GE Power Systems Main Plant. The location of the north-south ground water divide is well documented in numerous reports on the GE Power Systems Main Plant prepared by Terran Research, Inc. Ground water flow east of the divide is northeast toward the Mohawk River. In the area west of the hydrologic divide, ground water flow is to the northwest, toward the Schenectady and Rotterdam well fields.

The Riverview facility overlies an area described by the United States Geological Survey (USGS) (1981) as minor aquifer area. Well yields are typically limited to 5-20 gallons per minute. This area however, is a recharge area for the more permeable and productive major aquifer located in the valley. The most productive portions of the Great Flats or Schenectady aquifer are located in the narrow valley reach upstream of Scotia. The Schenectady and Rotterdam well fields are located in the easternmost portion of the coarsest, most productive portion of the aquifer.

The portion of the aquifer east of the north-south trending hydraulic divide described by Terran Research is composed of sand and silts deposited in a lower energy depositional environment and do not represent the same potential well yields as observed in the Rotterdam and Schenectady well fields.

The current conceptual hydrogeologic model of the site is that the ground water zones on the Riverview site and the GE Power Systems Main Plant site are not contiguous. The presence of the clayey sands and silts at an elevation of about 270 feet on the site is above the ground surface on the GE Power Systems Main Plant. This apparent separation of the ground water zones may explain the almost 50 foot difference in ground water elevations between the Riverview site and the GE Power Systems Main Plant. Therefore, ground water on the Riverview site is not in direct hydraulic connection with the Schenectady and Rotterdam well field aquifer. Proposed site ground water investigations will provide additional information for the conceptual model.

3.3. Ground water quality

3.3.1. Historical on-site ground water sampling

Smith & Mahoney, P.C.

On September 27, 1991, Smith & Mahoney, P.C. collected ground water samples from monitoring wells SMW-1 and SMW-2 located to the east and west of Building RV-42, respectively. The locations of monitoring wells SMW-1 and SMW-2 are shown on Plate 1. These two monitoring wells were installed and sampled as part of an Environmental Assessment Update of Building RV-42 Warehouse performed by Smith & Mahoney, P.C. in September 1991(Smith & Mahoney, P.C.; March 1992) for Insulating Materials Incorporated (IMI). The ground water samples collected from SMW-1 and SMW-2 were analyzed for volatile organic compounds (VOCs) using United States Environmental Protection Agency (EPA) Method 624, semi-volatile organic compounds (SVOCs) using EPA Method 625, total cyanide using EPA Method 335.2, sulfide using Standard Methods SM-427D, pH using EPA Method 150.1, EH by an undetermined method, specific conductance using EPA Method 120.1, and reactivity using EPA SW-846 Section 7.3. It should be noted that total xylenes were not on the VOC target compound list (TCL). A copy of the associated analytical data is provided in Appendix D.

Ground Water Technology, Inc.

On April 20 and May 27, 1987, GTI collected ground water samples from monitoring wells GT-1 and GT-2 located to the south and north of the former RCRA Storage Tank Location, south of Buildings RV-37 and RV-33 (GTI, January 1993). The location of these monitoring wells is shown on Plate 1. GTI collected ground water samples from GT-1 and GT-2 as part of an investigation to determine whether a 1987 spill next to the former RCRA Storage Tank impacted ground water. The ground water samples were analyzed for VOCs and a copy of the table summarizing the analytical results is presented in Appendix E. These two wells were sampled again on October 23, 1987 for organic compounds and a copy of the table containing the results is presented in Appendix E.

Between August 3 and 21, 1987, GTI collected two rounds of ground water samples from monitoring wells GT-1, GT-2, GT-3, GT-4, GT-5, GT-6, GT-7, GT-8 and GT-9. These monitoring wells are located throughout the Riverview site and are shown on Plate 1. GTI collected ground water samples from these monitoring wells as part of subsurface investigation to assess areas of concern throughout the Riverview site. The ground water samples were analyzed for VOCs and acid-extractable SVOCs and a copy of the table summarizing the analytical results is presented in Appendix E.

On February 18, 1988, GTI collected ground water samples from monitoring wells GT-1, GT-2, GT-10, GT-11 and GT-12. These monitoring wells are located throughout the Riverview site and are shown on Plate 1. GTI collected ground water samples from these monitoring wells as part of an additional subsurface investigation requested by NYSDEC (GTI, January 1993). The ground water samples were analyzed for VOCs by EPA Methods 503.1 and 601, and acid-extractable SVOC by EPA Method 625. A copy of the table summarizing the analytical results is presented in Appendix E.

On September 9, 1988, GTI collected ground water samples from monitoring wells GT-2, GT-3, GT-7, GT-8, GT-9, and GT-11. NYSDEC collected split samples from the same monitoring wells. These monitoring wells are located throughout the Riverview site and are shown on Plate 1. GTI collected ground water samples from these monitoring wells as part of an additional subsurface investigation requested by NYSDEC (GTI, January 1993). The ground water samples were analyzed for VOCs and total metals by undetermined methods. The ground water samples collected by NYSDEC were also analyzed for PCBs. A copy of the table summarizing the analytical results is presented in Appendix E.

Between September 8 and 11, 1992, GTI collected ground water samples from monitoring wells GT-1, GT-3, GT-4, GT-5, GT-7, GT-8, GT-9, GT-

10, GT-12, GT-13, GT-14, GT-15 and GT-16. These monitoring wells are located throughout the Riverview site and are shown on Plate 1. GTI collected ground water samples from these monitoring wells as part of an additional subsurface assessment program requested by NYSDEC. The ground water samples were analyzed for VOCs, SVOCs, pesticides/PCBs, total and/or dissolved metals, and total cyanide by New York State Analytical Services Protocol (ASP) Methods 91.1, 91.2, 91.3, ASP-Contract Laboratory Program (CLP) Metals, and 335.2, respectively. A copy of the table summarizing the analytical results is presented in Appendix E.

Rust Environment & Infrastructure, Inc. (Rust)

On September 2, 1993, Rust collected ground water samples from monitoring wells GT-9 and GT-13 located to the northwest and west of Building RV-33, respectively. Rust collected ground water samples from these monitoring wells to evaluate the potential impact of the June 1992 IMI wash solvent spill had on the ground water quality, if any (Rust, February 1994). The ground water samples collected from GT-9 and GT-13 were analyzed for VOCs using EPA SW-846 Method 8240 and acid-extractable SVOCs using EPA SW-846 Method 8270. A copy of the associated analytical data is provided in Appendix F. Rust also sampled, on a separate occasion, GT-4 associated with 73128 product discharge remediation (Rust, February 1994).

Wagner, Heindel and Noyes, Inc. (WH&N)

Between December 12 and 13, 1994, WH&N collected ground water samples from monitoring wells GT-1, GT-4, GT-5, GT-7, GT-9, GT-10, GT-12, GT-13, GT-14, GT-15 and GT-16. These monitoring wells are located throughout the Riverview site and are shown on Plate 1. WH&N collected ground water samples from these monitoring wells as part of a real estate transaction investigation (WH&N, February 1995). However, only the ground water samples collected from monitoring wells GT-1, GT-5, GT-7, GT-9, GT-13, and GT-16 were analyzed for VOCs by EPA SW-846 Method 8260 and SVOCs by EPA SW-846 Method 8270. The ground water samples from the remaining monitoring wells sampled were not analyzed based on WH&N's limited scope of work. The associated analytical data is provided in Appendix G.

3.3.2. Off-site ground water sampling

The GE Power Systems Main Plant is located to the north of the Riverview facility. The off-site ground water monitoring wells discussed below are located on the GE Power Systems Main Plant property and are hydraulically downgradient of the Riverview facility.

Woodward-Clyde Consultants (WCC)

The WCC October 1989 Field Investigation Report, Volume 1 of 3, prepared for the GE Power Systems Main Plant, contained a summary of the analytical data obtained from the ground water samples collected from monitoring well GE-11 on August 6, 1980 and January 28, 1986. The locations of the monitoring wells at the GE Power Systems Main Plant are provided in Figure 5 in Appendix C. The ground water samples were submitted for priority pollutant organic analyses and a copy of a table summarizing the analytical results is provided in Appendix H.

Dames & Moore (D&M)

The Dames & Moore Sampling and Analysis Report for the GE Power Systems Main Plant dated March 4, 1998, contained a historical summary of analytical results obtained from ground water samples obtained from monitoring wells GE-30 and GE-31 located in the southwest corner of the GE Power Systems Main Plant. Ground water samples were collected from GE-30 and GE-31 during 12 sampling events from March 1983 through December 1997 and submitted for the following analyses:

- VOC analysis during nine sampling events (i.e., August and November 1991, March , June and August 1992, June 1993, April 1994, May 1995, and December 1997);
- SVOC analysis during seven sampling events (i.e., April 1988, August and November 1991, March and June 1992, May 1995, and December 1997);
- Phenol analysis during two sampling events (i.e., September 1983 and July 1989);
- Pesticides and/or PCB analysis during six sampling events (i.e., August and November 1991, March and June 1992, May 1995, and December 1997);
- Total metal analyses during eleven sampling events (i.e., March, June, and September 1983, April 1988, July 1989, August and November 1991, March and June 1992, May 1995, and December 1997); and,
- Dissolved metal analyses during one sampling event (i.e., December 1997).

A copy of a table summarizing the analytical results is provided in Appendix I.

3.4. Riverview monitoring well condition and ground water flow

The results of the visual inspection of the monitoring wells indicate the following:

- Monitoring wells GT-6 and GT-11 have been damaged beyond repair. The protective casings and upper portion of the riser pipe were broken off the well and were observed lying on the ground next to the approximate location of the well. These wells should be located and properly decommissioned. Decommissioning could be accomplished by first locating the former well head and grouting in the screen and riser pipe to within three feet of the ground surface.

- Monitoring well GT-2 is obstructed approximately 4 feet below ground surface. The nature of the obstruction was not determined but it appears the riser pipe is bent below grade and a bailer is stuck in the riser pipe. This well needs to be either repaired or properly decommissioned.

- The protective casing and riser pipe at monitoring well GT-3 is loose and the concrete pad is cracked. The surface completion at this location needs to be repaired.

- Monitoring well GT-7 was previously damaged and repaired with a 3-inch steel pipe. The well needs a locking cap installed on it and needs to be resurveyed to determine the new measuring point elevation.

- Monitoring well GT-9 could not be located. The well head should be located and a determination on the integrity at the well should be completed.

- The flush mount well casing at monitoring well GT-15 needs to be replaced. The riser pipe of the well appears in good condition.

- Monitoring well SMW-1 was partially paved over. The well needs to be examined to determine its integrity.

- Based on site reconnaissance, existing monitoring wells examined exhibited significant silting of well screens.

- Observed ground water levels in wells measured and calculated ground water flow directions are consistent with previous GTI and WH&N reports.

- A review of ground water flow reports from the GE Power Systems Main Plant indicate that ground water flow to the north of the Riverview site is predominantly to the north/northeast across GE property toward the Mohawk River.

- A review of GE Power Systems Main Plant information indicates that three wells (GE-11, GE-30 and GE-31) are located in the southwestern portion of the GE Power Systems Main Plant are positioned downgradient of the Riverview site (see Figure 5 in Appendix C). Recent chemical analyses indicate that no VOCs have been detected in these wells.

- The Riverview facility area is described by USGS and NYSDEC as a minor aquifer area. Subsurface soils consist primarily of glaciolacustrine medium to fine silty sand.

- Most recent ground water sampling events are the comprehensive ground water sampling by GTI in 1992, and partial sampling rounds by Rust in 1994, and in 1994 by WH&N.

3.5. Constituents of concern in ground water

The following discussion includes the identification of the constituents of concern in the ground water at the Riverview site. Chemical compounds or elements detected in the ground water samples collected from the monitoring wells on-site are considered constituents of concern if the concentrations are equal to or greater than the associated NYSDEC, Division of Water, Technical and Operational Guidance Series (TOGS) 1.1.1 (March 12, 1998), ambient water quality standards for ground water utilized as drinking water (i.e., Class GA standard). Constituents detected at the Riverview site at concentrations at or above NYSDEC Class GA standards are considered constituents of concern, unless justifiable rationale (i.e., chemical concentration is consistent with background levels) is provided. Based on the analytical data generated from the ground water sampling events listed above, the following constituents of concern have been identified.

VOCs

Toluene, ethylbenzene, total xylenes, isopropylbenzene, p-isopropyltoluene, n-propylbenzene, 1,2,4-trimethylbenzene, 1,3,5-trimethylbenzene, trichloroethene and tetrachloroethene are considered constituents of concern because concentrations at or above the NYSDEC

Class GA standard have been detected in ground water samples collected from the Riverview site.

Methylene chloride was also detected above NYSDEC Class GA standard in two ground water samples collected from monitoring well GT-1 in August 1987. However, methylene chloride (a common laboratory contaminant) is not considered a constituent of concern. Methylene chloride was only detected above the NYSDEC Class GA standard in ground water samples collected from GT-1 in August 1987 from the Riverview site. Methylene chloride was not detected in the samples collected from monitoring well GT-1 in two previous sampling events in 1987, as well as the four subsequent sampling events conducted between October 1987 and December 1994.

SVOCs

Total phenols, 4-methylphenol, isophorone, 4-nitroaniline and bis-2-ethylhexyl phthalate were detected at or above the NYSDEC Class GA standards in ground water samples collected at the Riverview site. However, bis-2-ethylhexyl phthalate is not considered a constituent of concern. Bis-2-ethylhexyl phthalate was detected once above the NYSDEC Class GA standard in ground water samples collected from the Riverview site. The bis-2-ethylhexyl phthalate was detected in the background monitoring well GT-8 in September 1992 and, therefore, may be an indication of upgradient contamination. It should also be noted that bis-2-ethylhexyl phthalate is also considered a common laboratory contaminant.

PCBs

PCBs were detected above the NYSDEC Class GA standard in one ground water sample collected from monitoring well GT-9. However, PCBs are not considered a constituent of concern because it was only detected once at a concentration of 3.0 parts per billion in the ground water sample collected from GT-9 by NYSDEC in September 1988. PCBs were not detected in the ground water samples from monitoring well GT-9 or wells GT-1, GT-3, GT-4, GT-5, GT-7, GT-8, GT-10, GT-12, GT-13, GT-14, GT-15 and GT-16 collected September 8 and 11, 1992 at the Riverview site.

Inorganic constituents of concern

Dissolved sodium is considered a constituent of concern because concentrations above NYSDEC Class GA standards have been detected in ground water samples collected from the Riverview site. A total concentration of dissolved manganese plus iron (868 ug/L) was detected above the Class GA standard in the ground water sample collected from

monitoring well GT-9. However, dissolved iron and manganese are not considered constituents of concern because they are likely contributed by native geological formations. According to Winslow (1965), both iron and manganese are native constituents of the shale bedrock, as well as the sand and gravel. A number of ground water samples collected in eastern Schenectady County from both overburden and bedrock wells in the area contained dissolved iron and manganese. Total concentrations of dissolved iron plus manganese ranged from 20 to 4,650 ug/L in the ground water samples collected in eastern Schenectady County.

3.6. Surface water

In April 1988 and July 1989, WCC collected surface water samples from the Poentic Kill (SW-1 & SW-5) and Poenties Kill (SW-3 & SW-4) (GTI, January 1993). Surface water samples were analyzed for VOCs. In November 1990, NUS collected surface water samples from the Poentic Kill (SW-1 & SW-5) and Poenties Kill (SW-4) (GTI, January 1993). Surface water samples were analyzed for total metals. Copies of tables summarizing the analytical results and a map showing the sampling locations is provided in Appendix E.

3.7. Seep water

As described in the January 1993 GTI report, sometime after 1979, GE collected a sample of a seep on the hillside north of the Riverview facility. The specific location of the hillside seep is unknown. The seep water sample was analyzed for undetermined organic and inorganic parameters. As reported by GTI in the January 1993 report, trace concentrations of organics were detected in the seep, and no unusual concentrations of inorganic elements were detected, with the exception of iron. The report also stated that the concentrations of constituents detected in the seep sample did not exceed primary drinking water standards.

Between March and September 1988, various hillside seep sampling programs were undertaken by GE and/or NYSDEC (GTI, January 1993). Again, the specific location of the hillside seep is unknown. The seep water sample was analyzed for undetermined organic parameter(s), total phenols, and priority pollutant total metals, plus iron and manganese. The GTI, January 1993 report states that no organics, total phenols, or total metals, with the exception of iron, were detected in the hillside seep sample.

4. Synopsis of potential areas of concern

Based on the site history, a number of areas of potential environmental concern have been identified. These sections present a synopsis of current conditions for each of the areas of potential concern.

4.1. RV-14 varnish room leach field/dry well (SWMU #6)

Location
Area is located outside the varnish room loading area on the east side of building RV-14 underneath the former Outdoor Container Storage Area #2.

Description
Between 1960 and 1980 flammable varnishes and solvents from the varnish room were directed into a dry well and leach field. The dry well leach field received solvents and resins spilled on the floor in the RV-14 varnish room, wash water and precipitation.

Analytical data
Photoionization detector (PID) vapor readings by WH&N in auger spoils ranged from 235 to 350 ppm at depths of 5 to 10 feet below grade. PID headspace screening of soils from 5 to 10 feet below grade yielded readings of 1,400 to 1,500 ppm and PID readings to 1,000 ppm at a depth of 15 feet. No sheens of free-phase product were observed. Results of a soil sample collected at a depth of 5 to 10 feet indicated the following principal constituents: xylene, 1,180 ppm; ethylbenzene, 133 ppm; toluene, 37 ppm; and 1,2,4-trimethylbenzene, 18.9 ppm.

4.2. RV-14 former superior boiler underground fuel oil tank (SWMU #8)

Location
Former fuel oil underground storage tank area is located outdoors at the northeast corner building RV-14.

Description
Between 1960 and 1987 the area was occupied by a 10,000 gallon steel underground storage tank and associated piping. The tank was originally used to store No. 6 fuel oil and at some point was changed over to No. 2 fuel oil. The tank was removed in 1987 and according to the RCRA Preliminary Review - Visual Site Inspection (PR-VSI), approximately 100 cubic yards of soil were removed and disposed off site by a contractor.

Analytical data
Area was investigated by WH&N and reported PID vapor readings of up to 120 ppm and evidence of subsurface oil down to depths of 20 feet below ground surface. One soil sample was collected from a depth of 17 to 20 feet and submitted to a laboratory for VOC analysis. Results of the soil sample indicate the following principal constituents: xylene, 6.03 ppm; 1,2,4-trimethylbenzene, 9.23 ppm; naphthalene, 3.53 ppm; and 1,3,5-trimethylbenzene, 3.74 ppm. Additionally, a total petroleum hydrocarbon (TPH) concentration of 40,000 ppm was reported.

4.3. RV-14 boiler dry well (not identified as a SWMU)

Location
The R-14/15 boiler dry well is located at the northeast corner of building RV-14 approximately midway between the RV-14 varnish room dry well and the RV-14 former superior boiler underground fuel oil tank areas.

Analytical data
One soil sample was collected from the RV-14 boiler dry well area by WH&N. Results indicate only naphthalene was detected at a concentration of 0.21 ppm.

4.4. RV-37 former RCRA tank (SWMU #19)

Location
The RV-37 former RCRA underground storage tank is located on the west side of the facility between buildings RV-33 and RV-37 and to the east of the intersection of the main road and the road to the RV-37 boiler house.

Description

The RV-37 former RCRA underground storage tank was a 10,000 gallon carbon steel holding tank for ignitable wastes. The unit began operations in 1961 and ceased operations in March 1987. Up to 79,000 gallons per year of waste process water containing 5 to 12 percent organics were managed in this unit. The unit underwent partial closure in November 1988 at which time the tank was removed along with 60 cubic yards of soil. April 6, 1989, NYSDEC indicated the closure activities to date were not sufficient due to PID readings. The NYSDEC required that ground water monitoring be performed.

Analytical Data

The RV-37 former RCRA tank was investigated by WH&N. Soil boring investigation indicated chemical odors and split-spoon sample PID reading of 2.2 ppm from 14 to 17 feet below grade. A soil sample was collected and submitted to the laboratory for TCL-VOC and SVOC analysis. Laboratory analysis of the sample collected in the R-7 RCRA tank area indicate no TCL-VOCs or SVOCs were detected.

Remedial activities

Closure activities for this tank were initiated on November 4, 1988 by Clean Harbors under the direction of Clough Harbour and Associates of Albany, New York (Clough Harbour). The underground storage tank was triple rinsed and all remaining residue removed. An HNU-PID was used to segregate clean and contaminated soil during the tank removal. After the tank was removed, contaminated soil was removed from the excavation and stockpiled on clear plastic sheeting. At the time the tank was excavated results of PID measurements indicate the highest PID readings in the northeastern portion of the excavated area with PID readings of up to 450 ppm, at a depth of 10 feet. The PID readings decreased to 70 ppm at a depth of 18 feet. At a depth of approximately 18 feet, soil at the bottom of the excavation showed no signs of contamination. Approximately 60 cubic yards of soil were removed. Due to the sandy soil and close proximity of several structures further lateral excavation of the soil to the northwest was not feasible. The December 9, 1988, Clough Harbour report indicates that the excavated soil was scheduled to be incinerated at an approved hazardous waste disposal site.

4.5. RV-33 raw material tank farm (SWMU #18)

Location

This area is located in the northwest corner of the facility behind Building RV-33.

Description

The RV-33 north tank farm contained eight aboveground storage tanks and piping within the 3-foot high diked area with the blue stone face on the southern wall. Aboveground storage tanks were installed by General Electric between 1960 and 1966. Piping from the tank farm extended to the tank track unloading area (SWUM #17) and rail car loading/unloading area (SWMU #16). In addition, wire enamels were transferred to tank cars at the rail car loading/unloading area. Many of the raw materials stored in the aboveground storage tanks were used in the manufacture of wire enamel at the facility.

Remedial activities

In November 1996 MC Environmental Services of South Glens Falls, New York (MCES), under the direction of Clough Harbour, closed the RV-33 tank farm, rail car unloading station, pump stations, and the associated piping. Prior to removal, each of the aboveground storage tanks were flushed, pressure washed, and decontaminated to a level where no visible residue or liquid were present and no vapors were detected. Following decontamination, each tank was mechanically dismantled and reinspected for presence of residual material. In early December 1996 MCES began demolition of the former rail car unloading station and pump stations. All pumps, piping supports and miscellaneous equipment in the truck unloading area and pump station south of the tank farms were removed. All piping and equipment was decontaminated. Some piping that was not decontaminated was cut up and placed in drums for disposal by IMI. Raw material lines extending from one loading area to tanks were also removed and decontaminated and disposed of. On February 18, 1997, Clough Harbour issued a Certification of Closure for the eight aboveground storage tanks and piping associated with the RV-33 north tank farm.

Analytical data

The tank farm was visually inspected for evidence of contamination prior to dismantling of the aboveground storage tanks and the associated piping. No visual or olfactory indications of contamination associated with the tank farm or piping were observed. Based on preliminary field observations, a test pit soil sampling program was implemented to investigate potential subsurface contamination in the RV-33 north tank farm area. A total of 10 test pits were excavated and soil samples collected for analysis by EPA Method 8260 and 8270. Analytical results indicate the presence of the following principal constituents: 2,4,6-trimethylphenol, xylene and trimethylbenzene.

4.6. Former RCRA drum storage area (SWMU #25)

Location

The former outdoor RCRA container storage area is located outdoors in the western portion of the facility southwest of building RV-37.

Description

The former drum storage area is a 75 by 65 foot macadam area used to store 55 gallon drums of hazardous waste generated at the facility from 1979 to 1989. Up to 670, 55 gallon drums were managed in this area at a time.

Analytical data

This area was evaluated by both test pit excavations and soil borings by WH&N. Two test pits were excavated in the west and south margins of the site and yielded PID vapor readings of up to 1.4 ppm in soils between 5 and 8 feet in depth. Soil borings were conducted inside the drum storage area. Auger spoils recovered during drilling to a depth of 15 feet yielded moderate chemical odors and PID vapor readings of up to 35 to 40 ppm. A sample of subsurface soil from this interval was collected and submitted for laboratory analysis. Results of the soil sample collected in the RCRA drum storage area labeled R-6A indicated n-propyl benzene was detected at 37.4 parts per billion (ppb) and 111 ppb total xylenes. No TCL-SVOCs were detected.

4.7. RV-30 former UST tank farm area (AOC B)

Location

This area is located outdoors northwest of building RV-30 and east of RV-33.

Description

The inactive underground storage tank (UST) farm consisted of three (3) tanks (2 single compartment 10,000 gallon tanks and one compartmentalized 30,000 gallon tank having three 10,000 gallon compartments) and was situated in an approximately 90 by 60 foot area located on the western portion of the facility property. The area is bordered by a tanker truck off-loading building (RV-30) and nitrogen storage to the south, production building RV-33 to the west, an aboveground toluene storage tank and associated diking to the northeast, and an access road to the east.

Analytical data

In December of 1994, this portion of the facility was investigated by WH&N. A soil sample was collected from this area for TCL-VOC and SVOC analysis as well as formaldehyde. Analytical results indicate no TCL-VOC or SVOCs or formaldehyde were detected in the sample collected.

Analytical results for conformation soil samples collected indicate that formaldehyde was not detected in soil samples associated with the formalin tank underground storage tank removal program in 1994.

Analysis of soil samples collected from the area of the 30,000 gallon underground storage tank areas do not indicate the presence of contaminants in the soil associated with the excavation of these tanks.

Remedial activities

In 1994, McLaren Hart Environmental Engineering Corporation (McLaren Hart) observed the removal of the Formalin underground storage tank. The underground storage tank was observed in good condition with no visual leaks or damage. No visual contamination or elevated field screening readings were observed for the soil removed. In 1994 McLaren Hart also observed the removal of toluene/di-isocyanate (TDI) tank associated soil from this same area. Additionally, McLaren Hart observed the excavation and removal of a 30,000 gallon underground storage tank from the same general location. These additional tanks were observed to be in good conditions with no visual leaks or damage.

4.8. RV-14 outdoor underground tank (SWMU#7)

Location

This tank is located outside the central portion of the south wall of building RV-14.

Description

The unit is a 10,000 gallon underground storage tank constructed of steel coated with asphalt. Approximately 9,000 gallons per year of corrosive cleaning solution were handled in this tank annually. The unit began operations in 1976 and ceased operation in 1985. The tank is scheduled for removal in August 1998.

Analytical data
This area was investigated by WH&N. Based on soil sampling in this area, no evidence of contamination was observed.

4.9. RV-33 leach field and dry well (SWMU #15)

Location
The RV-33 leach field and dry well is located underneath the warehouse area added to the northwest corner of building RV-33.

Description
Prior to 1980, storm water runoff around building RV-33 was collected in this unit. The unit began operations in 1960 and ceased operations in 1980. The unit is currently completely covered by blacktop parking area in building RV-33.

Analytical data
The RV-33 dry well area was investigated by WH&N. As part of the work, a soil boring was drilled and PID vapor reading measurements collected. A maximum PID vapor reading of 1.1 ppm was observed at a depth of 6 to 8 feet. No other observations or subsurface contamination were detected.

4.10. Building RV-42 hazardous waste storage warehouse (SWMU #22)

Location
Building RV-42 is located between buildings RV-28 and RV-30 in the southwestern portion of the facility.

Description
Building RV-42 is an approximately 15,000 square foot building constructed of steel framing and slab on grade concrete floor. It was constructed in 1975 for use as the Mine Bolt Operation area. In 1984 following shutdown of the Mine Bolt Process Operation the building was converted into a warehouse for flammable components. In January 1989, the RCRA Hazardous Waste Storage area in building RV-42 became operational.

Analytical data
The RV-42 building area was investigated by Smith & Mahoney, P.C. in 1992. Two test borings and monitoring wells were drilled and installed in the area as close to building RV-42 as practical to detect potential

contaminants. Two subsurface soil samples were analyzed for VOCs by EPA Method 8240 and total phenols. The two soil samples did not indicate the presence of constituents above detection limits other than acetone which is a common laboratory artifact. Ground water samples were also collected from both monitoring well locations in September of 1991. No VOCs were detected in the two ground water samples.

4.11. Former outdoor container storage area (SWMU #26)

Location

This unit is located outdoors, north of the main parking area, to the east of Building RV-14, in the northeast corner of the facility.

Description

This unit is a 40- by 12-foot macadam area, fenced on three sides. From the early 1970s to 1985, 55 gallon drums and smaller containers of hazardous waste generated in Buildings RV-12, RV-13 and RV-14 were stored in the area prior to disposal off-site. From 1980 to 1985 waste containers requiring greater than 90 day storage were moved to the Former Outdoor RCRA Container Storage Area (SWMU No. 25) to await shipment off-site for disposal.

In 1985 the facility began storing wastes generated in Buildings RV-12, RV-13 and RV-14 at the Former Outdoor Container Storage Area 2 (SWMU No. 27). After 1985, the unit was used for the storage of uncleaned empty drums and totes, and product drums. There are no known releases associated with this area.

Analytical data

As part of their 1995 assessment, WH&N excavated two test pits to a depth of eight feet in the area adjacent to the former drum storage area. No odors were discernable in the two test pits nor was there any noticeable soil discoloration. PID readings were very low ranging from 0.4 to 1.0 ppm.

4.12. Former outdoor container storage area 2 (SWMU #27)

Location

The former outdoor container storage area 2 is located along the fence separating the main parking area and building RV-14, on the east side of the facility.

Description
This 30x10-foot macadam area is used to store up to 40 55-gallon drums of hazardous waste for less than 90 days. The area was used to store waste generated in buildings RV-12, RV-13 and RV-14 from 1985 to early 1989. Wastes were stored at this area prior to being moved to the former outdoor RCRA container storage area to await shipment off-site for disposal.

Since January 1989, the wastes generated at Buildings RV-12, RV-13 and RV-14 have been transferred to the RV-42 RCRA container storage area and this area has been used for the storage of empty, uncleaned drums and product drums. Waste containers are placed in this area for less than a day prior to being moved to the RV-42 RCRA container storage area. There are no known releases associated with this area.

Analytical data
As part of WH&N's 1995 assessment, a test pit was excavated through the asphalt pavement to observe subsurface soil conditions at this area. No evidence of contamination was observed.

4.13. Empty drum storage area (SWMU #29)

Location
The empty drum storage area is located on the south side of the facility, to the west of building RV-42.

Description
The area is an approximately 30 by 40-foot partially paved area of the facility where uncleaned empty waste drums and tote tanks have been stored. The containers are stored in this area until there are sufficient numbers to warrant transport offsite for cleaning prior to reuse. The area has been used for container storage since at least 1988 and is currently active. There are no documented releases from this unit.

Analytical data
As part of the WH&N, a test pit was excavated on the south side of the empty drum storage area. The test pit was excavated to a depth of nine feet. No odors in soil and discoloration was discernable. PID readings ranged from 0 to 1.7 ppm.

4.14. RV-33 rail loading/unloading area (SWMU #16 and #17)

Location

The RV-33 rail loading/unloading area was located outdoors, in the northwest corner of the facility, behind building RV-33.

Description

The area consisted of six rail car loading/unloading stations, designated A-F, the associated aboveground piping and the macadam covered ground beneath the area. The unit had been in use for various operations since the building was built in 1960. Up until November, 1989 raw material was brought onsite by railroad tank cars, entering the facility through the rail gate in the northeast corner of the facility.

Remedial activities

In early December 1996 MCES began demolition of the former rail car unloading station and pump stations. All pumps, piping supports and miscellaneous equipment in the truck unloading area and pump station south of the tank farms were removed. All piping and equipment was decontaminated. Some piping that was not decontaminated was cut up and placed in drums for disposal by IMI. Raw material lines extending from one loading area to tanks were also removed and decontaminated and disposed of. No evidence of significant contamination was noted in this area.

4.15. RV-37 leach field and dry well (SWMU #21)

Location

The RV-37 leach field and dry well is located outdoors, adjacent to the north side of building RV-37.

Description

The leach field received boiler blow down water until October 1989 from three boilers located in RV-37.

Analytical data

As part of their assessment of the Riverview facility, WH&N drilled a soil boring adjacent to the RV-37 dry well on the north side of the building to a depth of 17 feet. No significant evidence of contamination was observed. No odors, discoloration or other visible signs of contamination were observed. PID vapor readings were 0 down to a depth of 15 feet and 1.2 ppm from 15 to 17 feet in depth.

4.16. Former outdoor container storage area 3 (SWMU #28)

Location

The former outdoor container storage area 3 is located on the west side of the facility to the east of the former outdoor RCRA storage area.

Description

The former outdoor container storage area 3 is a 100 by 30-foot macadam area where up to 200-55 gallon drums of hazardous waste were stored for less than 90 days. The area was used for hazardous waste storage from the early 1980s to early 1989. During that time period containerized waste generated in building RV-33 was brought to the area when the former outdoor RCRA container storage area was full. The containers were stored at this unit only until there was room for them in the RCRA area. The unit ceased to handle hazardous waste in early 1989 when the RV-42 RCRA container storage area began operations.

Analytical data

As part of WH&N's 1995 assessment, a test pit was excavated to a depth of 4 feet on the south side of the container storage area. The highest PID reading observed was 1.0 ppm with no discernable odors or soil discoloration observed.

4.17. RV-33 truck loading area (AOC A)

Location

The area is located outdoors on the west side of building RV-33.

Description

This area is a tank truck loading area. Varnishes and resins from the product storage tanks in building RV-33 were loaded onto trucks. A concrete pad is located under the area. The area was covered and secondary containment was added in 1990.

Analytical data
As part of their assessment of the facility, WH&N completed a hand auger boring in this area. No evidence of contamination was detected.

4.18. RV-14 west loading area spill site (AOC C)

Location
This area is located on the west side of building RV-14 opposite the overhead door in the shipping and receiving area.

Description
In 1981 a spill of product containing cresylic acid and trimethylphenol reportedly cleaned up by facility personnel.

Analytical data
As part of their assessment of the facility, WH&N completed a soil boring in this area. No evidence of contamination was detected.

5. Previously identified potential areas of concern

The USEPA identified 32 solid waste management units (SWMUs) and three areas of concern (AOCs) in the RCRA Facility Assessment (RFA) (1992). The RFA concluded that 15 of the SWMUs (SWMUs # 1, 2, 3, 4, 5, 9, 10, 11, 12, 13, 14, 20, 22, 23, and 24) did not require further action. SWMUs #22, 23 and 24 are also contained in potential area of concern RV-42 Hazardous Waste Storage. Two of the SWMUs (SWMU #30 Soil Pile and SWMU #31 Storm Sewer System) have been eliminated from consideration by this report. The Soil Pile (SWMU #30) was removed in 1994 and disposed of off site. The Storm Sewer System (SWMU #31) is part of the SPDES discharge system with combined storm water and non-contact process cooling water discharge. VRI is under an agreement with the NYSDEC to clean the catch basins. The manhole covers were modified to allow facility personnel to place a sealing cap over the opening in the event of a spill. No soil or ground water investigations were recommended.

AOC B has been included in this summary report as part of the potential area of concern RV-30 Former UST Tank Farm.

6. Recommendation for additional activities

6.1. Site ground water monitoring well recommendations

- Former wells GT-6 and GT-11 be properly abandoned.
- Repair well GT-2. If repair is not possible, properly abandon.
- Repair wells GT-3 and GT-15 protective casing.
- Locate or replace well GT-9.
- Redevelop all existing monitoring wells.
- Resurvey all existing and new monitoring well elevations/locations.
- Conduct a round of ground water sampling in existing and newly installed monitoring wells for the site compounds of concern.
- As part of the site investigation, the hillside north of the Riverview facility should be investigated for seeps previously reported. Samples of up to three distinct seeps should be obtained and analyzed for site specific compounds of concern.

6.2. Selection of areas of concern for additional investigation

Considerable investigatory activities have been completed on the site. These activities have developed information on soil and ground water quality for many of the potential areas of concern on the site. In addition, remedial activities have been completed at some of the potential areas of concern.

This site has a long history as an industrial facility. Currently site is zoned for industrial use and continues to operate as an industrial facility with the associated access restrictions. The access and zoning mean that the pathways for potential human health and environmental impacts are via ground water and contact with soils under an industrial setting.

With respect to the ground water there is both a site wide monitoring well network and a historical data base of site ground water quality. In addition, there is an off-site ground water data from monitoring wells located downgradient of the site. These ground water data provide the basis for identifying the need for additional ground water monitoring locations instead of relying upon potential impacts based upon soil quality.

In order to provide for effective investigation and remediation of the potential areas of concern a screening of the potential areas of concern has been completed. This screening has separated those potential areas of concern which will require additional evaluation from the areas which require no further action. This screening focused on the ground water and soil contact pathways. Based upon the screening, areas which have impacted the ground water, have the potential for soil contact risk, or have insufficient data have been identified for additional evaluation of soil or ground water. Based upon previous investigations, areas which have no evidence of soil or ground water contamination or do not poise a risk to ground water or a soil contact risk represent areas for no further action.

For potential areas of concern where laboratory data has documented compounds in the soil, the criteria used for the screening include the site ground water monitoring data, the NYSDEC Technical Administrative Guidance Memorandum (TAGM) 3028, and the USEPA Region III Risk-Based Concentration Table (EPA RBCs). The site ground water data provides a more realistic indication of ground water impacts than projected impacts based upon soil concentrations. The thick unsaturated zone, which facilitates the adsorption and volatilization of compounds, likely plays a significant role in restricting ground water impacts from site soil contamination. TAGM 4046 provides guidance soil concentrations which may impact ground water quality, however the calculations used in this TAGM are overly conservative for this site and the conclusions based upon this TAGM are not supported by the site ground water data. Given the extensive ground water data at this site, the evaluation of potential impacts to ground water from soils is best addressed by the site ground water quality data and not TAGM estimates. With regards to the potential soil contact risk poised by soil contamination, TAGM 3028 and the EPA RBCs provide a useful tool for screening potential areas of concern. Potential

areas of concern with soil concentrations below TAGM 3028 and EPA RBCs values are considered to not present a soil contact risk.

6.3. Potential areas of concern recommendations

The following text presents the recommendations for the potential areas of concern. These recommendations are summarized on Table 2.

6.3.1. RV-14 varnish room leach field/dry well (SWMU #6)

VOCs reported were below applicable NYSDEC Technical and Administrative Guidance Memorandum (TAGM) 3028 guidance values and EPA RBCs for both industrial and residential exposure scenarios. No SVOCs were detected by EPA Test Method 8270. Based on the available analytical information, it appears unlikely that subsurface soils in this area will contain VOCs in excess of TAGM 3028 and EPA RBCs. However, two borings (SB98-1 and SB98-2, Plate 1) are recommended in the immediate vicinity of the dry well/leach field and soil samples collected for VOC analysis based on PID readings. Ground water downgradient of this area will also be evaluated.

6.3.2. RV-14 former superior boiler underground fuel oil tank (SWMU #8)

All VOCs reported were below applicable NYSDEC TAGM 3028 guidance values and EPA RBCs for both industrial and residential exposure scenarios. Results from ground water monitoring well GT-7, downgradient of the source area, do not indicate the presence of any TCL volatile organic chemicals. Based on the available analytical information, it appears unlikely that subsurface soils in this area will contain VOCs in excess of TAGM 3028 and EPA RBCs. However, one boring (SB98-3, Plate 1) is recommended in the immediate vicinity of the RV-14 former fuel oil tank area. Soil samples will be collected for VOC analysis based on PID readings to confirm the previous results.

6.3.3. RV-14 boiler dry well (not identified as a SWMU)

The concentration of naphthalene reported is well below the NYSDEC TAGM 3028 and EPA RBCs for both industrial and residential exposure scenarios. No other VOCs or TCL SVOCs were detected. Based on the available analytical information, no additional soil sampling is recommended for this area. Ground water in this part of the facility will be

evaluated by well GT-7, GT-16, and two additional wells proposed for this area of the facility (VRI-6 and VRI-7, Plate 1).

6.3.4. RV-37 former RCRA tank (SWMU #19)

Based on the available data, it appears unlikely that existing subsurface soils in this area are not expected to contain VOCs in excess of TAGM 3028 and EPA RBCs. The NYSDEC required ground water monitoring of the area. Ground water in this portion of the facility will be evaluated utilizing existing monitoring wells and proposed new monitoring wells (VRI-1, VRI-2 and VRI-3, Plate 1) in this portion of the facility.

6.3.5. RV-33 raw material tank farm (SWMU #18)

Based on the available analytical information, it appears that subsurface soils in this area contain elevated concentrations of VOCs and SVOCs. As a result, new ground water monitoring wells (VRI-2, VRI-3, and VRI-4, Plate 1) are recommended down gradient of the former RV-33 tank farm area and four soil borings (SB98-4, SB98-5, SB98-6 and SB98-7, Plate 1) will be installed and samples collected for VOC analysis to better evaluate this area as a potential ground water contaminant source.

6.3.6. Former RCRA drum storage area (SWMU #25)

The available analytical data do not indicate any significant releases of hazardous constituents in this part of the facility. Therefore, no additional borings or soil samples are proposed for this area. Ground water in this western portion of the facility will be evaluated with existing and proposed new wells for this portion of the facility.

6.3.7. RV-30 former UST tank farm area (AOC B)

Based on the past remedial activities and the available analytical information, no further action is recommended for this area.

6.3.8. RV-14 outdoor underground storage tank (SWMU #7)

Based on the WH&N work, no further action is proposed for this area.

6.3.9. RV-33 leach field and dry well (SWMU #15)

Based on the available analytical information, no additional soil sampling is recommended for this area. Ground water will be evaluated using the existing and proposed monitoring wells.

6.3.10. Building RV-42 hazardous waste storage warehouse (includes SWMU #22)

Based on the available analytical information no further action is recommended for the RV-42 warehouse area.

6.3.11. Former outdoor container storage area 1 (SWMU #26)

Based on the available analytical data, no further action is recommended for this area.

6.3.12. Former outdoor container storage area 2 (SWMU #27)

Based on the site history and the test pit observations by WH&N, no further action is recommended for this area.

6.3.13. Empty drum storage area (SWMU #29)

Based on the available information, no further action is recommended in the empty drum storage area.

6.3.14. RV-33 rail loading/unloading area (SWMU #16 and #17)

Based on the available information, no further action is recommended for the RV-33 rail loading/unloading area.

6.3.15. RV-37 leach field and dry well (SWMU #21)

Based on the available information, no further action is recommended for the RV-37 dry well/leach field area.

6.3.16. Former outdoor container storage area 3 (SWMU #28)

Based on the information available, no further action is recommended for this area.

6.3.17. RV-33 truck loading area (AOC A)

Based on the available information, no further action is recommended for this area.

6.3.18. RV-14 west loading area spill site (AOC C)

Based on the available information, no further action is recommended for this area.

7. Proposed scope of additional activities

- Based on the examination of the existing monitoring well network at the site, each existing monitoring well should be redeveloped to remove fine-grained materials from the well.

- Following redevelopment, a round of water level measurements will be collected to confirm previous results.

- Two soil borings (SB98-1 and SB98-2) are proposed for the immediate vicinity of the RV-14 varnish room leach field/dry well (Plate 1) to evaluate the extent of VOCs in the soil. The specific locations of the borings will be identified in the field. Soil borings will be advanced to minimum 20 foot depth and extend below evidence of impacts or to the ground water table. Drilling will be performed using hollow stem auger drilling techniques and soil samples will be collected in two foot intervals according to ASTM Method D-1586. Soil samples will be screened for the presence of VOCs with a portable PID. Selected samples, which will include documentation of the vertical extent of impacts will be submitted to the laboratory for VOC analysis by EPA SW-846 Method 8260.

- One soil boring (SB98-3) will be advanced in the immediate vicinity of the former superior boiler underground fuel oil tank (Plate 1). Soil samples will be collected, screened and analyzed for VOCs in accordance with the protocols outlined for the RV-14 varnish room leach field/dry well area.

- Four soil borings (SB98-4, SB98-3, SB98-6 and SB98-7) will be advanced in the RV-33 north tank farm (Plate 1). Soil samples will be collected and screened in accordance with the protocols outlined for the RV-14 varnish room leach field/dry well area. In addition to VOCs, soil samples submitted to the laboratory will be analyzed for SVOCs.

- Attempts will be made to repair GT-2. If it is not possible, to repair the well, it will be decommissioned in a manner consistent with NYSDEC guidance.

- Based on field observations, existing monitoring wells GT-6 and GT-11 cannot be repaired and should be properly decommissioned, in a manner consistent with NYSDEC guidance, by grouting the well from the bottom with a cement/bentonite grout. Existing soil gas monitoring points will be similarly abandoned by grouting. Additionally, the protective casing for monitoring wells GT-3 and GT-15 should be replaced and locking cap installed on well GT-7.

- Eight new monitoring wells are proposed for the (VRI-9) site. Additionally, well GT-9 is proposed to be replaced by a new well if the existing well GT-9 cannot be located. Monitoring wells will be drilled using hollow stem auger drilling techniques and soil sampling according to ASTM Method D-1586-84. Descriptions of soil sample texture, composition, color, consistency, moisture content and recovery will be recorded by the onsite geologist or hydrogeologist. Soil samples from these wells will also be screened with a PID for health and safety purposes.

  Monitoring wells will consist of two-inch ID threaded PVC or FRE, flush joint casing and screens completed approximately 8 to 10 feet into the ground water. Screens will be 10 to 15 feet in length and slot openings will be 0.010 inches. The annulus around the screens will be backfilled with an appropriate size of silica sand such as Morie #0 sand to a minimum height of two feet above the top of the screen. A bentonite pellet seal will be placed above the sand pack to form a seal at least two feet thick. The seal will be allowed to hydrate before placement of grout above the seal.

  The remainder of the annular space will be filled with a cement-bentonite grout to ground surface. The grout will be pumped through a tremie pipe. The grout mixture will be prepared in accordance with ASTM D5092-90. New monitoring wells will be completed with either standpipe or flush mounted lockable protective casings. Following installation, each new well will be developed in preparation for ground water sampling and water level measurements.

- Install two new wells (VRI-3 and VRI-4, Plate 1) between existing wells GT-14 and GT-15 to investigate ground water quality downgradient of the RV-33 north tank farm area.

- Install two new wells (VRI-1 and VRI-2, Plate 1) west of the western site fence line, northwest of building RV-33 to investigate ground water to the west of building RV-33 and wells GT-6 and GT-13.

Additionally, provide water level data to better define ground water flow in the northwestern portion of the site.

- In order to further evaluate the hydrogeology of the site and its relationship with the ground water on the GE Power Systems Main Site, one deep well (VRI-5, Plate 1) will be installed adjacent to existing well GT-15. This deep well will also be used to evaluate vertical hydraulic gradients and deeper overburden ground water quality.

- Install two new upgradient well (VRI-8, Plate 1) near the entrance road to provide additional background water quality data, especially inorganic parameters.

- Install two new wells (VRI-6 and VRI-7, Plate 1) in the northeastern portion of the facility to investigate potential ground water impacts from the RV-14 varnish room dry well/leach field, RV-14 former Superior Boiler oil storage tanks and RV-14/15 boiler dry well. One well should be located immediately north of building 13 and one well located southeast of building 13.

- The newly installed soil borings and monitoring wells will be surveyed to accurately determine their locations. In addition, newly installed and pre-existing monitoring wells will be surveyed for top-of-casing elevations.

- In-situ hydraulic conductivity tests will be performed on each new monitoring well to determine the hydraulic conductivity of the unconsolidated deposits.

- Following the completion and development of the new monitoring wells, a comprehensive round of ground water sampling and analysis will be conducted. In addition to each on-site pre-existing and new monitoring well, the ground water sampling round is proposed to include three wells (GE-11, GE-30 and GE-31) located in the southwestern portion of the GE Power Systems Main Plant. Samples from each well will be collected and analyzed for VOCs and SVOCs.

- As part of the site investigation, the hillside north of the Riverview facility will be investigated for seeps previously reported. Samples of up to three distinct seeps will be sampled and analyzed for VOCs and SVOCs (EPA SW-846 methods 8260 and 8270) compounds of concern. The seeps will be marked in the field and surveyed to accurately determine the locations and elevations.

- The additional investigatory activities will be completed using a Health and Safety Plan and a Quality Assurance Project Plan consistent with NYSDEC requirements. In addition, laboratory analysis will be completed by a NYS certified laboratory.

- Data developed from the field investigation will be combined with pre-existing data and information to form the basis of the Focused Remedial Investigation Report. Data generated will be arranged and presented in a clear and logical format using tables, graphs and figures. The report will present a clear, concise summary of existing conditions at the potential areas of concern subject to additional investigation and site ground water quality. The report will also present the results of a Focused Feasibility Study.

SMW-1	NA	NA	NM	NA	73.2	NM	NA
SMW-2	NA	340.97	65.08	275.89	73	72.27	0.73

Notes:

1. The installed total depth is based on the reported well depth measured on September 9, 1992 by GTI.
2. All elevations are expressed in feet above mean sea level.
3. "NM" indicates water level not measured.
3. "NA" indicates information not avaliable

TABLE 2

Summary of Potential Areas of Concern

Potential Area of Concern	Constituents detected in soil	Remedial Activities	Recommendations
RV-14 varnish room leach field/dry well (SWMU #6)	xylene, ethylbenzene, toluene, trimethylbenzene, PID	1980 drain lines sealed	2 borings, SB98-1, SB98-2, Soil sample analysis for VOCs, evaluate ground water
RV-14 fuel oil UST (SWMU #8)	xylene, trimethylbenzene, naphthalene, sec-butylbenzene, n-propylbenzene, TPH, PID	Tank and soil removed, 1987.	1 boring, SB98-3, soil sample analysis for VOC
RV-14 boiler dry well	naphthalene		Evaluate ground water
RV-37 former RCRA tank (SWMU #19)	toluene, ethybenzene, xylene, trimthylbenzene cyclohexane, cresylic acid, phenols, naphtha, PID	Tank and soils removed, but limited due to structures (11/88)	Evaluate ground water
RV-33 raw material tank farm (SWMU #18)	ethylbenzene, trimethylphenol, dimethylphenol, xylene, trimethlybenzene	Farm closed 1996	4 borings SB98-4, 5, 6 & 7 soil samples for VOCs & SVOCs 3 wells, VRI-2, VRI-3, VRI-4
Former RCRA drum storage (SWMU #25)	n-propyl benzene, xylene	closed 1989	Evaluate ground water
RV-30 former UST tank farm (AOC B)	phenol	tanks removed (1994)	No further action
RV-14 10,000 UST (SWMU #7)	None detected	scheduled for removal	No further action

TABLE 2
(continued)

Summary of Potential Areas of Concern

Potential Area of Concern	Constituents detected in soil	Remedial Activities	Recommendations
RV-33 leach field and dry well (SWMU #15)	None detected	ceased use 1980	No further action
RV-42 hazardous waste storage (SWMU #22)	None detected		No further action
Former outdoor container storage area 1 (SWMU #26)	None detected	ceased use 1985	No further action
Former outdoor container storage area 2 (SWMU #27)	None detected	ceased use 1989	No further action
Empty drum storage (SWMU #29)	None detected		No further action
RV-33 rail loading/unloading (SWMU #16)	1987 spill None detected	closed 1996	No further action
RV-33 Truck unloading area (SWMU #17)	cresylic acid, n-methylpyrolidone, phenol, trimethylphenol. xylene, trimethylbenzene, phenol	closed 1996	No further action
RV-37 leach field and dry well (SWMU #21)	None detected	ceased use 1989	No further action
Former outdoor container storage area 3 (SWMU #28)	None detected		No further action
RV-33 Truck Loading Area (AOCA)	None detected		No further action

TABLE 2
(continued)

Summary of Potential Areas of Concern

Potential Area of Concern	Constituents detected in soil	Remedial Activities	Recommendations
RV-14 West Loading Area Spill Site (AOCC)	None detected		No further action

APPENDIX 1: TABLE 4
CHRONOLOGY OF SPILLS AT THE RIVERVIEW SITE
Schenectady, New York

Date	Location	Material/ Quantity	Cause	Remedial Measures	Reported to DEC/Other (Spill No.)	Internal Spill No.	Ownership
1/78	RV-33 unloading station.	Wire enamel: 4,000 gal.	Hose rupture during unloading (human error).	Unknown	Unknown	78-1	G.E.
4/5/78	RV-33 tank farm.	Xylenol: 4,400 gal.	#6 tank - bottom cleaned out - cover not closed (human error).	Unknown	Unknown	78-2	G.E.
4/27/78	RV-33 tank farm.	Cresylic acid: 20 gal.	#3 tank overflowed during fill.	Unknown	Unknown	78-3	G.E.
10/5/78	RV-14 varnish room.	BF3 epoxy: 55 gal.	Overheated and exotherming (human error).	Unknown	Unknown	78-4	G.E.
10/20/78	RV-33 tank farm.	Xylenol: 400 gal.	Overfill (instrumentation).	Unknown	Unknown	78-5	G.E.
1/30/79	RV-33 5,000 gal. reactor.	Xylenol: 400 gal.	Overfilled reactor (instrumentation) Flow meter malfunctioned.	Unknown	Unknown	79-1	G.E.
2/9/79	RV-33 unloading station.	Xylenol: 50 gal.	Improper vendor unloading.	Unknown	Unknown	79-2	G.E.
4/10/79	RV-33 piping yard.	73162 wire enamel: 50 gal.	Face seal flange gasket failed	Unknown	Unknown	79-5A	G.E.
4/10/79	RV-33 storage #5.	73162 wire enamel: 200 gal.	Overflow tank.	Cleanup of Coastal Services, Inc.	Unknown	79-5	G.E.

APPENDIX 1: TABLE 4
CHRONOLOGY OF SPILLS AT THE RIVERVIEW SITE
Schenectady, New York

Date	Location	Material/ Quantity	Cause	Remedial Measures	Reported to DEC/Other (Spill No.)	Internal Spill No.	Ownership
6/16/79	Bldg. RV-33 (transfer line between bldg. and tank car loading station).	73162 wire enamel (21% phenol, 28% cresylic acid, 20% solvesso, 30% resins): 200 - 400 gal.	Gasket failure.	Cleanup by Coastal Services, Inc.	Unknown	79-6	G.E.
7/6/79	RV-33 tank car unloading station.	9517 wire enamel: 1,500 gal.	Overfilling.	Cleanup by Coastal Services, Inc.	Unknown	79-7	G.E.
7/6/79	Bldg. RV-33	73162 wire enamel: 50 gal.	Gasket failure.	Cleanup by Coastal Services, Inc.	Unknown	79-8	G.E.
10/23/79	RV-42 storage tank farm.	Polyester resin 18266: 50 gal.	Human error.	Removal of sand and crushed rock and disposed.	Unknown	79-9	G.E.
1/4/80	RV-33 roof.	Naptha and cresylic acid: approximately 50 gal.	Valve failed to close properly allowing material to overflow out onto roof surface. No human or environmental consequences	Unknown	Unknown	80-2	G.E.
1/8/80	RV-33 basement	Dowtherm G: 1,000 gal.	Reactor failure.	Spill contained and remediated for disposal.	No	80-1	G.E.

APPENDIX 1: TABLE 4
CHRONOLOGY OF SPILLS AT THE RIVERVIEW SITE
Schenectady, New York

Date	Location	Material/ Quantity	Cause	Remedial Measures	Reported to DEC/Other (Spill No.)	Internal Spill No.	Ownership
6/18/80	Unclear (between RV-42 and RV-42 storage tank impoundment area).	Water containing phenol contaminate: 40 gal.	Drum cover slipped off while moving.	Speedi-dri, adsorption material placed into drums for disposal.	No	80-3	G.E.
3/20/81	RV-33 Tank Car Pad	Cresylic acid: 2 - 5 lbs.	Leak at bottom discharged valve of tank car.	Absorbed and disposed.	No	81-2	G.E.
5/4/81	East side of drum storage area of RV-33.	RMC6164 (n-methyl pyrrolidone): 20 gal.	Leak in drum.	Unknown	No	81-3	G.E.
5/5/81	Blacktop area outside receiving dock on west side of RV-14.	Silicone adhesive: 20 gal.	Falling of drum onto driveway.	Speedi-dri and recovery of material.	No	81-4	G.E.
6/15/81	Basement floor of RV-33.	Dowtherm A: 50 gal.	Pump failure.	Soaked up and placed in drums for disposal.	No	81-5	G.E.
6/18/81	Blacktopped drum storage area on east side of RV-33.	18292 intermediate (solvesso 100, mondur SH, phenol and cresylic acid): 100 lbs.	Drum leaking.	Speedi-dri and placed in drum for dispsal.	No	81-6	G.E.
6/22/81	RV-14, cold room	18297 intermediate (47% MEK and epoxy resins): 3 gal.	Rack puncture of a drum.	Absorbed with Speedi-dry and disposed in drum.	No	81-8	G.E.

APPENDIX 1: TABLE 4
CHRONOLOGY OF SPILLS AT THE RIVERVIEW SITE
Schenectady, New York

Date	Location	Material/ Quantity	Cause	Remedial Measures	Reported to DEC/Other (Spill No.)	Internal Spill No.	Ownership
6/25/81	RV-33 basement	Downtherm A: 100 gal.	Seal of Dowtherm pump failed	Speedi-dri absorbed and disposed.	No	81-9	G.E.
6/27/81	RV-33 basement	Dowtherm A: 100 gal.	Equipment leakage.	Speedi-dri absorbed and disposed.	No	81-10	G.E.
8/5/81	Blacktop storage area opposite RV-14.	Product 73160 (containing ester-imide resin, cresylic acid, trimethyl, solvesso 100) 165 lbs.	Forks puncturing drums.	Speedi-dri used and truck cleaned by shipping personnel.	No report	81-11	G.E.
On or about 8/10/81	Varnish room floor RV-14.	Varnish: 30 gal.	Unclear	Unclear	Unknown	81-18	G.E.
9/15/81	Ground above buried tank containing 2-ethyl hexyl acrylate.	2 ethyl hexyl acrylate tank at G.E.: 75 gal (555 lbs.)	Pipeline blow out.	Pumping, removing of dirt and flushing.	No	81-12	G.E.
12/17/81	Blacktop in RV-14 outside varnsish storage area	18265 varnish (an alkyd resin dissolved in xylene): 150 lbs xylene: 75 lbs.	Slit in a drum while snowplowing.	Speedi-dri spread and contaminated material removed from snowbank. Scraped material placed in a drum and disposed.	No	81-16	G.E.

APPENDIX 1: TABLE 4
CHRONOLOGY OF SPILLS AT THE RIVERVIEW SITE
Schenectady, New York

Date	Location	Material/ Quantity	Cause	Remedial Measures	Reported to DEC/Other (Spill No.)	Internal Spill No.	Ownership
2/10/81	Tote tank in back of RV-14 (uncertain and ineligible)	Xylene: 300 gal.	Ineligible	Unclear	Unknown	81-17	G.E.
1/19/82	RV-14 drum storage pad adjacent to the east end. "Materials Handling Spill"	18206 (an intermediate varnish containing ethyl and isopropyl alcohol, MEK and toluene): 90 lbs.	Head clamp not fully tightened.	Speedi-dri and placed into drums for disposal	No	82-2	G.E.
6/3/82	RV-33 behind tank wagon unloaing pad.	RMC6173 (trimethyl phenol): 3 gal.	Discharge valve left slightly open.	Sand thrown on spill and shoveled into kits.	No	82-4	G.E.
9/2/82	RV-33 on concrete floor near new drum scle.	AI-630 (containing amid imide resin, n-mathyl pyrrolidone, solvesso 100): 10 gal.	Overflow reported.	Unknown	No	82-5	G.E.
9/13/82	Inside RV-42	RMC6761 (polyester resin containing styrene and vinytoluene): 400 gal. (approximately 660 lbs of styrene and 440 lbs of vinytoluene).	Pump left running.	Limestone used to absorb the resin.	No.	82-7	G.E.
3/16/83	Blacktop drum storage area to the east of RV-33.	Product 73166: less than 1 gal.	Drum puncture from fork of truck.	Not indicated in report.	No	83-3	G.E.

APPENDIX 1: TABLE 4
CHRONOLOGY OF SPILLS AT THE RIVERVIEW SITE
Schenectady, New York

Date	Location	Material/ Quantity	Cause	Remedial Measures	Reported to DEC/Other (Spill No.)	Internal Spill No.	Ownership
4/25/83	RV-14 concrete pad	No. 2 fuel oil: 5 - 10 gal.	Truck hit aboveground oil piping.	Speedi-dri and removal of contaminated dirt and replacement with fresh sand.	No	83-4	G.E.
2/11/84	RV-16 ground and catch basin to teh east of R-16.	Dowtherm A (73.5 / 26.5 diphenyl oxide / diphenyl) heat transfer fluid: 500 lbs	Relief valve opened and overflowed.	Dirt shoveled into drums for disopsal.	DEC notified of water contamination .	84-1	G.E.
4/9/84	BIC room. RV-33	TDI - quantity unknown	Dripping from previously drained and flushed pipes.	TDI sprayed with water, TDI room closed off, clean up continued until the monitor reached 10 ppbs.	No	None listed	G.E.
11/14/84	Floor near new banding tape installation. RV-14	18270 resin: approximately 10 gal.	Not listed	Material contained and cleaned up.	Unknown	None listed	G.E.
5/20/85	RV-33 ground and pavement by pump shaft to the underground storage tank east of RV-33.	Formalin (RMC6250, 37% formaldehyde, 60% methanol): 227 lbs.	Unloading from tank truck wihtout venting the tank	Recovery of dirt into 55 gal. drums for disposal. Replacement with clean dirt.	Yes: DEC #850935	85-1	G.E.

APPENDIX 1: TABLE 4
CHRONOLOGY OF SPILLS AT THE RIVERVIEW SITE
Schenectady, New York

Date	Location	Material/ Quantity	Cause	Remedial Measures	Reported to DEC/Other (Spill No.)	Internal Spill No.	Ownership
1/29/86	Ground area around the receiving station. RV-33	TMP (6652): amount unclear - approximately over 1,200 gal.	A hole near the elbow causing a leak.	Matrial picked up.	Yes	None listed	G.E.
3/12/86	RV-33 blacktop at south end.	Product 73027 (xylene, cresylic acid, and phenol): 1 gal.	Leak in drum	Speedi-dri absorbed contaminated material and placed in drum.	No	None listed	G.E.
3/31/86	Uncertain from contents of report	5 gal. (50% methylene chloride, 50% varnish)	Unclear from contents of report	Speedi-dri.	No	None listed	G.E.
1/10/87	RV-33 area. Gasket between 2 flanges on the trimethylol propane line.	Trimethylol propane: approximately 30 gal.	Rupture in propane line.	Report does not indicate.	Yes: DEC #866316		G.E.
3/16/87	RCRA tank. Located in southwest area of site, approximately 75' south of Bldg. RV-37.	D001 waste liquid (containing water, xylene, toluene, cyclohexane, naptha, cresylic acid and phenol): approximately 50 gal.	RCRA tank overflow.	Removal of contaminated dirt by Clean Harbors. Two groundwater monitor wells Installed in April 1987 (GT-1 and GT-2)	Yes: DEC #867647 & National Response Center, #2983		G.E.
11/24/87	Uncertain from contents of report.	No. 2 fuel oil: quantity unknown.	Unclear from contents of report.	Tank pulled and looked at for contamination	Yes; 11/24/87 DEC #877281		G.E.

APPENDIX 1: TABLE 4
CHRONOLOGY OF SPILLS AT THE RIVERVIEW SITE
Schenectady, New York

Date	Location	Material/ Quantity	Cause	Remedial Measures	Reported to DEC/Other (Spill No.)	Internal Spill No.	Ownership
3/3/88	Ground near stainer in the 73128 line, and the catch basin by the receiving shed.	Phenol and cresol: 1,500 lbs (approximately 225 gal.)	Gasket failure.	Remediated: catch basin diked; water shut-off; pumped water from and cleaned catch basins using vacuum truck; steamed all lines from catch basin. C.T. Male sampled Poentic Kill discharge per DEC request.	Yes: DEC # 8710175	88-1	G.E.
5/17/88	RV-33 Dowtherm pump.	600 ppb biphenyl, 200 ppb biphenylether (1-2 lbs. Dowthern A) in discharge water/ Poentic Kill. Dowtherm A (composed of byphenol and biphenyl ether.) Total amount not mentioned in report; however, CTM reported 600 ppb of biphenyl and 2,000 ppbs of biphenyl ether in discharge water.	Dowtherm storage tank overflowed due to pressure.	Clean Harbors remediated.	Yes: DEC #8801505	88-2	IMI

APPENDIX 1: TABLE 4
CHRONOLOGY OF SPILLS AT THE RIVERVIEW SITE
Schenectady, New York

Date	Location	Material/ Quantity	Cause	Remedial Measures	Reported to DEC/Other (Spill No.)	Internal Spill No.	Ownership
10/9-10/10/88	RV-33 inside floor.	88182 (Resin): 60-70 gal.	Pallet broke apart while being lifted.	Spill cleaned.	No; material contained to concrete floor inside RV-33 and remediated.	88-3	IMI
4/12/88	Concrete unloading pad by GT-9.	Toluene (<50%); and Benzene (<1%): 75 gal./608 lbs.		Spill contained on concrete pad.	No		IMI
1/11/89	Concrete under and around a tank wagon.	18519 (epoxy-polyurethane wire enamel) and 18521 (epoxy-polyurethane solution) green dye solution: approximately 200 gal.	Overflow while filling tank wagon.	Diked with Speedi-Dri. Spill contained on concrete pad. No solution entered the ground or drainage system; spill cleaned up.	No; spill contained on concrete pad and remediated.	89-1	IMI
4/12/89	Concrete unloading pad only by GT-9.	Trimethyl phenol: 75 gal./608 lbs.	Valve failed because frozen material held it open.	Completely cleaned up. Spill contained on concrete pad.	No; spill contained on concrete pad and remediated.	89-2	IMI

APPENDIX 1: TABLE 4
CHRONOLOGY OF SPILLS AT THE RIVERVIEW SITE
Schenectady, New York

Date	Location	Material/ Quantity	Cause	Remedial Measures	Reported to DEC/Other (Spill No.)	Internal Spill No.	Ownership
5/12/89	RV-33 near wash storage area northwest side of new factory area.	Toluene: 153 lbs. Ethyl alcohol: 103 lbs.	Pallet broke, drum fell and broke open.	Absorbent placed on spill and cleaned up; small catch basin (not connected to plant drain pipes) was pumped out.	Yes: DEC #89-01396	89-3	IMI
Between 12/19/89 and 1/10/90	RV-14 storage pad on asphalt.	18205 (varnish intermediate and xylene): 420 lbs.	Hole in drum- 1" from bottom; apparantly punctured with fork or pallet; with snow and ice spill not noticed until ice melted.	Material contained on pad and cleaned up on 1/10/90.	No; material contained to pad and remediated.	90-1	
1/18/90 and 1/20/90	RV-33 LTR 2 reactor in new factory.	74031: 3,00 lbs epoxy resin, 300 lbs. phenolic resin, 180 lbs. catechol exothermed.	Reaction in processing equipment.	Clean Harbors fully remediated.	Yes: DEC #8909984	90-2	IMI
6/13/90	RV-33 north tank farm (into sand).	Phenol: 10 gal./ 88lbs.	Phenol tank overfilled.	Remediated.	Yes: DEC #9002914	90-3	IMI
10/20/90	RV-33, cellar.	702A (polyster): approximately 900 lbs.	Gasket failure.	Contained and cleaned with Speedi-dri.	No; material contained inside and remediated.	90-1	IMI

APPENDIX 1: TABLE 4
CHRONOLOGY OF SPILLS AT THE RIVERVIEW SITE
Schenectady, New York

Date	Location	Material/ Quantity	Cause	Remedial Measures	Reported to DEC/Other (Spill No.)	Internal Spill No.	Ownership
3/11/91	RV-33 tank wagon loading pad.	18519H (clear wire enamel) on concrete pad: 30 lbs., and 3 lbs. of same on ground.	Open line not disconnected by a tagged and locked-out valve.	Absorbent spread-contaminated material remediated.	Yes: DEC #9012655	91-1	IMI
4/16/91	Rotterdam landfill.	1-3 bags of maleic anhydride: 55 lbs./bag	BFI dumped a 30-yard dumpster from IMI at Rotterdam landfill.	Clean Harbors responded and remediated.	Yes: DEC #9100607	91-2	IMI
5/10/91	Blacktop in front of RV-14 compactor.	Hydraulic fluid: several drops on blacktop only.	Hydraulic line on the BFI transporter burst.	Responded with Speedi-dri and brooms; spill cleaned up. BFI responded with sand truck. BFI driver took materials to Rotterdam depot and placed materials in W553 drums for disposal.	No; petroleum product.	91-3	IMI

APPENDIX 1: TABLE 4
CHRONOLOGY OF SPILLS AT THE RIVERVIEW SITE
Schenectady, New York

Date	Location	Material/ Quantity	Cause	Remedial Measures	Reported to DEC/Other (Spill No.)	Internal Spill No.	Ownership
8/16/91	Grass below pump area on underground tank.	37% formaldehyde: 44lbs. 7% methanol: 8lbs. 56% water	When pump turned on a small trickle of formaldehyde solution.	West Central Environmental remediated and removed 5 drums of dirt. Drums moved to RCRA storage area snd disposed of as U122 Hazardous Waste.	Yes: DEC #9105326	91-4	IMI
5/20/92	Interior concrete floor of RV-33, 2,000 gal. reactor.	Phenol-formalin mixture: 10 gal. (approximately 67.5 lbs. of phenol; 8.3 lbs. of formaldehyde; 1.6 lbs. of methanol; 12.6 lbs. of water). Total of 90 lbs.	Leak from agitator shaft onto concrete floor.	Material pumped into a tote tank and placed in open head drums. Speedi-dri added and shoveled up. Neutralizing solution added to floor. Mixture of phenol and formalin in the reactor was pumped into closed head drums.	No; material contained to interior of RV-33 and remediated.	92-1	IMI

Schenectady, New York

Date	Location	Material/ Quantity	Cause	Remedial Measures	Reported to DEC/Other (Spill No.)	Internal Spill No.	Ownership
6/6/92	Railcar used to store cleaning solution.	Cleaning solution (50% cresylic acid, 25% aromatic 100, and 25% xylene): 10 gal./85lbs.	Railcar overfilled	Clean Harbors - see report submitted to DEC. (Date and name of report and when submitted.)	Yes: DEC #9202750	92-2	IMI
10/23/92	RV-33, press room	73250 (wire enamel): phenol (10-30%); cresylic acid (10-30%); organic esters (10-30%); and xylenol (1-5%): 40-50 gal.	Failure of pipe.	Spill contained in building and cleaned up.	No; materials contaned in building and remediated.	92-3	IMI
4/22/93	RV-42 Pad 2.	IMI Product #3255 (237.74 lbs diallyl phthalate; 271.21 lbs. polyester resin; and .05 lbs. tertiary butyl catechol): 545 lbs.	Truck forks punctured drum while lifting.	Clay absorbant spread and cleaned up; West Central Environmental vacuumed collected rain water and used a high pressure spray to clean blacktop; oil pads placed around catch basins.	Yes: DEC #9301050	93-1	IMI

92-1

APPENDIX 1: TABLE 4

Schenectady, New York

Date	Location	Material/ Quantity	Cause	Remedial Measures	Reported to DEC/Other (Spill No.)	Internal Spill No.	Ownership
5/6/93	RV-3 ground in southeast corner.	IMI Product No. 73128: 440 lbs. of mixture 73128 Composition blocked isocyanate resin, 41.97%; dibutylin dilaurate, .03%; aromatic 100, 30.8%; dibasic esters, 6.6%; phenol, 12.7%; mesitol, 7.3%; cresylic acid, .6%.	Pin hole leak in pipe line.	Contaminated soil removed by IMI and West Central Environmental	Yes: DEC #9301681	93-2	IMI

*Memo form R.L. Cotton to R.H. Ferrow dated 10/14/86 re: added lems of interest - insulating materials. The substance of this memo is as follows. Tasso laborers uncovered gross cresylic acid contamination in the RV-33 tank farm last week when restoring the dikes. In 1978, there was a 4,000 gal. spill of Selkirk "bottoms" that was apparently poorly cleanup at that time. We immediately brought in Clean Harbors to clean up the contaminated earth and properly diposed of it. As Clean Harbors dug in, they discovered that the saturation went 2-3 feet deep in places and stretched across the whole width of the tank farm. The spill was contained, but soaked into a lot the sand base in that half of the tank farm. The rest of the memo talks about the cost of the response.

Source: The table above is compiled from a document developed by IMI Environmental Compliance Division based on RCRA Facility Assessment Report for IMI, 1992, A. T. Kearney, Inc.

TABLE 6

BUILDING HISTORY SUMMARY

INSULATING MATERIALS INCORPORATED - RIVERVIEW PLANT
Schenectady, New York

Building	Construction Date	Original Building Use	Subsequent Building Use	Current Building Use
RV-12 (former Q-10 bldg.)	1940s	Radar testing; (development of submarine sodium pump)	Research and development test facility for insulated materials, mine bolt resin	Testing lab for IMI products
RV13	1960 - 1964	Test facility for insulated materials; marketing research	-	Electrical testing for IMI products (gelatin test, viscosity test)
RV13A	1968	Hazardous chemical storage shed	-	Not in use
RV14 (former bldg. 5)	1945 (additions: 1951, 1963, 1965, 1969, 1984)	Radar development and manufacturing	Insulated materials manufacturing (mica products and insulating tapes); offices	Insulated materials manufacturing (mica products and insulating tapes); offices; product lab/development lab; QA/QC lab; varnish storage/mixing; wire tower process
RV16 (former bldg. 4)	1944	Radar development and testing (gyro control, electronics development, shielded test room, simulator)	calendered rubber production; blown plastic film manufacturing; electric tapes	low hazard waste storage (metal drums, fiberboard)
RV17	1960 - 1964	storage; tape slitting and packaging process	-	high voltage electrical testing area
RV28	1943	radar testing and development	administrative offices	administrative offices
RV30	1980	tanker truck unloading station for transfer of chemicals to underground storage tanks	-	tanker truck unloading station
RV31	1960 - 1964	maintenance shop; engineering offices; drafting offices	-	maintenance shop; engineering offices; drafting offices
RV32	1960 - 1964	oil and grease storage	-	oil and grease storage; landscaping equipment

REPORT OF LABORATORY ANALYSIS

CLIENT: Wagner, Heindel, and Noyes, Inc.
PROJECT NAME: George/Von Roll
DATE REPORTED: January 3, 1995
DATE SAMPLED: December 12-14, 1994

PROJECT CODE: HNGV1721
REF. #: 68,852, 68,854, 68,855
68,857, 68,858, 68,861

Enclosed please find the results of the analyses performed for the samples referenced on the attached chain of custody record.

Chain of custody indicated sample preservation with Sodium Azide.

All samples were prepared and analyzed by requirements outlined in the referenced methods and within the specified holding times.

All instrumentation was calibrated with the appropriate frequency and verified by the requirements outlined in the referenced methods.

Blank contamination was not observed at levels affecting the analytical results.

Analytical method precision and accuracy was monitored by laboratory control standards which included matrix spike, duplicate and quality control analyses. These standards were determined to be within established laboratory method acceptance limits.

Individual sample performance was monitored by the addition of surrogate analytes to each sample. All surrogate data was determined to be within Laboratory QA/QC guidelines unless otherwise noted.

CHARACTERIZATION OF UNIDENTIFIED PEAKS

Client: Wagner, Heindel, and Noyes, Inc.
Project: George/Von Roll
Analysis: EPA Method 8260
Reference #: 68,861
Station I.D.: GT-9
Unidentified Peaks: 4
Project Code: HNGV1721

Unidentified peak characterization is achieved by direct comparison of sample and library spectral data. The unidentified peaks in this sample consist of Alkylated Benzenes ranging from 250-2000 ug/L.

REPORT OF LABORATORY ANALYSIS

CLIENT: Wagner, Heindel, & Noyes, Inc.
PROJECT NAME: George/Von Roll
DATE REPORTED: December 30, 1994
DATE SAMPLED: December 12-14, 1994

PROJECT CODE: HNGV1722
REF. #: 68,864, 68,866, 68,867, 68,869, 68,870, 68,873, 68,875

Enclosed please find the results of the analyses performed for the samples referenced on the attached chain of custody record.

All samples were prepared and analyzed by requirements outlined in the referenced methods and within the specified holding times.

All instrumentation was calibrated with the appropriate frequency and verified by the requirements outlined in the referenced methods.

Blank contamination was not observed at levels affecting the analytical results.

Analytical method precision and accuracy was monitored by laboratory control standards which included matrix spike, duplicate and quality control analyses. These standards were determined to be within established laboratory method acceptance limits.

Individual sample performance was monitored by the addition of surrogate analytes to each sample. All surrogate data was determined to be within Laboratory QA/QC guidelines unless otherwise noted.

Reviewed by,

Harry B. Locker, Ph.D.
Laboratory Director

CHARACTERIZATION OF UNIDENTIFIED PEAKS

Client: Wagner, Heindel, & Noyes, Inc.
Project: George/Von Roll
Analysis: 8270
Reference #: 68,864
Station I.D.: GT-1
Unidentified Peaks: >10
Project Code: HNGV1722

Unidentified peak characterization is achieved by direct comparison of sample and library spectral data. The unidentified peaks in this sample consist of Aliphatic and Cyclic Hydrocarbons ranging from 2 to 10 ug/L.

TABLE 2-5 (CONTINUED)

SUMMARY OF PRIORITY POLLUTANT ORGANIC COMPOUNDS
IN GROUND WATER, G.E. LANDFILLS
VALUES IN UG/L EXCEPT AS NOTED

COMPOUND	WELL NUMBER										
	GE-11	GE-15	GE-16	GE-16	GE-16	GE-26	GE-26	GE-26	RW-2A	RW-5	RW-5
Benzene			20.4		11	108	18	73		4.6	4.6
Chlorobenzene			1.5			2.4	1.6				
Chloroethane			14.8	5.7	11	410.6	850	354		15	16.4
1,1-Dichloroethane						6.2					
Ethyl Benzene						20	1.3	13			
Methylene Chloride			1.1			15.2					
Toluene						8.6					
1,2-Trans-Dichloroethylene		14.9				1.2					
Trichlorofluoromethane											
Vinyl Chloride		14						61	19		
2,4-Dimethyl Phenol										27	5.1
Bis(2-Ethylhexyl) Phthalate											
Di-n-Octyl Phthalate	133							30			
Naphthalene											
Date of Sample	1/28/86	1/28/86	6/29/83	2/19/86	2/20/86	7/1/83	2/19/86	2/20/86	6/7/80	1/28/86	1/28/86
Reference	(b)	(b)	(b)	(c)	(b)	(b)	(c)	(b)	(a)	(b)	(b)

1 Duplicate sample. An additional sample was simultaneously analyzed by ENSECO and all parameters were reported to be below detection.

Blank Space = not detected
