Executive Summary

Introduction and background

A Remedial Investigation (RI) was performed for National Grid Company (National Grid) by AECOM Environment[1] for a site located on Clinton Street in the City of Schenectady, New York. The site is the location of a former manufactured gas plant (MGP) [New York State Department of Environmental Conservation (NYSDEC) Site No. V00474] that was operated in the late 1800's and early 1900's. The investigation of the site is being conducted pursuant to a Voluntary Consent Order (VCO) between National Grid and the NYSDEC, Index # D0-0001-0011, which was executed on July 3, 2001, and a set of Work Plans that were reviewed and approved by the NYSDEC.

The MGP operated for about 79 years (ca. 1851 to 1930) using coal to produce gas. Gas was distributed to consumers through buried mains and used primarily for illumination. Several residuals from the MGP process were generated which were identified at the site, including: coal tar, coke, ash, and purifier waste.

The on-site area consists of the area of the former MGP process operations, which is now occupied by the Schenectady Municipal Housing Authority (SMHA) and a portion of Clinton Street. The SMHA provides subsidized public housing for elderly or handicapped adults in several buildings at the site. The NYSDEC has indicated that this area will be designated Operable Unit 1 (OU1) of the site, and this report presents the results of all phases of investigation work performed in this area.

The off-site area consists of several roadways and portions of two city blocks to the west of the SMHA property. This area has been designated Operable Unit 2 (OU2) of the site. The NYSDEC has indicated that additional investigation work is necessary to determine the horizontal and vertical extent of the MGP-related residuals identified in this area. The fieldwork for OU2 is planned for the summer and fall of 2009, and a separate RI Report will be prepared to present the results of the sampling performed in this area.

Prior to the RI, several environmental investigations were performed for the site, beginning in 2003. The previous investigations obtained information regarding MGP operations, and identified the locations of subsurface MGP features. Subsurface soil and groundwater were found to be impacted with MGP-related constituents of concern (COC) in concentrations exceeding regulatory criteria, and the NYSDEC indicated that an RI would be necessary for the site. The objective of the RI was to obtain additional data regarding the nature and extent of the MGP-related residuals identified at the site and adjacent areas, and to evaluate the risks posed to human health and the environment by those residuals.

RI execution and results

The RI fieldwork consisted of the excavation of 12 test pits, the installation of 53 soil borings and 15 monitoring wells, the collection of 27 groundwater samples, and the collection of eight soil vapor intrusion evaluation samples. Soil and groundwater samples were also collected on the properties to the west of the site; however, the results of the sampling performed in these areas will be discussed in the RI Report for OU2 following further investigation planned for the summer or fall of 2009. The data collected from OU2 have been submitted to NYSDEC as part of the OU2 Work Plan.

[1] AECOM Environment is formerly known as ENSR Corporation (ENSR) and The RETEC Group, Inc. (RETEC).

RI results

Four soil units were identified at the site during the RI. A layer of historic fill material was observed in all areas of the site. The fill consists of sand and gravel mixed with varying amounts of coal fragments, coke, ash and clinkers and building debris such as bricks and concrete rubble. Beneath the fill is a thick layer of alluvium consisting of silt, silty sand, sand and lesser amounts of gravel. A peat unit was observed in several of the soil borings; however, the peat unit was not observed to be laterally continuous beneath the site. Beneath the alluvium is a glacial till unit comprised of dense clayey silt mixed with gravel. Groundwater is present at depths ranging between 7 and 10 feet below the ground surface (bgs) of the former MGP process area. The flow direction for groundwater in both the shallow and intermediate portions of the aquifer underlying the site is from the east to west/southwest.

Several subsurface MGP features are still present at the site. Portions of the foundation for the MGP process building are still present. Foundations for each of the three former gas holders for the MGP are present to the east of the former building area and beneath Clinton Street. Foundations also are present in the footprint of the former purifiers and one of the two former tar wells for the MGP.

Coal tar and coal tar non-aqueous phase liquid (NAPL) mixed with soil are present in localized areas of subsurface soils at the site. The occurrence of the coal tar NAPL on OU1 roughly corresponds to the footprint of the former MGP process area. Visible evidence of coal tar NAPL was observed down to depths of approximately 55 feet bgs of the site. The base of the coal tar and coal tar NAPL is within the alluvial soil unit. Borings advanced in all directions have delineated the horizontal and vertical extent of the coal tar-impacted soil in this area, with the exception of the area to the west of Broadway Avenue (OU2).

Visible evidence of coal tar NAPL was observed in one of the monitoring wells during the groundwater sampling performed during the RI. The analytical results of the groundwater sampling performed at the site indicated that several of the wells were found to have MGP-related COC in concentrations exceeding NYSDEC groundwater standards. Similar to the subsurface soil impacts, the area with the greatest concentrations of COCs was the former MGP process area. The groundwater plume extends further to the west and will be delineated during the RI for OU2.

A qualitative human health exposure assessment was performed for the site and the surrounding properties. Workers performing subsurface work could possibly be exposed to coal tar-impacted soil and groundwater in the SMHA property and Clinton Street. Measures to address this potential pathway will be evaluated in a feasibility study (FS) of potential remedial actions for site cleanup. Site residents, workers, and visitors are not currently exposed to MGP-related impacts. Off-site receptors are not at risk for exposure except in the OU2 area. (The risks to receptors in OU2 will be addressed as part of the OU2 RI.)

Conclusion

With the observations and data presented in this report, National Grid has performed a delineation and evaluation of conditions for the OU1 portion on the site, and thereby adequately fulfilled the specifications for a remedial investigation as outlined in the Order on Consent. Following approval of this report by the NYSDEC, an FS will be prepared to identify remedial methods that may be used to address the MGP-impacted media. The evaluation will review potential remedial actions for all portions of OU1, and will address subsurface soil, groundwater, and soil vapor.

1.0 Introduction

This Remedial Investigation (RI) Report has been prepared for National Grid Company (National Grid) by AECOM Environment to present the results of an investigation performed on a property located at Clinton Street in the City of Schenectady, Schenectady County, New York. This property was the site of a former manufactured gas plant (MGP) that operated in the late 1800's and early 1900's.

The investigation of the site is being conducted pursuant to a Voluntary Consent Order (VCO) between National Grid and the New York State Department of Environmental Conservation (NYSDEC), Index # D0-0001-0011, which was executed on July 3, 2001, and in accordance with applicable guidelines of the NYSDEC, the New York State Department of Health (NYSDOH), the United States Environmental Protection Agency (U.S. EPA), and the National Contingency Plan (NCP).

The fieldwork for the RI was performed using procedures described in the NYSDEC-approved documents entitled "Remedial Investigation Work Plan, Schenectady (Clinton Street) Non-owned Former MGP Site, Schenectady, New York," dated October 2, 2006 [RETEC, 2006a] and " Phase II Remedial Investigation Work Plan, Schenectady (Clinton Street) Non-owned Former MGP Site, Schenectady, New York," [RETEC, 2007].

Four companion documents were prepared to detail additional procedures and protocols for the RI. Field sampling methods and procedures that were used during the investigation were described in the document prepared by Foster Wheeler Environmental Corporation entitled "Generic Field Sampling Plan for Site Investigations at Manufactured Gas Plant Sites," dated November 2002 [Foster Wheeler, 2002a]. A Quality Assurance Project Plan (QAPP) was prepared to specify quality assurance/quality control (QA/QC) procedures that were implemented during the fieldwork and in the laboratory [Foster Wheeler, 2002b]. A Community Air Monitoring Program (CAMP) was prepared to provide information regarding the procedures used to monitor and control, if necessary, the potential release of airborne constituents at the downwind perimeters of the investigation work areas [RETEC, 2006b]. A Site-specific Health and Safety Plan (HASP) was prepared to outline procedures that were undertaken to protect site workers and visitors, and the public in the areas adjacent to the site from potential hazards that may exist as a result of the RI fieldwork [RETEC, 2006c].

Investigation work for the RI has previously been performed in two areas of the site. The On-site Area consists of the area of the former MGP process operations which is now occupied by the Schenectady Municipal Housing Authority (SMHA); a portion of Clinton Street; and a portion of a city block to the northwest of Clinton Street. The NYSDEC has indicated that these areas will be designated as Operable Unit 1 (OU1) of the site, and this report provides a summary of the investigation work performed in this area. RI sampling has also been performed in the two city blocks to the west of Broadway Avenue. This area has been designated as OU2 of the site. As specified by the NYSDEC, the results of the sampling performed in this area, and the results of additional sampling planned for the summer and fall of 2009, will be summarized in a separate RI Report for OU2.

1.1 Objectives

The objectives of the RI included the following:

- To collect additional data to determine the surface and subsurface characteristics of the site;
- To determine the nature and extent of MGP-related residuals that are present at the site and surrounding areas;
- To identify the potential routes of off-site migration from on-site sources of MGP-related residuals;
- To perform an exposure assessment to evaluate the pathways by which a human receptor (either on-site or off-site) may be exposed to an MGP-related constituents; and

- To obtain sufficient data to facilitate the selection of remedial actions to address MGP residuals at the site.

1.2 Scope of work

The scope of work for the RI, as defined in the NYSDEC-approved Work Plans, included the following:

- Subsurface utility clearance;
- Test trench excavation and subsurface soil sampling;
- Subsurface soil boring installation and subsurface soil sampling;
- Monitoring well installation and development;
- Groundwater sampling;
- Gauging for the presence of non-aqueous phase liquids (NAPLs);
- Hydrocarbon bail-down and recovery testing;
- Soil vapor intrusion (SVI) evaluation sampling;
- Site surveying; and
- Management of investigation-derived wastes (IDW).

1.3 Report organization

This report is organized into nine sections including this introduction.

- **Section 2** describes the site and off-site areas, and presents historical ownership, property use, and operational summary information.
- **Section 3** describes the RI activities performed at the site.
- **Section 4** summarizes information regarding the site's topography, geology, hydrology, and the observed extent of MGP-related residuals.
- **Section 5** summarizes the results of the laboratory analyses for environmental media sampled during the investigation.
- **Section 6** presents a qualitative human health exposure assessment for the site and the adjacent off-site areas.
- **Section 7** presents the conclusions for the investigation performed at the site.
- **Section 8** presents recommendations for additional actions.
- **Section 9** provides a list of references cited in this report.

Tables and figures are included in sections that immediately follow the report text.

Appendices to the report include the following:

- **Appendix A** – Subsurface test pit logs, borelogs, and well construction diagrams for the RI, and the previous investigations performed at the site.
- **Appendix B** – The laboratory Form I report sheets and chain-of-custody records for the samples analyzed during the RI and the previous investigations performed at the site and Data Usability Summary Reports (DUSRs) for all the RI samples (CD-ROM).
- **Appendix C** – The full NYSDEC Analytical Services Protocol (ASP) Category B deliverable data package (CD-ROM).

2.0 Site description and history

This section presents a description of the site, information regarding site ownership and operational history, and the results of the previous investigation and remedial work performed.

2.1 Site description

The site is located at the corner of Broadway Avenue and Clinton Street in the City of Schenectady, Schenectady County, New York. The location of the site is shown on Figure 2-1. The site is located in an area that is zoned for mixed commercial/residential use. As shown on Figure 2-2, the former process area of the MGP was situated on what are currently three separate parcels of land.

The majority of the process area was situated in the central portion of a 2.2 acre parcel of land that is currently identified by the City of Schenectady Tax Assessment Office as Section, Lot and Block Numbers 049.23-3-1. This parcel is owned by the SMHA. The SMHA provides federally subsidized public housing for elderly or handicapped adults, and offices and living units are present in the Golub Community Center Building (Figure 2-2). Also present at this parcel is a one-story building and grounds garage. The remainder of the parcel is comprised of parking lots, driveways, grass-covered areas, and landscaped areas.

As shown on Figure 2-2, a portion of a former gas holder (Gas Holder B) was located on what is now Clinton Street and a parcel of land that is currently identified by the City of Schenectady Tax Assessment Office as Section, Lot, and Block Numbers 039.79-2-13. This parcel is currently owned by the Schenectady Urban Renewal Authority. This parcel is currently covered by grass and landscaped areas.

As shown on Figure 2-2, the southeastern portion of the former process area is located on what is now a parcel of land that is identified by the City of Schenectady Tax Assessment Office as Section, Lot, and Block Numbers 049.23-3-3. This parcel is also owned by the SMHA. This parcel contains apartment buildings with adjacent grass or landscape-covered areas.

2.1.1 Adjacent properties

The northern-most parcel of the site is bounded to the north by two residential properties, with Hamilton Street beyond.

The central area of the site is bounded to the northwest by Broadway Avenue. Further to the northwest across Broadway is a parking lot located at 312 Broadway Avenue. This property is owned by the City of Schenectady and is the subject on an Environmental Restoration Project (ERP) being performed by the Schenectady County Metroplex Development Authority. Known as the 312 Broadway site, the City is performing a Phase II Environmental Site Assessment (ESA) of this parcel for a planned redevelopment project. A report of the findings of an investigation performed by C. T. Male Associates, P.C. for the City in 2004 to assess whether there were environmental impacts on the property, and to support the application to the ERP program is currently being reviewed by the NYSDEC. RI fieldwork was performed in the southeast corner of this property to assess whether MGP-related residuals are present in this area. Because this area is included in OU2 of the site, additional discussion of the results of the sampling performed in this area will be included in the RI Report for OU2.

To the northeast of the site is a parcel of land which is also owned by the SMHA. This parcel is identified by the City of Schenectady Tax Assessment Office as Section, Lot, and Block Numbers 49.23-3-2. This parcel is used as a park which is covered by grass and landscaped areas. A park pavilion is present in the northeastern area of the parcel.

To the south of the site is Millard Street, with additional SMHA land beyond.

To the west, the site is bounded by Broadway Avenue, with several commercial properties (318, 330, 336, and 340 Broadway Avenue) beyond. Additional sampling will be performed in this area as part of the OU2 investigation.

2.2 MGP site history

The New York State Archives, the Schenectady County Public Archives, historical atlases, historic Sanborn Fire Insurance maps, and information from the Schenectady County Historical Association were reviewed to obtain information regarding the history and former land use of the site. In addition, interviews were conducted with the Schenectady City Engineer and local Historian. Summary information regarding the history of the site from these sources is presented in Table 2-1.

The Sanborn Fire Insurance maps for the years 1884, 1889, 1894, 1900, 1914, 1930, 1951, 1988, 1992, 1993, and 1995 were included in the RI Work Plan to show the changes to the configuration of the MGP over the time of operations, and during the period following plant decommissioning. The MGP-related features identified on the Sanborn maps are shown in blue on Figure 2-2.

The MGP began operations in 1851. Information regarding plant decommissioning is not available; however, from the historical information cited above, it appears that the plant operated until the early 1930's.

2.2.1 Potential source areas for MGP residuals

Based on the review of the historical information available for the site, various former site features which could have been potential source areas for MGP residuals were identified. As such, these areas were investigated during the previous investigations performed at the site and the RI. The key features of the former MGP are shown on Figure 2-2 and are summarized below:

- The original 30-foot diameter gas holder located in the southern area of the site (Gas Holder A).
- A 60-foot diameter gas holder (Gas Holder B) present in the north area of the site.
- A 45-foot diameter gas holder (Gas Holder C) in the southern area of the site. The footprint of this holder partially overlapped the footprint of the initial Gas Holder A.
- Two tar wells (Tar Well A and Tar Well B) located to the north of the MGP Process Building adjacent to Broadway Avenue.
- The MGP Process Building located in the central portion of the site. A Meter Room, a "Dynamos" Room, Retorts, a Coal Storage Area, a Pipe Shop, a Pump House, an Office, and a Cable Storage Area were present within the footprint of the MGP Process Building.
- A Repair Shop to the east of the MGP.
- A building located to the northeast of the MGP Process Building that housed a Repair Room, Purifiers, a Lime Room, and a Meter Room.
- A Coke House located to the north of the MGP process area.
- A Gasoline Pump House and Tank located in the northern area of the site.

2.2.2 Other site uses

The historical information indicates that the buildings constructed for the MGP were later used for the storage and distribution of agricultural products. A label on the 1951 Sanborn Map shows that the property was being used by the Fruit & Grow Company at this time.

The northern portion of the MGP process area was redeveloped when a new roadway for Clinton Street was constructed in the footprint of Gas Holder B. To determine if any information was available regarding the conditions encountered when the new roadway was constructed, AECOM contacted the City Engineer for the

City of Schenectady. According to the City Engineer, records regarding environmental conditions encountered during roadway construction were not available.

The site was further redeveloped when the SMHA Golub Community Center Building, and adjacent parking lots and landscaped areas were constructed in the early 1990's.

2.3 Previous site investigation

The previous investigation work performed for the site includes the preparation of an investigation work plan and the completion of an initial phase of fieldwork.

A Site Characterization (SC) Work Plan was prepared by Foster Wheeler Environmental Corporation to present investigation activities and methods to be used to conduct an initial investigation of the site. The work plan procedures were presented in the document entitled "Schenectady (Clinton Street) Non-owned Former MGP Site, Schenectady, New York, Site-specific Work Plan for Site Characterization," dated July 2003 [Foster Wheeler, 2003]. The SC Work Plan included a description of the site, a summary of the history of the MGP operations and other uses of the site, and identified the scope-of-work and methods for performing the SC.

Several of the field tasks identified in the SC Work Plan were performed by Lightship Engineering in the fall of 2004. These tasks included the excavation of four test pits, the advancement of five subsurface soil borings and the analysis of subsurface soil samples, the installation of four monitoring wells and the analysis of groundwater samples, and a survey of the investigation data points and site features. The test pit, soil boring logs, and well construction logs for this investigation are included in Appendix A.

The sampling performed by Lightship identified several areas of the site where MGP-related constituents are present in concentrations exceeding regulatory criteria. Based on the sampling and analyses performed during this investigation, the NYSDEC indicated that a RI would be necessary to more completely delineate the nature and extent of the MGP-related residuals found at the site. The results of the laboratory analyses and data validation work performed by Lightship are included in Appendix B.

As indicated above, C. T. Male Associates has performed investigation work for the City in 2004 to assess whether there were environmental impacts on the 312 Broadway Ave. property. Two shallow monitoring wells (CTM14 and CTM15) were installed in OU1 during this investigation. The boring logs and well construction logs for these wells are included in Appendix A. The results of the soil and groundwater sampling performed by C.T. Male are discussed in Section 5.

3.0 Investigation activities

This section provides a description of the activities performed during the RI, and the methods used for conducting the fieldwork at the on-site and off-site areas. Unless otherwise noted in the following sections, the procedures used were consistent with the methods and procedures described in the NYSDEC-approved RI Work Plan, FSAP, QAPP, and CAMP. Each field activity performed during the investigation, grouped by field task or environmental media, is described in the following sections. The RI sample locations, and the locations of the samples collected during the previous investigations, are shown on Figure 3-1.

3.1 Subsurface utility location

Subsurface utilities were located prior to starting the invasive subsurface investigation work. The utility locating was initiated by contacting Dig Safely New York. Each company or municipality that had subsurface utilities present in the investigation area marked-out their utility lines prior to the initiation of the subsurface work. A private utility locating company was contracted by AECOM to further investigate the presence of sub-surface utilities near boring locations. This was done by using ground penetrating radar, a radio-detection pipe and cable locator, and a Fisher TW-6 Magnetic locator. Boring locations located near sub-surface utilities were hand cleared to a depth of five feet using soft dig methods. The subsurface utilities identified during this task were surveyed, and the types and locations of the utilities are shown on Figure 2-3.

3.2 Test pit excavations

The locations of the test pits excavated during the investigations performed by Lightship Engineering and AECOM are shown on Figure 3-1. The test pit logs are included in Appendix A. The results of the observations made during the test pit excavations are discussed in Section 4. Note that, several of the RI test trenches were sub-divided so that separate test trench logs could be prepared to show varying subsurface conditions. Test trenches were excavated within the footprint of, and adjacent to the each of the gas holder foundations, within the footprint of the MGP Building and purifiers, and the footprints of the tar tanks. Table 3-1 presents information regarding the test trench excavations including: the test trench identification, sample rationale, sampling depth, and the laboratory analyses performed.

The test trenches were excavated by MC Environmental Services of Albany, New York using a track mounted excavator. Soil samples were collected from every 2-foot depth interval within the test trench (and varying intervals along its length) and field-screened with a photo-ionization detector (PID) for the presence of volatile organic vapors. A subsurface test trench log was prepared to describe: the type of soil encountered using the modified Unified Soil Classification System (USCS), the presence of hydrocarbon-like odors, the presence of visible evidence of MGP-related residuals, and a description of each subsurface feature encountered (foundations, pipes, etc.).

Samples for laboratory analyses were collected from the test trenches at discrete intervals, biased to depths and locations exhibiting the greatest degree of impact based on visual, olfactory, and PID observations. The locations of the laboratory samples collected from the test trenches are shown on Figure 3-1. Note that samples of tar-like materials or soil saturated with tar or non-aqueous phase liquid (NAPL) were not sent to the laboratory for analysis (except for the hazardous characteristics analyses listed on Table 3-1). These materials were assumed to be impacted to the extent where remediation would be necessary. The horizontal and vertical extent of this material, as observed by the field geologist, is shown on the test trench logs and on the figures and cross-sectional views of the site discussed in Section 4.

At the conclusion of each test trench, the excavated materials were returned to the trench in the reverse order of its excavation. The ground surface at each trench location was re-graded using visibly non-impacted soils, covered with topsoil, or in the purifier area, covered with new asphalt pavement.

3.3 Subsurface soil borings

Forty-eight additional soil borings were advanced during the RI to obtain information regarding the presence or absence of structures, to define the thickness and composition of the fill and native soils beneath the site, to observe and screen subsurface soil to identify conditions that may be indicative of impacts by MGP or other residuals, and to install monitoring wells. The locations of the soil borings are shown on Figure 3-1. Summary information for the borings is provided in Table 3-1, including: the boring designations, the sample rationale, the depth interval analyzed, and the laboratory analyses completed.

Two general mobilizations were performed in 2006 and 2008 to complete the soil borings. The RI Work Plans for these mobilizations specified the locations of 41 soil borings. Seven additional borings were added as the fieldwork was performed to determine the extent of MGP impacts in several on-site locations. The additional borings include:

- SB52 was advanced to the west of the SMHA building to assess sub-surface conditions south of former Gas Holders A and C.
- SB53 was advanced in the western part of former Gas Holder C to further assess the west limits of coal tar impacts associated with former Gas Holder C.
- SB54 through SB59 were advanced in the northeast part of the site to further assess the north/northeast limits of coal tar impacts observed in the purifier area.

The 2006 soil borings were performed by Aztech Technologies Inc. of Ballston Spa, New York. The 2008 soil borings were performed by North Star Drilling Company of Homer, New York. The subsurface soil borings were advanced using the following drilling methods:

- The 2006 borings were completed with a track-mounted direct-push (Geoprobe™) drilling rig, with the use of a closed piston, discrete Macro-core™ sampler.
- The 2008 borings were completed by North Star using a sonic head equipped with a push tube sampler. Note that several borings in the area of Gas Holder B were completed by North Star using mud rotary during the 2008 work.

Soil samples at all locations were collected with either direct-push Macro-Core™ samplers, 2.5 inch sonic tube sampler or 2-inch diameter split-spoon samplers. All methods allowed for continuous, discrete soil samples to be taken from the ground surface to the bottom of the borehole for both field characterization (PID screening and observations), and for the collection of samples for chemical analyses.

The soil samples were logged by a geologist. Information regarding the presence of fill material or subsurface structures, the nature of each geologic unit encountered, observations regarding moisture content, the results of soil screening performed with a photo-ionization detector (PID), and visual and olfactory observations regarding the presence of coal tar residuals were recorded on soil boring logs are provided in Appendix A. The results are also summarized on the cross-sectional views of the site (discussed in Section 4).

Each of the boreholes not finished as a monitoring well was abandoned by filling the borehole with a cement/bentonite grout mixture. The location and ground surface elevation for each boring was surveyed at the conclusion of the drilling program.

3.4 Monitoring well installation

Wells MW1, MW2, MW3, and MW4 were installed during the SC investigation performed at the site. Seventeen monitoring wells were installed during the RI to obtain additional groundwater data at up-gradient, cross-gradient, and down-gradient locations from various former MGP features. Two wells were installed by C.T. Male for the 312 Broadway investigation. The location of each well is shown on Figure 3-1. Table 3-2 provides summary information for the wells installed at the site including: the well designation, the type of well construction, the elevation of the ground surface at each location, and the elevation of the top of each well riser

(in feet above North American Vertical Datum of 1988 [NAVD88]). The construction details for each well are shown on the respective soil boring logs in Appendix A, and on the cross-sectional views of the site.

3.5 Well development

Each of the RI monitoring wells were developed in order to remove fine-grained sediment and fluid residue from the well and the sand pack and to create maximum well efficiency. A surge-and-pump method was used to develop the wells. A surge block was used to actively surge and agitate the water column by forcing water back and forth through the well screen and sand pack. Following surging, the wells were pumped with a submersible pump.

3.6 Groundwater monitoring

The groundwater monitoring activities consisted of: 1) the collection of depth-to-water measurements to map the flow direction for groundwater in the investigation area; 2) gauging the wells for the presence of NAPL; and 3) the collection of groundwater samples for laboratory analyses.

3.6.1 Depth-to-water measurements

A complete round of depth-to-water measurements for all site wells was taken on December 8, 2008. The data obtained are summarized on Table 3-2. Included in the table are the measurements taken at each well, and the respective groundwater elevations, presented in feet above NAVD88. In addition, all new and existing wells were checked for the presence of light non-aqueous phase liquid (LNAPL) and dense non-aqueous phase liquid (DNAPL).

3.6.2 Groundwater sampling

The RI groundwater sampling was performed on November 28-29, 2006, and December 8-11, 2008. Monitoring wells were sampled at least two weeks after they were developed, and left to stabilize for a period of approximately 2 weeks. Table 3-1 presents summary information for the groundwater sampling including: the well designations, the sample rationale, and the laboratory analyses performed.

3.6.3 NAPL recovery gauging

One well (MW8) was found to accumulate measurable amounts of DNAPL in the well sump. The thickness of the DNAPL was observed to be two feet, a thickness equal to the length of the well sump. A NAPL bail-down test was performed to assess the potential for NAPL recovery at this location. The results of the bail-down test are provided on Figure 4-9.

3.7 Soil vapor intrusion evaluation sampling

The 2006 RI Work Plan included soil vapor and ambient air samples that were requested by the NYSDEC and the NYSDOH to evaluate the potential for intrusion into nearby buildings of soil vapor that may be affected by residual subsurface impacts that remain from historical MGP operations.

The initial round of soil vapor and ambient air sampling was performed at the site on November 13 and 14, 2006. The soil vapor samples included: SV1 and SV2 which were collected adjacent to the SMHA building, and SV3 and SV4 which were collected at locations adjacent to the apartment buildings to the east of the SMHA building. The sample locations are shown on Figure 3-1.

Following a review of the 2006 soil vapor data, the NYSDOH requested that additional sub-slab sampling and soil vapor sampling be performed as part of the 2008 RI field activities. The scope of work for this sampling was detailed in the RI Work Plan [RETEC, 2007].

In order to complete the sub-slab vapor sampling within the heating season, sub-slab samples SV5 and SV6 were collected in the SMHA building in March 2008. The results of this sampling were provided to the

NYSDEC and the NYSDOH in a preliminary data summary report dated May 21, 2008. The remaining soil vapor samples (SV8 and SV9) were collected on August 22, 2008.

The sampling and analytical methods used during this investigation were consistent with the document entitled "Final Guidance for Evaluating Soil Vapor Intrusion in the State of New York, New York State Department of Health," October 2006 [NYSDOH, 2006]. The work was conducted in accordance with the RI Work Plan, including the National Grid standard operating procedures (SOPs) for soil vapor sampling which were developed for this project.

Note that soil vapor sample SV7 was collected during the 2008 sampling event in a driveway between the off-site properties located at 318 Broadway and 330 Broadway. Since this sample was collected in OU2, the results of this sample will be discussed in the OU2 RI Report.

Sample points inside the SMHA building were selected in consultation with a representative of the NYSDEC at the general locations specified in the RI Work Plan. For both the sub-slab vapor samples and the soil vapor samples collected outside the buildings, a helium tracer gas evaluation was performed to ensure the integrity of the vapor sampling seals, and to assess the potential for introduction of ambient air into the soil vapor samples.

The soil vapor samples were shipped via overnight delivery to Air Toxics Laboratory (ATL) for volatile organic compound (VOC) analysis by U.S. EPA Method TO-15. Helium was analyzed by ASTM Method D-1946. A special list of compounds, including naphthalene, indan, indene, thiophene, styrene, 2-methylpentane, isopentane, 2,3-dimethylpentane, isooctane, and methyl tert-butyl ether (MTBE), were added to aid in determining potential MGP-related sources from other sources of impact.

3.8 Community air monitoring

Community air monitoring was performed to provide real-time measurements of total VOCs and particulate (airborne dust) concentrations in air at the downwind perimeter of each designated work area when intrusive investigation activities were in progress at the site. The procedures followed methods described in the CAMP [RETEC, 2006b]. Additionally, site personnel monitored the perimeter stations to determine if any odors were being produced as a result of the intrusive sampling activities. The monitoring was designed to provide protection for the downwind community, such as those present at the adjacent public areas and commercial properties, from potential releases of airborne constituents resulting from the investigation activities.

Total VOCs and particulates were monitored with a PID and dust meter, respectively, located upwind and downwind of each work zone. The VOC and particulate levels at each location were recorded on field forms every 15 minutes. The PIDs and dust meters were also set to log information continuously throughout the work day. This information was downloaded to a laptop computer at the end of each work day so that the NYSDEC and NYSDOH could review the information if needed. The specific action levels for VOCs and particulates are provided in the CAMP. Action levels were not reached as a result of the intrusive investigation activities at any time during the RI, so no response actions were necessary.

3.9 Site survey

The location of each investigation sample point and the property boundaries, street boundaries and buildings, along with other important site features were surveyed by C.T. Male Associates, P.C. of Latham, New York. C.T. Male's surveyor is a certified Professional Land Surveyor (PLS). Horizontal measurements were referenced to North American Datum of 1983 (NAD83), New York State Central Zone coordinates. Vertical elevations were referenced to the North American Vertical Datum of 1988 (NAVD88). The ground surface elevation was measured at each soil boring, test pits, monitoring well, and other locations. The reference elevation for each monitoring well (top of well casing) was also marked and surveyed. The ground surface contours for OU1 are shown on Figure 4-1.

3.10 Investigation-derived waste management

Several types of investigation-derived waste (IDW) were generated during the RI activities including: 1) decontamination wash-water from the down hole drilling tools; 2) soil from sampling activates; 3) well development water; 4) groundwater sampling purge water; 5) personal protective equipment (PPE); and 6) miscellaneous sampling equipment and plastic sheeting. All IDW generated during these tasks was placed in drums or polyethylene tanks, and properly labeled. The soil and water were sampled for waste profiling purposes. All IDW was transported off site to a permitted disposal facility for proper disposal.

4.0 Field investigation results

This section presents a summary of the field measurements and observations of the physical environment of the investigation area. Included is a discussion of the topography, geology and hydrology of the site, and observations regarding the observed extent of the MGP-related residuals in these areas.

4.1 Site topography and drainage

The ground surface at the site slopes from about 250 feet NAVD88 at Gas Holder C, to about 226 feet NAVD88 at Broadway Avenue. Surface water flow direction across the site is likely to mimic the slope of the ground surface with discharge to a series of catch basins in Clinton Street and Broadway Avenue.

4.2 Site geology

Information regarding the geology of the site was obtained from the test pit excavations, and from the soil boring and monitoring well installations. Observations made during these tasks are summarized on the test pit and soil boring logs included in Appendix A. Four cross-sectional views were prepared to illustrate the subsurface conditions observed during the investigation. The locations of the cross-sections are shown on Figure 4-2, and the cross-sections are included as Figure 4-3 (A-A'), Figure 4-4 (B-B'), Figure 4-5 (C-C'), and Figure 4-6 (D-D'). As shown on the figures, four subsurface soil units were identified during the investigation activities.

- Fill - Fill was observed to be present in all areas of the site in thicknesses that ranged from approximately 20 feet in former Gas Holder B, to approximately 5 feet in the area to the west of the site along Broadway Avenue. The fill is comprised of sand with varying amounts of silt, coal fragments, cobbles and boulders, brick and concrete fragments, clinker-like material, ashes, and coke fragments.
- Alluvium - Beneath the fill is a silty sand and sand unit which was observed in all borings advanced at the site. The alluvium thickness ranges up to approximately 90 feet thick in the central portion of the site at SB37.
- Peat - At the southwestern area of the site (along Broadway Avenue) is a thin peat layer within the alluvium which was observed range in thickness between 0.5 to 2 feet thick. This unit was not observed to the west and north of this area, therefore, is not laterally continuous across the site.
- Till - Glacial till was observed at five boring locations. The till was observed at 85 feet below the ground surface (bgs) at SB50, and to 97 feet bgs surface at SB37. The till was observed to be dense, dry clayey silt with varying amounts of amounts of gravel.

4.3 Site hydrogeology

A complete round of depth-to-water measurements were taken on December 8, 2008 for all the wells at OU1, OU2 and the 312 Broadway site. With one exception, the water table is found at depths which vary from 7 to 10 feet across the former process area. At up-gradient well MW6 the depth to water was approximately 30 feet bgs because this well is located at a higher elevation than the wells in the former process area.

The data obtained from the wells screened at the water table are summarized in Table 3-2. The data has been used to prepare a contour map of the shallow groundwater flow direction. As shown on Figure 4-7 shallow groundwater flow is from east to west across the site with an approximate hydraulic gradient of 0.022 feet/feet.

The data obtained from the wells screened in the deeper portion of the aquifer are summarized in Table 3-2. As shown on Figure 4-8, the groundwater flow direction for the deeper portion of the aquifer is also from east to west across the site.

4.4 Potential source area investigation results

This section presents a summary of the field observations made during the RI. During the subsurface investigation, residuals from former MGP operations were observed in various forms, such as hydrocarbon sheens, staining, and as NAPL. The term "tar" or "coal tar" is used to describe viscous NAPL from MGP operations which does not readily separate from soils. The term "coal tar NAPL" or "NAPL" is used to describe less viscous NAPL from former MGP operations which will readily flow or separate from soils. Specific testing was not performed on tar or NAPL encountered in the borings; it is presumed that these on-site materials are residuals from the gas production process. For discussion and illustrative purposes, the observations made by the field geologist have been grouped into the following general categories:

- Fill material comprised of non-indigenous material emplaced at the site that contained trace amounts of anthropogenic materials such as cinders, coal fragments, coke fragments, ashes, and varying amounts of construction debris;
- Moderately to grossly impacted soil or fill material exhibiting a visibly identifiable coal tar staining, coal tar sheen, and/or trace amounts of coal tar NAPL blebs (indicated by the yellow color on the figures and cross-sectional views of the site); and
- Coal tar or soil saturated with coal tar NAPL (indicated by the red color on the figures and cross-sectional views of the site).

If visible evidence of MGP-related residuals was not observed, the test pit, boring or well location is shaded green on the figures. It is important to note that these descriptions and colored illustrations are included to provide a useful tool in representing the extent of the observed residuals at the site; however, they are somewhat general in nature and are intended to be used along with the subsurface logs and the results of the chemical analyses to fully evaluate the nature and extent of impacts at the site.

4.4.1 Gas Holder A

The original gas holder at the MGP was Gas Holder A. Two borings and a test pit were advanced in the footprint of the holder. Based on the observations made during the excavation of TP8, the foundation of the holder was constructed of field stone with a concrete floor. Based on the soil borings advanced in the holder footprint (SB7 and SB11), visible evidence of MGP-related residuals was not observed at this location.

4.4.2 Gas Holder B

The foundation for Gas Holder B is still present at about 3 feet below the surface of Clinton Street and the adjacent property to the northwest. Two test pits were excavated in the footprint of foundation. Soil borings and monitoring wells were also installed inside and outside of the holder foundation. The test pits indicate the holder foundation is constructed of bricks and is still intact. The floor of the holder is constructed of bricks and is present at approximately 20 feet bgs. Hydrocarbon-like staining was observed in the foundation at SB50; however, coal tar was not observed in the borings or test pits excavated inside the holder foundation. A trace amount of hardened coal tar mixed with soil was observed in test pit TP7 outside of the holder at a depth of 3-6 ft bgs and a "neutral buoyancy" coal tar NAPL was observed in the water that accumulated in the test pit excavation.

4.4.3 Gas Holder C

Gas Holder C was the most recent holder constructed for the MGP. It partially overlapped Holder A which was demolished prior to the construction of the more recent holder (Figure 3-1). Two test pits were excavated in the footprint of the Gas Holder C during the RI. Five soil borings were also advanced inside and outside of the holder foundation.

The sampling performed inside the foundation indicates that the holder floor is still present in the subsurface at the location shown on Figure 3-1. The floor is constructed of concrete and is approximately 3 feet bgs. Impacted subsurface soil was observed at the western edge of, or just outside of the foundation wall at SB3 and SB14. Impacts were not observed in subsurface borings in the eastern portion of the holder.

4.4.4 Purifier area

Three soil borings (SB17, SB37 and SB40) and two test pits (TP10 and TP11) were advanced in the footprint of the former purifier area. The borings and test pits show that foundations are still present in the subsurface at this location. Coal tar or coal tar NAPL was not found inside the foundations in the Purifier Area; however, deeper subsurface soil impacts were observed at each of the boring locations. Viscous coal tar was observed at SB17 between 7 feet and 20 feet bgs. Heavy hydrocarbon-like sheen was observed at SB37 and SB40 at depths of 6 to 14 feet bgs. Non-viscous NAPL was observed at SB37 and SB40 at deeper depths intervals.

4.4.5 Tar well A

One test pit, and one boring were advanced in the footprint of Tar Well A. A flat concrete structure was observed at test pit TP5 at 3 to 5 ft bgs. Soil boring SB24 was advanced through the concrete structure. Visible evidence of MGP residuals was not observed in the footprint of the structure; however, deeper soil samples indicated the presence of coal tar NAPL in the area to the north of the former tar well (SB4 and SB39).

4.4.6 Tar Well B

One test pit was excavated in the footprint of Tar Well B. Two borings and two monitoring wells were installed just to the north of the tar well. No structures were identified in the test pit or borings in this area. At boring SB19 hardened coal tar was observed at 7.5-9 feet bgs. Less viscous NAPL was observed in this boring between 12 and 16 feet bgs. Non-viscous NAPL was observed at boring SB44 at 38.5-40 feet bgs. Well MW8 has been observed to accumulate coal tar NAPL in the well sump.

4.4.7 MGP building

The MGP Process Building is located in the central portion of the site and contained a Meter Room, a “Dynamos” Room, Retorts, a Coal Storage Area, a Pipe Shop, a Pump House, an Office, and a Cable Storage Area. Nine borings were advanced in the footprint of these former structures as shown on Figure 3-1. Foundations were observed in this area; however, coal tar or coal tar NAPL was not observed to be present in the foundations. Deeper subsurface soil impacts were observed in the footprint of the MGP Building at SB16, SB27, SB33 and SB34.

4.4.8 Coke house

A Coke House was located to the north of the MGP process area (Figure 3-1). A foundation for the house was not encountered at SB47. Deeper soil impacts were observed in the borings advanced in this area (SB47 and CTM15).

4.4.9 Gasoline Pump House and Tank

A Gasoline Pump House and Tank was located in the northern area of the site, in the footprint of Clinton Street. A trace amount of hydrocarbon staining was observed near the elevation of the water table at MW9 which was installed at a location adjacent to the pump house to the west.

4.4.10 NAPL bail-down summary

DNAPL was observed to accumulate in the sump for monitoring well MW8. Three draw-down tests were performed that consisted of removing the NAPL in the well sump with a peristaltic pump. The rate of recovery for each of the three tests is shown on Figure 4-9.

5.0 Analytical results

This section presents the results of the laboratory analyses performed during the RI. A discussion of the results of the analyses, and a comparison to applicable NYSDEC Standards, Criteria and Guidance (SCGs) values are grouped according to environmental media in the following sections.

To include the results of all the sampling that has been completed at the site in this report, the laboratory reports and summary spreadsheets for the previous investigations performed by Lightship Engineering and C.T. Male are included in Appendix B, and the results are summarized on the figures discussed in this section.

5.1 Analytical program

Subsurface soil, groundwater, and soil vapor samples were analyzed during the RI. Except where noted below, the soil and water samples were analyzed by Test America of Pittsburgh, Pennsylvania. Soil vapor samples were analyzed by ATL of Folsom, California.

5.1.1 Subsurface soil analyses

The subsurface soil samples were analyzed for the following parameters:

- Target Compound List (TCL) VOCs by U.S. EPA SW-846 Method 8260B;
- TCL SVOCs by U.S. EPA SW-846 Method 8270C;
- Target Analyte List (TAL) Metals by U.S EPA SW-846 Methods 6010B/7471A; and
- Total Cyanide by U.S. EPA SW-846 Method 9012A.

5.1.2 Groundwater analyses

The groundwater samples were analyzed for the following parameters:

- TCL VOCs by U.S. EPA SW-846 Method 8260B;
- TCL SVOCs by U.S. EPA SW-846 Method 8270C;
- TAL Metals by U.S. EPA SW-846 Methods 6010B/7471A; and
- Total Cyanide by U.S. EPA SW-846 Method 9012A.

5.1.3 Soil vapor sample analyses

The soil vapor samples were analyzed for the following parameters:

- VOCs by Modified U.S. EPA Compendium Method TO-15; and
- Helium by Modified ASTM Method D-1946.

5.1.4 Hazardous characteristics testing

Hazardous characteristics samples were analyzed for the following parameters:

- Toxicity Characteristic Leaching Procedure (TCLP) ZHE Extraction – U.S. EPA Method 1311;
- TCLP VOC – U.S. EPA Method 8260B;
- TCLP SVOC – U.S. EPA Method 8270C;

- TCLP ICP Metals – U.S. EPA Method 6010B (Mercury 7470A);
- Corrosivity – U.S. EPA SW-846 Chapter 7;
- Ignitability – U.S. EPA SW-846 Method 1010; and
- Reactive Sulfide – U.S. EPA SW-846 Chapter 7.

5.2 Quality assurance/quality control analyses

Field and laboratory quality control samples for the investigation were collected and analyzed to document the accuracy and precision of the samples. The quality assurance/quality control (QA/QC) samples included trip blanks, field duplicates, matrix spikes, and matrix spike duplicates. The data quality level for the investigation was Level IV and was consistent with procedures outlined in the NYSDEC Analytical Services Protocol (ASP) July 2005 methodologies.

5.3 Data validation

For quality control purposes, comprehensive data packages were produced by Test America for the soil and groundwater samples for validation by a qualified chemist. The results of the data validation are presented in a Data Usability Summary Reports (DUSR) prepared by Lightship and AECOM for each soil and water sample delivery group (SDG). The DUSRs for this project are included in Appendix B.

As part of the data review process, analytical results and data qualifiers were corrected where necessary to reflect quality control issues. The Form I Report Sheets in Appendix B, and the data summary spreadsheets discussed in this section, have been modified to reflect the findings of the data validation.

Organic compound data quality was evaluated by reviewing the following parameters: holding times, GC/MS tuning and performance, internal standards, initial and continuing calibrations, surrogate recoveries, matrix spike/matrix spike duplicate (MS/MSD) samples, MS/MSD relative percent differences (RPDs), laboratory control standards (LCSs), laboratory blanks, laboratory and field duplicates, compound identification, and compound quantitation. As a result of the review, all data were found to be useable with some qualifications.

Inorganic analyte data quality (metals and cyanide) was evaluated by reviewing the following parameters: holding times, matrix spikes, initial and continuing calibrations, contract required detection limit (CRDL) standard recoveries, laboratory control samples, ICP interference check sample results, ICP serial dilution results, laboratory and field duplicates, and laboratory blanks. All inorganic results were found to be useable with some qualification.

5.4 Subsurface soil results

A list of the subsurface soil samples collected from the test pits and soil borings, and the analyses performed for each sample are summarized in Table 3-1. The results of the subsurface soil samples are summarized in Table 5-1 (VOC results), Table 5-2 (SVOC results), and Table 5-3 (metal and cyanide results).

The subsurface soil results included in the tables are compared to the Soil Cleanup Objectives (SCOs) provided in the document entitled “NYSDEC Rules and Regulations, 6 NYCRR Subpart 375-6, Remedial Program Soil Cleanup Objectives,” dated December 14, 2006 [NYSDEC, 2006a]. Both the Restricted Residential Use and Commercial Use SCOs are included in the tables. Where a result is greater than the respective Subpart 375-6 Restricted Residential Use SCO, the result is shown with a bold font. If a result is greater than the respective Subpart 375-6 Commercial Use SCO, the result has been shaded on the tables.

The results of the subsurface soil sampling performed at the site are summarized on Figure 5-1. Included on the figure are the sample designations, the total benzene, toluene, ethyl benzene and xylenes (BTEX) concentrations, and the total polycyclic aromatic hydrocarbon (TPAH) concentrations.

As indicated in the RI Work Plan, the sampling rationale included the collection of one to two samples for laboratory analyses from each boring. In general, samples were collected from the most impacted intervals based on the PID screening and field observations (visual and olfactory) regarding the presence of MGP-related residuals. Note that only a few samples of NAPL-impacted soil were collected to characterize the NAPL. NAPL impacted soils are assumed to contain concentrations of compounds greater then Commercial Use Values and under NYSDEC policy, these materials pose a potential risk to groundwater and other receptors and therefore must be addressed. If impacts were not encountered, a sample was collected from the 1-foot interval immediately below the water table at several boring locations. Samples were also collected from depth intervals where impacts were encountered in other adjacent borings. In addition, samples were collected to document non-impacted conditions below or outside of known impacted areas. The intervals sampled at each boring location are shown on the borelogs in Appendix A and are summarized in Table 3-1.

5.4.1 MGP process area

Sixty-eight subsurface soil samples were collected from the borings and test pits advanced in the former MGP process area. Hydrocarbon impacts were not observed below 55 feet bgs as shown on the borelogs (Appendix A) and cross-sections (Figures 4-2, 4-3, 4-4, 4-5, and 4-6).

Total BTEX concentrations ranged from non-detect to 759.7 mg/Kg (SB44(38-40)). Only one sample (SB45(8-10)) contained BTEX compounds that were greater than the Commercial Use SCO values.

As shown on Table 5-2, PAH compounds were detected in 60 of the 68 subsurface samples collected from this portion of the site. Total PAH concentrations ranged from non-detect to 62,115 mg/Kg (SB45(8-10)). Twenty-four samples had one or more PAH compound detected above the Commercial Use SCO from within this portion of the site.

The deepest sample where PAHs were detected above the Commercial Use SCOs was sample SB44(38-40), located just north of Tar Well B. A deeper sample was collected from this location, SB44(52.5-55), with a total PAH concentration of 0.053 mg/Kg and no PAHs detected above the Commercial Use SCOs.

Several other SVOCs were detected in the samples from the borings on this portion of the site. Only one of these compounds, dibenzofuran, was detected at a concentration greater than the Commercial Use SCOs in one sample, SB45(8-10).

Several metals were detected in the subsurface soil samples from this portion of the site (Table 5-3). Only lead (1,220 mg/Kg for sample SB25(18-19.5)) and mercury (3.5 mg/Kg for sample SB45(8-10)) exceeded the Commercial Use SCO of 1,000 mg/Kg and 2.8 mg/Kg, respectively. All other metal detections were below the Commercial Use SCOs.

Total cyanide was detected in several of the subsurface soil samples collected from this portion of the site, at concentrations ranging from 0.13 mg/Kg to 429 mg/Kg. Four results exceeded the Commercial Use SCO of 27 mg/Kg (TP7S(7.5)(HORZ 0-10) at 110 mg/Kg, TP12(5)W(8-8.5) at 42.1 mg/Kg, SB41(15-17) at 35.3 mg/Kg, and SB45(8-10) at 429 mg/Kg).

5.4.2 Outside the MGP process area

To evaluate subsurface soil conditions at the perimeter of the Former MGP Process Area, 17 subsurface soil samples were collected from the borings and test pits advanced on this portion of the site. Coal tar or coal tar NAPL was not observed in any of the borings advanced around the perimeter of the MGP Process Area, as shown on the borelogs (Appendix A) and cross sections (Figures 4-2, 4-3, 4-4, 4-5, and 4-6).

Total BTEX concentrations for the samples collected in this area ranged from non-detect to 0.056 mg/Kg (SB13(37-39)). None of the samples contained BTEX compound results that were greater than the Commercial Use SCO values.

As shown on Table 5-2, PAH compounds were detected in 9 of the 17 subsurface samples collected from the perimeter of the Former Process Area. Total PAH concentrations ranged from non-detect to 1.75 mg/Kg (SB11(38-40)). None of the PAH compounds were detected above the Commercial Use SCO.

Several other SVOCs (butyl benzyl phthalate, 4-methylphenol, dimethyl phthalate, bis (2-ethylhexyl) phthalate, phenol, 1,1'-biphenyl, and dibenzofuran) were detected in the samples from the borings. None of these compounds was detected at a concentration greater than the Commercial Use SCOs.

Several metals were detected in the subsurface soil samples from this portion of the site (Table 5-3). Only arsenic, measured as 30.3 mg/Kg in sample SB53(25-26), exceeded the Commercial Use SCO of 16 mg/Kg. All other metal detections from the samples from the perimeter of the Former Process Area were below the Commercial Use SCOs.

Total cyanide was detected in four of the subsurface soil samples collected from this area, at concentrations ranging from 0.27 mg/Kg to 1.6 mg/Kg. None of the results exceeded the Commercial Use SCO of 27 mg/Kg.

5.5 Groundwater analytical results

The results of the groundwater samples collected during the RI are summarized in Table 5-4 (VOC results), Table 5-5 (SVOC results), and Table 5-6 (metals and total cyanide). The evaluation of the groundwater results in the following sections is based on a comparison to the guidance or standard values provided in the NYSDEC - Division of Water – Technical Operation Guidance Series (TOGS) (1.1.1) [NYSDEC, 1998, with addenda]. On the tables, where a result is greater than the method reporting limits, the result is shown with a bold font. Where a result is greater than the respective groundwater standard or guidance value concentration, the result is shaded on the tables.

The results of the groundwater sampling performed during the period between 2004 and 2008 are summarized on Figure 5-2. Included on the figure are the well locations; the dates sampled; and the BTEX, TPAH, and total cyanide concentrations. The inferred distribution of dissolved BTEX found during the sampling performed during the RI is shown in green on Figure 5-2. The inferred distribution of dissolved PAHs is shown in blue on the figure.

5.5.1 Shallow groundwater results

VOCs

BTEX compounds were detected in the samples from 4 of the 12 shallow wells. Total BTEX concentrations ranged from 1.6 ug/L (MW04) to 51,820 ug/L (MW08). One or more BTEX compounds were greater than the groundwater standard values in three of the 12 wells. As shown on Figure 5-2, the greatest BTEX concentrations were detected down-gradient of the former MGP process area and are non-detect at up-gradient locations.

The limits of the BTEX-impacted groundwater are defined by the non-detect results to the east and southeast at wells MW10, MW02, MW06, and MW05. At down-gradient well MW08, the total BTEX concentration was 51,820 ug/L with concentrations of benzene (39,000 ug/L), ethylbenzene (220 J ug/L), toluene (9,700 ug/L), and xylenes (2,900 ug/L) detected in a concentrations greater than the groundwater standard values. Well CTM15, located between the Coke House and Gas Holder B, contained benzene (86 ug/L), ethylbenzene (19 ug/L), and xylenes (19 ug/L) above the groundwater standard values whereas well MW04, located on the northern perimeter of Gas Holder B, contained benzene at a concentration of 1.6 ug/L, slightly greater than the groundwater standard value of 1 ug/L.

As shown on Figure 5-2, the limit of the BTEX-impacted groundwater was not determined to the west. The area to the west of the site will be investigated further as OU2.

Five of the 12 shallow wells had at least one other VOC detected in 2008; however, all of these detections were below the groundwater standard or guidance values, except for styrene in well MW08.

SVOCs

PAH compounds were detected above the method reporting limits in 8 of the 12 shallow wells in 2008. Total PAH concentrations ranged from 1.2 ug/L (MW04) to 8,008 ug/L (MW08). PAHs were greater than the groundwater standard or guidance values in 3 of the 12 shallow wells. Figure 5-2 shows the distribution of total PAHs.

Similar to the BTEX results, the greatest concentrations of PAH results were detected in the former MGP process area or at locations down-gradient from this area. Similar to the BTEX detections, PAHs were not detected at up-gradient wells MW10, MW02, MW06, and MW05.

Four of the 12 wells had at least one other SVOC detected in 2008; however, all of these detections were below the groundwater standard or guidance values except for 2,4-dimethylphenol and phenol in well MW08.

Metals

The majority of the samples from the shallow wells contained iron, magnesium, manganese, and sodium in concentrations greater than the groundwater standard values for these compounds. These metals are commonly found to be elevated in groundwater throughout New York State and the concentrations detected likely reflect ambient conditions.

Well MW03, located down-gradient of Gas Holders A and C, contained selenium above the groundwater standard concentration. Well MW05, located south of the SMHA Golub Community Center Building, contained arsenic (34.3 ug/L) above the groundwater standard concentration of 25 ug/L. Well MW06, located east of Gas Holder A, contained lead (31.7 ug/L) above the groundwater standard concentration of 25 ug/L.

Total cyanide

Total cyanide was detected in 10 of the 12 shallow wells sampled during the RI in 2008. Only one sample exceeded the groundwater standard of 200 ug/L (CTM15 at 226 ug/L).

5.5.2 Deep overburden groundwater results

VOCs

BTEX compounds were detected in all five of the samples from the deep overburden wells. Total BTEX concentrations ranged from 5.67 ug/L (MW15D) to 11,000 ug/L (MW1D). One or more BTEX compounds were greater than the groundwater standards in all 5 of the wells. As shown on Figure 5-2, the deep overburden wells are located along the western perimeter of the site.

Four of the 5 deep wells had at least one other VOC detected; however, all of these detections were below the groundwater standard or guidance values except for isopropylbenzene and styrene in well MW7D, and isopropylbenzene in wells MW8D and MW11D.

SVOCs

PAH compounds were detected above the method reporting limits in all 5 of the deep overburden wells. Total PAH concentrations ranged from 3.83 ug/L (MW15D) to 10,755 ug/L (MW8). PAHs were greater than the groundwater standard or guidance values in 4 of the 5 shallow wells. Figure 5-2 shows the distribution of total PAHs.

Four of the 5 wells had at least one other SVOC detected; however, all of these detections were below the groundwater standard or guidance values except for phenol in well MW1D and 1,1'-biphenyl in wells MW7D, MW8D, and MW11D.

Metals

The majority of the samples from the deep overburden wells contained iron, magnesium, manganese, and sodium in concentrations greater than the groundwater standard values for these compounds. These metals are commonly found to be elevated in groundwater throughout New York State and the concentrations detected likely reflect ambient conditions. No other metals were detected above their groundwater standard concentrations in the deep wells.

Total cyanide

Total cyanide was detected in all five of the deep wells. None of these wells contained total cyanide above the groundwater standard of 200 ug/L.

5.5.3 Soil vapor results

The soil vapor results are tabulated, along with several other comparison values, on Table 5-7. The analytes are segregated into two categories: the first group contains compounds that may be associated with MGP sources; and the second group includes compounds which are not related to MGP sources. The first group contains compounds such as naphthalene, benzene, ethylbenzene, toluene, and xylenes, which are common components of numerous products, including gasoline, diesel, asphalt, automotive additives, paints, inks, adhesives, and solvents. Other compounds in this group, namely indan, indene, and thiophene are potentially MGP-related, and are much less common in other sources. Detections of these compounds are frequently associated with MGP sources.

The second group contains compounds such as alcohols and chlorinated solvents which are not associated with MGP impacts. Sources of these compounds include cleaning products, deodorizers, personal care products, dry cleaning fluids, degreasers, and other solvents.

The New York State guidance document states that New York does not have any Standards, Criteria or Guidance values for concentrations of VOCs in subsurface vapors. Additionally, there currently are no databases available of background levels of VOCs in soil vapor. Therefore, the soil vapor results were reviewed in conjunction with other environmental sampling performed at the site and the site conceptual model. To put some perspective on the data, and as a very conservative approach, the soil vapor results were converted to attenuated values. These values were then compared to ambient air sample results, to published indoor air background values, and to health-based screening levels. Background levels for residential and commercial indoor air as well as the OSWER Target Concentrations are provided on Table 5-7.

Health-based screening levels were taken from U.S. EPA OSWER Target Concentrations, which are available only for benzene, ethylbenzene, naphthalene, toluene, and xylenes. Target Concentrations for cancer risk of 10^{-5} were used to represent residential health risk screening levels.

Soil vapor results were attenuated to estimate worst-case indoor air concentrations resulting from vapor intrusion for comparison to OSWER Target Concentrations. The attenuation assumes that the resulting indoor air concentrations are equal to or less than the one-tenth of the soil vapor concentrations. Indoor air concentrations attributable to vapor intrusion are often lower, by orders of magnitude, than soil vapor concentrations due to the attenuation caused by the slab and due to the dilution of the compound into a large volume of indoor air. U.S. EPA guidance recommends an attenuation factor of 0.1 be used to conservatively screen shallow soil vapor concentrations (attenuation factor = indoor air concentration / soil vapor concentration, ((U.S. EPA, 2002)). Actual attenuation factors have been found to be as low as 10^{-5}. As shown on Table 5-7, the attenuation factor of 0.1 has been used to screen soil vapor data.

Two sets of published background data were used to screen the results: the NYSDOH's database of typical background indoor air concentrations in residences from the "Study of Volatile Organic Chemicals (VOCs) in the Air of Fuel Heated Homes in New York State, 1997-2003," updated in November 14, 2005 [NYSDOH,

2006]; and the U.S. EPA BASE Data base for Indoor Air in Typical Commercial Buildings (NYSDOH Guidance Document, Table C2).

Sub-slab soil vapor

The two sub-slab soil vapor samples, SV5 and SV6, which were collected from below the concrete floor of the basement of the SMHA building, both contained ethylbenzene and xylenes (differentiated as meta/para-xylenes, and ortho-xylenes) at attenuated concentrations above the 90th percentile of background indoor air values. Sample SV5 also contained naphthalene at attenuated concentrations above the background value. Sample SV5 contained naphthalene at a concentration of 140 ug/m^3, (attenuated to 14 ug/m^3), whereas sample SV6 did not contain detectable naphthalene. Sample SV6 also contained chloroform at attenuated concentrations above the background indoor air values, whereas sample SV5 contained only low concentrations, within the range of background indoor air. Benzene was not detected in the sub-slab samples, but was detected at low concentrations in the ambient air sample. Acetone was detected in the soil vapor samples and in the ambient sample at similar concentrations. Neither of the samples contained indan, indene, or thiophene. Neither of the samples contained MTBE or 2,2,4-trimethylpentane (iso-octane).

The ambient air sample contained VOCs at low concentrations, within the range of background indoor air values. The results of the helium analyses were within the acceptable range indicated by the NYSDOH Guidance Document, thus confirming that a competent seal was obtained during the sampling.

In comparison to health-based screening levels, the conservative attenuated soil vapor concentration of 14 ug/m^3 for naphthalene at SV05 exceeded the EPA OSWER Target Concentration for residences of 3 ug/m^3. However, the typical background concentration for naphthalene of 5.1 ug/m^3 also exceeds the OSWER Target Concentration. The attenuated concentrations for benzene, ethylbenzene, toluene, and xylenes did not exceed the OSWER Target Concentrations for residences.

The presence of ethylbenzene, xylenes, and naphthalene, together with the absence of the MGP indicator compounds such as indan and indene, suggests that the source of the VOCs in these soil vapor samples is non-MGP petroleum fuels. Weathered gasoline can contain ethylbenzene and xylene, and heating oil can contain naphthalene. The samples were collected approximately 30 feet from a loading dock area. The heavy use of truck and cars at the loading dock has very likely impacted the soil vapor quality in this area. During the work on site, the former building supervisor reported that an underground heating oil storage tank had been removed from the area during the construction of the building. The residuals of the heating oil may have also impacted the soil vapor quality and may be a source of the VOCs in the soil vapor samples collected near the building.

The three soil vapor samples collected in August 2008 showed detections of benzene, ethylbenzene, and m/p-xylenes. SV08 was collected north of the Gas Holder B foundation, and SV09 was collected northeast of the former MGP process area. Benzene was detected in SV08 and SV09 at attenuated concentrations greater than the OSWER Target Concentration of 3.1 ug/m^3. However, the typical background concentration of benzene, 9.4 ug/m^3, also exceeds the OSWER Target Concentration. The attenuated concentration of ethylbenzene in SV08 of 5.8 ug/m^3, slightly exceeded the typical background concentration of 5.7 ug/m^3. Both SV08 and SV09 attenuated concentrations of m/p-xylenes exceeded the typical background concentration. Naphthalene was not detected in any of the soil vapor samples. None of the August 2008 samples contained MTBE, indan, indene, or thiophene.

The November 2006 results are included in Table 5-7. The source of the ethylbenzene, toluene, and xylenes in the SV05 and SV06 samples is not clearly apparent. The source does not appear to be residual impacts from the former MGP operations, because the typical indicator compounds (indan, indene, and thiophenes) were not present, and naphthalene was not consistently detected in both samples. Naphthalene can be associated with MGP tar and also many other products. The source of these hydrocarbons in the November 2006 samples may have been weathered gasoline or diesel fuel, but does not appear to be recently released gasoline, as MTBE was not detected.

5.5.4 Hazardous characteristics testing

Two samples were submitted for hazardous characteristics testing, including SB15(25-27) and SB17(10.5-11.5). These samples were chosen because they represented the most visibly impacted materials encountered during the RI. Results of the analyses are presented in Table 5-8. Sample SB17(10.5-11.5) contained TCLP benzene at a concentration greater than the regulatory criteria.

6.0 Qualitative human health exposure assessment

This section provides an assessment of the potential for human exposure to contaminants present in impacted soils and groundwater. This assessment identifies the potential release and transport mechanisms for the chemicals of concern (COC), point of exposure and exposure routes, and the receptors that could be at risk. The evaluation follows guidelines specified in the "NYSDEC DER-10 *Draft Technical Guidance for Site Investigation and Remediation*" [NYSDEC, 2002]. Because this site is located in an urban setting, the potential for exposure for ecological receptors was not evaluated.

6.1 Site setting

The RI has focused on the area known as OU1 including the former MGP process area and the off-site areas adjacent to, and/or hydraulically down-gradient of the site. The OU1 area is mostly comprised of property owned by the SMHA, Clinton Street, and a portion of the northern area which is owned by the Schenectady Urban Renewal Authority. The potential for residents and others to be exposed is discussed in the following sections.

6.1.1 On-site Area

The On-site Area is comprised of the SMHA Golub Community Center Building, an apartment building, parking lots, and some grassy or landscaped areas. This area includes the area formerly used for MGP process operations. Since the property is residential and is the location of apartment buildings, the general public has regular access to the On-site Area at all times.

6.1.2 Off-site Areas

The assessment of potential exposure to residents and workers in off-site areas is discussed using the following designations:

- **Northern Residential Area** – Residential properties to the north of the site with Hamilton Street located beyond this area.
- **312 Broadway Avenue** – Owned by the City of Schenectady, this property contains a parking lot that is located across Broadway Ave to the northwest of the site. The City is considering the redevelopment of this property.
- **Schenectady Municipal Housing Authority Park** – Located to the northeast of the site, consists of a grassy/landscaped park with a pavilion in the northeastern area of the park.
- **Millard Street** – Located to the south of the site with additional SMHA land beyond.
- **Broadway Avenue** – Runs along western perimeter of site with several commercial properties (318, 330, 336, and 340 Broadway Avenue) beyond.

6.2 Exposure assessment

Exposure is the process by which humans come into contact with chemicals in their environment. Humans can be exposed to chemicals in a variety of environmental media including surface soil, subsurface soil, groundwater, and air. Exposure to these media can occur through several routes including ingestion, dermal contact, and inhalation. The exposure assessment identifies pathways by which humans are potentially exposed to constituents of concern. The assessment includes the following:

- Development of a conceptual site model;
- Discussion of potential sources;

- Discussion of potential release mechanisms; and
- Identification of potential human receptors and receptor-specific exposure pathways.

Although the potential for exposure to MGP residuals for the site includes an evaluation of the potential for exposure to COCs via drinking impacted site groundwater, according to information provided by the City of Schenectady, all residential and commercial property in the City obtains drinking water from municipal sources. Other than an evaluation of potential incidental ingestion of impacted groundwater during subsurface construction activities, this pathway is not further discussed in this exposure assessment. The management of groundwater impacted by site-related residuals will be addressed in the FS.

6.2.1 Conceptual site model

Figure 6-1 presents the conceptual model for the RI study area. Included on the figure is information regarding the known or potential sources of constituents of interest, the identified release mechanisms, and the affected source media. The potential migration pathways, the exposure media, and the potential exposure routes are identified. Note that the exposure routes are considered potential unless there is an ongoing or documented exposure. Information regarding the potential receptors identified in the area of interest is presented on Table 6-1 (potential on-site receptors).

6.2.2 Potential sources

The sources of environmental impact for the Schenectady MGP site are residual materials associated with MGP-related structures and materials. Hydrocarbon materials, including coal tar and coal tar NAPL, have been observed in subsurface soil and groundwater adjacent to the former MGP structures at the site. Volatile and semi-volatile compounds in these materials have leached to groundwater and these constituents have migrated to down-gradient locations. NAPL has also been observed to accumulate in wells adjacent to a former tar well in the western area of OU1. The dissolved groundwater plume roughly corresponds to the footprint of the former MGP process area and appears to extend beneath the northeast portion of the SMHA building. The lower molecular weight hydrocarbons may also volatilize and migrate into ambient air where subsurface soil and groundwater are impacted by MGP residuals.

6.2.3 Potential release mechanisms

As shown on Table 6-1 there are several potential release mechanisms by which the constituents identified in the soil and groundwater may be transported to other media. Each mechanism is considered for the identified media and potential receptor group. Potential release mechanisms for soil include the following:

- **Fugitive Dust**. Constituents in surface and subsurface soil could be a potential source for fugitive dust via physical disturbance.
- **Volatilization**. Volatile constituents may potentially be transported from subsurface soil by volatilizing into soil-pore space and eventually emanate into ambient or indoor air.
- **Leaching**. Constituents in surface or subsurface soil could potentially leach to groundwater.

There are three mechanisms by which constituents in groundwater can be transported to other media. These migration pathways include the following:

- **Adsorption**. Constituents in groundwater may be sorbed onto subsurface soils.
- **Volatilization to Ambient Air**. Volatile constituents in groundwater may potentially desorb into soil gas and be transported into ambient or indoor air.
- **Extraction**. Constituents in groundwater may migrate to other media by extraction and use of impacted groundwater.

Each of these potential release mechanisms is evaluated for each potential receptor group on Table 6-1.

6.2.4 Potential human receptors and exposure pathways

This section discusses the identified potential receptors and the potential that the receptor may be exposed to site-related residuals.

6.2.4.1 On-site area receptors

An assessment of potential exposure pathways for receptors in the On-site Area is presented in Table 6-1. The analysis includes an identification of each potential receptor group, a listing of each potential exposure media and potential pathway, and a rationale for inclusion or exclusion of each potential receptor in the consideration of remedial actions for the FS. Potential receptor groups and potential exposure pathways that may exist for the site are discussed below.

On-site residents

Surface soil sampling was not performed because of numerous episodes of redevelopment which have involved the re-grading of the ground surface and the installation of parking lots, buildings, and modern landscaped areas. Though there are known areas of subsurface impacts, it is unlikely that any residents of the SMHA apartment building would come into contact with impacted groundwater or subsurface soils. Soil vapor sample results from the SMHA Buildings building did not indicate elevated concentrations of possibly MGP-related volatile organic compounds. Therefore, the potential for exposure to residents is considered low.

On-site workers

On-site Workers are those who are employed by the SMHA as assistants to the residents and office staff. Due to the nature of their work, it is unlikely that on-site workers would come into contact with subsurface soils or groundwater. Therefore, the potential for exposure to on-site workers is considered low. These workers also spend little or no time in the basement of the building, therefore, they have very low potential for exposure to soil vapor.

On-site outdoor maintenance workers

Outdoor Maintenance Workers may potentially be exposed to constituents in surface soil via direct contact pathways (i.e., incidental ingestion, dermal contact, and inhalation of volatiles or particulates) while performing light maintenance activities such as lawn care. Since surface soil impacts are not expected, the soil is covered with grass or pavement, and the period of time that they would be present in impacted areas is minimal, the potential for exposure is considered to be low. Exposure to constituents in subsurface soil is possible if these workers perform maintenance activities which require excavation.

On-site outdoor subsurface utility workers

Outdoor Subsurface Utility Workers may potentially be exposed to MGP-related residuals in subsurface soil and groundwater via incidental ingestion, dermal contact, and inhalation of volatiles or particulates if subsurface excavation work is needed to repair or replace underground gas lines or other utilities or equipment at the site. Impacted subsurface soil, groundwater and coal tar NAPL are known to be present in the central portion of the site. Only properly trained field personnel should perform the subsurface utility work in this area using methods specified in a site-specific health and safety plan (HASP) until the area has been cleared of impacted materials.

Site visitors

Site Visitors may potentially contact surface soil in the grassy or landscaped areas, or inhale indoor air while at the site. Since the surface soil is covered with grass or paving, and the soil vapor in the SMHA Building is not adversely impacted by MGP-related COC, the potential for exposure is considered to be low.

6.2.4.2 Off-site receptors

Potential receptor groups and potential exposure pathways for the areas adjacent to OU1 are discussed below.

Northern residential area

The Northern Residential Area consists of residential properties to the north of the site beyond Hamilton Street. Because this area is hydraulically up-gradient of the MGP process area and soil samples between the process area and this area had minimal impacts, it is not expected that MGP related impacts are present in the Northern Residential Area. The potential for exposure is considered low.

312 Broadway Avenue

This area includes the parking lot that is located across Broadway Avenue to the northwest of the site and is owned by the City of Schenectady. The property is the subject of an Environmental Restoration Project (ERP) being performed by the Schenectady County Metroplex Development Authority. RI sampling has been performed in this area, and additional sampling will be performed during OU2 to assess the presence of MGP-related COC at this location. Potential exposure pathways for this property will be assessed following the additional investigation activities and summarized in the OU2 RI Report. Note that this property is fully paved, therefore; the potential for uncontrolled use or exposure under current conditions is low.

Schenectady Municipal Housing Authority Park

This area is located to the northeast of the site and consists of a grassy/landscaped park with a pavilion in the northeastern portion of the park. The SMHA Park is hydraulically up-gradient of the MGP process area and is not expected to have been impacted by MGP residuals based on borings and wells installed between this area and the former MGP process area. The potential for exposure to MGP related residuals in this area is considered to be low.

Millard Street

Millard Street is located to the south of the site. Just beyond Millard Street, additional Municipal Housing Authority land exists which consists of apartment buildings. Because subsurface soil and groundwater samples taken at the southern perimeter of the site showed minimal concentration, it appears unlikely that MGP-related residuals have migrated from the MGP process area past Millard Street. Therefore the potential for exposure to MGP related COC in this area is considered to be low. Additional information regarding the potential impacts in this area will be obtained during the investigation of OU2.

Broadway Avenue

Broadway Avenue runs along the western perimeter of OU1 and is down-gradient of the MGP process area. There are several commercial properties (318, 330, 336, and 340 Broadway Avenue) located beyond Broadway further to the west. MGP-related residuals have been observed in borings installed along the western edge of Broadway Avenue and additional sampling will be performed during the OU2 investigation to assess the horizontal and vertical extent of the residuals in this area. The potential for exposure in this area will be further assessed during the OU2 investigation and discussed in the OU2 RI Report.

6.3 Conclusions

Residents, workers and visitors to OU1 of the site are unlikely to contact soil vapor, soil or groundwater impacted with MGP-related residuals and the potential for exposure for these possible receptor groups is considered to be low.

For a Subsurface Utility or Construction Worker who may perform excavation work on OU1, the worker may potentially be exposed to coal tar or coal tar NAPL, impacted soil, soil vapor, and/or groundwater. Therefore,

subsurface work should only be performed by properly trained personnel, using methods specified in a HASP, or only after the area has been cleared of impacted media.

For the off-site areas consisting of Broadway Avenue, and the two city blocks beyond, potential receptors may be exposed to MGP related COC in these areas based on borings and wells installed in these areas. The horizontal and vertical extent of the MGP-related residuals will be further assessed during the OU2 investigation and the potential for an exposure in these areas will be discussed in the OU2 RI Report.

The areas hydraulically and topographically up-gradient and cross-gradient of the former MGP site are not impacted by COC, therefore, there is low risk of exposure to the receptors in these areas.

7.0 Summary and conclusions

This section summarizes the findings of the investigation of the Schenectady Clinton Street former MGP site. An overview of the nature and extent of COC is presented by area of concern and by media, and known and potential source areas are identified.

7.1 Site geology

- Historic fill material covers the majority of the site. The fill consists primarily of sand with varying amounts of silt, coal fragments, cobbles and boulders, brick and concrete fragments, clinker-like material, ash, and coke fragments.
- Underlying the fill is a thick layer of alluvium comprised of silty sand and sand. A thin peat layer was observed within the alluvium in the southwestern portion of the site.
- Beneath the alluvium is a glacial till unit which is found at depths of 85 to 97 feet below the ground surface of the site. The till is comprised of dense, dry clayey silt with varying amounts of gravel.

7.2 Site hydrogeology

- Storm water runoff is towards Clinton Street and Broadway Avenue, following the slope of the ground surface.
- The fill and the alluvium deposits comprise an unconfined aquifer.
- Groundwater is found at depths which ranged from approximately 7 to 10 feet bgs across the former MGP process area.
- Groundwater flow in both the shallow and deeper portions of the aquifer is from the east to the west across the site.
- Groundwater is not used for drinking water in the immediate vicinity of the site. Drinking water for the City of Schenectady is provided by municipal sources.

7.3 Potential source areas

Several subsurface MGP features are still present in the subsurface at the site.

- The original 30-foot diameter gas holder foundation is located in the southern area of the site (Gas Holder A). Visible evidence of MGP-related residuals was not observed inside the holder foundation.
- A 60-foot diameter gas holder foundation (Gas Holder B) is present in the north area of the site. Hydrocarbon-like staining was observed in soil in the foundation; however, coal tar was not observed within the holder foundation.
- A 45-foot diameter gas holder foundation (Gas Holder C) was identified in the southern area of the site. The footprint of this holder partially overlapped the footprint of Gas Holder A. Impacted subsurface soil was observed in the western edge of or just outside of the foundation wall. MGP-related residuals were not observed in the eastern portion of the holder.
- Two tar wells (Tar Well A and Tar Well B) located to the north of the MGP Process Building adjacent to Broadway Avenue. No visible evidence of MGP residuals was observed in the footprint of Tar Well A though coal tar was observed in soil in the area to the north of this tar well. Hardened coal tar and NAPL were observed in the area of Tar Well B.

- The MGP Process Building foundation is located in the central portion of the site. Coal tar or coal tar NAPL was not observed in the foundations of this building. However, deeper subsurface soil impacts were found in the footprint of this building.
- A Coke House located to the north of the MGP process area. A foundation for the feature was not identified in this area. Deeper subsurface soil impacts were observed in this area.
- A Gasoline Pump House and Tank were located in the northern area of the site, in the footprint of Clinton Street. A foundation for this feature was not identified in this area. A trace amount of hydrocarbon staining was observed near the elevation of the water table in a well adjacent to the western side of the pump house.

7.4 Nature and extent of constituents of concern

Three media were investigated at the site, including subsurface soil, groundwater, and soil vapor. Test trenches and soil borings were completed in, and around MGP features to determine the presence of structures and the condition of subsurface soil, and in locations outside of the MGP to determine the extent of impacts. Conclusions for each media are summarized below.

7.4.1 Subsurface soil

Coal tar-impacted subsurface soil with VOC and PAH concentrations greater than Commercial Use SCOs is present in the MGP process area. Based on the borings completed during the RI it does not appear that the coal tar NAPL has migrated below approximately 55 feet bgs. The horizontal extent of the MGP-related impacts has been determined by borings completed around the perimeter of the Former MGP Process Area, and the area of impact roughly corresponds to the foot print of the former MGP Process Area.

7.4.2 Groundwater

The highest concentrations of MGP-related COC in groundwater were detected in and down-gradient of the former MGP process area. Wells MW10, MW02, MW06, and MW05 at the eastern and southeastern perimeter of the site were not impacted, therefore, the horizontal extent of the MGP-related COCs in groundwater has been determined except in the down-gradient (OU2) portion of the site. Total cyanide was only detected in one well on the site in concentrations greater than the groundwater standard value.

7.4.3 Soil Vapor

Soil vapor and ambient air samples were collected to evaluate the potential for intrusion of COCs into nearby buildings. The soil vapor results indicate that non-MGP petroleum products are the most likely sources of the VOCs found in the soil vapor samples. Evidence of MGP-related soil vapor impacts that would provide a potential for MGP-related vapor intrusion into the building was not identified.

7.5 Human health exposure assessment

A qualitative human health exposure assessment was performed for the site and off-site areas characterized by the investigation. The assessment identified several potential pathways that could result in an exposure to impacted media at the site.

Residents, workers and visitors to the SMHA property are unlikely to contact soil vapor, soil or groundwater impacted with MGP-related residuals and the potential for exposure for these possible receptor groups is considered to be low.

For a Subsurface Utility or Construction Worker who may perform excavation work on the site, the worker may potentially be exposed to coal tar or coal tar NAPL, impacted soil, soil vapor, and/or groundwater. Therefore, subsurface work should only be performed by properly trained personnel, using methods specified in a HASP, or only after the area has been cleared of impacted media.

For the off-site areas consisting of Broadway Avenue, and the two city blocks beyond, potential receptors may be exposed to MGP related COC in these areas based on borings and wells installed in these areas. The horizontal and vertical extent of the MGP related residuals will be further assessed during the OU2 investigation and the potential for an exposure in these areas will be discussed in the OU2 RI Report.

Off-site receptors in all other areas are outside of the zone of MGP impact, therefore, these receptors are not expected to be at risk of exposure.

8.0 Recommendations

8.1 Operable Unit 2

The off-site area which is impacted by MGP residuals will continue to be investigated as OU2. The work plan for the OU2 RI has been approved by NYSDEC, and the fieldwork for the OU2 RI will be performed in the second half of 2009. This division of the onsite former MGP area from the offsite area of impact will allow the FS for OU1 to be performed while the OU2 RI is underway.

8.2 Interim remedial measures

Interim Remedial Measures (IRMs) are warranted when existing site conditions pose an immediate threat to human health or the environment. Such conditions often come about due to on-going releases of constituents to surface water, groundwater, or soil vapor, or where exposure pathways allow the receptors to come into contact with the impacted media. Conditions that would warrant an IRM were not observed during the RI. MGP-related residuals are covered by grass, buildings, and pavement, and therefore do not pose an immediate risk to receptors as the residuals are isolated from human contact. Groundwater in the vicinity of the site is not used for drinking water.

8.3 Feasibility study

With the observations and data presented in this report, an evaluation of conditions on OU1 of the site has been performed fulfilling the specifications of the Order on Consent. Following approval of this report by the NYSDEC, an FS which presents an evaluation of remedial options will be prepared to identify methods that may be used to remediate the impacted media. The evaluation will review potential remedial actions and will address surface and subsurface soil, groundwater, and soil vapor.

Historical Information Summary
Schenectady Clinton Street MGP Site

Year	Source of Information	Comments
1851-1852	Foster Wheeler Report	Gas production began at the site during this period. The Gas Works was built by Robert Clements and John Eaton.
1880	Atlas of Schenectady	Atlas depicts the Site with two main buildings, the hexagonal office, and a gasometer.
1884	Sanborn Fire Insurance Map	The MGP is labeled "City Gas Works". Two main buildings are present at the Site. A central building includes a repair shop, purifiers, lime room, and meter room. West of the central building, a second building houses retorts, dynamos, a compressor, and a lamp room. Just northeast of the western building is a tar well with a cited capacity of 100 barrels. South of the west building is a coal storage building. A small gasometer (approximate 30-foot diameter) is depicted east of the coal storage building at the southern margin of the facility (historic evidence suggests that this was the original holder constructed about 1851/1852). A hexagonal structure located approximately half way between the two main buildings is labeled "office".
1866	Atlas of Albany and Schenectady Counties	Atlas depicts the gas works (consisting of an unlabeled gasometer, the hexagonal office building, and other structures) bounded by South Centre St., Hamilton St., Lafayette St., and Oothout Street.
1889	Sanborn Fire Insurance Map	The MGP is labeled "Schenectady Electric Light and Gas Company". The features identified on the map are consistent with the 1884 Sanborn Map.
1900	Sanborn Fire Insurance Map	The MGP is labeled "City Gas Works". Sanborn map indicates that the gasometer at the south end of the property has been replaced by a larger gasometer with a scaled diameter of 55-feet. A coke house has been constructed along South Centre Street (Broadway) north of the two main buildings. The circular office building is now identified as a pump house. A rectangular shaped tar well is now shown along S. Centre Street.
1914	Atlas of Schenectady and Sanborn Fire Insurance Map	The MGP is labeled "Mohawk Gas Company". Map shows the coke house and large gasometer in the north part of the site have been removed. A small gasoline pump house containing a 250 gallon gasoline tank is located northeast of the former gasometer location. The central building is identified as offices. The west building has been expanded and appears to be used for storage, meter testing, and office space. The large gasometer at the south end of the property is now labeled as "Auto Ho.".
1930	Sanborn Fire Insurance Map	The footprints of the main buildings are essentially unchanged from the 1914 Sanborn Map. The former gasometer at the south end of the site property is now labeled as "Offices & Storage". A gasoline tank is located in the proximity of the former northern gasometer location.
1951	Sanborn Fire Insurance Map	Map shows the west building of the facility is now identified as "Fruit & Gro.". The central building is no longer present. Much of the former facility has become parking. The gasoline tank in the north former gasometer location is still depicted, but closer to Broadway. Historic records have indicated the original brick holder was used to store fruit during this time period.
1988	Sanborn Fire Insurance Map	Map shows no indication of the former facility. Clinton Avenue has been extended from the northeast between Hamilton and Broadway across the approximate former location of the north gasometer. The south gasometer had been dismantled in 1959 (Hart, 1984).
1989 and 1990	Sanborn Fire Insurance Maps	Maps do not show any changes from the 1988 map.
1992	Sanborn Fire Insurance Map	Map shows an apartment complex (The Schenectady Municipal Housing Authority) south of the former facility location has expanded northward. The northernmost corner of the expansion appears to overlie the location of the former western facility building.
1993, 1994 and 1995	Sanborn Fire Insurance Maps	Sanborn maps show site conditions unchanged from the 1992 Sanborn map.

Notes:
NL = Not Listed
NA = Not Applicable
U = The material was analyzed for but not detected at or above the reporting limit. The associated numerical value is the sample quantitation limit.
J = The associated numerical value is an estimated quantity.
Bold value - compound detected at concentration greater than the Restricted Residential SCO.
Yellow Shading = Compound detected in concentration greater than the Commercial SCO.
NYSDEC Subpart 375-6, Remedial Program Soil Cleanup Objectives, December 14, 2006.
(Note 1) - Total VOCs includes all of the BTEX and other VOC compounds.

Notes:
NL = Not Listed
NA = Not Applicable
U = The material was analyzed for but not detected at or above the reporting limit. The associated numerical value is the sample quantitation limit.
J = The associated numerical value is an estimated quantity.
Bold value - compound detected at concentration greater than the Restricted Residential SCO.
Yellow Shading = Compound detected in concentration greater than the Commercial SCO.
NYSDEC Subpart 375-6, Remedial Program Soil Cleanup Objectives, December 14, 2006.
(Note 1) - Total VOCs includes all of the BTEX and other VOC compounds.

Notes:
NL = Not Listed
NA = Not Applicable
U = The material was analyzed for but not detected at or above the reporting limit. The associated numerical value is the sample quantitation limit.
J = The associated numerical value is an estimated quantity.
Bold value - compound detected at concentration greater than the Restricted Residential SCO.
Yellow Shading = Compound detected in concentration greater than the Commercial SCO.
NYSDEC Subpart 375-6, Remedial Program Soil Cleanup Objectives, December 14, 2006.
(Note 1) - Total VOCs includes all of the BTEX and other VOC compounds.

Table 5-1
Subsurface Soil VOC Results

Notes:
NL = Not Listed
NA = Not Applicable
U = The material was analyzed for but not detected at or above the reporting limit. The associated numerical value is the sample quantitation limit.
J = The associated numerical value is an estimated quantity.
Bold value - compound detected at concentration greater than the Restricted Residential SCO.
Yellow Shading = Compound detected in concentration greater than the Commercial SCO.
NYSDEC Subpart 375-6, Remedial Program Soil Cleanup Objectives, December 14, 2006.
(Note 1) - Total VOCs includes all of the BTEX and other VOC compounds.

Table 5-1
Subsurface Soil VOC Results

Notes:
NL = Not Listed
NA = Not Applicable
U = The material was analyzed for but not detected at or above the reporting limit. The associated numerical value is the sample quantitation limit.
J = The associated numerical value is an estimated quantity.
Bold value - compound detected at concentration greater than the Restricted Residential SCO.
Yellow Shading = Compound detected in concentration greater than the Commercial SCO.
NYSDEC Subpart 375-6, Remedial Program Soil Cleanup Objectives, December 14, 2006.
(Note 1) - Total VOCs includes all of the BTEX and other VOC compounds.

Table 5-1
Subsurface Soil VOC Results

Notes:
NL = Not Listed
NA = Not Applicable
U = The material was analyzed for but not detected at or above the reporting limit. The associated numerical value is the sample quantitation limit.
J = The associated numerical value is an estimated quantity.
Bold value - compound detected at concentration greater than the Restricted Residential SCO.
Yellow Shading = Compound detected in concentration greater than the Commercial SCO.
NYSDEC Subpart 375-6, Remedial Program Soil Cleanup Objectives, December 14, 2006.
(Note 1) - Total VOCs includes all of the BTEX and other VOC compounds.

Notes:
NL = Not Listed
NA = Not Applicable
U = The material was analyzed for but not detected at or above the reporting limit. The associated numerical value is the sample quantitation limit.
J = The associated numerical value is an estimated quantity.
Bold value - compound detected at concentration greater than the Restricted Residential SCO.
Yellow Shading = Compound detected in concentration greater than the Commercial SCO.
NYSDEC Subpart 375-6, Remedial Program Soil Cleanup Objectives, December 14, 2006.
(Note 1) - Total SVOCs includes all of the PAH and other SVOC compounds.

Table 5-2
Subsurface Soil SVOC Results

NL = Not Listed
NA = Not Applicable
U = The material was analyzed for but not detected at or above the reporting limit. The associated numerical value is the sample quantitation limit.
J = The associated numerical value is an estimated quantity.
Bold value - compound detected at concentration greater than the Restricted Residential SCO.
Yellow Shading = Compound detected in concentration greater than the Commercial SCO.
NYSDEC Subpart 375-6, Remedial Program Soil Cleanup Objectives, December 14, 2006.
(Note 1) - Total SVOCs includes all of the PAH and other SVOC compounds.

Table 5-2

Notes:
NL = Not Listed
NA = Not Applicable
U = The material was analyzed for but not detected at or above the reporting limit. The associated numerical value is the sample quantitation limit.
J = The associated numerical value is an estimated quantity.
Bold value - compound detected at concentration greater than the Restricted Residential SCO.
Yellow Shading = Compound detected in concentration greater than the Commercial SCO.
NYSDEC Subpart 375-6, Remedial Program Soil Cleanup Objectives, December 14, 2006.
(Note 1) - Total SVOCs includes all of the PAH and other SVOC compounds.

Table 5-2
Subsurface Soil SVOC Results

Notes:
NL = Not Listed
NA = Not Applicable
U = The material was analyzed for but not detected at or above the reporting limit. The associated numerical value is the sample quantitation limit.
J = The associated numerical value is an estimated quantity.
Bold value - compound detected at concentration greater than the Restricted Residential SCO.
Yellow Shading = Compound detected in concentration greater than the Commercial SCO.
NYSDEC Subpart 375-6, Remedial Program Soil Cleanup Objectives, December 14, 2006.
(Note 1) - Total SVOCs includes all of the PAH and other SVOC compounds.

Table 5-2
Subsurface Soil SVOC Results

Notes:
NL = Not Listed
NA = Not Applicable
U = The material was analyzed for but not detected at or above the reporting limit. The associated numerical value is the sample quantitation limit.
J = The associated numerical value is an estimated quantity.
Bold value - compound detected at concentration greater than the Restricted Residential SCO.
Yellow Shading = Compound detected in concentration greater than the Commercial SCO.
NYSDEC Subpart 375-6, Remedial Program Soil Cleanup Objectives, December 14, 2006.
(Note 1) - Total SVOCs includes all of the PAH and other SVOC compounds.

Table 5-3
Subsurface Soil Metals and Cyanide Results

Notes:
NL = Not Listed
NA = Not Applicable
U = The material was analyzed for but not detected at or above the reporting limit. The associated numerical value is the sample quantitation limit.
J = The associated numerical value is an estimated quantity.
J- = The result is an estimated quantity, likely to be biased low. The associated numerical value is the approximate concentration of the analyte in the sample.
J+ = The result is an estimated quantity, likely to be biased high. The associated numerical value is the approximate concentration of the analyte in the sample.
Bold value - compound detected at concentration greater than the Restricted Residential SCO.
Yellow Shading = Compound detected in concentration greater than the Commercial SCO.

Notes:
NL = Not Listed
NA = Not Applicable
U = The material was analyzed for but not detected at or above the reporting limit. The associated numerical value is the sample quantitation limit.
J = The associated numerical value is an estimated quantity.
J- = The result is an estimated quantity, likely to be biased low. The associated numerical value is the approximate concentration of the analyte in the sample.
J+ = The result is an estimated quantity, likely to be biased high. The associated numerical value is the approximate concentration of the analyte in the sample.
Bold value - compound detected at concentration greater than the Restricted Residential SCO.
Yellow Shading = Compound detected in concentration greater than the Commercial SCO.
NYSDEC Subpart 375-6, Remedial Program Soil Cleanup Objectives, December 14, 2006.

Notes:
NL = Not Listed
NA = Not Applicable
U = The material was analyzed for but not detected at or above the reporting limit. The associated numerical value is the sample quantitation limit.
J = The associated numerical value is an estimated quantity.
J- = The result is an estimated quantity, likely to be biased low. The associated numerical value is the approximate concentration of the analyte in the sample.
J+ = The result is an estimated quantity, likely to be biased high. The associated numerical value is the approximate concentration of the analyte in the sample.
Bold value - compound detected at concentration greater than the Restricted Residential SCO.
Yellow Shading = Compound detected in concentration greater than the Commercial SCO.
NYSDEC Subpart 375-6, Remedial Program Soil Cleanup Objectives, December 14, 2006.

Notes:
NL = Not Listed
NA = Not Applicable
U = The material was analyzed for but not detected at, or above, the reporting limit. The associated numerical value is the sample quantitation limit.
J = The associated numerical value is an estimated quantity.
Bold value - compound detected at concentration greater than the reporting limit
Yellow Shading = Compound detected at a concentration greater than the standard or guidance value.
s = Standard Value
g = Guidance Value
Note 1 - Guidance or Standard Values - NYSDEC, Division of Water, TOGS (1.1.1) [NYSDEC, 1998, with addenda through 2004].
Note 2 - Total VOCs includes BTEX compounds.

Notes:
NL = Not Listed
NA = Not Applicable
U = The material was analyzed for but not detected at, or above, the reporting limit. The associated numerical value is the sample quantitation limit.
J = The associated numerical value is an estimated quantity.
Bold value - compound detected at concentration greater than the reporting limit
Yellow Shading = Compound detected at a concentration greater than the standard or guidance value.
s = Standard Value
g = Guidance Value
Note 1 - Guidance or Standard Values - NYSDEC, Division of Water, TOGS (1.1.1) [NYSDEC, 1998, with addenda through 2004].
Note 2 - Total VOCs includes BTEX compounds.

Notes:
NL = Not Listed
NA = Not Applicable
U = The material was analyzed for but not detected at, or above, the reporting limit. The associated numerical value is the sample quantitation limit.
J = The associated numerical value is an estimated quantity.
Bold value - compound detected at concentration greater than the reporting limit
Yellow Shading = Compound detected at a concentration greater than the standard or guidance value.
s = Standard Value
g = Guidance Value
Note 1 - Guidance or Standard Values - NYSDEC, Division of Water, TOGS (1.1.1) [NYSDEC, 1998, with addenda through 2004].
Note 2 - Total SVOCs includes PAH compounds.

Notes:
NL = Not Listed
NA = Not Applicable
U = The material was analyzed for but not detected at, or above, the reporting limit. The associated numerical value is the sample quantitation limit.
J = The associated numerical value is an estimated quantity.
J+ = The result is an estimated quantity, likely to be biased high. The associated numerical value is the approximate concentration of the analyte in the sample.
Bold value - compound detected at concentration greater than the reporting limit
Yellow Shading = Compound detected at a concentration greater than the standard or guidance value.
s = Standard Value
g = Guidance Value
Note 1 - Guidance or Standard Values - NYSDEC, Division of Water, TOGS (1.1.1) [NYSDEC, 1998, with addenda through 2004].

Notes:
All units in micrograms per cubic meter (µg/m³)
1 - These compounds may be related to either MGP sources or non-MGP sources, or both. MGP sources include MGP tars and petroleum feedstocks used in MGP processes, such as the carburetted water gas process. Non-MGP sources include cleaning products, floor wax and polish, vehicle exhaust, construction materials, and cigarette smoke.
2 - These compounds are not related to MGP sources and are present due to non-MGP sources, such as vehicle exhaust, heating and air conditioning systems, cleaning agents, art supplies, paints, etc.
3 - New York State Department of Health, November 14, 2005. 90th percentile values from homes heated with fuel oil.
4 - Typical commercial background indoor air concentrations are the 90th percentile values observed by the USEPA in a study conducted from 1994 through 1996, which are the values recommended for comparison in the NYSDOH "Guidance for Evaluating Soil Vapor Intrusion in the State of New York" (NYSDOH, October 2006).
5 - OSWER Draft Guidance for Evaluating the Vapor Intrusion to Indoor Air Pathway from Groundwater and Soils (Subsurface Vapor Intrusion Guidance) Risk factor 10E-5 used for benzene and ethyl benzene for conservative residential scenario.
Bold - Compound detected in a concentration greater than the method reporting limits.
Total/10 - An attenuation factor of 0.1 was used to conservatively screen shallow soil vapor concentrations.
NA - Not Applicable
NL - Not listed - data not available for background concentrations for these compounds.
U - The compound was analyzed for, but was not detected above the method reporting limit.
J - The analyte was positively identified. The associated numerical value is the approximate concentration of the analyte in the sample.
UJ - The analyte was analyzed for, but was not detected. The reported quantitation limit is approximated and may be inaccurate or imprecise.

Notes:
ND = The material was analyzed for, but not detected.
B = The associated numerical value is an estimated quantity. The result is less than the laboratory reporting limit.
J = The associated numerical value is an estimated quantity.
Shaded Value Concentration greater than regulatory criteria.
Note(1) - Regulatory Level - Federal Register [Nov. 1992]

Table 6-1
Exposure Pathway Analysis - Potential Receptors
Schenectady MGP Site

Receptor	Exposure Medium	Exposure Pathway	Pathway Not Considered Complete	Pathway Considered Potentially Complete, But Not Likely to Result in Exposure	Pathway Potentially Complete and Will Be Addressed in the Feasibility Study for the Site	Rationale for Inclusion or Exclusion
On-site Residents						
Residents	**On-site Surface Soil (0-2 inches)**	Ingestion	---	**X**	---	Surface soil sampling not performed because of numerous episodes of redevelopment which have involved the re-grading of the ground surface and the installation of parking lots, buildings, and modern landscaped areas. Impacts to surface soil are not expected.
		Dermal Contact	---	**X**	---	
		Inhalation of Particulates	---	**X**	---	
		Inhalation of Volatiles in Ambient Air	---	**X**	---	
	On-site Subsurface Soil (>2 inches)	Ingestion	**X**	---	---	Residents are not likely to contact subsurface soils.
		Dermal Contact	**X**	---	---	
		Inhalation of Particulates	**X**	---	---	
		Inhalation of Volatiles in Ambient Air	**X**	---	---	
	Groundwater	Ingestion	**X**	---	---	Residents are not likely to contact groundwater.
		Dermal contact	**X**	---	---	
		Inhalation of Volatiles in Ambient Air	**X**	---	---	
On-site Workers						
On-site Workers	**On-site Surface Soil (0-2 inches)**	Ingestion	---	**X**	---	On-site Workers may be exposed to residuals in surface soil while working at the site; however, all areas that might be impacted are covered with grass, pavement, or buildings. Also, impacts to surface soil are not expected, therefore exposure is not likely.
		Dermal contact	---	**X**	---	
		Inhalation of Particulates	---	**X**	---	
		Inhalation of Volatiles in Ambient Air	---	**X**	---	
	On-site Subsurface Soil (>2 inches)	Ingestion	**X**	---	---	On-site Building Workers would not be exposed to subsurface soil while working at the site. On-site Building Workers may be exposed to impacted vapors from impacted subsurface soil at the site; however a vapor intrusion pathway analyses was performed and indoor air is not adversly impacted in the building.
		Dermal contact	**X**	---	---	
		Inhalation of Particulates	**X**	---	---	
		Inhalation of Volatiles in Ambient Air	**X**	---	---	
		Inhalation of Volatiles in Indoor Air	---	**X**	---	
	Groundwater	Ingestion	**X**	---	---	On-site Building Workers would not be exposed to groundwater while working at the site. On-site Building Workers may be exposed to impacted vapors from impacted groundwater at the site; however a vapor intrusion pathway analysis was performed and indoor air is not adversly impacted in the building.
		Dermal contact	**X**	---	---	
		Inhalation of Volatiles in Ambient Air	**X**	---	---	
		Inhalation of Volatiles in Indoor Air	---	**X**	---	
On-site Outdoor Maintainence Worker						
On-site Outdoor Maintainence Worker	**On-site Surface Soil (0-2 inches)**	Ingestion	---	**X**	---	Outdoor Maintenance Workers who mow the grass on the site may be exposed to residuals in surface soil or particulates, therefore the exposure pathway is considered potentially complete. Since the site is covered with grass, the tar materials and NAPL are covered with pavement or buildings, the workers would only be on site for a short time, and impacts to surface soil are not expected, exposure is not likely.
		Dermal Contact	---	**X**	---	
		Inhalation of Particulates	---	**X**	---	
		Inhalation of Volatiles in Ambient Air	---	**X**	---	Outdoor Maintenance Workers may be infrequently exposed to ambient air VOCs emanating from on-site tar materials and NAPL near the surface; however, exposure is not likely due to pavement cover, atmospheric mixing, and dilution of the VOCs in ambient air.
	On-site Subsurface Soil (>2 inches)	Ingestion	---	**X**	---	Outdoor Maintenance Workers are not likely to contact subsurface soils during their workday.
		Dermal Contact	---	**X**	---	
		Inhalation of Particulates	---	**X**	---	
		Inhalation of Volatiles in Ambient Air	---	**X**	---	
	Groundwater	Ingestion	**X**	---	---	Outdoor Maintenance Workers are not likely to contact groundwater during their workday.
		Dermal contact	**X**	---	---	
		Inhalation of Volatiles in Ambient Air	**X**	---	---	
On-site Outdoor Subsurface Utility Worker						
On-site Outdoor Subsurface Utility or Construction Workers	**On-site Surface Soil (0-2 inches)**	Ingestion	---	**X**	---	Outdoor Utility Workers who repair or maintain equipment at the site may be exposed to residuals in surface soil or particulates, therefore the exposure pathway is considered potentially complete. Since the site is covered with pavement, buildings and grass and the tar materials and NAPL are covered, the workers would only be on site for a short time, and impacts to surface soil are not expected, exposure is not likely.
		Dermal contact	---	**X**	---	
		Inhalation of Particulates	---	**X**	---	
		Inhalation of Volatiles in Ambient Air	---	**X**	---	
	On-site Subsurface Soil (>2 inches)	Ingestion	---	---	**X**	Outdoor Subsurface Utility Workers may be exposed to tar and MGP related residuals in subsurface soil, dust, or VOCs in ambient air while completing excavation work to repair or replace subsurface utilities or other equipment that is present at the site. Therefore, the pathway will be addressed in the FS evaluation of potential remedial actions for the site.
		Dermal contact	---	---	**X**	
		Inhalation of Particulates	---	---	**X**	
		Inhalation of Volatiles in Ambient Air	---	---	**X**	
	Groundwater	Ingestion	---	---	**X**	Outdoor Subsurface Utility Workers may be exposed to residuals in groundwater and VOCs in ambient air while completing excavation work to repair or replace gas pipes or other equipment that is present at the site. Therefore, the pathway will be addressed in the FS evaluation of potential remedial actions for the site.
		Dermal contact	---	---	**X**	
		Inhalation of Volatiles in Ambient Air	---	---	**X**	
On-site Visitor or Tresspassor						
Site Visitor or Tresspassor	**On-site Surface Soil (0-2 inches)**	Ingestion	---	**X**	---	On-site Visitors and Tresspassors may be exposed to residuals in surface soil and VOCs in ambient air while visiting the site; however, the site is covered with grass or pavement, and the Visitors or Tresspassors would only be on site for a short time, therefore, exposure is not likely.
		Dermal contact	---	**X**	---	
		Inhalation of Particulates	---	**X**	---	
		Inhalation of Volatiles in Ambient Air	---	**X**	---	
	On-site Subsurface Soil (>2 inches)	Ingestion	**X**	---	---	On-site Visitors or Tresspassors would not be exposed to subsurface soil while visiting the site.
		Dermal contact	**X**	---	---	
		Inhalation of Particulates	**X**	---	---	
		Inhalation of Volatiles in Ambient Air	**X**	---	---	
	Groundwater	Ingestion	**X**	---	---	On-site Visitors or Tresspassors would not be exposed to groundwater while visiting the site.
		Dermal contact	**X**	---	---	
		Inhalation of Volatiles in Ambient Air	**X**	---	---	
Off-site Receptors Outside of OU2						
Residents, Workers, Visitors and Tresspassors	**Off-site Surface Soil (0-2 inches)**	Ingestion	**X**	---	---	Off-site receptors would not be exposed to residuals in surface soil or VOCs in ambient air as OU1 is covered with grass or pavement, preventing the migratio of fugative dust or volatiles.
		Dermal contact	**X**	---	---	
		Inhalation of Particulates	**X**	---	---	
		Inhalation of Volatiles in Ambient Air	**X**	---	---	
	Off-site Subsurface Soil (>2 inches)	Ingestion	**X**	---	---	Off-site receptors would not be exposed to subsurface soil from OU1
		Dermal contact	**X**	---	---	
		Inhalation of Particulates	**X**	---	---	
		Inhalation of Volatiles in Ambient Air	**X**	---	---	
	Groundwater	Ingestion	**X**	---	---	Off-site receptors would not be exposed to impacted groundwater.
		Dermal contact	**X**	---	---	
		Inhalation of Volatiles in Ambient Air	**X**	---	---	

Notes:
OU2 receptors are not addressed in this report. All OU2 receptors will be evaluated in the OU2 Remedial Investigation.
Yellow shading indicates potentially complete pathway exists.

Boring ID: SB14

Project Name: Schenectady, Clinton Street MGP Site
Project Number: NIMO2-19711
Date Started/Completed: November 6, 2006
Boring Location: Outside of Gas Holder C
Drilling Company: Aztech Technologies, Inc.

Drilling Method: Direct-push
Sampling Method: 5 ft Macro-core
Ground Elevation (ft/msl): 231.44
Total Depth: 50.0 ft bgs
Logged By: Scott Hauswirth

Geologic Description

Dark brown fine to medium SAND, little brick and concrete fragments and gravel; dry.
Brown fine SAND; dry.

Brown and white SAND and ASH.
Concrete slab at 3.5 ft bgs.
Orangish-brown fine to medium SAND; dry.

Brown fine to medium SAND, little silt; moist.
Becomes wet at 7 ft bgs.

Hydrocarbon-like odor from 10-11 ft bgs.
Brown and black fine to medium SAND, little silt, trace gravel; wet, saturated with brown low viscosity NAPL from 11-15 ft bgs.

Brown fine to medium SAND; wet, saturated with brown low viscosity NAPL from 15-22.2 ft bgs.

Brown fine to medium SAND; wet, hydrocarbon-like odor.
Dark brown and gray SAND and SILT; wet, saturated with brown low viscosity NAPL from 23.1-25.2 ft bgs.

Remarks

Tar or NAPL/Tar Saturated Soil

Hydrocarbon Staining, Hydrocarbon Sheen or NAPL Blebs

Comments: Soil samples SB14(15-17.5) and SB14(38-40) analyzed for VOCs, SVOCs, TAL metals and total cyanide.
Boring location hand cleared to 3.5 ft bgs on October 31, 2006.

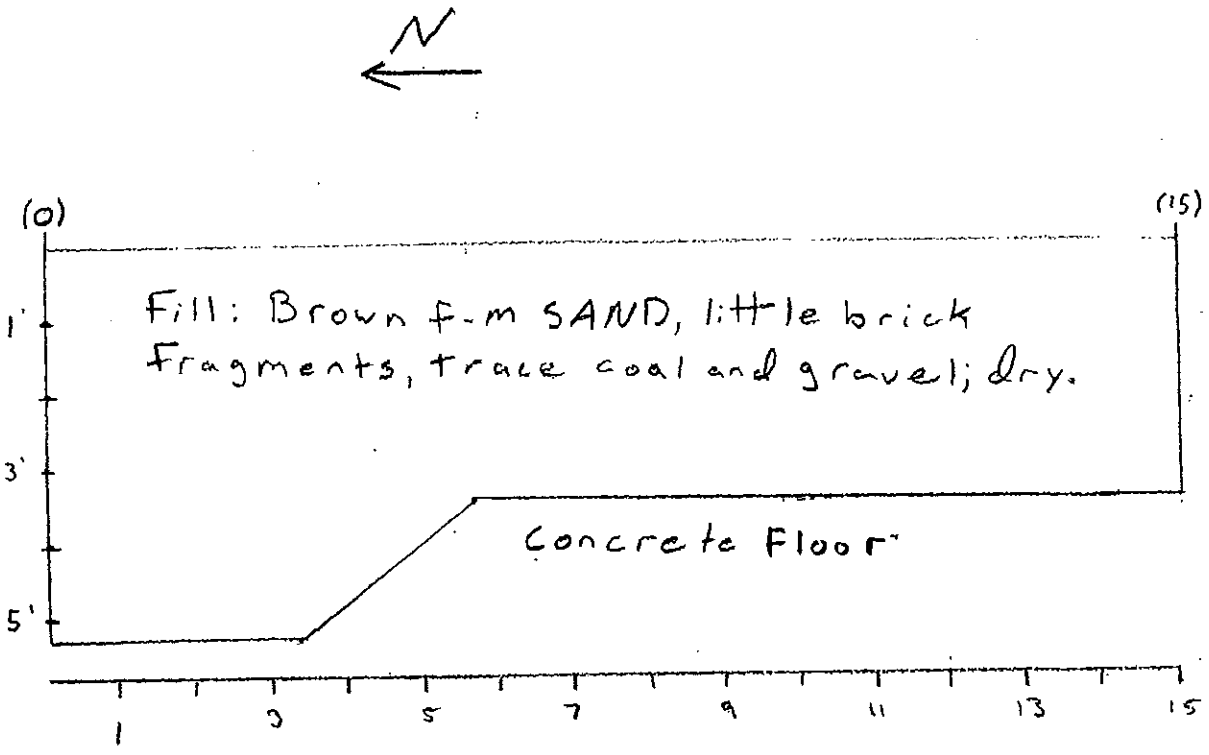
	START TIME: NA
	FINISH TIME: NA



DEPTH (FEET)	SAMPLE DEPTH (FEET)	PID HEADSPACE (PPM)	SOIL LITHOLOGY USCS	SOIL CLASS USCS	SOIL DESCRIPTION LOG	STRUCTURES ENCOUNTERED OR COMMENTS
1		0.1		Fill	Brown fine to medium SAND, trace silt; dry.	
2				Fill	Brown fine to medium SAND, trace silt, gravel and ashes; dry.	Outer brick foundation of Gas Holder B, approximately 3 ft thick from 2-11 ft bgs.
3		0.5			Pieces of black hardened coal tar from 3.5-5.0 ft bgs.	
4					Brown fine to medium SAND, trace silt, gravel and ashes; dry.	
5		0.8		Fill		
6					Brown fine to medium SAND, trace silt, gravel and ashes; damp.	
7		1.9		Fill		
8					Black fine to medium SAND, little silt and gravel, trace brick fragments; wet, hydrocarbon-like odor. Trace yellow low-viscosity NAPL. Slight hydrocarbon-like sheen on water surface.	Pit filling with water at 8 ft bgs.
9		11.6			Brown fine to medium SAND, little silt and gravel; wet, hydrocarbon -like odor, trace hydrocarbon-like sheen.	
10				Fill	Brown and black fine to medium SAND, trace gravel and silt; wet, hydrocarbon-like odor.	
11		8.9				Bottom of brick foundation was not found.

Bottom of Test Pit

Comments: bgs = below ground surface
Soil sample TP7S(7.5)(HORZ 0-10) was analyzed for VOCs, SVOCs, TAL metals and total cyanide.

RE: Data Usability Summary Report for the NMPC Schenectady site
Chemtech SDG Nos. S5626, S5659, S5662, and S5869

Dear Mr. La Pierre:

Review has been performed on the data packages generated by Chemtech Laboratories that pertain to samples collected 11/2/04 through 11/22/04 at the NMPC Schenectady site. Seventeen soil samples were processed for BTEX, PAH, and cyanide; six of these were also analyzed for TOC. Two soil samples were analyzed for TCL volatiles, PAHs, TAL metals, cyanide, and TOC. One additional soil was processed for BTEX only. Four aqueous samples (including one field duplicate) were analyzed for TCL volatiles and TAL metals. Field and trip blanks, and sample matrix spikes were also processed. Laboratory methodologies utilized are those of the NYSDEC ASP/USEPA SW846 8260B, 8270C, 6010B, 3810, and 9060.

The data packages submitted contain full deliverables. This usability report is generated from review of the summary form information, with review of sample raw data, and only limited review of associated QC and instrumental raw data. Full validation has not been performed. However, the reported summary forms have been reviewed for application of validation qualifiers, per the USEPA Region 2 validation SOPs and the USEPA National Functional Guidelines for Data Review, as affects the usability of the sample data. The following items were reviewed:

* Laboratory Narrative Discussion
* Custody Documentation
* Holding Times
* Surrogate and Internal Standard Recoveries
* Matrix Spike Recoveries/Duplicate Correlations
* Preparation/Calibration Blanks
* Control Spike/Laboratory Control Samples
* Instrumental Tunes
* Calibration Standards
* ICP Interference Check Standards
* CRI/CRA Standards
* ICP Serial Dilution Correlations
* Instrument IDLs
* Sample Result Verification

Those items listed above which show deficiencies are discussed within the text of this narrative. All of the other items were determined to be acceptable for the DUSR level review.

In summary, sample processing was conducted primarily in compliance with protocol requirements. Sample results are usable as reported, or usable with minor qualification as estimated. There are no data gaps.

Copies of the laboratory sample ID summaries and case narratives are attached to this text, and should be reviewed in conjunction with this report. Included with this submission are red-ink results forms reflecting the edits and qualifications recommended within this report.

The following text discusses quality issues of concern. Sample IDs referenced within this report are prefixed with "LE-".

General

Reporting limits should be derived from the "RL" column on the sample report forms.

Aqueous blind field duplicate evaluation was performed on TCL volatiles and metals on MW-3, and shows acceptable accuracy and precision. Although a soil blind field duplicate was submitted for TCL volatiles, PAHs, metals, cyanide, and TOC, the laboratory processed that sample for organics only as matrix spikes, and therefore no soil field duplicate evaluation is possible for the volatiles or PAHs. The metals, cyanide, and TOC soil field duplicate evaluation shows acceptable recoveries and correlations. No qualification is made to the data due to unavailable organic evaluation.

Field blank and trip blanks show no contamination affecting sample results, with the exception of those associated with the aqueous samples. The following metal detections in those samples are considered contamination and are edited to reflect nondetection at the originally reported concentrations:

- Iron in MW-3
- Zinc in all aqueous field samples
- Copper on MW-2, MW-4, and QC-500

Samples were not transferred to the laboratory within the required 2 day timeframe, held up to a week before submission to the laboratory. Evaluation of analysis holding times are based upon a technical holding time being that of the laboratory requirement from VTSR plus two allowable days for transit. Volatile analyses of three soil samples and some dilution analyses were conducted within the protocol holding time from lab receipt, but beyond an allowable technical holding time, and those results are therefore qualified as estimated, as discussed below.

Some of the custodies do not show the release signature for the interim transfer.

TCL and BTEX Analyses by EPA 8260B

Results for analytes initially flagged by the laboratory as "E" in the samples are to be derived from the dilution analyses.

Results for the three soil samples collected 11/2/04 and for SB5-22-24 are qualified as estimated, with a possible low bias, due to outlying holding time. The value for ethylbenzene in SB5-10-12 and SB5-16-18 are qualified as estimated as they were derived from dilution analyses beyond allowable holding time.

Some samples exhibited a matrix effect on sample internal and surrogate standard responses. Therefore, the following analyte results are qualified as estimated in the indicated samples:

- TP-4-8-10 all results, use initial analysis
- SB3-10-12 –all analytes

SB6-16-18 and SB6-18-20 were initially run at a two fold dilution. The undiluted analyses were run beyond the technical holding time. The results for the two fold dilution are used preferentially, although the detected result for acetone in the latter is qualified as estimated due to elevated surrogate recovery in that analysis.

Only the medium level analyses of SB8-5-7, SB4-8-10, and SB3-10-12 should be used (exception to use benzene detection for the latter). The results for SB4-8-10 and SB3-10-12 are qualified as estimated as they are outside the technical holding time.

Soil matrix spikes of SB2-10-12 show acceptable recoveries and duplicate correlations.

The soil field duplicate QC-400 was run as matrix spikes. The lab was unaware as to the identification of the parent sample, and therefore did not take that constituency into consideration in the calculations for recoveries and duplicate correlations. Those form entries (Form 3) are not valid. When compared to the field duplicate (SB5-16-18), recoveries are acceptable. That soil spiked duplicate failed the analysis procedure (internal standard responses below 10%), and the duplicate precision is not possible. That spike should have been reanalyzed.

The aqueous matrix spikes of MW-3 show good accuracy and precision.

Initial and continuing calibration standard responses were acceptable, with the following exceptions, results for which are to be qualified as estimated:

- Chloroethane and methylcyclohexane (49%D and 23%D) in SB6-18-20
- Dichlorodifluoromethane (28%RSD) in the trip blank in S5659
- Trichlorofluoromethane and tetrachloroethene (63%D and 27%D) in MW-2 and MW-3
- Carbon disulfide (34%D and 35%D) in all aqueous samples
- Chloroethane (49%D) in SB5-16-18

In some cases, Tentatively Identified Compounds (TICs) were not properly identified by the laboratory in accordance with protocol requirements. The initial software match was reported, with disregard for the quality of the spectral fit. Those reported with CAS numbers should also have been flagged as "N" to indicate a tentative identification

The TICs called naphthalene in SB5-16-20 and QC-500 are removed from the volatile TIC lists as it is a PAH target analyte.

PAH Analyses by EPA 8270C

Results for analytes initially flagged by the laboratory as "E" in the samples are to be derived from the dilution analyses.

Several samples exhibited a matrix effect on recoveries of internal standards, indicating a potential for inadequate recovery or inaccurate quantitative values of target analytes:

Due to elevated response for internal standard d10-phenanthrene in the undiluted analysis of SB6-18-20, detected results for the two associated analytes used from that analysis are qualified as estimated.

The response for internal standard d12-perylene was below the 50% limit in the analysis of SB8-0-2, and results for the six associated analytes are qualified as estimated ("UJ" or "J") for that sample.

The dilution analyses for SB8-5-7 and SB4-12-14 should be used due to outlying multiple internal standard responses in the undiluted analyses of these samples.

Matrix spikes were performed on SB2-10-12 and SB8-10-12, and show acceptable recoveries and duplicate correlations. The set performed on QC-400 (should have been the field duplicate of SB5-16-18) shows several recoveries and duplicate correlations outside the recommended limit when incorporating the parent sample results into the calculation. No qualification is made.

Surrogate standard responses are acceptable. Holding times and instrument tunes meet requirements. Blanks show no contamination.

Initial and continuing calibration standard responses were acceptable, with the following exceptions, results for which are qualified as estimated in the following:

Indeno(1,2,3-cd)pyrene and benzo(g,h,i)perylene used from dilution analyses in S5659.

Detections of indeno(1,2,3-cd)pyrene, dibenz(a,h)anthracene, and benzo(g,h,i)perylene in all samples reported in SDG S5662, and naphthalene hits in three of those samples.

It is noted that at least one of the continuing calibration standards was processed at an inappropriately high concentration, making a less rigorous evaluation.

TAL Metals by 6010B/7470/7471

Matrix spike/duplicate evaluations were performed on soil samples SB6-18-20 and QC400, and on aqueous sample MW-4. Recoveries and correlations are within guidelines, with the exception of the recoveries of iron in MW-4 (74% and 69%). Results for iron in the aqueous samples are therefore qualified as estimated.

The ICP serial dilution of soil sample SB6-18-20 shows acceptable correlations. That for SB5-16-18 shows outliers for calcium and potassium (both 12%D); these should have been flagged as "E" by the laboratory. Results for those elements in sample SB5-16-18 are qualified as estimated.

The serial dilution for aqueous samples MW-4 shows an outlier for potassium (29%D); this should have been flagged as "E" by the laboratory. Results for that element in the aqueous sample are qualified as estimated.

Wet Chemistry Parameters-Cyanide and TOC

Review was conducted for method compliance, transcription, calculations, standard and blank acceptability, accuracy and precision, etc., as applicable to each procedure. All were found acceptable unless noted specifically within this text.

Laboratory duplicate evaluation of cyanide in SB2-10-12 and QC400 was acceptable. The recovery of cyanide was elevated in matrix spike of QC400 (188%). Therefore, results for cyanide in the soil samples is qualified as estimated.

The matrix spikes and duplicates of TOC in QC400 show good recoveries and correlations.

Cyanide results carry too many significant figures.

Please do not hesitate to contact me if you have comments or questions regarding this report.

Very truly yours,

Judy Harry

CHEMTECH

CASE NARRATIVE

Lightship Engineering (Env.&Land Use Consultants)
Project Name: National Grid Schenectady Site
Project # N/A
Chemtech Project # S5626

A. Number of Samples and Date of Receipt:
5 Solid samples were received on 11/8/04.
2 Water samples were received on 11/8/04.

B. Parameters
According to the Chain of Custody document, the following analyses were requested: BTEX by GC/MS, Cyanide, Mercury, Polynuclear Aromatic Hydrocarbons (PAH), TAL ICP Metals, TAL Metals, Total Organic Carbon, and VOCMS Group1. This data package contains results for BTEX by GC/MS and VOCMS Group1.

C. Analytical Techniques:
The analysis performed on instrument MSVOA I were done using GC column RTXVMS, which is 20 meters, 0.18 ID, 1.0 df, Restek Cat. #49914. The Trap was supplied by OI Analytical, OI #10 Trap , OI Eclipse 4660 Concentrator.The analysis performed on instrument MSVOA K were done using GC column DB624, which is 20 meters, 0.18 ID, 1.0 df, J&W Cat. #1211324. The Trap was supplied by OI Analytical, OI #10 Trap , OI 4560 Concentrator.

D. QA/ QC Samples:
The Holding Times were met for all analysis.
The Surrogate recoveries met the acceptable criteria.
The Internal Standards Areas met the acceptable requirements.
The Retention Times were acceptable for all samples.
The MS recoveries met the requirements for all compounds.
The MSD recoveries met the acceptable requirements except for Toluene.
The RPD recoveries met criteria except for Benzene, Trichloroethene, Toluene and Chlorobenzene.
The Blank Spike met requirements for all samples.
The Blank analysis did not indicate the presence of lab contamination.
The Calibration met the requirements.
The Tuning criteria met requirements.

CHEMTECH

CASE NARRATIVE

Lightship Engineering (Env.&Land Use Consultants)
Project Name: National Grid Schenectady Site
Project # 518.4.1
Chemtech Project # S5626

A. Number of Samples and Date of Receipt:
5 Solid samples were received on 11/8/04.
2 Water samples were received on 11/8/04.

B. Parameters
According to the Chain of Custody document, the following analyses were requested: BTEX by GC/MS, Cyanide, Mercury, Polynuclear Aromatic Hydrocarbons (PAH), TAL ICP Metals, TAL Metals, Total Organic Carbon, and VOCMS Group1. This data package contains results for Polynuclear Aromatic Hydrocarbons (PAH).

C. Analytical Techniques:
The samples were analyzed on instrument BNA A using GC Column RTX-5 SILMS which is 30 meters, 0.32 mm ID, 0.5 um df, Catalog # 12739.

D. QA/ QC Samples:
The Holding Times were met for all analysis.
The Surrogate recoveries met the acceptable criteria.
The Internal Standards Areas met the acceptable requirements.
The Retention Times were acceptable for all samples.
The MS recoveries met the requirements for all compounds.
The MSD recoveries met the acceptable requirements.
The RPD recoveries met criteria.
The Blank Spike met requirements for all samples.
The Blank analysis did not indicate the presence of lab contamination.
The Calibration met the requirements.
The Tuning criteria met requirements.

E. Additional Comments:

Samples LE-TP1-8-1 were diluted due to high concentrations.

I certify that the data package is in compliance with the terms and conditions of the contract, both technically and for completeness, for other than the conditions detailed above. The laboratory manager or his designee, as verified by the following signature has authorized release of the data contained in this hard copy data package.

B. Parameters:
According to the Chain of Custody document, the following analyses were requested: BTEX by GC/MS, Cyanide, Mercury, Polynuclear Aromatic Hydrocarbons (PAH), TAL ICP Metals, TAL Metals, Total Organic Carbon, and VOCMS Group1. This data package contains results for Mercury and TAL ICP Metals.

C. Analytical Techniques:
The analysis of Mercury was based on method 7470 and TAL ICP Metals was based on method 6010.

D. QA/ QC Samples:
The Holding Times were met for all analysis.
The Lab Control Sample met requirements for all samples.
The Duplicate analysis met criteria for all samples.
The Matrix Spike analysis met criteria for all samples.
The Matrix Spike Duplicate analysis met criteria for all samples.
The Blank analysis did not indicate the presence of lab contamination.
The Calibration met the requirements.
The Serial Dilution met the acceptable requirements except for Potassium and Sodium.

I certify that the data package is in compliance with the terms and conditions of the contract, both technically and for completeness, for other than the conditions detailed above. CHEMTECH

CASE NARRATIVE

Lightship Engineering (Env.&Land Use Consultants)
Project Name: National Grid Schenectady Site
Project # N/A
Chemtech Project # S5659

A. Number of Samples and Date of Receipt:
9 Solid samples were received on 11/10/04.
1 Water sample was received on 11/10/04.

B. Parameters
According to the Chain of Custody document, the following analyses were requested: BTEX by GC/MS, Cyanide, Mercury, Polynuclear Aromatic Hydrocarbons (PAH), TAL ICP Metals, TAL Metals, Total Organic Carbon, and VOCMS Group1. This data package contains results for VOCMS Group1.

C. Analytical Techniques:
The analysis performed on instrument MSVOA I were done using GC column RTXVMS, which is 20 meters, 0.18 ID, 1.0 df, Restek Cat. #49914. The Trap was supplied by OI Analytical, OI #10 Trap , OI Eclipse 4660 Concentrator. The analysis performed on instrument MSVOA K were done using GC column DB624, which is 20 meters, 0.18 ID, 1.0 df, J&W Cat. #1211324. The Trap was supplied by OI Analytical, OI #10 Trap , OI 4560 Concentrator.

D. QA/ QC Samples:
The Holding Times were met for all analysis.
The Surrogate recoveries met the acceptable criteria except for LE-SB6-16-18 and LE-SB6-18-20.
The Internal Standards Areas met the acceptable requirements except for LE-QA-QC-602-603MSD.
The Retention Times were acceptable for all samples.
The MS recoveries met the requirements for all compounds.
The MSD recoveries met the acceptable requirements.
The RPD recoveries met criteria except for Trichloroethene and Chlorobenzene.
The Blank Spike met requirements for all samples.
The Blank analysis indicated presence of Methylene Chloride with VK111705.Ddue to possible lab contamination.
The Calibration met the requirements.
The Tuning criteria met requirements.

E. Additional Comments:
Sample LE-SB8-5- was diluted due to high concentrations.
Sample # S5659-06 was diluted with MeoH because of bad matrix.

I certify that the data package is in compliance with the terms and conditions of the contract, both technically and for completeness, for other than the conditions detailed above. SURROGATE	PERCENT RECOVERY	RECOVERY LIMITS
2,4,6-Tribromophenol	NC,DIL	(21 - 144)
2-Fluorobiphenyl	NC,DIL	(26 - 128)
2-Fluorophenol	NC,DIL	(34 - 115)
Nitrobenzene-d5	NC,DIL	(30 - 118)
Phenol-d5	NC,DIL	(35 - 117)
Terphenyl-d14	NC,DIL	(40 - 115)

NOTE(S):

NC The recovery and/or RPD were not calculated.

DIL The concentration is estimated or not reported due to dilution or the presence of interfering analytes.

Results and reporting limits have been adjusted for dry weight.

J Estimated result. Result is less than RL.

Results were transposed over original, 20-fold, results for analytes that exceeded the cal range in the original analysis.

Data Validators

SUBJECT: National Grid – Schenectady MGP
October-November 2006 Air, Soil Gas, Soil, and Groundwater Sampling Events

Data Validation:

Air Toxics LTD. Work Order No.: 0611379

Severn Trent Laboratories, Inc. Lot Nos.: C6K030390
C6K060148
C6K080197
C6K100374
C6K300215

Overview

Soil, groundwater, ambient air, and soil gas samples were collected at the Schenectady MGP site on October 31 – November 29, 2006. The table below lists the samples collected for this project.

Schenectady MGP Sample Submittals
October – November 2006

Laboratory SDG	Client Sample ID	Laboratory Sample ID	Matrix	Date Collected
C6K030390	TP7S (7.5) (HORZ 0-10)	C6K030390-001	Soil	10/31/2006
	TP5 (7) (HORZ 15)	C6K030390-002	Soil	11/1/2006

[1]: Sample SB220 (18-20) is the field duplicate of sample SB22 (18-20).
[2]: Sample SB130 (37-39) is the field duplicate of sample SB13 (37-39).
[3]: Sample SV02 DUP is the field duplicate of sample SV02.
[4]: Sample MW080 is the field duplicate of sample MW08.
[5]: The trip blank sample required GC/MS volatiles analysis only.

Air Toxics, LTD., 180 Blue Ravine Road, Suite B, Folsom, CA 95630 analyzed the ambient air and soil gas samples for Volatile Organic Compounds (VOCs) using USEPA Compendium Method TO-15.

The groundwater and soil samples were analyzed by Severn Trent Laboratories, Inc., 301 Alpha Drive, Pittsburgh, PA 15238 using the following methodology.

- Volatile Organic Compounds by USEPA SW-846 Method 8260B
- Semivolatile Organic Compounds by USEPA SW-846 Method 8270C
- Trace Metals by USEPA SW-846 Methods 6010B, 7470A, and 7471A
- Total Cyanide by USEPA SW-846 Method 9012A

- Percent Solids for Dry Weight Corrections by MCAWW Method 160.3 mod.

Summary

Data quality for the organic analyses was evaluated by reviewing the following parameters: holding times, GC/MS tuning and performance, internal standards, initial and continuing calibrations, surrogate recoveries, laboratory control standards (LCSs), matrix spikes (MSs), matrix spike duplicates (MSDs), laboratory blanks, laboratory duplicates, field duplicates, compound identification, and compound quantitation.

Inorganic data quality was evaluated by reviewing the following parameters: holding times, initial calibrations, continuing calibration verification standard recoveries, contract required detection limit standard recoveries, LCSs, MSs, MSDs, post-digestion spikes (PDSs), ICP interference check sample recoveries, ICP serial dilution results, laboratory and field blanks, and compound quantitation..

The data summary reports attached as Appendix A were revised to include the data validation qualifiers. All USEPA-defined data qualifiers and changes made by the data evaluators were added in red ink. A glossary of data qualifier definitions is included as Attachment 1.

All samples were analyzed successfully and the results are useable with some qualification. Completeness of 100% was achieved for this data set.

Each specific issue of concern with respect to data usability is addressed below. Support documentation for data qualifications was included in Appendix B. Specific page references were provided in each item header for the supporting documentation.

Volatile Organic Compounds

C6K030390

a. Blank Contamination (pp. 45-47): Methylene chloride was detected in the low-level soil (LLS) method blank associated with preparation batch 6310052 at an estimated concentration of 3.5 µg/Kg. Methylene chloride is a common laboratory solvent. **The methylene chloride results for associated samples TP7S (7.5) (HORZ 0-10), TP5 (7) (HORZ 15), SB-13 (0-11), SB-18 (10-11), SB-18 (18.5-20), SB-21 (9-10), SB-24 (13.5-14.5), SB-24 (20-21), SB-19 (23-24.5), SB-20 (38.5-40), and SB-20 (16.5-18) were estimated below the reporting limits. Each result was raised to the reporting limit and qualified "U," as undetected, because of laboratory contamination.**

b. Calibrations (pp. 1170-1173, 1175, 1216-1217, 1222-1224): The 09/21/06 LLS initial calibration relative standard deviation (RSD) for acetone was greater than the 30% specification limit on instrument HP3. In addition, the continuing calibration percent difference (%D) for acetone was less than the lower specification limit of -25% on instrument HP3 at 05:03 hrs. **The positive and nondetect acetone results for samples TP7S (7.5) (HORZ 0-10), TP5 (7) (HORZ 15), SB-13 (0-11), SB-18 (10-11), SB-18 (18.5-20), SB-21 (9-10), SB-24 (13.5-14.5), SB-24 (20-21), SB-19 (23-24.5), SB-20 (38.5-40), and SB-20 (16.5-18) were qualified, "J" and "UJ," respectively, because of low instrument bias.**

   The 11/08/06 medium-level soil (MLS) continuing calibration percent differences (%Ds) for chloroethane and acetone were greater than the upper specification limit of +25% on instrument HP3 at 05:02 hrs. Chloroethane and acetone were not detected in associated sample SB-20 (30-32.5). No data qualifications were required in response to the high instrument bias.

C6K060148

a. Blank Contamination (pp. 1165, 1171, 1177): Methylene chloride was detected in all method blanks at estimated concentrations of 2.1, 3.2, and 2.8 µg/Kg. Methylene chloride is a common laboratory solvent. **The methylene chloride results for all samples were estimated below the reporting limits. Each result was raised to the reporting limit and qualified "U," as undetected, because of laboratory contamination.**

b. Calibrations (pp. 1088, 1134-1135, 1140-1141, 1146): The 09/21/06 initial calibration RSDs for acetone and methyl acetate were greater than the 30% specification limit on instrument HP3 affecting all samples. In addition, the continuing calibration %Ds for dichlorodifluoromethane and methyl acetate were less than the lower specification limit of -25% and the %D for acetone was greater than 25% on instrument HP3 at 05:01 hrs on 11/09/06 affecting sample SB23 (10-13). The continuing calibration %D for methyl acetate was less than the lower specification limit of -25% and the %D for acetone was greater than +25% on instrument HP3 at 05:23 hrs on 11/10/06 affecting samples SB23 (6-7) and SB25 (18-19.5). The continuing calibration %D for acetone was greater than 25% on instrument HP3 at 22:03 hrs on 11/12/06 affecting samples SB22 (18-20), SB220 (18-20), and SB15 (34-35). **All positive acetone results were qualified, "J," because of high instrument bias. All associated methyl acetate and dichlorodifluoromethane results were nondetect and were qualified as estimated, "UJ," because of low instrument bias.**

c. Field Duplicates: Samples SB22 (18-20) and SB220 (18-20) were the primary and field duplicate soil samples collected for this sampling event. *USEPA National Functional Guidelines* do not require qualification based on field duplicate data alone. However, the positive results are presented below to assess field sampling/laboratory precision and sample homogeneity. **Several relative percent differences (RPDs) were greater than the maximum advisory limit of 50% for soils. The primary and field duplicate results were qualified "J" or "UJ," as estimates, because of field sampling/laboratory imprecision and/or sample heterogeneity.**

Field Duplicate Results Comparison
Schenectady MGP 2006 Sampling Event

Analyte	SB22 (18-20)	Units	SB220 (18-20)	Units	%RPD	Qualifiers
Acetone	52 J^2	µg/Kg	110 J^2	µg/Kg	72	**J/J**
Benzene	83	µg/Kg	71	µg/Kg	16	
2-Butanone	23 J	µg/Kg	41 J	µg/Kg	56	**J/J**
Ethylbenzene	150	µg/Kg	210	µg/Kg	33	
Isopropylbenzene	23 J	µg/Kg	13 J	µg/Kg	56	**J/J**
Xylenes (total)	230	µg/Kg	260	µg/Kg	12	
Toluene	7.3 J^1	µg/Kg	6.3 J^1	µg/Kg	15	

J/J: The results were qualified as estimates because the RPD exceeded the maximum advisory limit of 50% or the difference between the primary and field duplicate results was greater than twice the reporting limit for results less than five times the reporting limits. Field sampling/laboratory imprecision and/or sample heterogeneity was indicated.
J^1: The result was estimated between the method detection limit and the reporting limit.
J^2: Result was qualified as an estimate due to continuing calibration nonconformance.

C6K080197

a. Blank Contamination (p. 1200): Methylene chloride was detected in the method blank associated with preparation batch 6316062 at an estimated concentration of 2.8 µg/Kg. Methylene chloride is a common laboratory solvent. **The methylene chloride results for associated samples**

SB16 (49-50), SB14 (38-40), SB11 (20-22), SB11 (38-40), SB10 (10.5-11.5), and SB10 (28-30) were estimated below the reporting limits. Each result was raised to the reporting limit and qualified "U," as undetected, because of laboratory contamination.

b. Calibrations (pp. 1128, 1174, 1180): The 09/21/06 initial calibration RSDs for acetone and methyl acetate were greater than the 30% specification limit on instrument HP3 affecting all samples. In addition, the continuing calibration %D for acetone was greater than 25% on instrument HP3 at 22:03 hrs on 11/12/06 affecting samples SB16 (49-50), SB14 (38-40), SB11 (20-22), SB11 (38-40), SB10 (10.5-11.5), and SB10 (28-30). All methyl acetate and acetone results in the affected samples were nondetect. Therefore, validation action was not required.

The 11/14/06 continuing calibration %Ds for trichlorofluoromethane, methylene chloride, and 2-butanone were less than the lower specification limit of -25% on instrument HP3 at 08:37 hrs affecting samples SB16 (35-37) and SB14 (15-17.5). **All associated trichlorofluoromethane, methylene chloride, and 2-butanone results were nondetect and were qualified as estimated, "UJ," because of low instrument bias.**

c. Dilutions/Surrogate Recoveries (p. 1004): Due to high analyte concentrations, samples SB16 (35-37) and SB14 (15-17.5) were analyzed as medium level soils. Additionally, sample SB14 (15-17.5) was analyzed at a 10-fold dilution. All surrogates were diluted out of the 10-fold dilution of sample SB14 (15-17.5). All other quality control check results were acceptable. Validation action was not necessary.

C6K100374

a. Blank Contamination (pp. 1123, 1129): Methylene chloride was detected in the method blanks at estimated concentrations of 2.8 and 2.3 μg/Kg. Methylene chloride is a common laboratory solvent. **The methylene chloride results for all samples were estimated below the reporting limits. Each result was raised to the reporting limit and qualified "U," as undetected, because of laboratory contamination.**

b. Calibrations (pp. 1055, 1101, 1107): The 09/21/06 initial calibration RSDs for acetone and methyl acetate were greater than the 30% specification limit on instrument HP3 affecting all samples. In addition, the continuing calibration %D for acetone was greater than the upper specification limit of 25% on instrument HP3 at 22:03 hrs on 11/12/06 affecting samples SB12 (25-26) and SB13 (37-39). The continuing calibration %Ds for chloroethane and acetone were greater than 25% on instrument HP3 at 22:37 hrs on 11/13/06 affecting samples SB12 (38-400 and SB130 (37-39). All methyl acetate, acetone, and chloroethane results were nondetect. Therefore, validation action was not required.

c. Field Duplicates: Samples SB13 (37-39) and SB130 (37-39) were the primary and field duplicate soil samples collected for this sampling event. *USEPA National Functional Guidelines* do not require qualification based on field duplicate data alone. However, the positive results are presented below to assess field sampling/laboratory precision and sample homogeneity. **Several RPDs were greater than the maximum advisory limit of 50% for soils. The primary and field duplicate results were qualified "J" or "UJ," as estimates, because of field sampling/laboratory imprecision and/or sample heterogeneity.**

Field Duplicate Results Comparison
Schenectady MGP 2006 Sampling Event

Analyte	SB13 (37-39)	Units	SB130 (37-39)	Units	%RPD	Qualifiers
Benzene	7.3 J	µg/Kg	3.1 UJ	µg/Kg	NC	**J/UJ**
Ethylbenzene	11 J	µg/Kg	1.4 J[1]	µg/Kg	155	**J/J**
Xylenes (total)	28 J	µg/Kg	4.2 J[1]	µg/Kg	148	**J/J**
Toluene	10 J	µg/Kg	1.2 J[1]	µg/Kg	157	**J/J**

NC: The RPD could not be calculated.
J/UJ: The results are qualified as estimates because the RPD exceeded the maximum advisory limit of 50% or the difference between the primary and field duplicate results was greater than twice the reporting limit for results less than five times the reporting limits. Field sampling/laboratory imprecision and/or sample heterogeneity were indicated.
J[1]: The result was estimated between the method detection limit and the reporting limit.

0611379 (Air and Soil Gas Data)

a. Chain-of-Custody (pp. 600-601, 183): The canister ID number for sample 0611379-04A (SV03) was recorded incorrectly on the quantitation report as "99." ATL recorded the correct canister number in the analysis log as "33987." All other canister ID numbers were recorded and transcribed correctly. No validation action was required.

b. Laboratory Control Samples (pp. 516-519, 633): The percent recoveries (%Rs) for cis-1,3-dichloropropene and 1,2,4-trimethylbenzene were less than the lower quality control limit of 70% for LCS 0611379-09A. All samples were affected. All cis-1,3-dichloropropene results were nondetect and were qualified "UJ" and positive and nondetect results for 1,2,4-trimethylbenzene were qualified "J" and "UJ," respectively, as estimates, because of low method bias.

   The %R for naphthalene was greater than the upper quality control limit of 130% for LCS 0611379-09A. All samples were affected. The positive naphthalene result for sample SV02 was qualified "J," as an estimated concentration, because of high method bias.

c. Laboratory Replicate Precision (pp.51-53, 300-301): Sample SV01 was analyzed in duplicate to assess analytical precision. All calculated RPDs were within the maximum quality control limit of 20%, except for methylene chloride. Based on professional judgment, all methylene chloride positive and nondetect methylene chloride results were qualified "J" and "UJ," respectively, as estimates, because of method imprecision. Methylene chloride is a common laboratory solvent. Methylene chloride contamination may have affected the laboratory's ability to quantitate this compound.

d. Field Duplicates: Samples SV02 and SV02 Dup were the primary and field duplicate soil gas samples collected for this sampling event. *USEPA National Functional Guidelines* do not require qualification based on field duplicate data alone. However, the positive results are presented below to assess field sampling/laboratory precision and sample homogeneity. **Several RPDs were greater than the maximum advisory limit of 25%. The primary and field duplicate results were qualified "J" or "UJ," as estimates, because of field sampling/laboratory imprecision and/or sample heterogeneity.**

NC: The RPD could not be calculated.
±RL: The difference between the primary and field duplicate results was less than twice the reporting limit for results less than five times the reporting limits. No data qualifications were required.
J/UJ: The results are qualified as estimates because the RPD exceeded the maximum advisory limit of 25% or the difference between the primary and field duplicate results was greater than twice the reporting limit for results less than five times the reporting limits. Field sampling/laboratory imprecision and/or sample heterogeneity was indicated.
J^1: The result was estimated between the method detection limit and the reporting limit.

C6K300215 (Groundwater Data)

a. Blank Contamination (pp. 39-40): Chloroform was detected in the equipment blank collected on 11/29/06 at an estimated concentration of 0.36 µg/L. The positive chloroform result for associated sample MW10 was greater than five times the blank level. **Based on professional judgment, the positive chloroform result for sample MW10 was qualified "J," as an estimated concentration, biased high, because of laboratory contamination.**

b. Dilutions/Surrogate Recoveries: Samples MW08 and MW080 required analysis at a secondary dilution to bring the analyte concentrations into the calibration range. The surrogate recoveries were acceptable. No data qualifications were required. The dilutions elevated the reporting limits for nondetect results.

c. Field Duplicates: Samples MW08 and MW080 were the primary and field duplicate groundwater samples collected for this sampling event. *USEPA National Functional Guidelines* do not require qualification based on field duplicate data alone. However, the positive results are presented

below to assess field sampling/laboratory precision and sample homogeneity. The RPDs were less than the maximum advisory limit of 30% for aqueous samples. No data qualifications were required.

Field Duplicate Results Comparison
Schenectady MGP 2006 Sampling Event

NC: The RPD could not be calculated.
±RL: The difference between the primary and field duplicate results was less than twice the reporting limit for results less than five times the reporting limits. No data qualifications were required.
J[1]: The result was estimated between the method detection limit and the reporting limit.

Semivolatile Organic Compounds

C6K030390

Dilutions/Surrogate Recoveries (p. 93): Samples TP7S (7.5) (HORZ 0-10) and TP5 (7) (HORZ 15) required analysis at a 40-fold dilution to bring the analyte concentrations into the calibration range. The dilution was sufficiently high to dilute out the surrogates. Surrogate recoveries could not be used to evaluate method accuracy. The surrogate recoveries were acceptable for the method blank and LCS samples. No data qualifications were necessary based on professional judgment. The dilution elevated the reporting limits for nondetect results.

Sample SB-20 (30-32.5) required analysis at an initial three-fold and subsequent 15-fold dilution to bring the analyte concentrations into the calibration range and minimize matrix interference. The 15-fold dilution was sufficiently high to dilute out the surrogates. Surrogate recoveries could not be used to evaluate method accuracy. The surrogate recoveries were acceptable for the three-fold dilution analysis samples. No data qualifications were necessary based on professional judgment. The three-fold dilution elevated the reporting limits for nondetect results.

C6K060148

a. Exceedances / Dilutions (pp. Form 1s, 50-75): Samples SB23 (10-13) and SB23 (6-7) were analyzed at 10-fold dilutions due to high analyte concentrations.

   Sample SB25 (18-19.5) was analyzed at an initial 10-fold dilution due to high analyte concentrations. Naphthalene exceeded the instrument calibration range in the 10-fold dilution. The sample was analyzed at a secondary 20-fold dilution. The naphthalene result from the 20-fold dilution was transposed over the original result. All other results were reported from the original, 10-fold analysis. The 10-fold dilution elevated the reporting limits for nondetect results.

   Samples SB22 (18-20) and SB220 (18-20) were analyzed at initial five-fold dilutions due to high analyte concentrations. Naphthalene exceeded the instrument calibration range in the five-fold dilutions. The samples were analyzed at secondary 10-fold dilutions. The naphthalene results from the 10-fold dilutions were transposed over the original results. All other results were reported from the original, five-fold analyses. The five-fold dilution elevated the reporting limits for nondetect results.

b. Calibrations (pp. 2191, 2193, 2235, 2282, 2285): The 11/13/06 initial calibration RSD for benzaldehyde was greater than the 30% specification limit on instrument 732 affecting all original analyses. In addition, the continuing calibration %D for 2,2'-oxybis(1-chloropropane) was less than the lower specification limit of -25% and the %Ds for benzo(g,h,i)perylene and dibenz(a,h)anthracene were greater than 25% on instrument 732 at 10:47 hrs on 11/16/06 affecting all original analyses. All benzaldehyde results were nondetect. Therefore, validation action was not required for benzaldehyde. **All positive benzo(g,h,i)perylene and dibenz(a,h)anthracene results were qualified, "J," because of high instrument bias. All 2,2'-oxybis(1-chloropropane) results were nondetect and were qualified as estimated, "UJ," because of low instrument bias.**

The 11/20/06 initial calibration RSDs for benzaldehyde and 2,4-dinitrophenol were greater than the 30% specification limit on instrument 732 affecting all secondary dilutions. However, benzaldehyde and 2,4-dinitrophenol were not reported from the secondary dilutions. Therefore, validation action was not necessary.

c. Surrogates (p. 2003): All surrogates were diluted out of the secondary 20-fold dilution of sample SB25 (18-19.5). Surrogate recoveries were acceptable in the original analysis. Validation action was not necessary.

d. Field Duplicates: Samples SB22 (18-20) and SB220 (18-20) were the primary and field duplicate soil samples collected for this sampling event. *USEPA National Functional Guidelines* do not require qualification based on field duplicate data alone. However, the positive results are presented below to assess field sampling/laboratory precision and sample homogeneity. **Several RPDs were greater than the maximum advisory limit of 50% for soils. The primary and field duplicate results were qualified "J," as estimates, because of field sampling/laboratory imprecision and/or sample heterogeneity.**

Field Duplicate Results Comparison
Schenectady MGP 2006 Sampling Event

Analyte	SB22 (18-20)	Units	SB220 (18-20)	Units	%RPD	Qualifiers

Pyrene	95 J[1]	µg/Kg	3300 U	µg/Kg	NC	

NC: The RPD could not be calculated.
J/J: The results are qualified as estimates because the RPD exceeded the maximum advisory limit of 50% or the difference between the primary and field duplicate results was greater than twice the reporting limit for results less than five times the reporting limits. Field sampling/laboratory imprecision and/or sample heterogeneity was indicated.
J[1]: The result was estimated between the method detection limit and the reporting limit.

C6K080197

a. Exceedances / Dilutions (pp. Form 1s, 45-50, 57-62): Sample SB16 (35-37) was analyzed at an initial 20-fold dilution due to high analyte concentrations. Anthracene, benzo(a)anthracene, chrysene, fluoranthene, fluorene, 2-methylnaphthalene, naphthalene, phenanthrene, and pyrene exceeded the instrument calibration range in the 20-fold dilution. The sample was analyzed at a

secondary 500-fold dilution. The results for the aforementioned analytes from the 500-fold dilution were transposed over the original results. All other results were reported from the original, 20-fold analysis. The 20-fold dilution elevated the reporting limits for nondetect results.

Sample SB14 (15-17.5) was analyzed at an initial 20-fold dilution due to high analyte concentrations. Acenaphthylene, anthracene, fluoranthene, fluorene, 2-methylnaphthalene, naphthalene, phenanthrene, and pyrene exceeded the instrument calibration range in the 20-fold dilution. The sample was analyzed at a secondary 500-fold dilution. The results for the aforementioned analytes from the 500-fold dilution were transposed over the original results. All other results were reported from the original, 20-fold analysis. The 20-fold dilution elevated the reporting limits for nondetect results.

b. Calibrations (pp. 2223, 2264-2265, 2271, 2273): The 11/13/06 initial calibration RSD for benzaldehyde was greater than the 30% specification limit on instrument 732 affecting all samples. In addition, the continuing calibration %Ds for indeno(1,2,3-cd)pyrene and dibenz(a,h)anthracene were less than the lower specification limit of -25% and the %D for hexachlorocyclopentadiene was greater than 25% on instrument 732 at 09:19 hrs on 11/15/06 affecting samples SB16 (35-37), SB16 (49-50), SB14 (38-40), SB14 (15-17.5), and SB11 (20-22). The continuing calibration %D for 2,2'-oxybis(1-chloropropane) was less than the lower specification limit of -25% and the %Ds for benzo(g,h,i)perylene and dibenz(a,h)anthracene were greater than 25% on instrument 732 at 10:47 hrs on 11/16/06 affecting the secondary dilution of samples SB16 (35-37) and SB16 (49-50), and samples SB11 (38-40), SB10 (10.5-11.5), and SB10 (28-30). All benzaldehyde and hexyachlorocyclopentadiene results were nondetect. Therefore, validation action was not required for benzaldehyde and hexachlorycyclopentadiene. **Positive dibenzo(g,h,i)perylene and dibenz(a,h)anthracene results in samples SB11 (38-40), SB10 (10.5-11.5), and SB10 (28-30) were qualified, "J," because of high instrument bias. All nondetect 2,2'-oxybis(1-chloropropane) results in samples SB11 (38-40), SB10 (10.5-11.5), and SB10 (28-30) were qualified, "UJ," because of low instrument bias. All positive and nondetect indeno(1,2,3-cd)pyrene, and dibenz(a,h)anthracene results in the samples SB16 (35-37), SB16 (49-50), SB14 (38-40), SB14 (15-17.5), and SB11 (20-22) were qualified as estimated, "J" or "UJ," because of low instrument bias.**

c. Surrogates (p. 2003): All surrogates were diluted out of 20-fold and 500-fold dilutions of samples SB16 (35-37) and SB14 (15-175). All other quality control check results were acceptable. Validation action was not necessary.

C6K100374

a. Calibrations (pp. 3062, 3104-3105): The 11/21/06 initial calibration RSD for benzaldehyde was greater than the 30% specification limit on instrument 732 affecting all original analyses. In addition, the continuing calibration %Ds for benzaldehyde, 2,4-dinitrophenol, and 4,6-dinitro-2-methylphenol were less than the lower specification limit of -25% on instrument 732 at 12:17 hrs on 11/28/06 affecting all samples. **All benzaldehyde, 2,4-dinitrophenol, and 4,6-dinitro-2-methylphenol results were nondetect and were qualified as estimated, "UJ," because of low instrument bias.**

b. Field Duplicates: Samples SB13 (37-39) and SB130 (37-39) were the primary and field duplicate soil samples collected for this sampling event. *USEPA National Functional Guidelines* do not require qualification based on field duplicate data alone. However, the positive results are presented below to assess field sampling/laboratory precision and sample homogeneity **Several RPDs were greater than the maximum advisory limit of 50% for soils. The primary and field duplicate results were qualified "J," as estimates, because of field sampling/laboratory imprecision and/or sample heterogeneity.**

NC: The RPD could not be calculated.
J/UJ: The results are qualified as estimates because the RPD exceeded the maximum advisory limit of 25% or the difference between the primary and field duplicate results was greater than twice the reporting limit for results less than five times the reporting limits. Field sampling/laboratory imprecision and/or sample heterogeneity was indicated.
J[1]: The result was estimated between the method detection limit and the reporting limit.

C6K300215

a. Blank Contamination (pp. 94-96): Bis(2-ethylhexyl)phthalate was detected in the equipment blank collected on 11/29/06 at an estimated concentration of 1.6 µg/L. The positive bis(2-ethylhexyl)phthalate results for associated samples MW06, MW02 (04), MW03 (04), and MW09 were less than ten times the blank level. **The positive bis(2-ethylhexyl)phthalate results for samples MW06, MW02 (04), MW03 (04), and MW09 were qualified "U," as undetected, because of laboratory contamination. Based on professional judgment, the positive bis(2-ethylhexyl)phthalate result for sample MW07 was qualified "J," as an estimated concentration, biased high because of laboratory contamination.**

b. Dilutions/Surrogate Recoveries (p. 97): Samples MW08 and MW080 required analysis at a secondary dilution to bring the analyte concentrations into the calibration range. The dilutions were sufficiently high to dilute out the surrogates. Surrogate recoveries could not be used to evaluate method accuracy. The surrogate recoveries were acceptable for the method blank and LCS samples. No data qualifications were necessary based on professional judgment. The dilution elevated the reporting limits for nondetect results.

c. Field Duplicates: Samples MW08 and MW080 were the primary and field duplicate groundwater samples collected for this sampling event. *USEPA National Functional Guidelines* do not require qualification based on field duplicate data alone. However, the positive results are presented below to assess field sampling/laboratory precision and sample homogeneity. The RPDs were less than the maximum advisory limit of 30% for aqueous samples. No data qualifications were required.

Field Duplicate Results Comparison
Schenectady MGP 2006 Sampling Event

Analyte	MW08	Units	MW080	Units	RPD (%)	Qualifier
2,4-Dimethylphenol	24000	µg/L	24000	µg/L	0	
2-Methylphenol	29000	µg/L	29000	µg/L	0	
4-Methylphenol	73000	µg/L	73000	µg/L	0	
Naphthalene	7900	µg/L	7900	µg/L	0	
Phenol	42000	µg/L	42000	µg/L	0	

Trace Metals

C6K030390

a. Blank Contamination (pp. 142-144, 3071, 3073): Antimony, copper, potassium, thallium and zinc were detected in the method blank and/or the initial and continuing calibration blanks at concentrations estimated below the reporting limits. All samples were affected. All affected antimony and thallium results were nondetect. No data qualifications were required. All affected copper and zinc results were greater than the reporting limits. No data qualifications were required. **Associated potassium results estimated below the reporting limit (RL) were qualified "U," as undetected, because of laboratory contamination. The "J" qualifiers appended to the positive aluminum, copper, and potassium results that were greater than the reporting limits were removed by the data validator as unnecessary.**

The method blank and/or the initial and continuing calibration blanks for aluminum and manganese were negative. All associated aluminum and manganese results were greater than the reporting limits. The effect on the data was minimal. No data qualifications were required based on professional judgment.

b. ICP Serial Dilution Percent Differences (p. 3078): An ICP serial dilution analysis was performed on sample SB-24 (20-21). The sample result was greater than 50 times the instrument detection limit (IDL) and the %D for the ICP serial dilution was greater than the maximum specification limit of 10% for zinc. All samples were affected. **All zinc results were positive and were qualified "J," as estimated concentrations, because of significant physical or chemical interferences due to sample matrix.**

c. Matrix Spike Recoveries and RPDs (pp. 151-158): MS/MSD analyses were conducted on sample SB-24 (20-21). The aluminum and iron spike added to SB-24 (20-21) MS/MSD were less than 25% of the original sample results. The recoveries and RPDs could not be calculated. The effects of matrix on these analyses could not be assessed. No data qualifications were required.

The SB-24 (20-21) MS/MSD recoveries for antimony and manganese were less than the lower advisory limit of 75% but greater than 30%. The RPDs were acceptable. All samples were affected. **All antimony results were nondetect and were qualified "UJ," as estimates, because of low method bias and/or matrix effects. All manganese results were positive were qualified "J-," as estimated concentrations, because of low bias attributable to matrix effects.**

C6K060148

a. Dilutions (p. 99): Lead was analyzed at a five-fold dilution for sample SB25 (18-19.5) due to the high lead concentration.

b. Blank Contamination (pp. 3021-3022, 3051, 3054-3055): Aluminum, beryllium, copper, potassium, manganese, and zinc were detected in the method blank and/or the initial and continuing calibration blanks at concentrations estimated below the reporting limits. All samples were affected. All aluminum, beryllium, copper, potassium, manganese, and zinc results were greater than the reporting limits. No data qualifications were required. **The "J" qualifiers appended to the positive beryllium, copper, potassium, manganese, and zinc results that were greater than the reporting limits were removed by the data validator as unnecessary.**

   Initial and/or continuing calibration blanks for aluminum and copper were negative. All associated aluminum and copper results were greater than the reporting limits. The effect on the data was minimal. No data qualifications were required based on professional judgment.

c. Reporting Limit Standard Recovery (p. 3048): The reporting limit standard recovery for lead was less than the lower specification limit of 70%. A low instrument bias was indicated. All samples were affected. Validation action was not required for lead results that were greater than two times the reporting limit. **The positive lead result for sample SB15 (34-35) was less than two times the reporting limit and was qualified as estimated, biased low, "J-."**

d. ICP Serial Dilution Percent Differences (p. 3063): An ICP serial dilution analysis was performed on sample SB23 (10-13). The sample results were greater than 50 times the IDL and the %Ds for the ICP serial dilution were greater than the maximum specification limit of 10% for cobalt, nickel and zinc. All samples were affected. **All cobalt, nickel, and zinc results were positive and were qualified "J," as estimated concentrations, because of significant physical or chemical interferences due to sample matrix.**

e. Matrix Spike Recoveries (pp. 3030, 3032-3033, 3038): MS/MSD analyses were conducted on sample SB23 (10-13). The aluminum, iron, manganese, and mercury spike added to SB23 (10-13) MS/MSD were less than 25% of the original sample results. The recoveries and RPDs could not be calculated. The effects of matrix on these analyses could not be assessed. No data qualifications were required.

   The SB23 (10-13) MS and/or MSD recoveries for calcium, lead, antimony, and zinc were less than the lower advisory limit of 75%, but greater than 30%. The RPDs were acceptable. All samples were affected. **The antimony results were nondetect and were qualified "UJ," as estimates, because of low method bias and/or matrix effects. All calcium and lead results were positive were qualified "J-," as estimated concentrations, because of low bias attributable to matrix effects. All zinc results were previously qualified, "J," due to ICP serial dilution nonconformance (see section e. above). No further data qualifications were required for zinc.**

d. Field Duplicates: Samples SB22 (18-20) and SB220 (18-20) were the primary and field duplicate soil gas samples collected for this sampling event. *USEPA National Functional Guidelines* do not require qualification based on field duplicate data alone. However, the positive results are presented below to assess field sampling/laboratory precision and sample homogeneity. All RPDs were within the advisory limit of 50% for soils. No data qualifications were necessary.

Field Duplicate Results Comparison
Schenectady MGP 2006 Sampling Event

Analyte	SB22 (18-20)	Units	SB220 (18-20)	Units	%RPD	Qualifiers

Mercury	0.03 J[1]	mg/kg	0.04 J[1]	mg/kg	29	

J[1]: The result was estimated between the method detection limit and the reporting limit.
J-[2]: The result was qualified due to matrix spike nonconformance.
J[3]: The result was qualified due to ICP serial dilution nonconformance.

C6K080197

a. Blank Contamination (pp. 3027-3028, 3059, 3063): Antimony, aluminum, copper, manganese, potassium, silver, and zinc were detected in the method blank and/or the initial and continuing calibration blanks at concentrations estimated below the reporting limits. All samples were affected. All affected antimony, aluminum, copper, manganese, silver, and zinc results were either nondetect or greater than the reporting limits. No data qualifications were required. **Associated potassium results estimated below the RL were qualified "U," as undetected, because of laboratory contamination. The "J" qualifiers appended to the positive aluminum, copper, and potassium results that were greater than the reporting limits were removed by the data validator as unnecessary.**

   The method blank and/or the initial and continuing calibration blanks for aluminum and manganese were negative. All associated aluminum and manganese results were greater than the reporting limits. The effect on the data was minimal. No data qualifications were required based on professional judgment.

b. ICP Serial Dilution Percent Differences (p. 3066): An ICP serial dilution analysis was performed on sample SB11 (20-22). The sample result was greater than 50 times the IDL and the %D for the ICP serial dilution were greater than the maximum specification limit of 10% for zinc. All samples were affected. **All zinc results were positive and were qualified "J," as estimated concentrations, because of significant physical or chemical interferences due to sample matrix.**

c. Matrix Spike Recoveries (pp. 3044-3045): MS/MSD analyses were conducted on sample SB-11 (20-22). The aluminum, iron, and manganese spikes added to SB-11 (20-22) MS/MSD were less than 25% of the original sample results. The recoveries and RPDs could not be calculated. The effects of matrix on these analyses could not be assessed. No data qualifications were required.

C6K100374

a. Dilutions (p. 84): Cadmium was analyzed at a five-fold dilution for sample SB12 (25-26) due to matrix effects.

b. Blank Contamination (pp. 5015-5016, 5045, 5048-5049): Copper, potassium, antimony, zinc, and silver were detected in the method blank and/or the initial and continuing calibration blanks at concentrations estimated below the reporting limits. All samples were affected. All copper, zinc, and silver results were either nondetect or greater than the reporting limits. No data qualifications were required. **Potassium and antimony results estimated below the RL were qualified "U," as undetected, because of laboratory contamination. The "J" qualifiers appended to the positive copper, potassium, and zinc results that were greater than the reporting limits were removed by the data validator as unnecessary.**

Initial and/or continuing calibration blanks for aluminum and manganese were negative. All associated aluminum and manganese results were greater than the reporting limits. The effect on the data was minimal. No data qualifications were required based on professional judgment.

c. Field Duplicates: Samples SB13 (37-39) and SB130 (37-39) were the primary and field duplicate soil samples collected for this sampling event. *USEPA National Functional Guidelines* do not require qualification based on field duplicate data alone. However, the positive results are presented below to assess field sampling/laboratory precision and sample homogeneity. All RPDs were within the advisory limit of 50% for soils. No data qualifications were required.

Zinc	16.5	mg/kg	16.8	mg/kg	2	

J[1]: The result was estimated between the method detection limit and the reporting limit.

C6K300215

a. Blank Contamination (pp. 140-145, 3064-3065, 3067-3069): Aluminum, calcium, manganese, mercury, potassium selenium, vanadium, and zinc were detected in the equipment blank, method blank and/or the initial and continuing calibration blanks at concentrations estimated below the reporting limits. All samples were affected. All affected calcium and manganese results were greater than the reporting limits. No data qualifications were required. **Associated aluminum, mercury, potassium, selenium, vanadium, and zinc results estimated below the RLs were qualified "U," as undetected, because of contamination. The positive selenium results for samples MW10 and MW03 (04) were qualified "J+," as estimated concentrations, biased high, because of laboratory contamination. The "J" qualifiers appended to the positive aluminum, potassium, and zinc results that were greater than the reporting limits were removed by the data validator as unnecessary.**

   The method blank and/or the initial and continuing calibration blanks for sodium and vanadium were negative. All associated sodium results were greater than the reporting limits. The vanadium results required qualification in response to a contaminated initial calibration blank. The effect on the data was minimal. No further data qualifications were required based on professional judgment.

b. ICP Serial Dilution Percent Differences (p. 3076): An ICP serial dilution analysis was performed on sampleMW03 (04). The sample result was greater than 50 times the IDL and the %D for the ICP serial dilution were greater than the maximum specification limit of 10% for sodium. All samples were affected. **All sodium results were positive and were qualified "J," as estimated concentrations, because of significant physical or chemical interferences due to sample matrix.**

c. Field Duplicates: Samples MW08 and MW080 were the primary and field duplicate groundwater samples collected for this sampling event. *USEPA National Functional Guidelines* do not require qualification based on field duplicate data alone. However, the positive results are presented below to assess field sampling/laboratory precision and sample homogeneity. **The RPD was less than the maximum advisory limit of 30% for zinc. The primary and field duplicate zinc results were qualified "J," as estimated concentrations, because of field sampling/laboratory imprecision and/or sample heterogeneity.**

Field Duplicate Results Comparison
Schenectady MGP 2006 Sampling Event

Analyte	MW08	Units	MW080	Units	RPD (%)	Qualifier
Aluminum	363	µg/L	412	µg/L	13	
Arsenic	14.0	µg/L	12.5	µg/L	11	
Barium	189 J[1]	µg/L	187 J[1]	µg/L	1	
Calcium	141000	µg/L	140000	µg/L	1	
Cobalt	0.90 J[1]	µg/L	1.2 J[1]	µg/L	29	
Chromium	2.5 J[1]	µg/L	2.0 J[1]	µg/L	22	
Copper	4.5 J[1]	µg/L	3.3 J[1]	µg/L	31	±RL
Iron	2020	µg/L	2040	µg/L	1	
Potassium	26000	µg/L	26100	µg/L	0	
Magnesium	32100	µg/L	32100	µg/L	0	
Manganese	1210	µg/L	1200	µg/L	1	
Sodium	653000 J[2]	µg/L	662000 J[2]	µg/L	1	
Nickel	2.9 J[1]	µg/L	2.4 J[1]	µg/L	19	
Silver	0.83 J[1]	µg/L	5.0 U	µg/L	NC	±RL
Zinc	70.0 J	µg/L	24.3 J	µg/L	97	**J/J**

NC: The RPD could not be calculated.
±RL: The difference between the primary and field duplicate results was less than twice the reporting limit for results less than five times the reporting limits. No data qualifications were required.
J/J: The results are qualified as estimates because the RPD exceeded the maximum advisory limit of 30% or the difference between the primary and field duplicate results was greater than twice the reporting limit for results less than five times the reporting limits. Field sampling/laboratory imprecision and/or sample heterogeneity was indicated.
J[1]: The result was estimated between the method detection limit and the reporting limit.
J[2] The result qualified as an estimate because of physical/chemical matrix interference.

Total Cyanide

C6K030390

a. Blank Contamination (p. 170): Cyanide was detected in the method blank associated with quality control batch 6318141 at a concentration estimated below the reporting limit. **The positive total cyanide result for associated sample SB-20 (16.5-18) was qualified "U," as undetected, because of laboratory contamination.**

b. Matrix Spike Recoveries and RPDs (p. 172): The cyanide spike added to TP7S (7.5) (HORZ 0-10) MS/MSD were less than 25% of the original sample result. The recoveries and RPD could not be calculated. The effects of matrix on this analysis could not be assessed. No data qualifications were required.

C6K060148

a. Blank Contamination (p. 4004): Cyanide was detected in the method blank associated with quality control batch 6319440 at a concentration estimated below the reporting limit. All samples were affected. Validation action was not required for results greater than the reporting limits. The positive total cyanide results for samples SB22 (18-20) and SB220 (18-20) were less than the reporting limits. **The total cyanide results for samples SB22 (18-20) and SB220 (18-20) were raised to the reporting limit and qualified "U," as undetected, because of laboratory**

contamination. The "J" qualifiers appended to total cyanide results that were greater than the reporting limits were removed by the data validator as unnecessary.

b. Field Duplicates: Samples SB22 (18-20) and SB220 (18-20) were the primary and field duplicate soil samples collected for this sampling event. *USEPA National Functional Guidelines* do not require qualification based on field duplicate data alone. However, total cyanide results for the field duplicate pair were qualified as undetected (see section a. above). No data qualifications were required.

C6K080197

Blank Contamination (p. 4004): Cyanide was detected in the method blank associated with quality control batch 6319163 at a concentration estimated below the reporting limit. All samples were affected. Validation action was not required for results greater than the reporting limits. The positive total cyanide results for samples SB16 (49-50) and SB14 (38-40) were less than the reporting limits. **The total cyanide results for samples SB16 (49-50) and SB14 (38-40) were raised to the reporting limit and qualified "U," as undetected, because of laboratory contamination. The "J" qualifiers appended to total cyanide results that were greater than the reporting limits were removed by the data validator as unnecessary.**

C6K100374

a. Blank Contamination (p. 7007): Cyanide was detected in the method blank associated with quality control batch 6324176 at a concentration estimated below the reporting limit. All samples were affected. The positive total cyanide results for samples SB13 (37-39) and SB130 (37-39) were less than the reporting limits. **The total cyanide results for samples SB13 (37-39) and SB130 (37-39) were raised to the reporting limit and qualified "U," as undetected, because of laboratory contamination. The "J" qualifiers appended to total cyanide results that were greater than the reporting limits were removed by the data validator as unnecessary.**

b. Field Duplicates: Samples SB13 (37-39) and SB130 (37-39) were the primary and field duplicate soil samples collected for this sampling event. *USEPA National Functional Guidelines* do not require qualification based on field duplicate data alone. However, total cyanide results for the field duplicate pair were qualified as undetected (see section a. above). No data qualifications were required.

C6K300215

No data quality issues were noted. No data qualifications were required.

Field Duplicates: Samples MW08 and MW080 were the primary and field duplicate groundwater samples collected for this sampling event. *USEPA National Functional Guidelines* do not require qualification based on field duplicate data alone. However, the positive results are presented below to assess field sampling/laboratory precision and sample homogeneity. The RPD was less than the maximum advisory limit of 30% for aqueous samples. No data qualifications were required.

Field Duplicate Results Comparison
Schenectady MGP 2006 Sampling Event

Analyte	MW08	Units	MW080	Units	RPD (%)	Qualifier
Total Cyanide	245	µg/L	233	µg/L	5	

Notes

ATL indicated that no second source (i.e., independently traceable) standard was commercially available for 2-methylpentane, isopentane, 2,3-dimethylpentane, indene, indan, and thiophene. These analytes were not spiked into the LCS sample.

Tentatively Identified Compounds (TICs) were identified by ATL and are included on the Form 1s for the air and soil gas samples.

Positive volatile and semivolatile results that were less than the laboratory reporting limit, but greater than the method detection limits (MDLs) were qualified "J," as estimated concentrations, by the laboratory due to increased uncertainty near the detection limit.

Positive metals results that were less than the laboratory reporting limit, but greater than the MDLs were qualified "B," as estimated concentrations by the laboratory, due to increased uncertainty near the detection limit. The "B" qualifiers were changed by the data validator to "U," in response to laboratory blank contamination, or to a "J," to indicate an estimated concentration, due to increased uncertainty near the detection limit.

Chain of Custody (COC) record 090 (SDG C6K060148) listed three samples jars for samples SB-22(18-20) and SB-220(18-20). The laboratory only received two samples jars for each sample.

The air and soil gas data were reviewed according to USEPA *Compendium Method TO-15, Determination of VOCs in Air Collected in Specially Prepared-Canisters and Analyzed by Gas Chromatography / Mass Spectrometry (GC/MS)*, January 1999, and with reference to *USEPA Contract Laboratory Program National Functional Guidelines for Organic Data Review*, October 1999, document number EPA 540/R-99/008.

Soil and groundwater data were validated according to the *USEPA Contract Laboratory Program National Functional Guidelines for Organic Data Review,* EPA540/R-99/008, October 1999, *USEPA Contract Laboratory Program National Functional Guidelines for Inorganic Data Review*, EPA 540-R-04-004, October 2004, as they apply to the analytical methods employed.

Attachment 1 of 1

Glossary of Data Qualifier Codes

GLOSSARY OF DATA QUALIFIER CODES

U	-	The analyte was analyzed for, but was not detected above the level of the reported samples quantitation limit.
UJ	-	The analyte was analyzed for, but was not detected. The reported quantitation limit is approximated and may be inaccurate or imprecise.
J	-	The result is an estimated quantity. The associated numerical value is the approximate concentration of the analyte in the sample.
J-	-	(Inorganics) The result is an estimated quantity, likely to be biased low. The associated numerical value is the approximate concentration of the analyte in the sample.
J+	-	(Inorganics) The result is an estimated quantity, likely to be biased high. The associated numerical value is the approximate concentration of the analyte in the sample.
N	-	Tentative identification. Consider present. Special methods may be needed to confirm its presence or absence in future sampling events.
NJ	-	Qualitative identification questionable due to poor resolution. Presumptively present at an approximate quantity.
R	-	The data are unusable. The sample results are rejected due to serious deficiencies in the ability to meet quality control criteria. The presence or absence of the analyte cannot be verified.

Appendix B

Support Documentation

CASE NARRATIVE
The Retec Group
Schenectady Street MGP

LOT # C6K030390

Sample Receiving:
STL Pittsburgh, PA received samples on November 3, 2006. The cooler was received within the proper temperature range.

The laboratory received sample SB20(16.5-18) that was not listed on the chain of custody. This sample was to be analyzed as discussed with James Edwards. Notation was made on the chain of custody.

If project specific QC was not required for samples contained in this report, when batch QC was completed on these samples, anomalous results will be discussed below.

GC/MS Volatiles:
Due to the concentration of target compounds detected, sample SB-20 (30-32.5) was analyzed as a methanol dilution.

The method blank for batch 6310052 had methylene chloride detected below the reporting limit but above the MDL. The result was flagged with a "J" qualifier. Any sample associated with this blank that had methylene chloride detected had the result flagged with a "B" qualifier.

GC/MS Semivolatiles:
Due to the concentration of target compounds detected, several samples were analyzed at a dilution.

Several samples had the surrogates diluted out.

Metals:
The serial dilution of sample SB-24(20-21) was outside of the percent difference control limits for zinc. The result was flagged with an "E" qualifier.

The method blank had analytes detected at concentrations between the MDL and the reporting limit. The results were flagged with a "B" qualifier. Any sample associated with a method blank that had the same analyte detected had the result flagged with a "J" qualifier.

For the matrix spike and matrix spike duplicate of sample SB-24(20-21), aluminum and iron recoveries were not calculated due to the concentration of analyte in the sample being >4 times the concentration of spike added.

CASE NARRATIVE
The Retec Group
Schenectady Street MGP

LOT # C6K030390

The matrix spikes of sample SB-24(20-21) recovered below the control limits for manganese and antimony. The RPD between the spikes and the recoveries of the laboratory control samples were within the control limits.

General Chemistry:
Sample TP7S(7.5)(HORZ 0-10) was analyzed at a dilution for total cyanide.

The method blank for batch 6318141 had cyanide detected at a concentration between the MDL and the reporting limit. The result was flagged with a "B" qualifier. Any sample associated with a method blank that had the same analyte detected had the result flagged with a "J" qualifier.

For the matrix spike and matrix spike duplicate of sample TP7S(7.5)(HORZ 0-10), cyanide recoveries were not calculated due to the concentration of analyte in the sample being >4 times the concentration of spike added.

NOTE(S):

- The analytical results of the samples listed above are presented on the following pages.
- All calculations are performed before rounding to avoid round-off errors in calculated results.
- Results noted as "ND" were not detected at or above the stated limit.
- This report must not be reproduced, except in full, without the written approval of the laboratory.
- Results for the following parameters are never reported on a dry weight basis: color, corrosivity, density, flashpoint, ignitability, layers, odor, paint filter test, pH, porosity pressure, reactivity, redox potential, specific gravity, spot tests, solids, solubility, temperature, viscosity, and weight.

SW846 8260B METHOD BLANK SUMMARY

BLANK WORKORDER NO.: JH16F1AA

Lab Name: Severn Trent Laboratories, Inc.

Lab Code: STLPIT

SDG Number:

Lab File ID: 3110601.D

Lot Number: C6K030390

Date Analyzed: 11/06/06

Time Analyzed: 06:43

Matrix: SOLID

Date Extracted:11/06/06

GC Column: RTX-624 ID: .18

Extraction Method: 5030B/8260B

Instrument ID: HP3

Level:(low/med) LOW

THIS METHOD BLANK APPLIES TO THE FOLLOWING SAMPLES, LCS, LCSD, MS , MSD:

CASE NARRATIVE
The Retec Group
Schenectady Street MPG

LOT # C6K060148

Sample Receiving:
STL Pittsburgh, PA received samples on November 6, 2006. The cooler was received within the proper temperature range.

The chain of custody listed 3 jars each for samples SB22(18-20) and SB220(18-20). The laboratory only received 2 jars for each of these samples. Notation regarding this was made on the chain of custody.

Project specific QC was not required for samples contained in this report. Where batch QC was completed on these samples, anomalous results will be discussed below.

GC/MS Volatiles:
The method blanks for batches 6313074, 6314052 and 6316062 had methylene chloride detected below the reporting limit but above the MDL. The result was flagged with a "J" qualifier. Any sample associated with this blank that had methylene chloride detected had the result flagged with a "B" qualifier.

GC/MS Semivolatiles:
Due to the concentration of target compounds detected and/or matrix, several samples were analyzed at a dilution.

The 20x dilution of sample SB25(18-19.5) had the surrogates diluted out.

Metals:
The serial dilution of sample SB23(10-13) was outside of the percent difference control limits for cobalt, nickel, and zinc. The results were flagged with an "E" qualifier.

The method blank had analytes detected at concentrations between the MDL and the reporting limit. The results were flagged with a "B" qualifier. Any sample associated with a method blank that had the same analyte detected had the result flagged with a "J" qualifier.

For the matrix spike and matrix spike duplicate of sample SB23(10-13), aluminum, iron, and manganese recoveries were not calculated due to the concentration of analyte in the sample being >4 times the concentration of spike added.

The matrix spikes of sample SB23(10-013) recovered below the control limits for lead, antimony, and zinc. The matrix spike duplicate recovered below the control limits for calcium. The RPDs between the spikes and the recoveries of the laboratory control sample were within the control limits.

CASE NARRATIVE
The Retec Group
Schenectady Street MPG

LOT # C6K060148

General Chemistry:
The method blank for batch 6319440 had cyanide detected at a concentration between the MDL and the reporting limit. The result was flagged with a "B" qualifier. Any sample associated with a method blank that had the same analyte detected had the result flagged with a "J" qualifier.

		Yes	No
1.	Were custody seals on the outside of the cooler?		✓
	If YES, how many and where? Quantity 1 Location Front		
	Were signatures and date correct?	✓	
2.	Were custody papers included inside the cooler?	✓	
3.	Were custody papers properly filled out (ink, signed, match labels)?	✓	
4.	Did you sign the custody papers in the appropriate place?	✓	
5.	Was shippers packing slip attached to this form?	✓	
6.	Were packing materials used?	✓	
	If YES, what type? Bubble Bag		
7.	Were the samples chilled? (Record temperatures on reverse side.)	✓	
8.	Were the samples appropriately preserved?	n/a	
9.	Were all bottles sealed in separate plastic bags?	✓	
10.	Did all bottles arrive in good condition (unbroken)?		✓
11.	Were all bottle labels complete (sample ID, preservatives, etc.)?		✓
12.	Did all bottle labels and/or tags agree with custody papers?		✓
13.	Were correct bottles used for tests indicated?	✓	
14.	Were all VOA vials checked for the presence of air bubbles?	n/a	
15.	Was a sufficient amount of sample sent in each bottle?	✓

JH2Q5	006	SB15(34-35)	11/03/06	16:20

NOTE(S):

- The analytical results of the samples listed above are presented on the following pages.
- All calculations are performed before rounding to avoid round-off errors in calculated results.
- Results noted as "ND" were not detected at or above the stated limit.
- This report must not be reproduced, except in full, without the written approval of the laboratory.
- Results for the following parameters are never reported on a dry weight basis: color, corrosivity, density, flashpoint, ignitability, layers, odor, paint filter test, pH, porosity pressure, reactivity, redox potential, specific gravity, spot tests, solids, solubility, temperature, viscosity, and weight.

CASE NARRATIVE
The Retec Group
Schenectady Street MGP

LOT # C6K080197

Sample Receiving:
STL Pittsburgh, PA received samples on November 8, 2006. The cooler was received within the proper temperature range.

If project specific QC was not required for samples contained in this report, when batch QC was completed on these samples, anomalous results will be discussed below.

GC/MS Volatiles:
Due to the concentration of target compounds detected, samples SB16(35-37) and SB14(15-17.5) were analyzed as methanol dilutions. Sample SB14(15-17.5) was analyzed at a subsequent dilution. This sample had the surrogates diluted out.

The method blank for batch 6316062 had methylene chloride detected below the reporting limit but above the MDL. The result was flagged with a "J" qualifier. Any sample associated with a blank that had methylene chloride detected had the result flagged with a "B" qualifier.

GC/MS Semivolatiles:
Due to the concentration of target compounds detected, several samples were analyzed at a dilution.

Several samples had the surrogates diluted out.

Metals:
The serial dilution of sample SB11(20-22) was outside of the percent difference control limits for zinc. The result was flagged with an "E" qualifier.

The method blank had analytes detected at concentrations between the MDL and the reporting limit. The results were flagged with a "B" qualifier. Any sample associated with a method blank that had the same analyte detected had the result flagged with a "J" qualifier.

For the matrix spike and matrix spike duplicate of sample SB11(20-22), aluminum, iron, and manganese recoveries were not calculated due to the concentration of analyte in the sample being >4 times the concentration of spike added.

General Chemistry:
The method blank for batch 6319163 had cyanide detected at a concentration between the MDL and the reporting limit. The result was flagged with a "B" qualifier. Any sample associated with a method blank that had the same analyte detected had the result flagged with a "J" qualifier.

SAMPLE SUMMARY

NOTE(S):

- The analytical results of the samples listed above are presented on the following pages.
- All calculations are performed before rounding to avoid round-off errors in calculated results.
- Results noted as "ND" were not detected at or above the stated limit.
- This report must not be reproduced, except in full, without the written approval of the laboratory.
- Results for the following parameters are never reported on a dry weight basis: color, corrosivity, density, flashpoint, ignitability, layers, odor, paint filter test, pH, porosity pressure, reactivity, redox potential, specific gravity, spot tests, solids, solubility, temperature, viscosity, and weight.

LOT # C6K100374

Sample Receiving:
STL Pittsburgh, PA received samples on November 10, 2006. The cooler was received within the proper temperature range.

Project specific QC was not required for samples contained in this report. Where batch QC was completed on these samples, anomalous results will be discussed below.

GC/MS Volatiles:
The method blanks for batches 6316062 and 6318010 had methylene chloride detected below the reporting limit but above the MDL. The results were flagged with a "J" qualifier. Any sample associated with a blank that had methylene chloride detected had the result flagged with a "B" qualifier.

TCLP GC/MS Volatiles:
Due to the concentration of benzene detected, sample SB17(10.5-11.5) was analyzed at an additional dilution.

GC/MS Semivolatiles:
There were no problems associated with the analysis.

TCLP GC/MS Semivolatiles:
Due to the concentration of cresols detected, SB17(10.5-11.5) was analyzed undiluted and at a 200X dilution. The surrogates were diluted out in the 200X analysis.

Metals:
Sample SB12(25-26) was analyzed at a dilution for cadmium as the undiluted result was less then the negative reporting limit.

The method blank had analytes detected at concentrations between the MDL and the reporting limit. The results were flagged with a "B" qualifier. Any sample associated with a method blank that had the same analyte detected had the result flagged with a "J" qualifier.

TCLP Metals:
The TCLP leachate blank had analytes detected at concentrations between the MDL and the reporting limit. The results were flagged with a "B" qualifier.

General Chemistry:
Sample SB17(10.5-11.5) was analyzed at a dilution for cyanide.

CASE NARRATIVE
The Retec Group
Schenectady Street MGP

LOT # C6K100374

The method blanks for batches 6324176, 6318141, and 6319440 had cyanide detected at a concentration between the MDL and the reporting limit. The results were flagged with a "B" qualifier. Any sample associated with a method blank that had the same analyte detected had the result flagged with a "J" qualifier.

SAMPLE SUMMARY

C6K100374

WO #	SAMPLE#	CLIENT SAMPLE ID	SAMPLED DATE	SAMP TIME

NOTE(S):

- The analytical results of the samples listed above are presented on the following pages.
- All calculations are performed before rounding to avoid round-off errors in calculated results.
- Results noted as "ND" were not detected at or above the stated limit.
- This report must not be reproduced, except in full, without the written approval of the laboratory.
- Results for the following parameters are never reported on a dry weight basis: color, corrosivity, density, flashpoint, ignitability, layers, odor, paint filter test, pH, porosity pressure, reactivity, redox potential, specific gravity, spot tests, solids, solubility, temperature, viscosity, and weight.

CASE NARRATIVE
The Retec Group
Schenectady Street MGP

LOT # C6K300215

Sample Receiving:
STL Pittsburgh, PA received samples on November 30, 2006. The coolers were received within the proper temperature range.

Project specific QC was not required for samples contained in this report. Where batch QC was completed on these samples, anomalous results will be discussed below.

GC/MS Volatiles:
Due to the concentration of target compounds detected, samples MW08 and MW080 were analyzed at a dilution.

GC/MS Semivolatiles:
The reporting limits were adjusted due to the amount of sample used in the extraction procedure.

Due to the concentration of target compounds detected, samples MW08 and MW080 were analyzed at a dilution. The surrogates were diluted out in these samples.

Metals:
The serial dilution percent difference was outside control limits for sodium.

Samples MW07, MW09, MW08, and MW080 were over the instrument's linear range for sodium and required dilution.

The method blank had analytes detected at concentrations between the MDL and the reporting limit. The results were flagged with a "B" qualifier. Any sample associated with a method blank that had the same analyte detected had the result flagged with a "J" qualifier.

General Chemistry:
There were no problems associated with the analysis.

NOTE(S):

- The analytical results of the samples listed above are presented on the following pages.
- All calculations are performed before rounding to avoid round-off errors in calculated results.
- Results noted as "ND" were not detected at or above the stated limit.
- This report must not be reproduced, except in full, without the written approval of the laboratory.
- Results for the following parameters are never reported on a dry weight basis: color, corrosivity, density, flashpoint, ignitability, layers, odor, paint filter test, pH, porosity pressure, reactivity, redox potential, specific gravity, spot tests, solids, solubility, temperature, viscosity, and weight.

LABORATORY NARRATIVE
Modified TO-15
The RETEC Group, Inc.
Workorder# 0611379

Six 6 Liter Summa Canister samples were received on November 16, 2006. The laboratory performed analysis via modified EPA Method TO-15 using GC/MS in the full scan mode. The method involves concentrating up to 1.0 liter of air. The concentrated aliquot is then flash vaporized and swept through a water management system to remove water vapor. Following dehumidification, the sample passes directly into the GC/MS for analysis.

Method modifications taken to run these samples are summarized in the below table. Specific project requirements may over-ride the ATL modifications.

Requirement	*TO-15*	*ATL Modifications*
ICAL %RSD acceptance criteria	+- 30% RSD with 2 compounds allowed out to < 40% RSD	30% RSD with 4 compounds allowed out to < 40% RSD
Daily Calibration	+- 30% Difference	</= 30% Difference with four allowed out up to </=40%.; flag and narrate outliers
Blank and standards	Zero air	Nitrogen
Method Detection Limit	Follow 40CFR Pt.136 App. B	The MDL met all relevant requirements in Method TO-15 (statistical MDL less than the LOQ). The concentration of the spiked replicate may have exceeded 10X the calculated MDL in some cases
Sample collection media	Summa canister	ATL recommends use of summa canisters to insure data defensibility, but will report results from Tedlar bags at client request

Receiving Notes

There were no receiving discrepancies.

Analytical Notes

The reported CCV for each daily batch may be derived from more than one analytical file due to the client's request for non-standard compounds.

Non-standard compounds may have different acceptance criteria than the standard TO-14A/TO-15 compound list as per contract or verbal agreement.

The reported LCS for each daily batch has been derived from more than one analytical file.

The following compounds, Naphthalene, indicated high bias (greater than 140% expected recovery) in the LCS.

Definition of Data Qualifying Flags

Eight qualifiers may have been used on the data analysis sheets and indicates as follows:

B - Compound present in laboratory blank greater than reporting limit (background subtraction not performed).

J - Estimated value.

E - Exceeds instrument calibration range.

S - Saturated peak.

Q - Exceeds quality control limits.

U - Compound analyzed for but not detected above the reporting limit.

UJ- Non-detected compound associated with low bias in the CCV

N - The identification is based on presumptive evidence.

File extensions may have been used on the data analysis sheets and indicates as follows:

a-File was requantified

b-File was quantified by a second column and detector

r1-File was requantified for the purpose of reissue

Subject Re: National Grid/Schenectady Soil Gas Analysis WO 0611379

Hello Greg,

The data entry of canister #99 was an oversight by the scientist. The sample run log indicates the correct canister was analyzed which also confirms with the canister ID that was scanned in under this sample. Upon investigation, we do not have a canister with Physical ID# 99 in our inventory, so it does not appear to be an instance of the wrong canister being analyzed. Would you like to reissue the ECVP?

Regards,
Ausha

DATA REVIEW CHECKLIST

Work Order #: 0611379

A	R	T	M	Q	
☑	☑	☐	☑	☐	Analysis/Reporting vs. Project Profile/SOP requirements checked (i.e. 100% Dups, J-Flag to MDL, etc)
	☑	☐	☑	☐	The final report has the correct reporting list, special units, and header info.
	☑	☐	☑	☐	Lab Narrative is correct (proper method & description/Receiving & Analytical notes correct)
☐	☐	☐	☐	☐	Corrective Action issued - # _____
☑	☐	☐	☐	☐	Unusual circumstances have been documented in the notes section below

LUMEN *validation report present and initialed* ***CIRCLE (YES / NO)***

☑	☐	☐	☐	☐	Lab Blank, CCV, LCS and DUP met QC criteria
☑	☐	☐	☐	☐	Hold time is met for all samples
	☐	☐	☐	☐	Appropriate data qualifier flags are applied
	☐	☐	☐	☐	Manual integrations for samples and QC are properly documented
☑	☐	☐		☐	Samples analyzed within the project or method specific clock
	☐	☐			Retention times have been verified
☑	☐	☐		☐	Appropriate ICAL(s) included
	☐	☐	☑	☐	At least one result per sample is verified against the target quant sheets/raw data

☑	☑	☐	☐	Dilution factor correctly calculated (sample load volume, syringe and bag dilutions, can pressurization(s))
☑	☑	☐		Correct amount of sample analyzed (i.e. sample not over-diluted)
	☑	☐		Spectra verified - documentation of spectral defense included (Section 5A of eCVP pkg)
	☑	☐		TICs resemble reference spectra
	☑	☐		TICs between duplicate samples are consistent
☑	☐	☐	☑	Checked samples for trends (i.e. Influent>Effluent, Landfill or Ambient etc)
	☑		☑	Special units for all samples in the final report are correctly calculated
	☑	☐	☑	Manually entered results checked (i.e. special CCV compounds)
	☑	☐	☑	TPH/NMOC (verify calculations and correct reference compound used)
	☑			Chain of Custody scanned correctly
			☐	Verify sample id's vs. chain of custody
☐	☑			Samples pressurized w/ appropriate gas (N_2 or He) ☐ Tedlar Bag only
☑	☑			Final pressure consistent with canister size (6L vs. 1L)
☑	☑			Verify receipt pressures against logbook and Target
☑	☑			Verify canister ID #'s
	☑		☑	Extra printed copies are provided per client profile
	☑		☑	Final invoice amount correct (adjusted for TAT, Penalties, Re-issue Charges etc.)
	☑	☐	☑	☐ Client LUMEN report reviewed for accuracy and completeness

Notes: *(to include: noting samples with QA/QC problems, Blanks with positive hits, narratives, etc.)*

A/R:

Multiple CCV/LCS.
Naphthalene 7150 in LCS. Client is OK with it / Narrate it.
3-out in LCS.
