TITLE PAGE

On February 7, 2003 five water samples were received by Adirondack Environmental Services, Inc. from URS Consultants, Inc. from the NYSEG Mechanicville site. On February 12, 2003 six water samples were received by Adirondack Environmental Services, Inc. from URS Consultants, Inc. from the NYSEG Mechanicville site. On 2/26/03 the samples were requested to have a NYSDEC ASP Category B data package supplied. These samples were analyzed for Volatile Organics, Semi-Volatile Organics, Metals and Conventionals as specified by the contract. The project was completed on April 9, 2003.

Initially this project was received as a routine analysis. On 2/26/03 the samples were requested to have a NYSDEC ASP Category B data package supplied. At this time all analyses had been completed. This data package was generated as best as possible, but since it was received as a routine analysis some portions of the data package may not conform to the requirements for a NYSDEC ASP Category B data package.

Volatile Organics

1) The samples were analyzed using EPA Method 8260 as per the NYSDEC Analytical Services Protocol 10/95 revision Exhibit E.

2) The %D's for the compounds 1,1-Dichloroethene and 1,1,2,2-Tetrachloroethane in the continuing calibration analyzed on 2/19/03 were outside the criteria established by the method. The %D's for these compounds were 36.3 % and 25.8 %, respectively. According to the protocol, two volatile organic compounds may exceed the %D limit of 25.0 % and the minimum RRF values as long as the %D is less than 40 % and the RRF is above 0.010. The %D was below 40 % and the RRF was greater than 0.010 for this compound.

3) A matrix spike and matrix spike duplicate analysis was not performed with this batch of samples. A Laboratory Control sample was analyzed with all compounds. The recoveries for 1,1-Dichloroethene and trans-1,2-Dichloroethene were just below the acceptable limits.

4) The internal standard recoveries for sample MEGDD0237 (AES sample number 030207J-03) were outside required limits. This sample was not re-analyzed.

5) The column used in Instrument C for analysis was an RTX-502.2, 60 meters long with an internal diameter of 0.32 mm. The trap used for this instrument is a VOCARB 4000 with Carbopack C&B / Carboxen 1000 & 1001.

Semi-Volatile Organics

1) The samples were analyzed for Polynuclear Aromatic Hydrocarbons only using EPA Method 8270 as per the NYSDEC Analytical Services Protocol 10/95 revision Exhibit E.

2) The RRF for the compound N-Nitroso-di-n-propylamine in the initial calibration analyzed on 12/17/02 was outside the required limits. The RRF for this compound was 0.494. According to the protocol, four semi-volatile organic compounds may exceed the %RSD limit of 20.5 % or the specified RRF as long as the %RSD is less than 40 % and the RRF is above 0.010. The %RSD was below 40 % and the RRF was greater than 0.010 for this compound.

3) The %D for the compound Benzo(k)fluoranthene in the continuing calibration analyzed on 2/18/03 was outside the criteria established by the method. The %D for this compound was 32.8 %. The RRF for the compound N-Nitroso-di-n-propylamine in the continuing calibration analyzed on 2/18/03 was outside the required limits. The RRF for this compound was 0.474. According to the protocol, four semi-volatile organic compounds may exceed the %D limit of 25.0 % and the minimum RRF values as long as the %D is less than 40 % and the RRF is above 0.010. The %D was below 40 % and the RRF was greater than 0.010 for this compound.

4) The %D for the compound 2,4-Dinitrotoluene in the continuing calibration analyzed on 2/27/03 was outside the criteria established by the method. The %D for this compound was 25.5 %. The RRF for the compound N-Nitroso-di-n-propylamine in the continuing calibration analyzed on 2/27/03 was outside the required limits. The RRF for this compound was 0.497. According to the protocol, four semi-volatile organic compounds may exceed the %D limit of 25.0 % and the minimum RRF values as long as the %D is less than 40 % and the RRF is above 0.010. The %D was below 40 % and the RRF was greater than 0.010 for this compound.

5) The %D for the compound Terphenyl-d14 in the continuing calibration analyzed on 2/28/03 was outside the criteria established by the method. The %D for this compound was 25.9 %. According to the protocol, four semi-volatile organic compounds may exceed the %D limit of 25.0 % and the minimum RRF values as long as the %D is less than 40 % and the RRF is above 0.010. The %D was below 40 % and the RRF was greater than 0.010 for this compound.

6) A matrix spike and the matrix spike duplicate analysis was not performed with this batch of samples. A matrix spike blank was analyzed and all recoveries were within required limits.

Inorganics – Total Metals

1) The recovery for Calcium and Iron in the ICSA and the ICSAB check standards were outside the required limit. The required concentration for these analytes in the check standards is 500,000 ug/L and 200,000 ug/L, respectively. The linear range on this instrument for Calcium and Iron is 200,000 ug/L and 80,000 ug/L, respectively. At this level accurate recovery of Calcium and Iron in the check standards is not possible. No further action is required.

2) A sample from another client was analyzed as the matrix spike and duplicate sample (AES sample number 030207F-01). All recoveries were within required limits.

3) A serial dilution was not analyzed with this set of data.

Conventionals

1) Samples MEGDD0239 and MEGUSH8602 (AES sample numbers 030212M-01 and 030212M-03) were used for the Cyanide matrix spike analysis. All recoveries were within required limits.

2) Samples MEGUSH8602 and another client's sample (AES sample numbers 030212M-03 and 030214028-006) were used for the Cyanide and Phenol duplicate samples respectively. All recoveries were within required limits

Initially this project was received as a routine analysis. On 2/26/03 the samples were requested to have a NYSDEC ASP Category B data package supplied. At this time all analyses had been completed. This data package was generated as best as possible, but since it was received as a routine analysis some portions of the data package may not conform to the requirements for a NYSDEC ASP Category B data package.

Volatile Organics

1) The samples were analyzed using EPA Method 8260 as per the NYSDEC Analytical Services Protocol 10/95 revision Exhibit E.

2) The %D's for the compounds 1,1-Dichloroethene and 1,1,2,2-Tetrachloroethane in the continuing calibration analyzed on 2/19/03 were outside the criteria established by the method. The %D's for these compounds were 36.3 % and 25.8 %, respectively. According to the protocol, two volatile organic compounds may exceed the %D limit of 25.0 % and the minimum RRF values as long as the %D is less than 40 % and the RRF is above 0.010. The %D was below 40 % and the RRF was greater than 0.010 for this compound.

3) A matrix spike and matrix spike duplicate analysis was not performed with this batch of samples. A Laboratory Control sample was analyzed with all compounds. The recoveries for 1,1-Dichloroethene and trans-1,2-Dichloroethene were just below the acceptable limits.

4) The internal standard recoveries for sample MEGDD0237 (AES sample number 030207J-03) were outside required limits. This sample was not re-analyzed.

5) The column used in Instrument C for analysis was an RTX-502.2, 60 meters long with an internal diameter of 0.32 mm. The trap used for this instrument is a VOCARB 4000 with Carbopack C&B / Carboxen 1000 & 1001.

Semi-Volatile Organics

1) The samples were analyzed for Polynuclear Aromatic Hydrocarbons only using EPA Method 8270 as per the NYSDEC Analytical Services Protocol 10/95 revision Exhibit E.

2) The RRF for the compound N-Nitroso-di-n-propylamine in the initial calibration analyzed on 12/17/02 was outside the required limits. The RRF for this compound was 0.494. According to the protocol, four semi-volatile organic compounds may exceed the %RSD limit of 20.5 % or the specified RRF as long as the %RSD is less than 40 % and the RRF is above 0.010. The %RSD was below 40 % and the RRF was greater than 0.010 for this compound.

3) The %D for the compound Benzo(k)fluoranthene in the continuing calibration analyzed on 2/18/03 was outside the criteria established by the method. The %D for this compound was 32.8 %. The RRF for the compound N-Nitroso-di-n-propylamine in the continuing calibration analyzed on 2/18/03 was outside the required limits. The RRF for this compound was 0.474. According to the protocol, four semi-volatile organic compounds may exceed the %D limit of 25.0 % and the minimum RRF values as long as the %D is less than 40 % and the RRF is above 0.010. The %D was below 40 % and the RRF was greater than 0.010 for this compound.

4) The %D for the compound 2,4-Dinitrotoluene in the continuing calibration analyzed on 2/27/03 was outside the criteria established by the method. The %D for this compound was 25.5 %. The RRF for the compound N-Nitroso-di-n-propylamine in the continuing calibration analyzed on 2/27/03 was outside the required limits. The RRF for this compound was 0.497. According to the protocol, four semi-volatile organic compounds may exceed the %D limit of 25.0 % and the minimum RRF values as long as the %D is less than 40 % and the RRF is above 0.010. The %D was below 40 % and the RRF was greater than 0.010 for this compound.

5) The %D for the compound Terphenyl-d14 in the continuing calibration analyzed on 2/28/03 was outside the criteria established by the method. The %D for this compound was 25.9 %. According to the protocol, four semi-volatile organic compounds may exceed the %D limit of 25.0 % and the minimum RRF values as long as the %D is less than 40 % and the RRF is above 0.010. The %D was below 40 % and the RRF was greater than 0.010 for this compound.

6) A matrix spike and the matrix spike duplicate analysis was not performed with this batch of samples. A matrix spike blank was analyzed and all recoveries were within required limits.

Inorganics – Total Metals

1) The recovery for Calcium and Iron in the ICSA and the ICSAB check standards were outside the required limit. The required concentration for these analytes in the check standards is 500,000 ug/L and 200,000 ug/L, respectively. The linear range on this instrument for Calcium and Iron is 200,000 ug/L and 80,000 ug/L, respectively. At this level accurate recovery of Calcium and Iron in the check standards is not possible. No further action is required.

2) A sample from another client was analyzed as the matrix spike and duplicate sample (AES sample number 030207F-01). All recoveries were within required limits.

3) A serial dilution was not analyzed with this set of data.

Conventionals

1) Samples MEGDD0239 and MEGUSH8602 (AES sample numbers 030212M-01 and 030212M-03) were used for the Cyanide matrix spike analysis. All recoveries were within required limits.

2) Samples MEGUSH8602 and another client's sample (AES sample numbers 030212M-03 and 030214028-006) were used for the Cyanide and Phenol duplicate samples respectively. All recoveries were within required limits

CLP

SAMPLE CALCULATIONS FOR VOLATILE ORGANICS:

1) RRF of Benzene from the VSTD050 analyzed on 2/19/03:

$$= \frac{\text{area of Benzene in std.}}{\text{area of internal std}} \quad \mathbf{X} \quad \frac{\text{concentration of internal standard.}}{\text{concentration of standard}}$$

$$= \frac{154758}{70650} \times \frac{50}{50} = 2.190$$

2) Amount of Benzene in sample LCS@20 (AES sample number Laboratory Control Sample):

$$\text{ug/L} = \frac{\text{area of Benzene in sample}}{\text{area of internal standard in sample}} \times \frac{\text{amount of internal std. (ng)}}{\text{(ml of sample purged)(RRF)}}$$

$$= \frac{57273}{68592} \times \frac{(250)}{(5.0)(2.190)} = 19.1 \text{ ug/L}$$

which is reported as 19 ug/L on the Form I for Volatile Organics

3) Calculation of spike recovery for Benzene in sample LCS@20:

$$\text{Percent spike recovery} = \frac{\text{quantity determined by analysis}}{\text{quantity added to sample}} \times 100$$

$$\text{\% recovery of Benzene} = \frac{(19.1 - 0.0)}{20.0} \times 100 = 95.5\ \%$$

CLP

SAMPLE CALCULATIONS FOR SEMI-VOLATILE ORGANICS:

1) RRF of Acenaphthene from the STD050 analyzed on 3/4/03:

$$= \frac{\text{area of Acenaphthene in std.}}{\text{area of internal std}} \quad \mathbf{X} \quad \frac{\text{concentration of internal standard.}}{\text{concentration of standard}}$$

$$= \frac{696025}{220457} \times \frac{40}{50} = 2.526$$

2) Concentration of Acenaphthene in sample WMSB (AES sample number Matrix Spike Blank):

$$\text{ug/L} = \frac{\text{area of Acenaphthene in sample}}{\text{area of internal standard in sample}} \times \frac{\{\text{amount of internal std. (ng)}\}\{\text{Vol. extract (ul)}\}(\text{Df})}{\{\text{Vol. extracted (ml)}\}(\text{RRF})\{\text{Vol. injected(uL)}\}}$$

$$= \frac{206031}{118247} \times \frac{(40)(1000)(1)}{(1000)(2.526)(2)} = 13.8 \text{ ug/L}$$

which is reported as 14 ug/L on the Form I for Semi-Volatile Organics

3) Calculation of spike recovery for Acenaphthene for Matrix Spike Blank:

$$\text{Percent spike recovery} = \frac{\text{quantity determined by analysis}}{\text{quantity added to sample}} \times 100$$

$$\text{\% recovery of Acenaphthene} = \frac{(13.8 - 0.0)}{25.0} \times 100 = 55.2\ \%$$

TITLE PAGE

On February 18, 2003 seven water samples were received by Adirondack Environmental Services, Inc. from URS Consultants, Inc. at the NYSEG Mechanicville site. On February 20, 2003 eight water samples were received by Adirondack Environmental Services, Inc. from URS Consultants, Inc. at the NYSEG Mechanicville site. On February 24, 2003 six water samples were received by Adirondack Environmental Services, Inc. from URS Consultants, Inc. at the NYSEG Mechanicville site. On 2/26/03 the samples were requested to have a NYSDEC ASP Category B data package supplied. These samples were analyzed for Volatile Organics, Semi-Volatile Organics, Metals and Conventionals as specified by the contract. The project was completed on April 10, 2003.

Initially this project was received as a routine analysis. On 2/26/03 the samples were requested to have a NYSDEC ASP Category B data package supplied. At this time some of the analyses had been extracted and/or completed.

Volatile Organics

1) The samples were analyzed using EPA Method 8260 as per the NYSDEC Analytical Services Protocol 10/95 revision Exhibit E.

Adirondack Environmental Services, Inc.
Experience is the solution
314 North Pearl Street • Albany, New York 12207 • 800-848-4983 • (518) 434-4546 • Fax (518) 434-0891

2) The %RSD for the compound Bromomethane in the initial calibration analyzed on 2/21/03 was outside the criteria established by the method. The %RSD for this compound was 25.3 %. The RRF for the compound Trichloroethene in the initial calibration analyzed on 2/21/03 was outside the required limits. The RRF for this compound was 0.283. According to the protocol, two volatile organic compounds may exceed the %RSD limit of 20.5 % as long as the %RSD is less than 40 % and the RRF is above 0.010. The %RSD was less than 40 % and the RRF was greater than 0.010 for these compounds.

3) The %D for the compound 1,2-Dichloroethane in the continuing calibration analyzed on 2/26/03 was outside the criteria established by the method. The %D for this compound was 27.2 %. According to the protocol, two volatile organic compounds may exceed the %D limit of 25.0 % and the minimum RRF values as long as the %D is less than 40 % and the RRF is above 0.010. The %D was below 40 % and the RRF was greater than 0.010 for this compound.

4) Sample MEGDIM0128 (AES sample number 030220G-07) was used for the matrix spike and matrix spike duplicate analysis. All recoveries were within required limits.

5) The surrogate recovery for 1,2-Dichloroethane-d4 on sample MEGDD014 (AES sample number 030218J-04) was outside required limits. The recovery was just above the specified limits. This sample was not re-analyzed.

6) The column used in Instrument C for analysis was an RTX-502.2, 60 meters long with an internal diameter of 0.32 mm. The trap used for this instrument is a VOCARB 4000 with Carbopack C&B / Carboxen 1000 & 1001.

Semi-Volatile Organics

1) The samples were analyzed for Polynuclear Aromatic Hydrocarbons only using EPA Method 8270 as per the NYSDEC Analytical Services Protocol 10/95 revision Exhibit E.

2) The RRF for the compound N-Nitroso-di-n-propylamine in the initial calibration analyzed on 12/17/02 was outside the required limits. The RRF for this compound was 0.494. According to the protocol, four semi-volatile organic compounds may exceed the %RSD limit of 20.5 % or the specified RRF as long as the %RSD is less than 40 % and the RRF is above 0.010. The %RSD was below 40 % and the RRF was greater than 0.010 for this compound.

3) The %D for the compound Terphenyl-d14 in the continuing calibration analyzed on 2/28/03 was outside the criteria established by the method. The %D for this compound was 25.9 %. According to the protocol, four semi-volatile organic compounds may exceed the %D limit of 25.0 % and the minimum RRF values as long as the %D is less than 40 % and the RRF is above 0.010. The %D was below 40 % and the RRF was greater than 0.010 for this compound.

314 North Pearl Street • Albany, New York 12207 • 800-848-4983 • (518) 434-4546 • Fax (518) 434-0891

4) The RRF for the compound N-Nitroso-di-n-propylamine in the continuing calibration analyzed on 3/18/03 was outside the required limits. The RRF for this compound was 0.472. According to the protocol, four semi-volatile organic compounds may exceed the %D limit of 25.0 % and the minimum RRF values as long as the %D is less than 40 % and the RRF is above 0.010. The %D was below 40 % and the RRF was greater than 0.010 for this compound.

5) The %D's for the compounds Pyrene and Terphenyl-d14 in the continuing calibration analyzed on 3/24/03 were outside the criteria established by the method. The %D's for these compounds were 32.1 % and 37.9 %, respectively. The RRF for the compound N-Nitroso-di-n-propylamine in the continuing calibration analyzed on 3/24/03 was outside the required limits. The RRF for this compound was 0.404. According to the protocol, four semi-volatile organic compounds may exceed the %D limit of 25.0 % and the minimum RRF values as long as the %D is less than 40 % and the RRF is above 0.010. The %D was below 40 % and the RRF was greater than 0.010 for these compounds.

6) Sample MEGDIM0128 (AES sample number 030220G-07) was used for the matrix spike and the matrix spike duplicate analysis. All recoveries were within required limits.

7) The surrogate recovery for Nitrobenzene-d5 on sample MEGDSH0121 (AES sample number 030220G-04) was outside required limits. According to the protocol, one base/neutral surrogate may be outside specified limits with no further action necessary.

Inorganics – Total Metals

1) The recovery for Calcium and Iron in the ICSA and the ICSAB check standards were outside the required limit. The required concentration for these analytes in the check standards is 500,000 ug/L and 200,000 ug/L, respectively. The linear range on this instrument for Calcium and Iron is 200,000 ug/L and 80,000 ug/L, respectively. At this level accurate recovery of Calcium and Iron in the check standards is not possible. No further action is required.

2) The digested spike recoveries for the elements Antimony, Arsenic, Lead, Nickel, Selenium and Silver for sample MEGDIM0110 (AES sample number 030220G-01) were outside the required 75-125 % limits. A post digestion spike was performed and the recovery for Antimony was within acceptable limits. The results for these elements are flagged with an "N" as specified by the protocol. This indicates possible matrix interference.

3) The digested spike recoveries for the elements Arsenic, Lead, Mercury and Selenium for sample MEGUSH8611 (AES sample number 030224C-01) were outside the required 75-125 % limits. A post digestion spike was performed and the recoveries for Lead and Selenium were within acceptable limits. The results for these elements are flagged with an "N" as specified by the protocol. This indicates possible matrix interference.

4) The elements Chromium, Iron and Zinc for sample MEGDIM0110 (AES sample number 030220G-01) did not meet the serial dilution criteria of 10 %. These elements are flagged with an "E" as required by the protocol for the water samples. The "E" denotes an estimated value. This indicates a possible chemical or physical interference.

5) The %RPD recovery for Lead between sample MEGDIM0110 (AES sample number 030220G-01) and the duplicate sample was outside of the required 20 % acceptance limit. The results for this element are flagged with an "*" as required by the protocol.

Inorganics – Filtered Metals

1) The recovery for Calcium and Iron in the ICSA and the ICSAB check standards were outside the required limit. The required concentration for these analytes in the check standards is 500,000 ug/L and 200,000 ug/L, respectively. The linear range on this instrument for Calcium and Iron is 200,000 ug/L and 80,000 ug/L, respectively. At this level accurate recovery of Calcium and Iron in the check standards is not possible. No further action is required.

2) The digested spike recoveries for the elements Arsenic, Lead, Selenium and Silver for sample MEGDIM0110 filtered (AES sample number 030220G-01) were outside the required 75-125 % limits. A post digestion spike was performed and all recoveries were within acceptable limits. The results for these elements are flagged with an "N" as specified by the protocol. This indicates possible matrix interference.

3) The digested spike recovery for the element Mercury for sample MEGUSH9601 filtered (AES sample number 030220G-02) was outside the required 75-125 % limits. The results for this element are flagged with an "N" as specified by the protocol. This indicates possible matrix interference.

4) The digested spike recoveries for the elements Arsenic and Mercury for sample MEGUSH8611 (AES sample number 030224C-01) were outside the required 75-125 % limits. A post digestion spike was performed and the recovery for Arsenic was within acceptable limits. The results for these elements are flagged with an "N" as specified by the protocol. This indicates possible matrix interference.

Conventionals

1) Samples MEGDD0121 and MEGDIM0128 (AES sample numbers 030220G-03 and 030220G-07) were used for the Cyanide and Phenols matrix spike and duplicate analysis. All recoveries were within required limits.

SEMIVOLATILE METHOD BLANK SUMMARY

EPA SAMPLE NO.

WBLK03

Lab Name: AES, Inc. Contract:

Lab Code: AES Case No.: URS0307 SAS No.: SDG No.: MEGCD0131

Lab File ID: B0538 Lab Sample ID: WBLK 2/26/03

Instrument ID: 5973 B Date Extracted: 02/26/03

Matrix: (soil/water) WATER Date Analyzed: 03/17/03

Level: (low/med) LOW Time Analyzed: 18:38

THIS METHOD BLANK APPLIES TO THE FOLLOWING SAMPLES, MS AND MSD:

	EPA SAMPLE NO.	LAB SAMPLE ID	LAB FILE ID	DATE ANALYZED
1	MEGUSH8611	MEGUSH8611	B0568	03/19/03
2	MEGCD0131	MEGCD0131	B0569	03/19/03

Initially this project was received as a routine analysis. On 2/26/03 the samples were requested to have a NYSDEC ASP Category B data package supplied. At this time some of the analyses had been extracted and/or completed.

Volatile Organics

1) The samples were analyzed using EPA Method 8260 as per the NYSDEC Analytical Services Protocol 10/95 revision Exhibit E.

2) The %RSD for the compound Bromomethane in the initial calibration analyzed on 2/21/03 was outside the criteria established by the method. The %RSD for this compound was 25.3 %. The RRF for the compound Trichloroethene in the initial calibration analyzed on 2/21/03 was outside the required limits. The RRF for this compound was 0.283. According to the protocol, two volatile organic compounds may exceed the %RSD limit of 20.5 % as long as the %RSD is less than 40 % and the RRF is above 0.010. The %RSD was less than 40 % and the RRF was greater than 0.010 for these compounds.

3) The %D for the compound 1,2-Dichloroethane in the continuing calibration analyzed on 2/26/03 was outside the criteria established by the method. The %D for this compound was 27.2 %. According to the protocol, two volatile organic compounds may exceed the %D limit of 25.0 % and the minimum RRF values as long as the %D is less than 40 % and the RRF is above 0.010. The %D was below 40 % and the RRF was greater than 0.010 for this compound.

4) Sample MEGDIM0128 (AES sample number 030220G-07) was used for the matrix spike and matrix spike duplicate analysis. All recoveries were within required limits.

5) The surrogate recovery for 1,2-Dichloroethane-d4 on sample MEGDD014 (AES sample number 030218J-04) was outside required limits. The recovery was just above the specified limits. This sample was not re-analyzed.

6) The column used in Instrument C for analysis was an RTX-502.2, 60 meters long with an internal diameter of 0.32 mm. The trap used for this instrument is a VOCARB 4000 with Carbopack C&B / Carboxen 1000 & 1001.

Semi-Volatile Organics

1) The samples were analyzed for Polynuclear Aromatic Hydrocarbons only using EPA Method 8270 as per the NYSDEC Analytical Services Protocol 10/95 revision Exhibit E.

2) The RRF for the compound N-Nitroso-di-n-propylamine in the initial calibration analyzed on 12/17/02 was outside the required limits. The RRF for this compound was 0.494. According to the protocol, four semi-volatile organic compounds may exceed the %RSD limit of 20.5 % or the specified RRF as long as the %RSD is less than 40 % and the RRF is above 0.010. The %RSD was below 40 % and the RRF was greater than 0.010 for this compound.

3) The %D for the compound Terphenyl-d14 in the continuing calibration analyzed on 2/28/03 was outside the criteria established by the method. The %D for this compound was 25.9 %. According to the protocol, four semi-volatile organic compounds may exceed the %D limit of 25.0 % and the minimum RRF values as long as the %D is less than 40 % and the RRF is above 0.010. The %D was below 40 % and the RRF was greater than 0.010 for this compound.

314 North Pearl Street • Albany, New York 12207 • 800-848-4983 • (518) 434-4546 • Fax (518) 434-0891

4) The RRF for the compound N-Nitroso-di-n-propylamine in the continuing calibration analyzed on 3/18/03 was outside the required limits. The RRF for this compound was 0.472. According to the protocol, four semi-volatile organic compounds may exceed the %D limit of 25.0 % and the minimum RRF values as long as the %D is less than 40 % and the RRF is above 0.010. The %D was below 40 % and the RRF was greater than 0.010 for this compound.

5) The %D's for the compounds Pyrene and Terphenyl-d14 in the continuing calibration analyzed on 3/24/03 were outside the criteria established by the method. The %D's for these compounds were 32.1 % and 37.9 %, respectively. The RRF for the compound N-Nitroso-di-n-propylamine in the continuing calibration analyzed on 3/24/03 was outside the required limits. The RRF for this compound was 0.404. According to the protocol, four semi-volatile organic compounds may exceed the %D limit of 25.0 % and the minimum RRF values as long as the %D is less than 40 % and the RRF is above 0.010. The %D was below 40 % and the RRF was greater than 0.010 for these compounds.

6) Sample MEGDIM0128 (AES sample number 030220G-07) was used for the matrix spike and the matrix spike duplicate analysis. All recoveries were within required limits.

7) The surrogate recovery for Nitrobenzene-d5 on sample MEGDSH0121 (AES sample number 030220G-04) was outside required limits. According to the protocol, one base/neutral surrogate may be outside specified limits with no further action necessary.

Inorganics – Total Metals

1) The recovery for Calcium and Iron in the ICSA and the ICSAB check standards were outside the required limit. The required concentration for these analytes in the check standards is 500,000 ug/L and 200,000 ug/L, respectively. The linear range on this instrument for Calcium and Iron is 200,000 ug/L and 80,000 ug/L, respectively. At this level accurate recovery of Calcium and Iron in the check standards is not possible. No further action is required.

2) The digested spike recoveries for the elements Antimony, Arsenic, Lead, Nickel, Selenium and Silver for sample MEGDIM0110 (AES sample number 030220G-01) were outside the required 75-125 % limits. A post digestion spike was performed and the recovery for Antimony was within acceptable limits. The results for these elements are flagged with an "N" as specified by the protocol. This indicates possible matrix interference.

3) The digested spike recoveries for the elements Arsenic, Lead, Mercury and Selenium for sample MEGUSH8611 (AES sample number 030224C-01) were outside the required 75-125 % limits. A post digestion spike was performed and the recoveries for Lead and Selenium were within acceptable limits. The results for these elements are flagged with an "N" as specified by the protocol. This indicates possible matrix interference.

314 North Pearl Street • Albany, New York 12207 • 800-848-4983 • (518) 434-4546 • Fax (518) 434-0891

4) The elements Chromium, Iron and Zinc for sample MEGDIM0110 (AES sample number 030220G-01) did not meet the serial dilution criteria of 10 %. These elements are flagged with an "E" as required by the protocol for the water samples. The "E" denotes an estimated value. This indicates a possible chemical or physical interference.

5) The %RPD recovery for Lead between sample MEGDIM0110 (AES sample number 030220G-01) and the duplicate sample was outside of the required 20 % acceptance limit. The results for this element are flagged with an "*" as required by the protocol.

Inorganics – Filtered Metals

1) The recovery for Calcium and Iron in the ICSA and the ICSAB check standards were outside the required limit. The required concentration for these analytes in the check standards is 500,000 ug/L and 200,000 ug/L, respectively. The linear range on this instrument for Calcium and Iron is 200,000 ug/L and 80,000 ug/L, respectively. At this level accurate recovery of Calcium and Iron in the check standards is not possible. No further action is required.

2) The digested spike recoveries for the elements Arsenic, Lead, Selenium and Silver for sample MEGDIM0110 filtered (AES sample number 030220G-01) were outside the required 75-125 % limits. A post digestion spike was performed and all recoveries were within acceptable limits. The results for these elements are flagged with an "N" as specified by the protocol. This indicates possible matrix interference.

3) The digested spike recovery for the element Mercury for sample MEGUSH9601 filtered (AES sample number 030220G-02) was outside the required 75-125 % limits. The results for this element are flagged with an "N" as specified by the protocol. This indicates possible matrix interference.

4) The digested spike recoveries for the elements Arsenic and Mercury for sample MEGUSH8611 (AES sample number 030224C-01) were outside the required 75-125 % limits. A post digestion spike was performed and the recovery for Arsenic was within acceptable limits. The results for these elements are flagged with an "N" as specified by the protocol. This indicates possible matrix interference.

Conventionals

1) Samples MEGDD0121 and MEGDIM0128 (AES sample numbers 030220G-03 and 030220G-07) were used for the Cyanide and Phenols matrix spike and duplicate analysis. All recoveries were within required limits.

CLP

SAMPLE CALCULATIONS FOR VOLATILE ORGANICS:

1) RRF of Benzene from the VSTD050 analyzed on 2/26/03:

$$= \frac{\text{area of Benzene in std.}}{\text{area of internal std}} \quad \mathbf{X} \quad \frac{\text{concentration of internal standard.}}{\text{concentration of standard}}$$

$$= \frac{92859}{43304} \times \frac{50}{50} = 2.144$$

2) Amount of Benzene in sample MEGDD0121 (AES sample number 030220G-03):

$$\text{ug/L} = \frac{\text{area of Benzene in sample}}{\text{area of internal standard in sample}} \times \frac{\text{amount of internal std. (ng)}}{\text{(ml of sample purged)(RRF)}}$$

$$= \frac{19508}{42185} \times \frac{(250)}{(5.0)(2.144)} = 10.8 \text{ ug/L}$$

which is reported as 11 ug/L on the Form I for Volatile Organics

3) Calculation of spike recovery for Benzene in sample MEGDIM0128 MS:

$$\text{Percent spike recovery} = \frac{\text{quantity determined by analysis}}{\text{quantity added to sample}} \times 100$$

$$\text{\% recovery of Benzene} = \frac{(44.7 - 1.5)}{50.0} \times 100 = 86.4\ \%$$

CLP

SAMPLE CALCULATIONS FOR SEMI-VOLATILE ORGANICS:

1) RRF of Naphthalene from the STD050 analyzed on 3/17/03:

$$= \frac{\text{area of Naphthalene in std.}}{\text{area of internal std}} \times \frac{\text{concentration of internal standard.}}{\text{concentration of standard}}$$

$$= \frac{220473}{178036} \times \frac{40}{50} = 0.991$$

2) Concentration of Naphthalene in sample MEGDD0121 (AES sample number 030220G-03):

$$\text{ug/L} = \frac{\text{area of Naphthalene in sample}}{\text{area of internal standard in sample}} \times \frac{\{\text{amount of internal std. (ng)}\}\{\text{Vol. extract (ul)}\}(\text{Df})}{\{\text{Vol. extracted (ml)}\}(\text{RRF})\{\text{Vol. injected(uL)}\}}$$

$$= \frac{162859}{148243} \times \frac{(40)(1000)(1)}{(970)(0.991)(2)} = 22.9 \text{ ug/L}$$

which is reported as 23 ug/L on the Form I for Semi-Volatile Organics

3) Calculation of spike recovery for Acenaphthene for MEGDIM0128 Matrix Spike:

$$\text{Percent spike recovery} = \frac{\text{quantity determined by analysis}}{\text{quantity added to sample}} \times 100$$

$$\text{\% recovery of Acenaphthene} = \frac{(18.5 - 0.0)}{25.0} \times 100 = 74.0\ \%$$
