TITLE PAGE

On February 28, 2003 nine water samples were received by Adirondack Environmental Services, Inc. from URS Consultants, Inc. at the NYSEG Mechanicville site. These samples were analyzed for Volatile Organics, Semi-Volatile Organics, Metals and Conventionals as specified by the contract. The project was completed on April 11, 2003.

Volatile Organics

1) The samples were analyzed using EPA Method 8260 as per the NYSDEC Analytical Services Protocol 10/95 revision Exhibit E.

2) The %RSD for the compound Bromomethane in the initial calibration analyzed on 2/21/03 was outside the criteria established by the method. The %RSD for this compound was 25.3 %. The RRF for the compound Trichloroethene in the initial calibration analyzed on 2/21/03 was outside the required limits. The RRF for this compound was 0.283. According to the protocol, two volatile organic compounds may exceed the %RSD limit of 20.5 % as long as the %RSD is less than 40 % and the RRF is above 0.010. The %RSD was less than 40 % and the RRF was greater than 0.010 for these compounds.

3) The RRF for the compound Trichloroethene in the continuing calibration analyzed on 3/3/03 was outside the required limits. The RRF for this compound was 0.292. According to the protocol, two volatile organic compounds may exceed the %D limit of 25.0 % and the minimum RRF values as long as the %D is less than 40 % and the RRF is above 0.010. The %D was below 40 % and the RRF was greater than 0.010 for this compound.

4) Sample MEGDIM0237 (AES sample number 030228H-01) was used for the matrix spike and matrix spike duplicate analysis. All recoveries were within required limits.

Adirondack Environmental Services, Inc.
Experience is the solution
314 North Pearl Street • Albany, New York 12207 • 800-848-4983 • (518) 434-4546 • Fax (518) 434-0891

5) The surrogate recovery for Toluene-d8 on sample MEGUIM0119 (AES sample number 030228H-03) was outside required limits. The recovery was just above the specified limits. This sample was not re-analyzed.

6) The surrogate recovery for sample MEGDIM0237 MSD (AES sample number 030228H-01 MSD) was outside required limits. According to the protocol, matrix spike and matrix spike duplicate are not re-analyzed for surrogate recoveries outside specified limits.

7) The column used in Instrument C for analysis was an RTX-502.2, 60 meters long with an internal diameter of 0.32 mm. The trap used for this instrument is a VOCARB 4000 with Carbopack C&B / Carboxen 1000 & 1001.

Semi-Volatile Organics

1) The samples were analyzed for Polynuclear Aromatic Hydrocarbons only using EPA Method 8270 as per the NYSDEC Analytical Services Protocol 10/95 revision Exhibit E.

2) The %D for the compound Benzo(k)fluoranthene in the continuing calibration analyzed on 3/29/03 was outside the criteria established by the method. The %D for this compound was 25.5 %. According to the protocol, four semi-volatile organic compounds may exceed the %D limit of 25.0 % and the minimum RRF values as long as the %D is less than 40 % and the RRF is above 0.010. The %D was below 40 % and the RRF was greater than 0.010 for this compound.

3) Sample MEGDIM0237 (AES sample number 030228H-01) was used for the matrix spike and the matrix spike duplicate analysis. Several of the recoveries in the matrix spike and matrix spike duplicate were outside required limits. According to the protocol, a matrix spike blank must be analyzed. A matrix spike blank was analyzed and all recoveries were within required limits.

Inorganics – Total Metals

1) The recovery for Calcium and Iron in the ICSA and the ICSAB check standards were outside the required limit. The required concentration for these analytes in the check standards is 500,000 ug/L and 200,000 ug/L, respectively. The linear range on this instrument for Calcium and Iron is 200,000 ug/L and 80,000 ug/L, respectively. At this level accurate recovery of Calcium and Iron in the check standards is not possible. No further action is required.

Adirondack Environmental Services, Inc.
Experience is the solution
314 North Pearl Street • Albany, New York 12207 • 800-848-4983 • (518) 434-4546 • Fax (518) 434-0891

2) The digested spike recoveries for the elements Aluminum, Arsenic, Mercury and Selenium for sample MEGDIM0237 (AES sample number 030228H-01) were outside the required 75-125 % limits. A post digestion spike was performed and the recoveries for Aluminum and Selenium were within acceptable limits. The results for these elements are flagged with an "N" as specified by the protocol. This indicates possible matrix interference.

Inorganics – Filtered Metals

1) The recovery for Calcium and Iron in the ICSA and the ICSAB check standards were outside the required limit. The required concentration for these analytes in the check standards is 500,000 ug/L and 200,000 ug/L, respectively. The linear range on this instrument for Calcium and Iron is 200,000 ug/L and 80,000 ug/L, respectively. At this level accurate recovery of Calcium and Iron in the check standards is not possible. No further action is required.

2) The digested spike recoveries for the elements Aluminum, Arsenic, Lead, Manganese, Mercury, Selenium and Zinc for sample MEGDIM0237 filtered (AES sample number 030228H-01) were outside the required 75-125 % limits. A post digestion spike was performed and all recoveries, except Arsenic were within acceptable limits. The results for these elements are flagged with an "N" as specified by the protocol. This indicates possible matrix interference.

3) The elements Iron and Manganese for sample MEGDIM0237 filtered (AES sample number 030228H-01) did not meet the serial dilution criteria of 10 %. These elements are flagged with an "E" as required by the protocol for the water samples. The "E" denotes an estimated value. This indicates a possible chemical or physical interference.

4) The %RPD recovery for Lead between sample MEGDIM0110 (AES sample number 030220G-01) and the duplicate sample was outside of the required 20 % acceptance limit. The results for this element are flagged with an "*" as required by the protocol.

Conventionals

1) Samples MEGDIM0237 (AES sample number 030228H-01) were used for the Cyanide and Phenols matrix spike and duplicate analysis. All recoveries were within required limits.

SEMIVOLATILE ORGANICS ANALYSIS DATA SHEET

EPA SAMPLE NO.

WBLK01

Lab Name: AES, Inc. Contract:

Lab Code: AES Case No.: URS0310 SAS No.: SDG No.: MEGDD0120

Matrix: (soil/water) WATER Lab Sample ID: WBLK 3/4/03

Sample wt/vol: 1000.0 (g/mL) ML Lab File ID: A3158

Level: (low/med) LOW Date Received:

% Moisture: _____ decanted: (Y/N)___ Date Extracted: 03/04/03

Concentrated Extract Volume: 1000.0 (uL) Date Analyzed: 03/30/03

Injection Volume: 2.0 (uL) Dilution Factor: 1.0

GPC Cleanup: (Y/N) N pH: 7.0

CAS NO.	COMPOUND	CONCENTRATION UNITS: (ug/L or ug/Kg) UG/L	Q
91-20-3	Naphthalene	5.	U
91-57-6	2-Methylnaphthalene	5.	U
208-96-8	Acenaphthylene	5.	U
83-32-9	Acenaphthene	5.	U
132-64-9	Dibenzofuran	5.	U
86-73-7	Fluorene	5.	U

Volatile Organics

1) The samples were analyzed using EPA Method 8260 as per the NYSDEC Analytical Services Protocol 10/95 revision Exhibit E.

2) The %RSD for the compound Bromomethane in the initial calibration analyzed on 2/21/03 was outside the criteria established by the method. The %RSD for this compound was 25.3 %. The RRF for the compound Trichloroethene in the initial calibration analyzed on 2/21/03 was outside the required limits. The RRF for this compound was 0.283. According to the protocol, two volatile organic compounds may exceed the %RSD limit of 20.5 % as long as the %RSD is less than 40 % and the RRF is above 0.010. The %RSD was less than 40 % and the RRF was greater than 0.010 for these compounds.

3) The RRF for the compound Trichloroethene in the continuing calibration analyzed on 3/3/03 was outside the required limits. The RRF for this compound was 0.292. According to the protocol, two volatile organic compounds may exceed the %D limit of 25.0 % and the minimum RRF values as long as the %D is less than 40 % and the RRF is above 0.010. The %D was below 40 % and the RRF was greater than 0.010 for this compound.

4) Sample MEGDIM0237 (AES sample number 030228H-01) was used for the matrix spike and matrix spike duplicate analysis. All recoveries were within required limits.

Experience is the solution
314 North Pearl Street • Albany, New York 12207 • 800-848-4983 • (518) 434-4546 • Fax (518) 434-0891

5) The surrogate recovery for Toluene-d8 on sample MEGUIM0119 (AES sample number 030228H-03) was outside required limits. The recovery was just above the specified limits. This sample was not re-analyzed.

6) The surrogate recovery for sample MEGDIM0237 MSD (AES sample number 030228H-01 MSD) was outside required limits. According to the protocol, matrix spike and matrix spike duplicate are not re-analyzed for surrogate recoveries outside specified limits.

7) The column used in Instrument C for analysis was an RTX-502.2, 60 meters long with an internal diameter of 0.32 mm. The trap used for this instrument is a VOCARB 4000 with Carbopack C&B / Carboxen 1000 & 1001.

Semi-Volatile Organics

1) The samples were analyzed for Polynuclear Aromatic Hydrocarbons only using EPA Method 8270 as per the NYSDEC Analytical Services Protocol 10/95 revision Exhibit E.

2) The %D for the compound Benzo(k)fluoranthene in the continuing calibration analyzed on 3/29/03 was outside the criteria established by the method. The %D for this compound was 25.5 %. According to the protocol, four semi-volatile organic compounds may exceed the %D limit of 25.0 % and the minimum RRF values as long as the %D is less than 40 % and the RRF is above 0.010. The %D was below 40 % and the RRF was greater than 0.010 for this compound.

3) Sample MEGDIM0237 (AES sample number 030228H-01) was used for the matrix spike and the matrix spike duplicate analysis. Several of the recoveries in the matrix spike and matrix spike duplicate were outside required limits. According to the protocol, a matrix spike blank must be analyzed. A matrix spike blank was analyzed and all recoveries were within required limits.

Inorganics – Total Metals

1) The recovery for Calcium and Iron in the ICSA and the ICSAB check standards were outside the required limit. The required concentration for these analytes in the check standards is 500,000 ug/L and 200,000 ug/L, respectively. The linear range on this instrument for Calcium and Iron is 200,000 ug/L and 80,000 ug/L, respectively. At this level accurate recovery of Calcium and Iron in the check standards is not possible. No further action is required.

Adirondack Environmental Services, Inc.
Experience is the solution
314 North Pearl Street • Albany, New York 12207 • 800-848-4983 • (518) 434-4546 • Fax (518) 434-0891

2) The digested spike recoveries for the elements Aluminum, Arsenic, Mercury and Selenium for sample MEGDIM0237 (AES sample number 030228H-01) were outside the required 75-125 % limits. A post digestion spike was performed and the recoveries for Aluminum and Selenium were within acceptable limits. The results for these elements are flagged with an "N" as specified by the protocol. This indicates possible matrix interference.

Inorganics – Filtered Metals

1) The recovery for Calcium and Iron in the ICSA and the ICSAB check standards were outside the required limit. The required concentration for these analytes in the check standards is 500,000 ug/L and 200,000 ug/L, respectively. The linear range on this instrument for Calcium and Iron is 200,000 ug/L and 80,000 ug/L, respectively. At this level accurate recovery of Calcium and Iron in the check standards is not possible. No further action is required.

2) The digested spike recoveries for the elements Aluminum, Arsenic, Lead, Manganese, Mercury, Selenium and Zinc for sample MEGDIM0237 filtered (AES sample number 030228H-01) were outside the required 75-125 % limits. A post digestion spike was performed and all recoveries, except Arsenic were within acceptable limits. The results for these elements are flagged with an "N" as specified by the protocol. This indicates possible matrix interference.

3) The elements Iron and Manganese for sample MEGDIM0237 filtered (AES sample number 030228H-01) did not meet the serial dilution criteria of 10 %. These elements are flagged with an "E" as required by the protocol for the water samples. The "E" denotes an estimated value. This indicates a possible chemical or physical interference.

4) The %RPD recovery for Lead between sample MEGDIM0110 (AES sample number 030220G-01) and the duplicate sample was outside of the required 20 % acceptance limit. The results for this element are flagged with an "*" as required by the protocol.

Conventionals

1) Samples MEGDIM0237 (AES sample number 030228H-01) were used for the Cyanide and Phenols matrix spike and duplicate analysis. All recoveries were within required limits.

CLP

SAMPLE CALCULATIONS FOR VOLATILE ORGANICS:

1) RRF of Benzene from the VSTD050 analyzed on 3/3/03:

$$= \frac{\text{area of Benzene in std.}}{\text{area of internal std}} \quad \mathbf{X} \quad \frac{\text{concentration of internal standard.}}{\text{concentration of standard}}$$

$$= \frac{103828}{49886} \times \frac{50}{50} = 2.081$$

2) Amount of Benzene in sample MEGDIM0237 MS (AES sample number 030228H-01 MS):

$$\text{ug/L} = \frac{\text{area of Benzene in sample}}{\text{area of internal standard in sample}} \times \frac{\text{amount of internal std. (ng)}}{\text{(ml of sample purged)(RRF)}}$$

$$= \frac{89565}{45607} \times \frac{(250)}{(5.0)(2.081)} = 47.2 \text{ ug/L}$$

which is reported as 47 ug/L on the Form I for Volatile Organics

3) Calculation of spike recovery for Benzene in sample MEGDIM0237 MS:

$$\text{Percent spike recovery} = \frac{\text{quantity determined by analysis}}{\text{quantity added to sample}} \times 100$$

$$\text{\% recovery of Benzene} = \frac{(47.2 - 0.0)}{50.0} \times 100 = 94.4\ \%$$

Title : CLP BNA Calibration
Last Update : Tue Apr 01 10:15:57 2003
Response via : Multiple Level Calibration

	Compound	R.T.	QIon	Response	Conc	Unit		Qvalue
35)	2,4,6-Trichlorophenol	18.34	196	228018	50.19			50
36)	2,4,5-Trichlorophenol	18.44	196	248407	52.24			49
38)	2-Chloronaphthalene	18.78	162	540566	52.07			74
39)	2-Nitroaniline	19.38	65	256913	49.38		#	51
40)	Dimethylphthalate	20.16	163	420879	51.48			96
41)	Acenaphthylene	20.14	152	700067	51.18		#	95
42)	2,6-Dinitrotoluene	20.33	165	128527	51.25		#	63
43)	3-Nitroaniline	20.74	138	191955	49.09		#	35
44)	Acenaphthene	20.75	153	759451	48.90			49
45)	2,4-Dinitrophenol	21.08	184	77609	37.21			66
46)	4-Nitrophenol	21.47	109	202980	50.11		#	20
47)	Dibenzofuran	21.27	168	660773	52.42			79
48)	2,4-Dinitrotoluene	21.57	165	179043	50.02		#	64
49)	Diethylphthalate	22.45	149	535423	49.80			95
50)	Fluorene	22.36	166	825489	52.02			58
51)	4-Chlorophenyl-phenylether	22.48	204	370970	54.23			61
52)	4-Nitroaniline	22.72	138	187458	50.90			64
54)	4,6-Dinitro-2-methylphenol	22.83	198	77109	48.60			100
55)	n-Nitrosodiphenylamine	22.92	169	512898	54.48			59
57)	4-Bromophenyl-phenylether	24.00	248	327716	56.39		#	41
58)	Hexachlorobenzene	24.38	284	254356	59.77		#	56
59)	Pentachlorophenol	25.00	266	217288	59.18		#	46
60)	Phenanthrene	25.38	178	830089	50.93		#	95
61)	Anthracene	25.52	178	847178	51.78			95
62)	Benzidine	29.63	184	269293	84.78	ug		97
63)	Carbazole	26.15	167	564538	49.65	ug		100
64)	Di-n-butylphthalate	27.58	149	876513	49.62		#	96
65)	Fluoranthene	29.08	202	824575	51.98		#	83
67)	Pyrene	29.71	202	997042	44.97		#	77
69)	Butylbenzylphthalate	31.87	149	665611	43.85		#	58
70)	Benzo[a]anthracene	33.10	228	1073113	48.96			81
71)	3,3'-Dichlorobenzidine	33.17	252	511172	52.13		#	68
72)	Chyrsene	33.20	228	1083596	48.37		m	91
73)	bis(2-Ethylhexyl)phthalate	33.51	149	790105	45.03		#	90
75)	Di-n-octylphthalate	35.40	149	1139427	40.59			97
76)	Benzo[b]fluoranthene	36.54	252	1207410	45.28		#	70
77)	Benzo[k]fluoranthene	36.64	252	1210034	47.75		#	69
78)	Benzo[a]pyrene	37.84	252	1153435	48.04		#	76
79)	Indeno[1,2,3-cd]pyrene	43.98	276	1102415	48.39		m	64
80)	Dibenz[a,h]anthracene	44.22	278	1290340	52.34		#	53
81)	Benzo[g,h,i]perylene	45.76	276	1370946	51.03		#	45

CLP

SAMPLE CALCULATIONS FOR SEMI-VOLATILE ORGANICS:

1) RRF of Acenaphthene from the STD050 analyzed on 3/31/03:

$$= \frac{\text{area of Acenaphthene in std.}}{\text{area of internal std}} \times \frac{\text{concentration of internal standard.}}{\text{concentration of standard}}$$

$$= \frac{759451}{267643} \times \frac{40}{50} = 2.270$$

2) Concentration of Acenaphthene in sample MEGDIM0237 MS (AES sample number 030228H-01 MS):

$$\text{ug/L} = \frac{\text{area of Acenaphthene in sample}}{\text{area of internal standard in sample}} \times \frac{\{\text{amount of internal std. (ng)}\}\{\text{Vol. extract (ul)}\}(\text{Df})}{\{\text{Vol. extracted (ml)}\}(\text{RRF})\{\text{Vol. injected(uL)}\}}$$

$$= \frac{283839}{172009} \times \frac{(40)(1000)(1)}{(1000)(2.270)(2)} = 14.5 \text{ ug/L}$$

which is reported as 15 ug/L on the Form I for Semi-Volatile Organics

3) Calculation of spike recovery for Acenaphthene for MEGDIM0237 Matrix Spike:

$$\text{Percent spike recovery} = \frac{\text{quantity determined by analysis}}{\text{quantity added to sample}} \times 100$$

$$\text{\% recovery of Acenaphthene} = \frac{(14.5 - 0.0)}{25.0} \times 100 = 58.0\ \%$$

Attention: Eriko Fujita

RE: NYSEG Mechanicville Data Packages

Dear Ms. Fujita:

Several samples were submitted for analysis from the NYSEG Mechanicville site in February 2003. After the data packages were received by and reviewed you asked if any Methyl-tert-butyl ether (MTBE) was present. Based on a Tentatively Identified Compound (TIC) search of the samples submitted **none** of the samples contained MTBE.

If you should have any other questions regarding this project, please feel free to contact us.

Sincerely,

Christopher Hess
Quality Assurance Manager

RE: M'Ville/MGP Site

Order No.: 030602014

Dear Eriko Fujita:

Adirondack Environmental Services, Inc received 3 samples on 6/2/2003 for the analyses presented in the following report.

There were no problems with the analyses and all associated QC met EPA or laboratory specifications, except if noted.

If you have any questions regarding these tests results, please feel free to call.

Sincerely,

ELAP#: 10709
AIHA#: 100307

TERMS, CONDITIONS & LIMITATIONS

All Services rendered by **Adirondack Environmental Services, Inc.** are undertaken and all rates are based upon the following terms:

(a) Neither **Adirondack Environmental Services, Inc.**, nor any of its employees, agents or sub-contractors shall be liable for any loss or damage arising out of **Adirondack Environmental Services, Inc.'s** performance or non-performance, whether by way of negligence or breach of contract, or otherwise, in any amount greater than twice the amount billed to the customer for the work leading to the claim of the customer. Said remedy shall be the sole and exclusive remedy against **Adirondack Environmental Services, Inc.** arising out of its work.

(b) All claims made must be in writing within forty-five (45) days after delivery of the **Adirondack Environmental Services, Inc.** report regarding said work or such claim shall be deemed as irrevocably waived.

(c) **Adirondack Environmental Services, Inc.** reports are submitted in writing and are for our customers only. Our customers are considered to be only those entities being billed for our services. Acquisition of an **Adirondack Environmental Services, Inc.** report by other than our customer does not constitute a representation of **Adirondack Environmental Services, Inc.** as to the accuracy of the contents thereof.

(d) In no event shall **Adirondack Environmental Services, Inc.**, its employees agents or sub-contractors be responsible for consequential or special damages of any kind or in any amount.

(e) No deviation from the terms set forth herein shall bind **Adirondack Environmental Services, Inc.** unless in writing and signed by a Director of **Adirondack Environmental Services, Inc.**

(f) Results pertain only to items analyzed. Information supplied by client is assumed to be correct. This information may be used on reports and in calculations and **Adirondack Environmental Services, Inc.** is not responsible for the accuracy of this information.

Sample Delivery Group Narrative

Project: Mechanicville

Client: URS
646 Plank Road, Suite 202
Clifton Park, NY 12065

Report Contact: Eriko Fujita

Date of Receipt: 4/17/01, 10/03/02

Sample Summary:

The samples received for this project are summarized in the attached sample login forms.

META Project Number: U03003-60

Chain of Custody

Samples were received in good condition. The internal temperatures of the shipment containers were as follows:

Sample received 4/17/2001	10.3°C
Sample received 10/03/2002	4.8°C

Internal chain of custody procedures were followed after sample receipt. Samples were stored in a locked refrigerator. A sample custody logbook contains the record of sample removal from the secure sample storage area to the sample preparation laboratory. The custody record for the sample extracts is present on the sample extraction logbook page.

The disposal of samples and extracts will be authorized 1 month after the release of this data report. Sample disposal will be documented.

Methods

The samples were prepared by solvent extraction (EPA 3570) using dichloromethane (DCM). The extracts were spiked with internal standard and analyzed by GC/FID (EPA 8100 mod.) and GC/MS (EPA 8270 mod.).

Results

Sample results were presented in summary forms (CLP Form 1 equivalent) which follow this narrative.

Quality Control

Analyte Flags

The detection limits were determined as the sample equivalent of the lowest linear initial calibration standard. Analytes measured between 50% and 100% of the lowest standard were reported as "estimated" and flagged with the letter "J." No value was reported above the calibration range. Undetected analytes were flagged with the letter, "U." Analytes marked with a "B" were detected in the associated blank and should be reviewed for a possible positive bias. No deviations were thought significant enough to compromise the integrity of the reported values.

Holding Times

The soil samples were frozen upon receipt on 4/17/01 in anticipation of later sediment sampling. Upon receipt of the sediment samples, the soils were thawed and all the samples were extracted within seven days of sediment sampling. All extracts were stored at 4°C ± 2° C prior to analysis. All extracts were analyzed within 40 days of sample preparation.

Blanks

No target analytes were present above the detection limits in the blank.

Internal Standards

Internal standards were recovered within acceptable QC limits (50%-200%) relative to the continuing calibration standards.

Interpretation

Sample MESB00020116
This sample contained low concentrations of a few PAHs, but did not contain any recognizable hydrocarbon patterns.

Sample MESB12140116
This sample contained pyrogenic and petrogenic substances (see definitions). The pattern of PAHs, especially the ratios of fluoranthene to pyrene and dibenzofuran to fluorene indicate that this sample contains MGP tar, probably from a carburetted water gas (CWG) process. The reduced concentration of naphthalene relative to other PAHs indicates that this material has been moderately weathered.

The petroleum is indicated by an unresolved complex mixture (UCM or "hump") which eluted from approximately decane (C10 - 9 minutes) to hexacosane (C26 - 27 minutes). Examples of common petroleum products with these features include middle distillates such as diesel and #2 fuel oils.

Sample MESB14160116
This sample contained pyrogenic and petrogenic substances. The patterns and ratios of PAHs are consistent with MGP tar, probably CWG. The reduced concentration of naphthalene relative to other PAHs indicates that this material has been subject to mild to moderate weathering.

The petroleum is indicated by a UCM from approximately decane (C10 - 9 minutes) to hexacosane (C26 - 27 minutes). Examples of common petroleum products with these features include middle distillates such as diesel and #2 fuel oils.

Sample MESB16180118
This sample contained pyrogenic and petrogenic substances. The patterns and ratios of hydrocarbons are similar to those found in samples MESB12140116 and MESB14160116.

Sample MEMW16160R1
This sample contained pyrogenic and petrogenic substances. The patterns and ratios of PAHs are consistent with MGP tar, probably CWG. The presence of MAHs and high concentration of naphthalene relative to other PAHs indicate that this material is relatively unweathered.

The petroleum is indicated by a UCM from approximately decane (C10 - 9 minutes) to hexacosane (C26 - 27 minutes). Examples of common petroleum products with these features include middle distillates such as diesel and #2 fuel oils.

Sample MEAK00010201
This sample contained low concentrations of a few PAHs, but did not contain any recognizable hydrocarbon patterns.

Sample MEAK00010205

This sample contained a pyrogenic substance. The patterns and ratios of PAHs are consistent with MGP tar, probably CWG. The high concentration of naphthalene relative to other PAHs indicates that this material is relatively unweathered.

Sample MEAK00010207

This sample contained pyrogenic and petrogenic substances. The patterns and ratios of PAHs are consistent with MGP tar, probably CWG. The presence of MAHs and high concentration of naphthalene relative to other PAHs indicate that this material is relatively unweathered.

The petroleum is indicated by a UCM from approximately decane (C10 - 9 minutes) to hexacosane (C26 - 27 minutes). Examples of common petroleum products with these features include middle distillates such as diesel and #2 fuel oils.

Discussion

With the exception of samples MESB00020116 and MEAK00010201, all the samples contained pyrogenic substances consistent with MGP tar from a CWG process. The diagnostic ratios (Table 1 & Figure 1) and ion fingerprints (Appendix E) show that the materials in these samples are reasonably similar, indicating that they share a common source in spite of the variability of the degree of weathering.

Definitions

Pyrogenic substances are complex mixtures of primarily hydrocarbons produced from organic matter subjected to high temperatures but with insufficient oxygen for complete combustion. Pyrogenic materials are produced by fires, internal combustion engines, and furnaces. They also are formed when coke or gas are produced from coal or oil. Coal-tar based products, such as roofing, pavement sealers, waterproofing, pesticides, and some shampoos contain pyrogenic materials.

Petrogenic substances include crude oil and crude oil derivatives such as gasoline, heating oil, and asphalt.

Pitch is the semi-solid or solid material consisting of high molecular weight hydrocarbons that remain following coal tar distillation.

2,5-Dibromotoluene	Not Spiked	50%	150%
2-Bromonaphthalene	Not Spiked	50%	150%
1-Chlorooctadecane	Not Spiked	50%	150%

Qualifiers:

B	Analyte detected in the blank
D	Analyte reported from a diluted extract
U	Undetected above the detection limit
J	Estimated value detected between the reporting and detection limits
E	Estimated value detected above calibration range
RL	Reporting limit is the sample equivalent of the lowest linear calibration concentration
EDL	Estimated detection limit is 50% of the RL

C0 - Benz(a)anthracene/Chrysene		U	0.06	0.03	
C1 - Benz(a)anthracene/Chrysene		U	0.06	0.03	
C2 - Benz(a)anthracene/Chrysene		U	0.06	0.03	
C3 - Benz(a)anthracene/Chrysene		U	0.06	0.03	
C4 - Benz(a)anthracene/Chrysene		U	0.06	0.03	

EXTRACTION SURROGATE COMPOUNDS:	%R	Min	Max
Fluorobenzene	81%	50%	150%
2-Fluorobiphenyl	118%	50%	120%
5a-Androstane	81%	50%	120%
Benzo(a)pyrene-d12	77%	50%	120%

Qualifiers:

B	Analyte detected in the blank
D	Analyte reported from a diluted extract
U	Undetected above the detection limit
J	Estimated value detected between the reporting and detection limits
E	Estimated value detected above calibration range
RL	Reporting limit is the sample equivalent of the lowest linear calibration concentration
EDL	Estimated detection limit is 50% of the RL

GROUNDWATER SAMPLING DATA SHEET
NYSEG-Mechanicville, NY

WELL NO: MW-31S
Page 1 of ____

Field Personnel:
EL
CM

Date: 6/11/01
Job No.: 11035-606
Location: NYSEG Mechanicville

Total Well Depth (from top of casing): 19.65 feet

Depth to Water Surface Before Purging (from top of casing): -17.53 feet

Height of Water Column: = 2.12 feet

Well Diameter (d): 2 inches Gals per ft: (d^2 x 0.0408) = x ~~.153~~ .163

Volume of Water Column Before Purging: = ~~0.353~~ gallons

Volume of Water Equal to three Well Volumes: (Volume of Column by 3.0) ____ gallons

12. = 1032 / x = .26 gal

1.25 x .26 = .330 x 3 = .990

Purging Method: Bladder Pump/Waterra Pump/Peristaltic Pump Meter # ____

Time	Well Volumes (Gallons / Liters)	Depth to Water (feet)	SC (mmhos/cm or µmhos)	Temp (°F or °C)	pH (SU)	Dissolved Oxygen (mg/L)	Redox Potential (mV)	Turbidity (NTU)
0950	1.25	DRY	1.30	14.0	7.07	NA	NA	29.2

Total Volume of Water Purged: .33 gallons/liters

VOCs/Total Phenols Cyanide PAH

Sampling Data:
- Sampling Method: Bailer or Pump
- Depth of Pump intake or bailer: 19.6' feet
- Color: Clear Odor: None Sheen/Appearance: No/Transparent

Notes:

Well was purged with disposable bailer. Went dry after 1.25 Liters
Returned @ 1600 to SAMPLE - Filled 1 VOA well went dry
Bailer (Disposible) - Returned on 6/12/01 @ 0850 Filled 2 VOA vials and 0.5 L (1L glass) For VOCs/Total Phenols
(peristaltic Pump) Returned on 6/13/01 @ 0830 Filled 1. 8oz plastic For Cyanide
↳ Returned on 6/13/01 @ 1330 FILLED 1. 1L GLASS FOR PAH

APPENDIX I
DATA VALIDATION

LIMITED DATA REVIEW SUMMARY

NYSEG MECHANICVILLE SITE

Thirty three water samples, two matrix spike/matrix spike duplicate (MS/MSD) pairs, two field duplicates, and six trip blanks were collected on February 06-28, 2003 from the NYSEG Mechanicville site, Mechanicville, NY. The samples were sent to Adirondack Environmental Services, Inc. of Albany, NY. The samples were analyzed in accordance with New York State Department of Environmental Conservation Analytical Services Protocol (NYSDEC ASP) 1995 for Target Compound List (TCL) Volatile Organic Compounds (VOC) by United States Environmental Protection Agency (USEPA) method 8260, Polynuclear Aromatic Hydrocarbons (PAHs) by USEPA method 8270, Total and Dissolved Metals by USEPA method 6010, Total and Dissolved Mercury by USEPA method 7470, Cyanide by Methods for the Chemical Analysis of Water and Wastes (MCAWW) 335.3, Total Phenols by MCAWW 310.1 and Amenable Cyanide by method 4500CNG (Standard Methods for the Examination of Water and Wastewater, 20^{th} edition, 1998). Not all samples were analyzed for all parameters. All samples were received at Adirondack intact, under proper chain-of-custody (COC) and temperature (i.e., 4°C +/- 2°C).

A limited data review was performed for completeness, holding times, and compliance with the referenced methods. The data was qualified following the guidelines presented in USEPA Region II *Standard Operating Procedure (SOP) for the Validation of Organic Data Acquired Using SW-846 Method 8260B*, SOP HW-24, Revision 1, June 1999; USEPA Region II *SOP for the Validation of Organic Data Acquired Using SW-846 Method 8270C*, SOP HW-22, Revision 2, June 2001; and USEPA Region II *Evaluation of Metals Data for the CLP Program*, SOP HW-2, Revision 11, January 1992. The COCs are presented in Appendix A. The validated Form Is are presented in Appendix B. Definitions of data qualifiers are presented at the end of this text. Only data requiring qualification is discussed in this summary.

VOCs

The initial calibration (ICAL) standards analyzed on 2/14/03 exhibited a relative standard deviation (%RSD) that exceeded the QC limit (i.e., >15%) for VOC methylene chloride. The detected results for methylene chloride were qualified as estimated ("J") in samples MEGDIM0236 and the trip blank (TB030207).

The percent difference (%D) between the ICAL average relative response factor (RRF) and the continuing calibration (CCAL) RRF (2/19/03, 2/26/03, and 2/27/03) exceeded the QC limit (i.e., >20%) for several VOCs. Acetone, choromethane, 1,1-dichloroethane, 1,2-dichloroethane, 4-methyl-2-pentanone, 2-hexanone, chloroethane, methylene chloride, acetone, carbon disulfide, 1,1-dichloroethene, 1,2-dichloroethene-cis, bromodichloromethane, 1,2-dichloropropane, cis-1, 3-dichloropropane, dibromochloromethane, 1,1,2-trichloroethane, trans-1, 3-dichloropropene, bromoform and/or 1,1,2,2-tetrachloroethane were qualified as estimated ("UJ" or "J") in samples DUP021803, DUP022003, MEGCD0115, MEGCIM0102, MEGDD014, MEGDD0117, MEGDD0120, MEGDD0121, MEGDD0123, MEGDD0129, MEGCD0131, MEGDD0132, MEGDD0134, MEGDD0236, MEGDD0237, MEGDD0238, MEGDD0239, MEGDD0240, MEGDD0241, MEGDD0243, MEGDIM0110, MEGDIM0117, MEGDIM0128, MEGDIM0236, MEGDIM0237, MEGDIM8618, MEGDSH8617, MEGSH0121, MEGUIM0119, MEGUSH8601,

MEGUSH8602, MEGUSH8611, MEGUSH8616, Trip Blank (TB) 030207, TB030212, TB030218, TB030220, TB030224, and TB030227.

The recoveries of internal standards (ISs) 1,4-difluorobenzene and chlorobenzene were below the lower QC limit in sample MEGDD0237. All compounds associated with these ISs were qualified as estimated ("UJ"), unless previously qualified due to the calibration outlier.

The recovery of surrogate toluene-d8 was greater than the QC limit (i.e., >110%) in sample MEGUIM0119. The detected result (i.e., chloroform) was qualified as estimated ("J").

No other data qualifications were made, and all other data are usable as reported.

PAHs

The %D between the ICAL average RRF and the CCAL RRF (2/19/03, 2/28/03, 3/19/03, 3/29/03, 3/30/03) exceeded the QC limit (i.e., >20%) for pyrene, benzo (g, h, i) perylene, dibenzo (a, h) anthracene, 2-methylnaphthalene, and/or benzo (k) fluoranthene. These compounds were qualified as estimated ("UJ" or "J") in samples MEGCIM0102, MEGDD0117, MEGDD0132, MEGDD0134, MEGDD0238, MEGDD0240, MEGDD0241, MEGDD0243, MEGDIM0117, MEGDIM0236, MEGDSH0121, and MEGUSH8616.

No other data qualifications were made, and all other data are usable as reported.

METALS

The continuing calibration verifications (CCVs) for aluminum (Al) on the ICP run of 2/20/03 exceeded the upper QC limit (i.e., > 110%). The detected Al results in samples MEGCIM0102, MEGCIM0102 (filtered), MEGDD0241, MEGDD0237, MEGDD0237 (filtered), and MEGDIM8618 were qualified as estimated ("J").

The metals contract required detection limit (CRDL) standards associated with samples MEGCIM0102 (filtered), MEGDD0132 (filtered), MEGDD0134 (filtered), MEGDD0240, MEGDD0240 (filtered), MEGDD0241 (filtered), MEGDIM0237, MEGDIM0237 (filtered), MEGDSH8617, MEGUIM0119, and MEGUIM0119 (filtered) exhibited a high recovery (i.e., >120%) for nickel (Ni), manganese (Mn), lead (Pb), selenium (Se), and/or vanadium (V). The detected Ni, Mn, Pb, Se and/or V results in these samples were qualified as estimated ("J").

The metals CRDL standards associated with samples MEGDD0117, MEGDD0117 (filtered), MEGDD0236, MEGDD0236 (filtered), MEGDD0239, MEGDD0239 (filtered), MEGDIM0236, MEGDIM0236 (filtered), MEGUIM0119, MEGUSH8602, and MEGUSH8602 (filtered) exhibited a high recovery (i.e., >120%) for Pb and chromium (Cr), and a low recovery (i.e.<80%) for Se. The Pb, Cr, and/or Se results in these samples were qualified as estimated ("J" or "UJ").

The metals CRDL standards associated with samples MEGDD0132 (filtered) and MEGUIM0119 exhibited a low recovery (i.e., <80%) for Pb. The Pb results in these samples were qualified as estimated ("UJ").

The recovery of Iron (Fe) was below the QC limit (i.e., <80%) in the ICSAB samples analyzed on the ICP run of 2/28/03. The concentration of Fe in sample MEGDD0117 was greater than the concentration of Fe in the ICSAB samples, therefore the Fe result in sample MEGDD0117 was qualified as estimated ("J"). All other samples analyzed on this ICP run exhibited Fe concentrations well below the ICSAB concentration, therefore no qualification was necessary.

The recoveries of Fe and Zinc (Zn) were below the QC limit (i.e., <80%) in the ICSAB samples analyzed on the ICP run of 3/30/03. Since the concentration of Fe in samples DUP021803, MEGDD014, MEGDD0129, MEGDIM0110, MEGDIM0117, and MEGUSH8601 was greater than the concentration of Fe in the ICSAB samples, the Fe and Zn results in these samples have been qualified as estimated ("J").

The recoveries of antimony (Sb), arsenic (As), nickel (Ni), Se, and silver (Ag) were below 30% in the total MS sample associated with samples DUP021803, DUP022003, MEGCD0131, MEGDD014, MEGDD0115, MEGDD0121, MEGDD0123, MEGDD0129, MEGDD0132, MEGDD0238, MEGDD0243, MEGDIM0110, MEGDIM0117, MEGDIM0128, MEGDSH0121, MEGUSH8601, MEGUSH8611, and MEGUSH8616. In accordance with the validation guidelines the results for Sb, As, Ni, Se, and Ag were rejected ("R") in these samples.

The recoveries of Hg and Se were below 30% in the filtered MS sample associated with samples MEGDD0120 (filtered), MEGDD0132 (filtered), MEGDD0134 (filtered), MEGDD0240 (filtered), MEGDIM0237 (filtered), and MEGUIM0119 (filtered). In accordance with the validation guidelines the results for Hg and Se were rejected ("R") in these samples.

The recoveries of Al and Pb grossly exceeded the QC limit (i.e., >150%) in the filtered MS sample associated with samples MEGDD0120 (filtered), MEGDD0134 (filtered), MEGDD0240 (filtered), MEGDIM0237 (filtered), and MEGUIM0119 (filtered). In accordance with the validation guidelines the detected results for Al and Pb were rejected ("R") in these samples.

The recoveries of As, Mn, and Zn were above the QC limit (i.e., >125%) in the filtered MS sample associated with samples MEGDD0120 (filtered), MEGDD0132 (filtered), MEGDD0134 (filtered), MEGDD0240 (filtered), MEGDIM0237 (filtered), and MEGUIM0119 (filtered). In accordance with the validation guidelines the detected results for As, Mn, and Zn were qualified as estimated ("J") in these samples.

The recoveries of Al and As grossly exceeded the QC limit (i.e., >150%) in the total MS sample associated with samples MEGDD0120, MEGDD0134, MEGDD0240, MEGDIM0237, MEGDSH8617, and MEGUIM0119. In accordance with the validation guidelines the detected results for Al and As were rejected ("R") in these samples.

The recoveries of Hg and Se were below the QC limit (i.e., <75%) in the total MS sample associated with samples MEGDD0120, MEGDD0134, MEGDD0240, MEGDIM0237, MEGDSH8617, and MEGUIM0119. In accordance with the validation guidelines the results for Hg and Se were qualified as estimated ("J" or "UJ") in these samples.

The recoveries of Pb and Hg were below the QC limit (i.e., <75%) in the total MS sample associated with samples DUP021803, DUP022003, MEGCD0131, MEGDD014, MEGDD0115, MEGDD0121, MEGDD0123, MEGDD0129, MEGDD0132, MEGDD0238, MEGDD0243,

MEGDIM0110, MEGDIM0117, MEGDIM0128, MEGDSH0121, MEGUSH8601, MEGUSH8611, and MEGUSH8616. In accordance with the validation guidelines the results for Pb and Hg were qualified as estimated ("J" of "UJ") in these samples.

The recoveries of As, Hg, Pb, Se, and Ag were below the QC limit (i.e., <75%) in the filtered MS sample associated with samples DUP021803 (filtered), DUP022003 (filtered), MEGCD0131 (filtered), MEGDD014 (filtered), MEGDD0115 (filtered), MEGDD0121 (filtered), MEGDD0123 (filtered), MEGDD0129 (filtered), MEGDIM0110 (filtered), MEGDIM0117 (filtered), MEGDSH0121 (filtered), MEGUSH8601 (filtered), and MEGUSH8611 (filtered). In accordance with the validation guidelines the results for As, Hg, Pb, Se, and Ag were qualified as estimated ("J" or "UJ") in these samples.

The percent difference (%D) of the serial dilution performed on total metals sample MEGDIM0110 exceeded the QC limit (i.e., >10%) for Cr, Fe and Zn. The Cr, Fe, and/or Zn results in samples DUP021803, DUP022003, MEGCD0131, MEGDD014, MEGDD0115, MEGDD0121, MEGDD0123, MEGDD0129, MEGDD0132, MEGDD0238, MEGDD0243, MEGDIM0110, MEGDIM0117, MEGDIM0128, MEGDSH0121, MEGUSH8601, MEGUSH8611, and MEGUSH8616 have been qualified as estimated ("J"), if the sample concentration was greater than ten times the instrument detection limit.

The %D of the serial dilution performed on filtered metals sample MEGDIM0237 exceeded the QC limit (i.e., >10%) for Fe. The Fe results in samples MEGDD0120 (filtered), MEGDD0134 (filtered), and MEGDIM0237 (filtered) have been qualified as estimated ("J").

The %RPD between the concentration of total metals Al, Ba, Cu, Mn, and V in sample MEGDD0129 and field duplicate DUP021803 exceeded the QC limit (i.e., >50%RPD). In accordance with the validation guidelines the total Al, Ba, Cu, Mn, and V results in these samples have been qualified as estimated ("J").

The %RPD between the concentration of filtered metals Al and Fe in sample MEGDD0129 and field duplicate DUP021803 exceeded the QC limit (i.e., >50%RPD). In accordance with the validation guidelines the filtered Al and Fe results in these samples have been qualified as estimated ("J").

The %RPD between the concentration of total metal V in sample MEGUSH8611 and field duplicate DUP022003 exceeded the QC limit (i.e., >50%RPD). In accordance with the validation guidelines the total V results in these samples have been qualified as estimated ("J").

The %RPD between the concentration of filtered metals Ba and Zn in sample MEGUSH8611 and field duplicate DUP022003 exceeded the QC limit (i.e., >50%RPD). In accordance with the validation guidelines the filtered Ba and Zn results in these samples have been qualified as estimated ("J").

The %D between the concentration of total Ba and filtered Ba in sample MEGDD0115 exceeded the QC limit (i.e., filtered concentration>total concentration by more than 10%). In accordance with the validation guidelines the total and filtered Ba results in these samples have been qualified as estimated ("J").

The %D between the concentration of total Zn and filtered Zn in sample MEGDD0240 and MEGDIM0237 exceeded the QC limit (i.e., filtered concentration>total concentration by more than 10%). In accordance with the validation guidelines the total and filtered Zn results in these samples have been qualified as estimated ("J").

The %D between the concentration of total Zn and filtered Zn in sample MEGUIM0119 grossly exceeded the QC limit (i.e., filter concentration >total concentration by more than 50%). In accordance with the validation guidelines the total and filtered Zn results in these samples have been rejected ("R).

No other data qualifications were made, and all other data are usable as reported.

WET CHEMISTRY

The CCVs for cyanide (analysis date 2/20/03 and 02/27/03) exhibited %Rs that were below the lower QC limit (i.e., < 85%). The undetected total and amenable cyanide results in samples MEGDD0115, MEGDD0121, MEGDD0123, MEGDD0132, MEGDD0239, MEGDIM0110, MEGDIM0128, MEGDSH0121, MEGUSH8601, and MEGUSH8611 were qualified as estimated ("UJ").

The cyanide CRDL standards associated with samples MEGDD0120, MEGDD0134, MEGDD0240, MEGDIM0237, MEGSH8617, and MEGUIM0119 exhibited a low recovery (i.e., <80%) for cyanide. The total and amenable cyanide results in these samples were qualified as estimated ("J" or "UJ").

cc: M. Gutmann
File: 11171861 (AD-1)

DEFINITIONS OF DATA QUALIFIERS

U – The analyte was analyzed for, but was not detected above the reported sample quantitation limit.

J – The analyte was positively identified; the associated numerical value is the approximate concentration of the analyte in the sample.

UJ – The analyte was not detected above the reported sample quantitation limit. However, the reported quantitation limit is approximate and may or may not represent the actual limit of quantitation necessary to accurately and precisely measure the analyte in the sample.

D – Results reported from a secondary dilution analysis.

R – The sample results are rejected due to serious deficiencies in the ability to analyze the sample and meet qualify control criteria. The presence or absence of the analyte cannot be verified.

FISH AND WILDLIFE IMPACT ANALYSIS
FORMER MANUFACTURED GAS PLANT (MGP) SITE,
MECHANICVILLE, NY

1. INTRODUCTION

Environmental scientists from EcoLogic LLC completed a Fish and Wildlife Impact Assessment (FWIA) at the site of a former manufactured gas plant (MGP) facility in Mechanicville New York. The facility is owned by New York State Electric and Gas (NYSEG) and is under investigation to determine the nature and extent of contamination, if any, associated with the site's former use.

The FWIA was completed in accordance with the criteria outlined in New York State Department of Environmental Conservation (NYSDEC), Division of Fish and Wildlife's *Fish and Wildlife Impact Analysis for Inactive Hazardous Waste Sites* (1994). Steps I through IIC of the analysis were completed, including the description of the site and fish and wildlife resources and values within a 0.5-mile and 2-mile radius, identification of applicable regulations, identification of contaminants of concern, analysis of contaminant pathways and receptors, and a review of the effects of site-related contaminants on potentially exposed individuals, population and community.

Data were compiled from reviews of published maps and reports; information obtained from state and federal regulatory agencies; a field investigation of the site and the surrounding area on September 10, 2002; and analytical data collected as part of this Supplemental Remedial Investigation (SRI). Technical literature regarding the effects of site-related contaminants on biota was reviewed. A photographic atlas of items described in the following sections is included as Appendix 1. The numbered photographs correspond to the numbered locations indicated on Figure 1.

2. SITE CONDITIONS

2.1 Site Location

The NYSEG MGP site is located in the City of Mechanicville, Saratoga County, New York, (Figure 2) along the southern bank of the Anthony Kill immediately west of North Central Avenue (Figure 3). The

site is situated adjacent to an urban residential area, where it meets a commercial/industrial area. A mix of urban, commercial/industrial development, forested areas and agricultural fields dominates the land within 0.5 and 2 miles from the site. A map showing dominant development/cover types in the study area is included as Figure 4.

2.2 Nature of the Property and Surroundings

The property is essentially rectangular in shape, bordered on two sides by public roads, on one side by the Anthony Kill, and on the fourth side by a railway. The site contains two buildings that are currently vacant. The land surrounding the buildings is a highly compacted mixture of soil and gravel. The vegetated areas of the site have herbaceous and shrub plant communities typical of disturbed sites. The area between the site and the Hudson River, about ¼ mile to the east, is completely developed. To the north of the site is the Anthony Kill; North Central Avenue bounds the site on the east, Ferris Lane is the southern boundary, and railroad tracks border the site to the west.

2.3 Topographic Features

The NYSEG MGP site is on a relatively flat, level piece of land at an elevation of approximately 95 feet above mean sea level (msl), and 15 - 20 feet above the Anthony Kill. The topography within a 0.5-mile radius is relatively flat. The topography within a 2-mile radius includes the relatively flat, level floor of the Hudson River Valley, and terraces to the north and south of Mechanicville that are over 300 feet above msl.

2.4 Surface Drainage Patterns

The NYSEG MGP site drains primarily to the northeast into the Anthony Kill. The surrounding area within a 2-mile radius drains in many directions; however, the entire 2-mile radius is within the watershed of the Hudson River. From the border of the subject property, the nearest waterway is the Anthony Kill, which constitutes the northern perimeter of the site. The Anthony Kill flows east to southeast into the Hudson River, which flows into Upper New York Bay.

3. ECOLOGICAL COMMUNITIES

The dominant ecological communities were identified within a 0.5-mile radius and within a 2-mile radius of the former MGP site. The results of this survey are outlined below. Diversity of vegetation was fairly low due to the developed nature of the area. There was no evidence of stressed vegetation within the area of study.

3.1 Within 0.5 mile radius

3.1.1 Riparian corridor

The Anthony Kill riparian corridor extends for 10 - 20 feet on both sides of the stream. This corridor is isolated from any other natural areas except directly across from the site, where there is a successional old field community. Deciduous tall shrubs, wild grape vine, and mature specimens of cottonwood and maple dominate the riparian vegetation throughout the corridor.

3.1.2 Successional old field

This community occurs in sites that have been cleared for agriculture or development, and later abandoned. This parcel is about 5000 square meters and is currently vacant. Vegetation on the site includes a mixture of grasses and low growing (shrub) vegetation (spotted knapweed, goldenrod, New England aster, evening primrose, wild grape vine, foxtail) in the eastern two-thirds of the parcel, with taller shrubs (sumac, raspberry, common mullein, goldenrod) and trees (maples, cottonwood) bordering the Anthony Kill and towards the western third of the parcel.

3.2 Within 2 mile radius

In addition to old fields as described above, other ecological communities found within a 2-mile radius of the former MGP site include the following:

3.2.1 Wetland habitats

Directly south of the site, along the railroad tracks and Hudson River, there are a series of regulated wetlands designated ME-16 and ME-17. ME-16 is a class 3 wetland comprising 22.8 acres. ME-17 is a series of class 2 wetlands comprising a total of 66.6 acres. Class 2 wetlands are those emergent marshes where purple loosestrife and/or phragmites constitute less than 2/3 of the cover type. Class 3 wetlands can

be emergent marshes where purple loosestrife and/or phragmites constitute greater than 2/3 of the cover type, or other types of wetlands. A field visit identified the ME-16 wetland as an emergent marsh with greater than 2/3 cover type dominated by phragmites and/or purple loosestrife.

3.2.2 Emergent marsh

Characteristic plants in emergent marshes include cattails, purple loosestrife, swamp loosestrife, arrowheads, reeds, bur-reeds, pickerel-weed, wildrice, water plantain, bulrushes, and arrow-arum. Emergent marshes offer a variety of habitat for wildlife including amphibians (eastern American toad, northern spring peeper, green frog, salamanders) and birds (red-winged blackbird, marsh wren, common yellowthroat).

3.3 Fish and Wildlife

The developed nature and industrial commercial use of the site degrades the site itself in terms of wildlife habitat; however, the surrounding area provides a wide variety of habitat for many wildlife species. Wildlife typically found in urban, suburban, and rural agricultural areas is most likely to be present in the vicinity of the project site. A list of wildlife species that are likely to use the area at some time of year is presented below. Species that were observed on or near the site during field activities are listed in italics.

3.3.1 Birds

Mourning Dove
Song Sparrow
Gray Catbird
American Crow
Black Capped Chickadee
Common Grackle
Mallard
Wild Turkey
Red-tailed Hawk
Coopers Hawk
Short-eared Owl
Ruby-throated Hummingbird
Common Flicker
Tree Swallow
White-breasted Nuthatch
Blue-gray Gnatcatcher
Warblers
Eastern Meadowlark
Northern Cardinal
Common Yellowthroat

European Starling
House Sparrow
Mockingbird
Red Winged Blackbird
House Wren
House Finch
Black Duck
Northern Harrier
Sharp-shinned Hawk
Red-shouldered Hawk
Long-eared Owl
Chimney Swift
Red-bellied Woodpecker
Barn Swallow
Brown Creeper
Cedar Waxwing
Bobolink
Northern Oriole
American Goldfinch

American Robin
Downy Woodpecker
Rock Dove
Blue Jay
Dark eyed Junco
Canada Goose
Belted Kingfisher
Turkey Vulture
Kestrel
Great Horned Owl
Screech Owl
Hairy Woodpecker
Eastern Kingbird
Tufted Titmouse
Eastern Bluebird
Red-eyed Vireo
Common Grackle
Brown-headed Cowbird
Marsh Wren

3.3.2 Mammals

White-tailed Deer
House Mouse
Raccoon
Mole
Cottontail Rabbit
Norway Rat
Woodchuck
Gray Squirrel
Meadow Vole
Muskrat

3.3.3 Herptiles

Common Snapping Turtle
Eastern Box Turtle
Spring Peeper
Eastern Garter Snake
American Toad
Salamanders
Northern Water Snake
Green Frog

3.3.4 Fish

The Anthony Kill is a small stream, providing feeding, spawning, cover, and dispersal habitat for a variety of fish species. According to the NYSDEC Division of Fish, Wildlife, and Marine Resources, there are no records of fish kills in the Anthony Kill. The stream varies in width, but is ±15 feet wide near the subject site. Based on field observations, depth varies in the study area from less than 1 foot near shore to about 1 - 2 feet in the channel. These observations were made in late September and early October 2002 during a period of relatively low flow conditions. The following fish species are part of the community of the Anthony Kill (based on Smith, 1995, and field observations (October 10, 2002):

American eel
Alewife
Brown bullhead
White sucker
Hog sucker
Carp
Cutlips minnow
Silvery minnow
Emerald shiner
Common shiner
Golden shiner
Bluntnose minnow
Fathead minnow
Brown trout
Banded killifish
Rock bass
Pumpkinseed
Bluegill
Smallmouth bass
Tessellated darter
Logperch

3.4 Rare, Threatened, Endangered, and Special Concern Species

Requests were made to the NYSDEC Natural Heritage Program (NHP) for information regarding rare, threatened, endangered, or special concern species on the site or within the 2-mile radius area. NHP records indicate that no rare, threatened, endangered, or species of special concern are known to be on or within 2 miles of the subject site (Appendix 2).

3.5 Value of Fish and Wildlife Resources

There is little valuable terrestrial wildlife habitat on the site itself; however, the lands within the 2-mile radius provide a wide range of habitats, from open agricultural and pasture fields, to forested areas, to intensive urban development (City of Mechanicville). This area provides food, cover, water, and dispersal space resources to a wide variety of wildlife.

Remaining habitat is divided among suburban developed areas, which favor urban wildlife species such as squirrels, raccoons, mice, rats, and cosmopolitan bird species commonly found at backyard bird feeders, and open agricultural lands and forests which provide habitat for more rural species such as deer, turkey, and neotropical migrant songbirds. The site provides little value to wildlife, but the surrounding area is particularly valuable for the variety of habitat that it provides.

As described above, the site adjoins the Anthony Kill. This stream segment is classified D, meaning its designated best use is for fishing. Class D waters shall be suitable for secondary contact recreation, although other factors may limit the use for these purposes. There is no regulatory indication that water quality or habitat conditions in this segment of the stream threaten or preclude attainment of the designated best use. That is, the NYSDEC compendia of waterbody segments with known water quality problems {e.g. the State's 303(d) and 305 (b) lists} do not include the Anthony Kill.

The primary value to humans of the natural resources surrounding the NYSEG MGP site lies in development and recreational opportunities. The area is already partially developed in residential and commercial industrial corridors, but large tracts of open agricultural land and some forest remain in the outlying areas. The suburban and urban areas present opportunities for expanding and renovating developed areas, while the open lands and forests provide for continued agricultural, forestry, and recreational pursuits of the region. The site itself offers little due to its size and location in a developed corridor. However, valuable natural resources can be found in close proximity. The Anthony Kill offers recreational angling opportunities as well as a peaceful contrast to the adjacent commercial and suburban corridor.

4. PATHWAY ANALYSIS

The pathway and receptor analysis examines which media are contaminated, which chemicals are involved, the spatial extent and concentrations of chemicals measured during the site investigation, and what (non-human) organisms might be exposed to the chemicals. To assess whether fish and wildlife species are potentially at risk from the existing site conditions, EcoLogic scientists have reviewed reports that relate levels of chemicals with an adverse impact on fish and wildlife receptors. Site data are compared with these benchmark values. This approach helps define the spatial extent of potentially hazardous contamination, which media are contaminated, and the species potentially at risk from contamination.

Review of the Mechanicville former MGP site data indicates that there are elevated concentrations of target compounds present in certain media that may be accessible to fish and wildlife receptors. An analysis of the likelihood and importance of pathways of exposure and the wildlife receptors is presented in Table 1. The challenge for completing this analysis is to draw technically defensible conclusions regarding the potential for specific chemical compounds to partition into the terrestrial or aquatic food web. Because data are limited, it is necessary to extrapolate from limited studies. The following documents were reviewed as part of this analysis:

- USEPA Region 4 Ecological Risk Assessment Bulletins (Supplement to Risk Assessment Guidance for Superfund)
- NYS guidance documents
- Toxicological benchmarks for screening contaminants of potential concern for effects on sediment-associated biota: 1997 revision (Department of Energy report ES/ER/TM-95/R4).

4.1 Exposure to shallow (surface) soils (0-0.5 feet)

Results of the RI indicate that concentrations of some target compounds in shallow soils exceed the EPA's recommended screening values and, in some cases, the NYS recommended soil cleanup objectives. The contaminants of concern include benzo(a)pyrene, total phenols, and metals. Wildlife communities can be exposed to site-related contaminants present in shallow soils by several mechanisms:

- Wind and water transport (erosion) of contaminated soil particles to nearby surface water.

- Direct ingestion, inhalation, or dermal absorption of contaminants present in soil by resident or transient wildlife.
- Vegetative uptake of contaminants from soil and related food web effects.
- Food web effects of ingesting soil organisms containing elevated body burden of contaminants.

Wind and water transport is the only pathway of exposure determined to be complete and potentially important at the former Mechanicville MGP site. Given the limited extent of contamination and the developed nature of the site, the other three pathways were determined to be potentially complete but unlikely to be important.

4.2 Exposure to sub-surface soils (0.5-4 feet)

It is unlikely that wildlife could be exposed to subsurface soils at depths greater than 4 feet. Sub-surface test pit samples at the Mechanicville former MGP site were taken at depths ranging from 0.5 to 4 feet. Contaminants of concern include semi-volatile organic compounds, total phenols, cyanide, and metals. This pathway was determined to be unlikely to be complete and unlikely to be of ecological importance because of the limited nature of potential exposure to subsurface soils.

4.3 Exposure to surface water sediments

Results of the RI field investigations indicate that concentrations of a limited number of target compounds in stream sediments exceed the NYSDEC sediment quality criteria, which have been developed to protect benthic organisms against acute and chronic toxicity effects. The contaminants of concern measured in stream sediments adjacent to the site include total phenols and manganese.

Wildlife may be exposed to sediment-borne contaminants through various mechanisms as described in Table 1, including:

- Ingestion and absorption by resident macroinvertebrates.
- Partitioning to overlying water.
- Food web effects on higher organisms.

Ingestion and absorption by the resident macroinvertebrate community were determined to be complete and important, given the elevated concentrations of certain target compounds in stream sediments at the

site and downstream, and the sessile nature of these organisms. A benthic macroinvertebrate survey was conducted on September 10, 2002, by EcoLogic, LLC staff. Results of this survey are presented in Appendix 3. The other two exposure pathways were determined to be complete but unlikely to be important given the limited extent of contamination, the open nature of the system, and the mobility of higher organisms (fish, birds, mammals).

Sediment quality is a significant component of the aquatic environment; sediments provide habitat for benthic animals, and moderate the partitioning of several classes of chemicals with the overlying water. Predicting the fate and toxicity of chemicals in sediments is complicated by the potential for chemicals to bind to sediment. The total chemical content in the sediment is not an adequate predictor of biological availability of chemicals, as the same total quantity of a chemical in different sediments can cause different biological effects. However, the potential toxicity of certain classes of chemicals can be predicted in sediments of different composition by normalizing the quantity of chemical by the amount of total organic carbon (for non-ionic organic compounds) and acid volatile sulfide (AVS) for divalent toxic metals: copper, cadmium, lead,, nickel, zinc, and mercury in aquatic sediments (DiToro *et al*. 1991).

The concentrations of organic compounds detected in the Anthony Kill sediments were analyzed and reported in units of µg of contaminant per g organic carbon. Based on this calculation, only total phenols were detected at concentrations above screening levels at sediment site 6. For semivolatile organic compounds (SVOCs), only sites 5 and 7 show concentrations above detection levels. Total phenols were present above detection levels only at site 6.

For sediment metals, the extent of contamination may be assessed by comparing downstream concentrations to background concentrations. Based on this analysis, only manganese exhibited a statistically significant higher concentration downstream of the site as compared to upstream (background) samples. Molar sums for simultaneously extracted metals (SEM) analyses and molar ratios of SEM to AVS are presented in Table 6. When the ratio of SEM to AVS is greater than one, the potential for biological toxicity effects can be seen. The SEM:AVS ratio at site 3 is slightly higher than 1, but the macroinvertebrate data presented in Figure 5 do not clearly show higher toxic effects at site 3.

4.4 Exposure to surface waters

Previous site investigations conducted from 1986 – 1988 tested for the presence and concentrations of target compounds in the surface waters of the Anthony Kill at four locations upstream and downstream of the former Mechanicville MGP site. Of the SVOCs, only four compounds (2-methylnaphthalene, bis(2-ethylhexyl)phthalate, acenaphthene and acenaphthylene) were present above the analytical limit of detection. However, no exceedences of ambient water quality standards were reported. No other contaminants of concern were determined to be present in surface water samples.

Because of the trace levels of contamination found in surface waters it was concluded that this pathway is potentially complete but unlikely to be important.

4.5 Exposure to Groundwater

Site-related contaminants have the potential to migrate off site through surface runoff or groundwater transport. The Anthony Kill is a regional groundwater discharge area and also receives surface runoff from a considerably large and developed drainage basin, including the former MGP site. The stream effectively precludes groundwater and surface water runoff from affecting any area to the north. Considering the prevailing northward groundwater and surface runoff direction, areas east, west, and south of the site are not particularly susceptible to groundwater or runoff impacts. With respect to surface runoff, it is further noted that storm sewers servicing the study area intercept the majority of surface flows and convey runoff away from adjacent resource areas.

However, groundwater and surface runoff from the site represent transport mechanisms that could potentially affect aquatic resources within the Anthony Kill, as either seepage via groundwater or surface runoff from storm sewer outfalls. Since no stormwater outfalls were identified within several hundred feet of the study area either upstream or downstream, groundwater is viewed as the primary transport mechanism for site contaminants, potentially affecting water and sediment quality of the Anthony Kill and downstream Hudson River.

Results of the RI field investigations indicate that concentrations of several target compounds in groundwater exceed NYSDEC standards or guidance value. The contaminants of concern include several VOCs, SVOCs, metals and total phenols.

Because of the proximity of the former Mechanicville MGP site to the Anthony Kill, groundwater seepage into the river sediments is a complete and potentially important pathway.

5. CRITERIA-SPECIFIC ANALYSIS

Consistent with Step II-B of the NYSDEC FWIA guidance document, contaminants present at this site were compared with regulatory standards or guidance criteria of the NYSDEC, where available, or with other published sources. The criteria/screening values used for this analysis are summarized in Table 2. Note that the criteria-specific analysis is directed at pathways and receptors considered complete and most likely to be important, the resident macroinvertebrate community directly affected by sediment contamination.

5.1 Semi-volatile organic compounds (SVOCs)

Results from the SVOC sample analysis (Table 3) for the sediment sites were normalized for the amount of organic carbon found at in each sediment sample. These results are presented in Table 4 with data for all PAHs broken down into Low Molecular Weight (LMW) and High Molecular Weight (HMW). The sum of all results in these categories was used to compare against the published screening values for Total PAHs, Total LMW PAHs, and Total HMW PAHs.

These results were compared with the criteria/screening values in Table 2 to determine where exceedences occurred. Any exceedences found are marked with an "*" in Table 4.

With the exception of total phenols at site 6, no SVOCs were found in exceedence of published criteria or screening values. The normalized results were compared first to NYSDEC sediment quality criteria; if none was available, they were compared to the EPA Region 4 screening values or the EPA Office of Solid Waste and Emergency Response ecotoxicological thresholds, as available, in that order.

5.2 Metals

Metals detected in stream sediments are presented in Table 5. Of those, only manganese shows levels higher than published criteria. There is also a statistically significant (P=0.05) difference between upstream and downstream concentrations of manganese in this system.

6. TOXIC EFFECTS ANALYSIS

In this section, the toxic effects of site-related contaminants are reviewed. The list of compounds includes: hydrocarbons and PAH, phenols, and manganese.

According to Albers (1995), "trophic level increases in accumulation of hydrocarbons have not been observed in aquatic ecosystems." This is presumably because aquatic and terrestrial mammals, reptiles, and amphibians can metabolize hydrocarbons very efficiently. Albers cautions that the observation might be due, in part, to the fact that the effects of hydrocarbons on fish and some aquatic invertebrates have been studied more completely.

In the terrestrial environment several studies have demonstrated that plant uptake of PAHs in contaminated soils is minimal. Porta *et al*. (1999) conducted a study of phytotoxicity in a site that had been contaminated by an oil spill. They grew corn and rice plants in soils with four levels of PAH contamination. Results from their study showed no apparent uptake of soil PAHs by plants. Corn plants showed signs of stress at total petroleum hydrocarbon content above 2000 mg/kg. As described in Section 3, there were no visual signs of stress on terrestrial vegetation at or near the former Mechanicville MGP site.

Aquatic sediments in the Anthony Kill showed low levels of organic contamination, with only total phenols exceeding the screening value at one site. Brent and Herricks (1998) studied the post-exposure effects of phenol on *Ceriodaphnia dubia* (a water column invertebrate). The researchers found that, for exposures below 1000 mg/l, these organisms recovered rapidly after transfer to clean water. Since only one site exhibited elevated sediment phenol levels, the Anthony Kill system can be compared to a situation where brief exposure to contamination may cause sub-lethal effects of short duration. During the Visual Stream Habitat Assessment, site 6 was found to be on the borderline between poor and fair

conditions (Figure 5A) while all other sites had fair or better conditions. This assessment of physical conditions characterized this site as poor macroinvertebrate habitat, regardless of contamination levels.

Manganese was found to exceed sediment screening criteria at sites 5 and 7. However, a review of the literature did not result in any reports of manganese toxicity in freshwater sediments. Manganese in water is regulated as a "secondary contaminant" in water supplies, considered important for aesthetic considerations but not as a toxic substance. Elevated concentrations of manganese in groundwater may be associated with reducing conditions that mobilize the metal from the soil matrix. It is not considered to be an important structuring element of the Anthony Kill biological community.

7. CONCLUSIONS

The Supplemental Remedial Investigation has documented the following conditions in the Anthony Kill at the former Mechanicville MGP site:

- Total phenols concentrations in sediments above chronic benthic criteria or screening levels at one site;
- Manganese levels found in the Anthony Kill sediments near the former Mechanicville MGP site exceed the NYSDEC LEL criteria at two sites;
- Water column concentrations of target compounds mostly below detection levels;
- Surface soils show concentrations above screening values of benzo(a)pyrene, total phenols, and certain metals;
- Sub-surface soils show concentrations above screening values of several SVOCs, total phenols, and metals;
- Possible continued source of contaminants from groundwater and sub-surface runoff; and,
- An open system where water is constantly renewed and most organisms are not limited to contaminated areas.

Given these environmental conditions, one would expect to find a limited effect of contamination on aquatic or terrestrial organisms. It is possible that the community of benthic organisms in the region of the stream most affected by site conditions is comprised of a reduced biomass of organisms, and/or limited to

those species most tolerant of the residual contamination. This would reduce the mass of contaminant potentially transferred to other organisms through the food web.

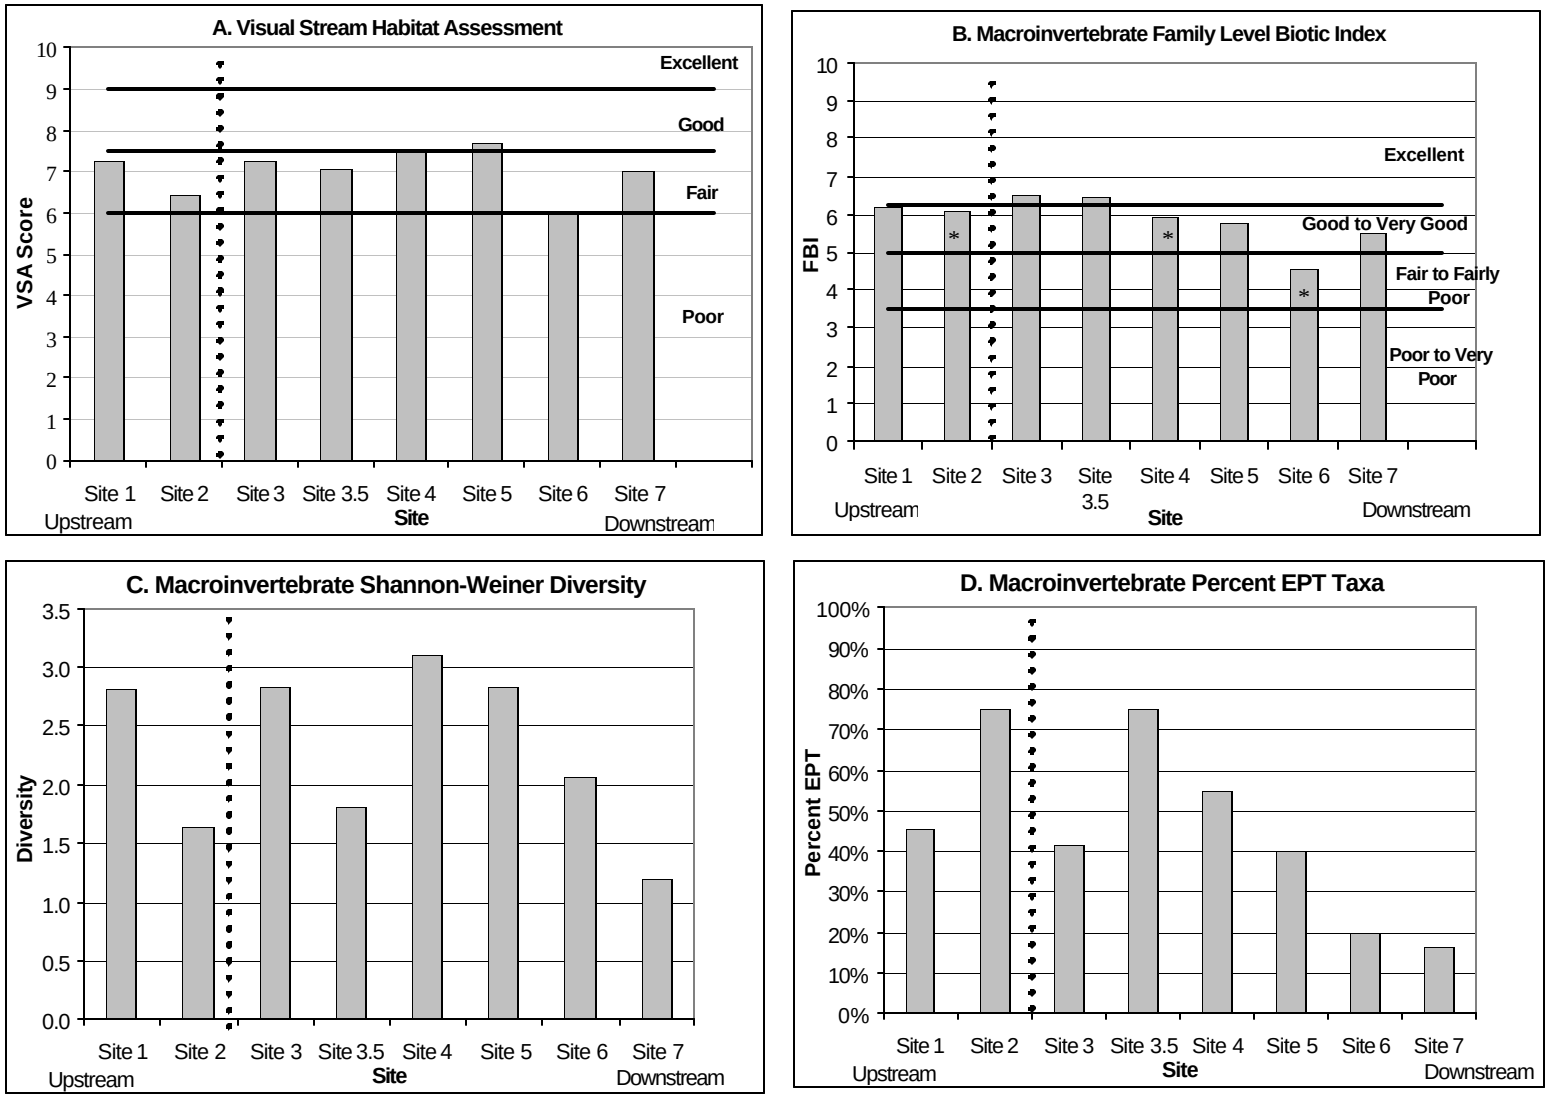

Figure 5. Summary charts of VSA, FBI, diversity and % EPT metrics collected in proximity to the NYSEG Mechanicville New York site. * in Figure B indicates that less than 100 organisms were collected and used in the calculation of the FBI at these sites, therefore results should be viewed with caution. Dashed line between Site 2 and 3 indicates the distinction between sites that are presumably contaminated (downstream of the line) and those that are not (upstream of the line).

Table 1. Summary Of Pathways And Receptors, Fish And Wildlife Impact Analysis
Mechanicville Former MGP Site

Contaminant Source	Pathways of Exposure	Receptors	Completeness and Ecological significance
Surface soils (0 – 0.5 feet)	Loss to surface waters by erosion (wind and water)	Aquatic organisms	Complete, potentially important. Surface soils on the site have elevated SVOC.
	Ingestion, inhalation, dermal absorption by resident and transient wildlife	Soil organisms (earthworms) Burrowing organisms (voles)	Potentially complete, unlikely to be important. Surface soils on the site have elevated SVOC. Wildlife habitat is limited on the developed site.
	Vegetative uptake from soils and related food web effects	Herbivorous wildlife (deer mouse)	Potentially complete, unlikely to be important. Surface soils on the site have elevated SVOC. Wildlife habitat is limited on the developed site.
	Food web effects of ingesting soil organisms	Birds	Potentially complete, unlikely to be important due to limited extent of spatial contamination and limited habitat.
Sub-surface soils (0.5-4 feet)	Ingestion, inhalation, dermal absorption by burrowing wildlife	Meadow vole	Unlikely to be complete, unlikely to be important. Test pits show contamination is higher at depths beyond which wildlife would use. Developed nature of site limits use by wildlife.
Surface water sediments	Ingestion and absorption by resident macroinvertebrates	Aquatic insects and worms	Complete, potentially important
	Partitioning to overlying water	Fish	Complete, unlikely to be important due to limited extent of contamination.
	Food web effects on higher organisms	Mink, heron	Complete, unlikely to be important due to limited extent of contamination.
Surface Waters	Ingestion and absorption by aquatic organisms	Fish	Complete, unlikely to be important (surface water contaminant levels are mostly non-detectable)
Groundwater	Seepage to surface water	Aquatic organisms (especially benthic organisms)	Complete, potentially important

Ana L. Fernandez
EcoLogic
Atwell Mill Annex, Suite S-2
132 ½ Albany Street
Cazenovia, NY 13035

Dear Ms. Fernandez:

In response to your recent request, we have reviewed the New York Natural Heritage Program databases with respect to the proposed Remedial Investigation for the Anthony Kill, area as indicated on the map you provided, located in the Town of Mechanicville, Saratoga County.

> We have no records of known occurrences of rare or state-listed animals or plants, significant natural communities, or other significant habitats, on or in the immediate vicinity of your site.

The absence of data does not necessarily mean that rare or endangered elements, natural communities or other significant habitats do not exist on or adjacent to the proposed site, but rather that our files currently do not contain any information which indicates the presence. For most sites, comprehensive field surveys have not been conducted. For these reasons, we cannot provide a definitive statement on the presence or absence of rare or state-listed species, or of significant natural communities. This information should not be substituted for on-site surveys that may be required for environmental assessment.

Our databases are continually growing as records are added and updated. If this proposed project is still under development one year from now, we recommend that you contact us again so that we may update this response with the most current information.

This response applies only to known occurrences of rare or state-listed animals and plants, signicant natural communities and other significant habitats maintained in the Natural Heritage Databases. Your project may require additional review or permits; for information regarding other permits that may be required under state law for regulated areas or activities (e.g., regulated wetlands), please contact the appropriate NYS DEC Regional Office, Division of Environmental Permits, at the enclosed address.

Sincerely,

Heidi J. Krahling, Information Services
NY Natural Heritage Program

Appendix 3. Aquatic Habitat Survey

STREAM WATER QUALITY AND HABITAT ASSESSMENT, ANTHONY KILL

Physical Habitat and Baseline Water Quality

Habitat assessments were conducted at eight locations on the Anthony Kill in proximity to the NYSEG form MGP site in Mechanicville on September 10, 2002 (Figure 1). Seven of these locations (Sites 1,2,3,4,5,6,7) correspond to the areas where sediment samples were previously been collected and an eighth site (Site 3.5) was located near the center point of the sediment sampling locations. The field team completed the elements of the standard Stream Visual Assessment Protocol (SVAP) at each of the eight sites. In addition, the benthic macroinvertebrate community was sampled and the Family Level Biotic Index (FBI), Shannon-Weiner diversity, and percent EPT taxa were calculated at each site. These indices are discussed below. Water quality parameters of temperature, dissolved oxygen, specific conductance and pH were measured at each site using a calibrated Hydrolab water quality meter.

The SVAP is a methodology developed by the Natural Resource Conservation Service (NRCS) to evaluate the basic physical and habitat characteristics of a stream. The SVAP is based primarily on physical conditions within the assessment areas, standardized as a stream segment extending about 12 times the active steam width. Taken together, the SVAP results and water quality measurements indicate the physical quality and habitat conditions of the stream reaches under investigation. Upstream conditions that affect habitat and water quality, however, may not be revealed by this method. The overall scoring system is as follows:

Table A. Visual Assessment Scores

Condition	Overall Score
Poor	<6.0
Fair	6.1-7.4
Good	7.5-8.9
Excellent	>9.0

The NRCS protocol includes ten elements that were assessed in the field and assigned a numerical score to each element in the field. The elements include:

- Channel condition
- Hydrologic alteration
- Riparian zone
- Bank stability
- Water appearance
- Nutrient enrichment
- Barriers to fish movement
- Instream fish cover
- Pools
- Invertebrate habitat

Macroinvertebrates as Biological Indicators

Macroinvertebrates were temporarily collected from the stream using a kick sample. Ideal habitat for obtaining a kick sample are riffle areas with substrate predominately composed of cobble, gravel and/or sand, water depth of less than 0.5m, and mean water column velocity greater than 0.4m/sec. These habitat characteristics were present at most of the sampling sites. The exceptions were Sites 2 and 6, which were located in sections of the stream with slower water velocity. At these sites the area with the highest velocity was sampled. At all sites, a standard 9 in. x 18 in. D-net with 0.8 mm mesh was used. Three areas in close proximity were sampled by positioning the D-net on the bottom about 0.5 m downstream of the sampler. The sampler used his/her feet to disturb about ½ m^2 of the bottom so that the streambed material, including macroinvertebrates, was carried into the net. Once sampling was completed, the sample was taken to shore and the first 100 organisms, or the entire sample if 100 organisms were not recovered, were sorted from the sample and identified to the family level. Macroinvertebrates were then immediately released alive back to the stream.

Macroinvertebrates are an important component of the aquatic food web. Freshwater macroinvertebrate taxa include aquatic insects (Insecta), worms (Oligochaeta), snails (Gastropoda), clams (Bivalvia), leeches (Hirudinea), and crustaceans (Crustacea). These organisms provide the link in the food web between microscopic organisms and fish, and facilitate the transfer of energy and materials between the terrestrial and aquatic ecosystems.

There are important differences among groups of macroinvertebrates that influence the structure and function of a particular community. Difference in tolerance to environmental conditions is the basis for using these organisms as biological indicators of environmental quality. The biological community integrates the effects of different pollutant stressors and thus provides a holistic measure of their aggregate effect. Benthic macroinvertebrates are good indicators of localized conditions. Because they have limited migration patterns or a sessile mode of life, they are well suited for assessing site-specific impacts of point and nonpoint discharges. Many state agencies use macroinvertebrates as indicators of stream quality.

One important difference between groups of macroinvertebrates is their tolerance to organic (oxygen-demanding) wastes. Macroinvertebrates can be grouped into three broad categories based on their tolerance to organic waste: intolerant, moderately tolerant, and tolerant. The intolerant group includes species of mayflies, stoneflies, caddisflies, riffle beetles, and hellgrammites; the tolerant group includes worms, some midges, leeches, and some snails. The moderately tolerant group includes most snails, sowbugs, scuds, blackflies, craneflies, fingernail clams, dragonflies, and some midges (Welch 1980). What follows is a general description of the major groups of organisms that are of significance to this study.

> **Mayflies; Class Insecta, Order Ephemeroptera.** The mayflies are a primitive insect found in a wide variety of running and standing water habitats. They are aquatic as larvae (nymphs) and briefly terrestrial as adults. Mayflies are unique in that an intermediate fully winged terrestrial life stage (the subimago) occurs between the aquatic nymph stage and the sexually mature winged adult stage (imago). Nymphs are primarily grazers and collectors feeding on a variety of detritus and algae, although some are also filter-feeders and predators. Mayflies typically reach peak abundances in cool clean headwater streams and are generally less abundant and diverse in lakes (Peckarsky et al.

1990). Many are highly susceptible to water pollution and habitat degradation, including low dissolved oxygen, chlorine, ammonia, metals, pesticides and acidity (Bode et al. 1993). For this reason mayflies have proven to be very useful for biomonitoring of water and habitat quality.

Stoneflies; Class Insecta, Order Plecoptera. The stoneflies are close relatives of cockroaches. These organisms have retained the primitive characteristic of possessing tails but have the advanced ability to fold their wings over their back (Peckarsky et al. 1990). Stoneflies are entirely aquatic as nymphs and most are terrestrial as adults. For the most part, stonefly nymphs are either predators (feeding on other invertebrates) or leaf detritivores (feeding on shredded leaves). Most species of stonefly are restricted to flowing waters of relatively high oxygen concentration and their presence is generally considered to be an indicator of good water quality. They are sensitive to many of the same pollutants as mayflies with the exception of acidity (Bode et al. 1993).

Caddisflies; Class Insecta, Order Trichoptera. Caddisflies are a highly advanced and common order that is closely related to the moths and butterflies (Order: *Lepidoptera*), but are adapted for aquatic life as larvae (McCafferty 1983). Many caddisflies build intricate shelters from sand, small stones, leaf fragments, sticks etc. The material and shapes of shelters are generally unique to each taxon. Caddisflies employ a variety of feeding strategies, from strict predation to the construction of intricate nets for filtering detritual particles from the water. Caddisflies are most commonly found in cool water streams, although some species are found in lakes and ponds. Many species are sensitive to pollution, although there are some that are tolerant of polluted conditions and one family is often found in the recovery zones of streams below sewage discharges (Bode et al. 1993). Although caddisflies have a wide range of tolerances, their presence generally indicates good water quality.

Water Beetles; Class Insecta, Order Coleoptera. Beetles as a whole constitute the largest and most highly advanced order of insects with over 30,000 species known in North America (McCafferty 1983). Of these, over 1,000 are either aquatic or semi-aquatic (McCafferty 1983). Water beetles occur over a wide variety of aquatic and semi-aquatic habitats. They can be found in or on the substrate, in or on aquatic macrophytes, or swimming at or beneath the water's surface (McCafferty 1983). Almost all adults are dependent on atmospheric oxygen and must either carry an air bubble with them or have physical adaptations to acquire atmospheric oxygen. Riffle beetles and water pennies are the beetles most commonly found in streams; both usually require swift current and high dissolved oxygen concentrations. Presence of these two species is generally considered to indicate good water quality. There are also many other species of aquatic beetles that live in virtually all common freshwater habitats and have varying degrees of tolerance to pollution (McCafferty 1983).

Midges and Flies; Class Insecta, Order Diptera. The dipterans are one of the largest, most highly evolved, and most diverse groups of aquatic insects (Peckarsky et al. 1990). Some commonly known dipterans include mosquitoes, deerflies, craneflies, blackflies, and midges. Most dipterans spend much of their lives as aquatic larvae that hatch into terrestrial adults. The dipteran family *Chironomidae* is present in almost all freshwater systems and is of special importance not only because of its diversity but because of the ability of some species to tolerate extreme levels of pollution (McCafferty 1983). Some species contain hemoglobin that stores oxygen within the body thus allowing the organism to exist temporarily in habitats with little or no dissolved oxygen (Peckarsky et

al. 1990). These species are typically bright red in color and are commonly referred to as "bloodworms". Bloodworms are highly tolerant of polluted conditions and organic enrichment; some are common in sewage oxidation ponds. In general, the presence of bloodworms or chironomids in large numbers is an indicator of poor water quality (Bode et al. 1993).

Aquatic Worms; Phylum Annelida, Class Oligochaeta. Aquatic worms resemble earthworms but are generally smaller, although some species can reach a length of up to three inches. Most aquatic worms live in silty substrates and among the debris and detritus of fresh waterbodies. They ingest large quantities of soft sediment and utilize the organic fraction for their nutrient and energy source (McCafferty 1983, Peckarsky et al. 1990). Many worms, especially tubificid worms, burrow headfirst into the soft sediments and build vertical tubes from which their posterior end protrudes and undulates in the current (McCafferty 1983). Some worms can tolerate severe levels of pollution and can often be found at high densities in organically polluted waterbodies and are therefore valuable pollution indicators.

Snails; Class Gastropoda. Snails are common in freshwater habitats throughout the northeastern United States (Peckarsky 1990). They are divided into two groups: the prosobranchs and pulmonates (Peckarsky 1990). Respiration in snails occurs by means of gills in the prosobranchs and by a type of lung in the pulmonates (Peckarsky 1990). All snails, to at least some extent, use cutaneous respiration through their body membranes (Ghiretti 1966). Because they respire through gills, the prosobranchs are usually intolerant of low concentrations of dissolved oxygen in their aquatic habitat. The pulmonates, on the other hand, can often tolerate extreme levels of pollution by rising to the surface and breathing air. Most feed on encrusted algae and organic material, but some are detritivores or omnivores (McCafferty 1983).

Sowbugs: Class Crustacea, Order Isopoda. Most sowbugs are either terrestrial or marine, with only about 5% occurring in freshwater (Peckarsky 1990). Sowbugs are primarily scavengers, feeding on dead animal and plant material (Peckarsky 1990). Many can tolerate high organic inputs and the resulting low concentrations of dissolved oxygen (Bode et al. 1993).

Family Level Biotic Index (FBI)

The Family Level Biotic Index (FBI) is a rapid field assessment of stream arthropods used to determine relative degrees of impact from organic pollution (such as those from animal waste or sewage). The FBI is based on the well known Hilsenhoff Biotic Index (HBI) but identifies organisms to the family level in the field instead of identifying to genus or species in the laboratory. Use of the FBI is advantageous for quickly evaluating the general status of the organic pollution in streams (Hilsenhoff 1988). However, the FBI can be less accurate than the HBI. The FBI tends to indicate greater pollution in unpolluted or slightly polluted streams and less pollution in polluted streams. Typical FBI's range from 0 to 10 with lower number indicating better conditions; this scaling convention can lead to confusion when trying to present both SVAP scores and FBI scores as SVAP indicate poorer conditions as numbers get lower. Therefore in this report the inverse FBI value is reported to indicate stream condition (Table B). By using the inverse FBI value, both FBI and SVAP values represent improved condition with increasing numbers.

Table B. Evaluation of water quality using the inversed family-level biotic index values.

FBI	Water Quality	Degree of Organic Pollution
10.00-6.26	Excellent	Organic pollution unlikely
6.25-5.76	Very Good	Possible slight organic pollution
5.75-5.01	Good	Some organic pollution probable
5.00-4.26	Fair	Increased organic pollution likely
4.25-3.51	Fairly Poor	Substantial pollution likely
3.50-2.76	Poor	Very substantial pollution likely
2.72-0.00	Very Poor	Severe organic pollution likely

Percent EPT

Another useful macroinvertebrate metric is the percent contribution of the Orders **E**phemeroptera, **P**lecoptera, and **T**richoptera in a sample (% EPT). These taxa are typically sensitive to water quality and habitat degradation so their proportion in a sample is a useful index of the general health of a stream segment. This metric is simply presented as the percent of the total number of individuals collected at a site that are within the EPT orders.

Shannon-Weiner diversity index

The Shannon-Weiner diversity index (Shannon and Weaver 1949, Weiner 1948) as modified by Weber (1973) was selected to quantify diversity. Diversity is a function of both the number of species present (richness) and the equitability of distribution of individuals within these species (evenness) (Washington 1984). Anthropogenic activities, such as high organic inputs, typically influence the measure of diversity (Brown 1978, Horn 1988). Diversity is greatest when high numbers of taxa are represented in equal proportions. Diversity can help determine if disparity occurs between different sites within the same waterbody. However, much information is lost when using this index because the composition of the community (i.e., are the organisms present tolerant or sensitive to pollution?) is not taken into consideration. For example, a site that contains a diverse assemblage of tolerant organisms would likely not be considered "better" than a site with a less diverse assemblage of sensitive organisms. For this reason diversity is usually utilized with other more descriptive indices that, taken together, can yield a more thorough view of the community.

RESULTS

At the time of the field investigation, water levels were relatively low based upon the observation of bank height and high water marks. The Anthony Kill within the boundaries of the study reach is a shallow, moderately high gradient stream with alternating riffle/pool habitats. Substrate is composed of mostly gravel and cobble on top of coarse sand. Riffles contained high proportions of large cobble and the substrate composition of pools was predominantly sands. Visible oil sheens were observed when walking in the stream at Sites 4 to 6, and in sediments collected in kick samples at Sites 5 and 6.

The stream flows through a riparian zone vegetated with a mixture of hardwoods, shrubs and grasses. There is adequate riparian vegetation in most areas; the vegetation helps stabilize streambanks and provide fish cover. Adjacent to the North Central Avenue Bridge, the riparian zone has had most of its riparian vegetation removed. The streambanks were covered with rip-rap in the vicinity of the road crossing.

Results of the SVAP at eight sites along the stream indicated that habitat conditions ranged from fair to good (Figure 5). In general, barriers to fish movement (there are none), hydrologic alteration and bank stability received high scores at most sites indicating little disturbance of nearshore areas and stream bottom. The most commonly observed problem (as indicated by low SVAP scores) was a general lack of pools in this shallow stream segment and lack of in-stream fish cover.

Water quality in the stream during sampling was within the ranges expected for a freshwater stream in this area and varied little between sites (Table C). Temperature was seasonably warm, dissolved oxygen was high with over 100% saturation and specific conductance and pH were at levels that would not be stressful to fish or invertebrates.

Table C. Water quality measured in the Anthony Kill in September 2002.

Variable	Site 1	Site 2	Site 3	Site 3.5	Site 4	Site 5	Site 6	Site 7
Temperature (C)	22.4	22.1	21.8	21.4	21.4	21.2	21.1	20.5
Dissolved Oxygen (mg/L)	8.4	8.4	8.4	8.1	8.1	8.3	8.3	8.3
Percent Oxygen Saturation	112	113	112	108	108	109	110	108
Specific Conductance (uS)	844	848	850	842	842	855	851	852
pH	8.3	8.3	8.3	8.3	8.3	8.2	8.2	8.2

There was high variability in the macroinvertebrate metrics between sites (Figure 1). In general, however, poorest results were found at Sites 6 and 7, which would be most affected by migration of site-related contaminants. In particular, the percent EPT richness is substantially lower at these sites. The sample collected at Site 6 contained a paucity of macroinvertebrates, only 18 individuals were collected (Table D). The low number of organisms collected at this location makes interpretation of the metrics (particularly FBI, which is typically calculated from a sample of 100 organisms) problematic. The low abundance of macroinvertebrates at this location could be influenced by elevated concentrations of contaminants in the sediment and/or degraded habitat conditions. As described elsewhere, sediment testing did not reveal concentrations of target compounds that exceed thresholds for acute toxicity. Site 6 was located in a low velocity pool with predominantly sand substrate that did not offer ideal kick sampling habitat; it is likely that the poor habitat quality contributed to the reduced abundance and diversity of organisms. The SVAP assessment was lowest at Site 6, indicating poor stream habitat that could affect macroinvertebrate populations.

All three indices (percent EPT, diversity, and FBI) exhibit a general downward trend as the Arthur Kill flows downstream past the former MGP site. This decline is likely to be the result of a combination of habitat degradation and pollution effects as the stream flows through the urban corridor and is influenced by runoff, storm water, and site-related contaminants. No point sources of oxygen-demanding waste enter the Arthur Kill in the region of the former MGP site.

Table D. Number of macroinvertebrates collected during sampling of the Anthony Kill in September 2002.

Scientific Name	Common Name	Site 1	Site 2	Site 3	Site 3.5	Site 4	Site 5	Site 6	Site 7
Oligochaeta	Aquatic Worm	1		1					6
Sphaeriidae	Fingernail Clam						2		
Asellidae	Isopod					6		2	6
Gammaridae	Scud	53	38	2	34	5	14	8	83
Baetidae	Mayfly	8	20	6		16	38		
Heptageniidae	Mayfly						6		
Coenagrionidae	Damselfly					2			1
Aeshnidae	Dragonfly					4			2
Chloroperlidae	Stonefly			3	6				
Perlidae	Stonefly			12					
Psephenus	Water Beatle	6		8		14	8		
Elmidae	Water Beatle			3					
Corydalidae	Hellgramite	6							
Philopotamidae	Caddisfly	15	8	28	28	12	10	2	8
Hydropsychidae	Caddisfly	22	6	43	31	10			
Helicopsychidae	Caddisfly	9				3	6		
Hydroptilidae	Caddisfly	4							
Rhyacophilidae	Caddisfly					3			
Polycentropodidae	Caddisfly					2			
Tipulidae	Cranefly	4		6			4		
Ceratopogonidae	Biting Midges	12					12		
Chironomid-Other	Midges			2			4	4	
Chironomid-Blood Red	Blood Worm			4				2	
Total		140	72	118	99	77	104	18	106

Overall, there is substantial variability in the macroinvertebrate community of the study area in the Anthony Kill. Variability in samples collected upstream of the former MGP site complicates interpretation of results. However, the downward trend of all three macroinvertebrate metrics from upstream to downstream of the former MGP site is consistent with adverse impacts of the site on habitat and sediment quality. These results should be reviewed in concert with the results of the SRI sediment quality testing.

Impacts to Threatened and/or Endangered Species

There are no known threatened or endangered aquatic species occurring within the study area.
