NON-CONFORMANCE SUMMARY

Job#: A06-B305

STL Project#: NY5A9393.3
Site Name: Ecology and Environment NYSDEC Standby

General Comments

The enclosed data may or may not have been reported utilizing data qualifiers (Q) as defined on the Data Comment Page.

Soil, sediment and sludge sample results are reported on "dry weight" basis unless otherwise noted in this data package.

According to 40CFR Part 136.3, pH, Chlorine Residual, Dissolved Oxygen, Sulfite, and Temperature analyses are to be performed immediately after aqueous sample collection. When these parameters are not indicated as field (e.g. pH-Field), they were not analyzed immediately, but as soon as possible after laboratory receipt.

Sample dilutions were performed as indicated on the attached Dilution Log. The rationale for dilution is specified by the 3-digit code and definition.

Sample Receipt Comments

A06-B305
Sample Cooler(s) were received at the following temperature(s); 6@2.0 °C
All samples were received in good condition.

GC Extractable Data

For Method 8082, all samples and batch QC had percent recoveries (%R) for the surrogate Decachlorbiphenyl outside client control limits, but within laboratory limits. Sample NM-MW-01-GW had a recovery for the surrogate Tetrachloro-m-xylene that was outside client quality control limits but within laboratory limits. No further action was taken.

Metals Data

The recoveries of sample NM-MW-02-GW Matrix Spike and Matrix Spike Duplicate exhibited results below the quality control limits for Barium, Potassium and Sodium. Sample matrix is suspect. However, the LFB was acceptable.

The recoveries of sample NM-MW-02-GW Matrix Spike and Matrix Spike Duplicate exhibited results below the quality control limits for Calcium, Iron, Magnesium, and Manganese. The sample result is more than four times greater than the spike added. The LFB is acceptable.

The recoveries of sample NM-MW-02-GW Post Spike exhibited results below the quality control limits for Barium, Calcium, Iron, Magnesium, Manganese, Potassium, and Sodium. However, the LFB was acceptable.

The Serial Dilution of sample NM-MW-02-G exceeded the quality control limits for Barium, Calcium, Iron, Magnesium, Manganese, and Sodium. However, the LFB was acceptable.

****

The results presented in this report relate only to the analytical testing and condition of the sample at receipt. This report pertains to only those samples actually tested. All pages of this report are integral parts of the analytical data. Therefore, this report should be reproduced only in its entirety.

SEVERN TRENT STL

DATA QUALIFIER PAGE

These definitions are provided in the event the data in this report requires the use of one or more of the qualifiers. Not all qualifiers defined below are necessarily used in the accompanying data package.

ORGANIC DATA QUALIFIERS

ND or U	Indicates compound was analyzed for, but not detected.
J	Indicates an estimated value. This flag is used either when estimating a concentration for tentatively identified compounds where a 1:1 response is assumed, or when the data indicates the presence of a compound that meets the identification criteria but the result is less than the sample quantitation limit but greater than zero.
C	This flag applies to pesticide results where the identification has been confirmed by GC/MS.
B	This flag is used when the analyte is found in the associated blank, as well as in the sample.
E	This flag identifies compounds whose concentrations exceed the calibration range of the instrument for that specific analysis.
D	This flag identifies all compounds identified in an analysis at the secondary dilution factor.
N	Indicates presumptive evidence of a compound. This flag is used only for tentatively identified compounds, where the identification is based on the Mass Spectral library search. It is applied to all TIC results.
P	This flag is used for CLP methodology only. For Pesticide/Aroclor target analytes, when a difference for detected concentrations between the two GC columns is greater than 25%, the lower of the two values is reported on the data page and flagged with a "P".
A	This flag indicates that a TIC is a suspected aldol-condensation product.
1	Indicates coelution.
*	Indicates analysis is not within the quality control limits.

INORGANIC DATA QUALIFIERS

ND or U	Indicates element was analyzed for, but not detected. Report with the detection limit value.
J or B	Indicates a value greater than or equal to the instrument detection limit, but less than the quantitation limit.
N	Indicates spike sample recovery is not within the quality control limits.
S	Indicates value determined by the Method of Standard Addition.
E	Indicates a value estimated or not reported due to the presence of interferences.
H	Indicates analytical holding time exceedance. The value obtained should be considered an estimate.
*	Indicates the spike or duplicate analysis is not within the quality control limits.
+	Indicates the correlation coefficient for the Method of Standard Addition is less than 0.995.

NON-CONFORMANCE SUMMARY

Job#: A06-B305

STL Project#: NY5A9393.3
Site Name: Ecology and Environment NYSDEC Standby

General Comments

The enclosed data may or may not have been reported utilizing data qualifiers (Q) as defined on the Data Comment Page.

Soil, sediment and sludge sample results are reported on "dry weight" basis unless otherwise noted in this data package.

According to 40CFR Part 136.3, pH, Chlorine Residual, Dissolved Oxygen, Sulfite, and Temperature analyses are to be performed immediately after aqueous sample collection. When these parameters are not indicated as field (e.g. pH-Field), they were not analyzed immediately, but as soon as possible after laboratory receipt.

Sample dilutions were performed as indicated on the attached Dilution Log. The rationale for dilution is specified by the 3-digit code and definition.

Sample Receipt Comments

A06-B305
Sample Cooler(s) were received at the following temperature(s); 6@2.0 °C
All samples were received in good condition.

GC Extractable Data

For Method 8082, all samples and batch QC had percent recoveries (%R) for the surrogate Decachlorbiphenyl outside client control limits, but within laboratory limits. Sample NM-MW-01-GW had a recovery for the surrogate Tetrachloro-m-xylene that was outside client quality control limits but within laboratory limits. No further action was taken.

Metals Data

The recoveries of sample NM-MW-02-GW Matrix Spike and Matrix Spike Duplicate exhibited results below the quality control limits for Barium, Potassium and Sodium. Sample matrix is suspect. However, the LFB was acceptable.

The recoveries of sample NM-MW-02-GW Matrix Spike and Matrix Spike Duplicate exhibited results below the quality control limits for Calcium, Iron, Magnesium, and Manganese. The sample result is more than four times greater than the spike added. The LFB is acceptable.

The recoveries of sample NM-MW-02-GW Post Spike exhibited results below the quality control limits for Barium, Calcium, Iron, Magnesium, Manganese, Potassium, and Sodium. However, the LFB was acceptable.

The Serial Dilution of sample NM-MW-02-G exceeded the quality control limits for Barium, Calcium, Iron, Magnesium, Manganese, and Sodium. However, the LFB was acceptable.

****

The results presented in this report relate only to the analytical testing and condition of the sample at receipt. This report pertains to only those samples actually tested. All pages of this report are integral parts of the analytical data. Therefore, this report should be reproduced only in its entirety.

Reviewed by: SEP 26 2006

Global Sample Information
Default Sample Volume : 1.000 uL
Quantitation Units : ng
Void Time : 0.000 min
Correct amounts during calibration : Yes
Convert unknowns to concentration units : Yes
Reject outliers during calibration : No

An External Standard calibration will be used
Unknown peaks will be quantitated using a response factor of 1.000000e+06
First peak will be relative retention reference

Component Information
TMX
Component Type : Single Peak Component
Retention Time : 1.793 min
Search Window : 3.00 s, 0.00 %
Reference Component :
Find peak closest to expected RT in window
Calibrating Area versus Amount using a 2nd Order Fit
Curve will ignore the origin
Amounts will not be scaled prior to the regression
Weighting factor for the regression: 1
Component standard purity percentage : 100.0000%

Description: NEW 7 PT 1016/1260 CURVE FOR INST #19 9/25/06.

Processed by: EM 9/26/06
Reviewed by: SEP 26 2006

Global Sample Information
Default Sample Volume : 1.000 uL
Quantitation Units : ng
Void Time : 0.000 min
Correct amounts during calibration : Yes
Convert unknowns to concentration units : Yes
Reject outliers during calibration : No

An External Standard calibration will be used
Unknown peaks will be quantitated using a response factor of 1.000000e+06
First peak will be relative retention reference

Component Information
TMX
Component Type : Single Peak Component
Retention Time : 1.551 min
Search Window : 3.00 s, 0.00 %
Reference Component :
Find peak closest to expected RT in window
Calibrating Area versus Amount using a 2nd Order Fit
Curve will ignore the origin
Amounts will not be scaled prior to the regression
Weighting factor for the regression: 1
Component standard purity percentage : 100.0000%

User Values
Label :
Value 1 : 0.030000
Value 2 : 0.000000

Were ICP interelement corrections applied? Yes/No YES

Were ICP background corrections applied? Yes/No YES

If yes-were raw data generated before application of background corrections? Yes/No NO

Comments:

I certify that this data package is in compliance with the terms and conditions of the contract, both technically and for completeness, for other than the conditions detailed above. Release of the data contained in this hardcopy data package and in the computer-readable data submitted on floppy diskette has been authorized by the Laboratory Manager or the Manager's designee, as verified by the following signature.

Signature: Tony Bogolin Name: Tony Bogolin

Date: 10/19/06 Title: Project Manager

ANALYTICAL REPORT

PREPARED FOR

Attn: Ashlee Smith
WSP USA Inc.
40 La Riviere Drive
Suite 320
Buffalo, New York 14202

Generated 7/19/2023 2:35:10 PM

JOB DESCRIPTION

Hudson SA-13

JOB NUMBER

480-210862-1

Eurofins Buffalo
10 Hazelwood Drive
Amherst NY 14228-2298

See page two for job notes and contact information.

Job Notes

This report may not be reproduced except in full, and with written approval from the laboratory. The results relate only to the samples tested. For questions please contact the Project Manager at the e-mail address or telephone number listed on this page.

The test results in this report relate only to the samples as received by the laboratory and will meet all requirements of the methodology, with any exceptions noted. This report shall not be reproduced except in full, without the express written approval of the laboratory. All questions should be directed to the Eurofins Environment Testing Northeast, LLC Project Manager.

GC Semi VOA

Qualifier	Qualifier Description
U	Indicates the analyte was analyzed for but not detected.

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
¤	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CFU	Colony Forming Unit
CNF	Contains No Free Liquid
DER	Duplicate Error Ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL	Detection Limit (DoD/DOE)
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision Level Concentration (Radiochemistry)
EDL	Estimated Detection Limit (Dioxin)
LOD	Limit of Detection (DoD/DOE)
LOQ	Limit of Quantitation (DoD/DOE)
MCL	EPA recommended "Maximum Contaminant Level"
MDA	Minimum Detectable Activity (Radiochemistry)
MDC	Minimum Detectable Concentration (Radiochemistry)
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
MPN	Most Probable Number
MQL	Method Quantitation Limit
NC	Not Calculated
ND	Not Detected at the reporting limit (or MDL or EDL if shown)
NEG	Negative / Absent
POS	Positive / Present
PQL	Practical Quantitation Limit
PRES	Presumptive
QC	Quality Control
RER	Relative Error Ratio (Radiochemistry)
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)
TNTC	Too Numerous To Count

Case Narrative

Client: WSP USA Inc.
Project/Site: Hudson SA-13

Job ID: 480-210862-1

Job ID: 480-210862-1

Laboratory: Eurofins Buffalo

Narrative

Job Narrative
480-210862-1

Comments
No additional comments.

Receipt
The samples were received on 7/14/2023 1:40 PM. Unless otherwise noted below, the samples arrived in good condition, and where required, properly preserved and on ice. The temperatures of the 2 coolers at receipt time were 3.7º C and 4.2º C.

GC Semi VOA
No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

Organic Prep
No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

Detection Summary

Client: WSP USA Inc.
Project/Site: Hudson SA-13

Job ID: 480-210862-1

Client Sample ID: NM-MW-02-JUL23 — **Lab Sample ID: 480-210862-1**

No Detections.

Client Sample ID: NM-MW-02-JUL23-FF — **Lab Sample ID: 480-210862-2**

No Detections.

Client Sample ID: NM-MW-04-JUL23 — **Lab Sample ID: 480-210862-3**

No Detections.

Client Sample ID: NM-MW-04-JUL23-FF — **Lab Sample ID: 480-210862-4**

No Detections.

Client Sample ID: NM-MW-04-JUL23-Q — **Lab Sample ID: 480-210862-5**

No Detections.

Client Sample ID: NM-MW-04-JUL23-Q-FF — **Lab Sample ID: 480-210862-6**

No Detections.

Client Sample ID: NM-MW-05-JUL23 — **Lab Sample ID: 480-210862-7**

No Detections.

Client Sample ID: NM-MW-05-JUL23-FF — **Lab Sample ID: 480-210862-8**

No Detections.

This Detection Summary does not include radiochemical test results.

Client Sample ID: NM-MW-02-JUL23

Lab Sample ID: 480-210862-1

Date Collected: 07/13/23 08:20

Matrix: Water

Date Received: 07/14/23 13:40

Method: SW846 8082A - Polychlorinated Biphenyls (PCBs) by Gas Chromatography

1 Introduction

On behalf of the New York State Department of Environmental Conservation (NYSDEC), Ecology and Environment Engineering and Geology, P.C. (E & E) has prepared this Pathway Analysis Report (PAR) to identify exposure pathways and potential risk to human receptors associated with polychlorinated biphenyls (PCBs) contaminated soils at the Second Fill Area of the Special Area 13 Dredge Spoil Disposal Area (SA-13) site, NYSDEC Site No. 546041. The SA-13 site is located along the western shore of the Hudson River in the Town of Moreau, Saratoga County, New York. The Second Fill Area (the site) is located on the northern bounds of the SA-13 dredge disposal area, , and is the subject of this PAR (see Figure 1-1).

1.1 Purpose of the Pathway Analysis

This PAR was prepared in accordance with the United States Environmental Protection Agency (USEPA) Risk Assessment Guidance for Superfund (RAGS), NYSDEC 6 NYCRR Part 375 and NYSDEC's guidelines titled *Pathway Analysis Report New York TSCA PCB Site,* provided in Appendix A of this report. This PAR is intended to support the PCB enhanced hybrid self-implementing clean-up and proposed remedial activities summarized in the *PCB Cleanup Plan for Special Area-13 Dredge Spoil Disposal Area* (E & E 2023a) and the Interim Site Management Plan (ISMP) (E & E 2023b). This PAR evaluates PCBs as the constituent group of potential concern and does not include the evaluation of other contaminants present at the site.

A risk assessment conceptual site model (CSM) was prepared as part of this PAR to summarize complete exposure pathways and potential human health risks associated with residual PCB contamination at the site. The CSM identifies the potential contamination source or location, transport through environmental media, activities that may result in exposure and the prospective receptor(s). The exposure scenarios characterized in this PAR consider current and future land use and site conditions.

Analytical data available from previous investigations completed at the site were used to perform a quantitative risk assessment described in this PAR. The methodologies used to perform the quantitative evaluation of risk associated with a complete exposure pathway are summarized in this report. This PAR also describes a summary of applicable standards and screening levels, methods used to

select the constituents of concern (COCs), exposure factors, routes of potential exposure, general assumptions, data usability and uncertainties.

2 Site Background

2.1 Site Description

The SA-13 Dredge Spoil Disposal Area is located along the western shore of the Hudson River approximately 1,200 feet south of Champlain Canal Lock 7 and near Buoy 219 that marks the western margin of the navigation channel of the Champlain Canal within the Hudson River. The SA-13 site consists of four distinct areas over approximately 25.3 acres: the main dredge disposal area, the first fill area, the second fill area and the third fill area. The main dredge disposal area consists of a closed and covered basin and earthen containment berm complex built by the Waterways Maintenance Division of the New York State Department of Transportation (NYSDOT) to dewater and hold drainage network soil removed from the Champlain Canal/Hudson River navigation channel south of Canal Lock 7 and from around Rogers Island. PCB-contaminated dredge spoils from the main area were graded out onto three adjoining areas prior to its closure, one of these adjacent areas being the Second Fill Area, and is the subject of this PAR. The Second Fill Area, herein identified as the site, is located on the northern end of the overall SA-13 study area and encompasses approximately 6.3 acres (see Figure 2-1).

2.2 Site Historical Use

Available NYSDOT records report that the SA-13 dredge spoil disposal area was used between 1952 and 1979 for the disposal of up to 802,000 cubic yards of dredge spoil material during canal maintenance operations. The Second Fill Area was first utilized for the disposal of dredged material when older dredge spoil material, excavated from the main dredge disposal area, was regraded. Dredge spoil material placed on the site was believed to be slightly graded outward and upward to create a containment berm. A portion of the Second Fill Area was paved in 2008 during the construction of the Work Support Marina Facility for use during the Hudson River PCBs Site remedial dredging project.

2.3 Current Zoning/Use

The site is owned by New York State and is zoned commercial. A large portion of the site is covered with clean fill and pavement; however, the remaining portion of the site is not covered but remains vegetated. Based on the site's current use and zoning designation, the reasonably anticipated future land use will remain commercial, low occupancy.

2.4 Environmental Assessment

2.4.1 Summary of Previous Investigations

Previous investigations were performed at the site to define the nature and extent of contamination. A summary of completed investigations are as follows:

- In 1992 Malcolm Pirnie, Inc., conducted investigations of eight Hudson River upland dredge spoil sites, including PCB soil sampling at the subject site (MPI 1992). Available data from this investigation reported PCB detections as total PCB concentrations (summation of detected Aroclors), results for individual Aroclor concentrations in samples were not reported.
- In 2002, NYSDEC conducted additional surface soil samples within the subject Site. A 100-foot by 200-foot sampling grid was established across the site, with sample collection prioritized at publicly assessable areas. All surface soil samples were grab samples collected from the 0 to 2-inch depth interval and submitted for PCB analysis.
- In 2005 E & E performed remedial investigations (RIs) at the Old Moreau, and Moreau sites to define the nature and extent of PCB contamination in surface soils, subsurface soils, surface drainage, and groundwater at the sites and assess if site conditions pose a potential threat to human health or the environment (E & E 2012a,b,c). At the time of the RI work, the site, which is now part of SA-13, was included as part of the Moreau dredge spoil disposal site, located northwest of the SA-13 dredge spoil disposal area. As such, samples were collected from the site under the Moreau and Old Moreau RIs conducted by E & E.
- In July 2023, E & E conducted additional groundwater sampling at the site. Both filtered and unfiltered samples were collected from four monitoring wells and analyzed for PCBs (E & E 2023c).

2.4.2 Sample Results

The focus of this PAR is to support the PCB enhanced hybrid self-implementing cleanup and disposal application and to evaluate the implications of residual PCB contamination at the site as it relates to human health risk. As such, PCBs are the only constituent group summarized here.

PCBs were detected in many of the soil samples collected at locations across the site. PCBs were detected below the existing asphalt cover at concentrations up to 25 parts per million (ppm) (total PCB) and at concentrations up to 55 ppm in the uncovered area which exceed the NYSDEC Soil Cleanup Objectives (SCOs) for commercial use (1 ppm) (NYSDEC 2006a). Results of surface soil samples (0 to 6-inches bgs) ranged from non-detect to 5.4 ppm at sample location OM-SS-L12 collected by E & E during the Old Moreau RI (E & E 2012b) for total PCBs. Results of subsurface soil samples ranged from non-detect to 55 ppm at borehole location OM-62 sampled from the depth two to three feet bgs during the 1992 MPI investigation (MPI 1992). The primary Aroclors detected in soil samples collected at the site were Aroclor 1242, 1248, and 1254.

Groundwater analytical data from samples collected by E & E during the 2006 RI were non-detect for PCBs (E & E 2012a). Samples collected during the RI were unfiltered with a turbidity of 43 nephelometric turbidity units or less. Additional groundwater sampling was performed in 2023 by E & E. Both filtered and unfiltered samples were collected during this sampling effort to evaluate the impacts of solids (i.e. turbidity) on PCB detections in groundwater. Results of both sampling efforts indicated PCBs were not present in site groundwater at concentrations above the TSCA decontamination standard for water containing PCBs (less than or equal to 0.5 µg/L for unrestricted use) per 40 CFR 761.79(b)(1)(iii) and therefore groundwater impacts are not a concern for this site (E & E 2023).

Sampling results from previous site investigations are summarized in Table 2-1 through Table 2-4. Sample locations are shown on Figures 2-2 and 2-3.

2.5 Site Remedy

In accordance with the NYSDEC's December 2012 Record of Decision (ROD) (NYSDEC 2012) and the PCB Cleanup Plan (E & E 2023a) a final site remedy has been selected for the site to remediate PCBs that remain on site at concentration exceeding the established SCO of 1 ppm. Human health-based SCOs are estimates of contaminant-specific soil levels that are without appreciable risk of either non-cancer or cancer health effects. They are based on a combination of toxicity assessment and exposure assessment. Exposure factors were considered in the development of DEC's soil cleanup objectives and are discussed in further detail in the 2006 Technical Support Document (NYSDEC 2006b) and the 2020 addendum to the Technical Support Document (NYSDEC 2020). The relevant land uses are defined as "Commercial use" which is a land use for the primary purpose of buying, selling or trading of merchandise or services. Commercial use includes passive recreational uses, which are public uses with limited potential for soil contact. The site remedy is to install a clean cover in areas of the site that exceed 1 ppm of PCBs in accordance with 40 CFR 761.61(a)(4)(i)(B) and 761.61(a)(7) In areas currently not covered with an adequate cover, the ROD calls for a one foot soil cover meeting the criteria set forth in 6 NYCRR part 375-6.7(d) The proposed cover will include a minimum of six-inches of compacted clean soils (as per 40 CFR 761.61(a)(7)) and six-inches of topsoil (total of 12-inches of cover material) placed over a demarcation layer. This soil cover will limit contact of surface water runoff with and the potential for exposure to the soil below the alternative cover by grading final surface elevations to promote storm water drainage to limit infiltration and prevent PCB contaminated soils from migrating offsite due to erosion. Existing impervious surfaces will be evaluated and augmented to meet the requirements of 40 CFR 761.61(a)(7) for asphalt/concrete caps. Potential future site exposure pathways and human receptors would be mitigated by the institutional and engineering controls. Any proposed redevelopment would be subject to the NYSDEC's Change of Use requirements and would be limited to instances where constructions workers breach the soil cover during redevelopment pursuant to requirements of a soil management plan. A Site Management Plan (SMP) will be implemented for the site that provides descriptions of the engineering and

institutional controls, and prescribes maintenance, monitoring, and reporting requirements in accordance with the NYSDEC Division of Environmental Remediation (DER) DER-10, *Technical Guidance for Site Investigation and Remediation*, dated May 2010 (NYSDEC 2010). The institutional control for the property will:

- Require the completion a periodic certification of institutional and engineering controls;
- Limit the future use and development of the Site to commercial;
- Restrict the site to low occupancy;
- Restrict the use of groundwater as a source of potable or process water;
- Prohibit agriculture or vegetable gardens; and,
- Require compliance with the Department approved Site Management Plan (which will include a soil management plan to guide any disturbance of materials containing > 1 ppm PCBs and regular inspections of the cover system).

OM-TP-26-04	22-Aug-05	8082-Screen	0.5	0.24 U	5.6	2.1

Note:

1. For samples with results available from both standard Method 8082 and Method 8082-screen, the standard Method 8082 values are show.
2. ** = The average detection and maximum RDL if non-detect is shown for duplicate and standard sample results.

Key:

ft = Feet
bgs = Below ground surface.
mg/Kg = Milligrams/Kilogram.
U = Not detected at the reporting limit shown.
UJ = Not detected at the estimated reporting limit shown.
J = Estimated value ("-" is biased low and "+" is biased high)
Blank spaces indicate PCBs were not analyzed for confirmation or field duplicate samples.

Table 2-3 Summary of Total PCB Concentrations in Surface Soil Samples, Second Fill Area

OM-SS-03	26-Aug-05	0 - 0.5	0.042	0.05

Note:

1. For samples with results available from both standard Method 8082 and Method 8083-screen, the standard Method 8082 values are show.

2. For samples collected during the E & E RI and analyzed under Method-8082-screen, results were adjusted using the mathematical equation derived duiring the regression analysis.

3. Bold and shaded values exceed Part 375 Commercial Use SCO of 1 mg/kg

Key:

ft = Feet
bgs = Below ground surface.
mg/Kg = Milligrams/Kilogram.
U = Not detected at the reporting limit shown.

Note:

1. For samples with results available from both standard Method 8082 and Method 8083-screen, the standard Method 8082 values are show.

2. For samples collected during the E & E RI and analyzed under Method-8082-screen, results were adjusted using
3. Bold and shaded values exceed Part 375 Commercial Use SCO of 1 mg/kg

Key:

ft = Feet
bgs = Below ground surface.
mg/Kg = Milligrams/Kilogram.
U = Not detected at the reporting limit shown.
Blank spaces indicate PCBs were not analyzed for confirmation or field duplicate samples.

3 Identification of Constituent of Concern

3.1 Data Collection Considerations

In accordance with provisions of 40 CFR 761.61 (a)(2), 40 CFR 761 Subpart N, sample collection for a site characterization is generally intended to be on a 10-foot grid system (one sample every 100 square feet). The site comprises approximately 6 acres of a larger hazardous waste site (Special Area-13 total acreage of 25.3) and to perform investigation sampling in accordance with these guidelines would have proved cost prohibitive. Statistical analysis was performed to evaluate the adequacy of the sample set available for the site study area to support a hybrid self-implementing corrective action. Results indicate that the current sample set consisting of both surface and subsurface soil samples are statistically acceptable for risk-based analysis and remedial design decision, and additional samples would provide limited benefit in reducing relative error on the mean. The statistical analysis is described in a technical memo submitted under separate cover (see Appendix D).

3.2 Available Data Sets

Data evaluated under this PAR include only samples and matrices required to quantify risk and toxicity associated with complete exposure pathways existing at the site. Complete exposure pathways identified at this site generally include incidental ingestion, dermal contact and inhalation of contaminated soil particles associated with site surface soil (0 to 6-inches bgs) and subsurface soil (> 6-inches bgs) Therefore, PCB results for surface and subsurface soil samples collected at the site during the E &E RIs and the MPI investigation were utilized in characterizing risk at the site. Analytical results from the NYSDEC 2002 investigation were not included in risk analyses performed under this PAR as validation, qualifier, and reporting limit information were not available to determine the usability of the data.

Several guidance values and standards apply to total PCB concentrations rather than individual Aroclor concentrations, including 6 NYCRR Subpart 375-6.8 SCOs. As a result, it is common for PCB detections to be expressed as total PCB concentration rather than individual Aroclor-specific detections. Accordingly, sample results from the MPI investigation were reported as total PCB concentrations to facilitate comparison to the Part 375 SCOs. Aroclor-specific detections from the MPI investigation were not available for use in this PAR. Therefore,

only total PCBs were evaluated and screened as a COC from the MPI investigation.

Both individual-Aroclor and total PCB data sets were available from the E &E RI. Therefore, both data sets were evaluated and screened as COCs under this PAR.

3.3 Laboratory Data Quality and Usability Considerations

Samples collected during the MPI investigation were submitted to Upstate Laboratory, Inc. for analysis of PCBs by USEPA method 846 Third Edition (MPI 1992). The data quality assurance measures, validation and usability considerations for analytical data gathered during the MPI investigation are unknown as sampling collection, analysis and validation were completed by others.

Samples collected at the site during the E & E RI were submitted to Severn Trent Laboratories (STL) of Buffalo, New York for laboratory analysis. In an effort to reduce analytical costs, PCBs in soil samples were analyzed using two similar analytical methods, standard EPA Method 8082 and a screening level analysis based on EPA Method 8082, which primarily differ only in the method used to extract PCBs from the sample matrix. All samples were analyzed using the screening method (EPA Method 8082-screen) and approximately 20% of the samples were analyzed using standard EPA Method 8082. The two methods are discussed in more detail in Section 3.3.1. All groundwater samples collected at the site were analyzed for PCBs using the standard EPA Method 8082 analysis. Sample collection and analysis completed during the E & E RI was conducted in accordance with the NYSDEC approved Quality Assurance Plan (QAPP), provided in the E & E Remedial Investigation Work Plan (E & E 2005). The procedures described in the QAPP were consistent with the current updates of the EPA SW-846 sampling procedures at the time of sampling. STL followed NYSDEC Analytical Services Protocol (ASP) of June 2000 for all analytical methods, quality assurance (QA)/quality control (QC), holding times, and reporting requirements. Any deviations from acceptable QC specifications are discussed in the applicable Data Usability Summary Report (DUSR), provided in the respective RI reports (E & E 2012a,b,c). Appropriate qualifiers were added to the data by the E & E data validators to indicate potential concerns with data usability.

3.3.1 Comparability of PCB Screening Results

The majority of the PCB soil samples collected during the E &E RI were analyzed by a screening method based on a modification of SW-846 EPA Method 8082. Standard EPA Method 8082 analysis for PCB samples was used for confirmation purposes. Overall correlation between screening and EPA method 8082 analysis was good. Comparison of the total PCB results of the two methods run on the same samples showed that, on average, standard EPA Method 8082 gave higher results than the screening method. Thus, the PCB data were effectively expressed in two different scales, much like temperatures expressed in the Fahrenheit and Celsius scales. To use the results in risk assessment calculations, it is necessary to convert the total PCB values to a single scale. Being the standard EPA method, Method 8082 is considered more reliable than the modified screening method;

therefore, for samples with results available from both methods, the standard Method 8082 values are used. For samples with only screening method results, the total PCB concentration determined by Method 8082-screen were converted to estimated Method 8082 values using the mathematical relationship between the two sets of values obtained by regression analysis. Comparison of the analyses indicated that a power function best described the relationship between total PCB concentrations reported for the two analytical methods, assuming a variety of shapes for the underlying data distribution (see Appendix M of the Old Moreau RI, [E &E 2012b]). The mathematical relationship used to correct the screening test data was:

$$y = 1.3714\, x^{1.0104}$$

Where:

x = reported screening test PCB concentration; and
y = estimated EPA Method 8082 PCB concentration.

6 NYCRR SCOs for PCBs are expressed in terms of total PCBs, as such, value adjustment was made to total PCB concentrations only. The relationship between Aroclor data derived from the standard USEPA Method 8082 and the Method 8082-screening has not been evaluated and Aroclor data has not been adjusted to account for discrepancies between the two analytical methods. As such, in accordance with the total PCB method comparison described above, Aroclor detections derived by Method 8082-screen may be slightly biased low. However, where sample results were available from the standard and the screening-method, the standard Method 8082 Aroclor results were utilized in the exposure assessment. Additionally, total PCBs were also screened and evaluated as a COCs under this PAR to account for uncertainty regarding Aroclor data discrepancies.

3.4 Data Usability Criteria

As indicated in Section 3.3, results for samples collected during the E & E RI were validated and qualified where potential data usability concerns exist. Qualified data were considered and assumed accurate for use in data analyses completed under this PAR. When duplicate samples were collected, the average concentrations of detected contaminants at a sampling point were utilized in calculating exposure point concentrations. Samples qualified as non-detect were evaluated as non-detect in calculating exposure point concentrations. Where detected Aroclor results were available from both the standard Method 8082 and EPA Method 8082-screen, results derived from the standard Method 8082 were used.

3.5 Summary of Constituent of Concern

Constituent detection frequency, detection limits, and regulatory criteria utilized to screen and identify COCs are summarized in accordance with requirements of Planning Table 2 of RAGS Part D and presented in Table B-2 of Appendix B. COCs were identified by comparing the maximum concentration of a chemical detected in site surface and subsurface soils with the corresponding USEPA Regional Screening Levels (RSL) or SCOs, as applicable. Individual-Aroclor

detections were compared to USEPA RSL for Industrial Soil at a target risk of 10^{-6} and a Hazard Quotient (HQ) of 0.1, released May 2023, while total PCB values were compared to 6 NYCRR Subpart 375-6.8 SCOs for Commercial Use (Low Occupancy).

Four COCs were identified in site soils for consideration in the risk assessment utilizing this methodology. Three of the four identified COCs were identified in site surface soils, while all four were identified in site subsurface soils. The identified COCs are as follows:

- Aroclor 1242 (subsurface soils only)
- Aroclor 1248 (surface and subsurface soils)
- Aroclor 1254 (surface and subsurface soils)
- Total PCBs (surface and subsurface soils)

4 Exposure Assessment

The purpose of an exposure assessment is to estimate the magnitude, frequency, duration, and route of exposure (USEPA RAGS Part A). To estimate exposure, the exposure setting and exposure pathways must be characterized. This section summarizes the exposure scenarios existing at the site considering current and future site use, and describes the methodologies used to quantify exposure.

4.1 Conceptual Site Model

COCs selected as described in Section 3 were identified to be present at the site at levels exceeding regulatory standards or guidance values. Although those regulatory criteria were developed to be health-protective, the mere presence of environmental contamination at higher concentrations does not necessarily pose an actual risk to human health. For contamination to pose a human health risk both of the following conditions must be true:

- There must be a complete pathway of exposure from the contamination to human receptors; and
- The magnitude of the receptors' exposure to contamination must be sufficient to cause an adverse health effect.

If there is no complete pathway of exposure, there will be no risk associated with the contamination. If a complete pathway exists, but the magnitude of the receptor's exposure is low, the associated risk may not be significant. Both factors need to be considered when evaluating potential human health risks posed by residual contamination at the site.

A schematic CSM was developed to identify complete exposure pathways potentially existing at the site. The CSM is provided in Figure 4-1. The CSM outlines the contaminant sources, fate and transport, exposure pathways, and receptors present at the site under current site conditions.

4.2 Potential Transport Mechanisms

Surface water flow (i.e., runoff) can be a transport mechanism that allows migration of contaminants if those contaminants are present in surface soils. Surface water flow at the site is a mechanism that potentially allows lateral migration of contaminants from surficial soil into on-site drainageways and ultimately into the Hudson River. Surface water flow at the site occurs primarily during heavy precipitation events or spring snow melts as surface runoff. The majority of the site

is vegetated with the exception of the paved portion. During heavy precipitation events, surface water from the site flows south into drainage ditches and swale located along the southern border of the site and accumulates in topographic low areas and/or infiltrates the ground. Although erosional features are not prevalent on site due to vegetative cover, PCB contamination identified in drainage network soil samples collected off-site show that migration of contaminants via surface water runoff occurs at the site, however the drainage network is a part of the neighboring NYSDEC Superfund site.

PCBs present in soils will likely remain absorbed to soil particles at the site. PCBs are relatively insoluble in water and are not expected to appreciably leach into groundwater or runoff, if present. Sampling has shown that PCBs have not leached into the groundwater below the site. The potential for leaching is further reduced by the presence of organic carbon in the soil because PCBs may bind to the carbon. Once bound, PCBs are much less likely to leach from the carbon, thus limiting the potential for transport to groundwater. Based on the analytical data, total organic carbon (TOC) concentrations in the samples ranged from 1% to 5% indicating that PCBs would most likely remain adsorbed to soil and not leach appreciably (E & E 2012 a,b,c). Additionally, since PCBs were not detected in groundwater; PCBs that have been present in site soils for greater than 35 years have not migrated to the groundwater monitoring well locations. This further demonstrates that it is unlikely for absorbed PCBs to leach from contaminated soils into groundwater under current or future conditions.

Exposure of wind to eroding PCB contaminated soils may generate contaminated airborne particles or vapors in the atmosphere. PCB chemicals present in soils may vaporize into the atmosphere when soil surfaces are exposed via removal of vegetation or general construction activities such as excavation. The physical and chemical properties vary widely across the class, however, in general, PCBs have low vapor pressures (their degree of solubility decreases with increased chlorination) (ATSDR 2000). As such, the vaporization of PCBs present in soils is unlikely, yet is conservatively evaluated as a transport mechanism under this PAR.

4.3 Potentially Exposed Receptors

Under the existing site conditions (see Section 2 for site description), residents living adjacent to the site may have contact with site surface soils (0 to 6-inches bgs) if they elect to trespass and access the site in an unauthorized manner. All surface soil data collected from the site was used to evaluate exposure for trespassers (adult and child) at the site. Exposure to trespassers may occur through incidental ingestion via hand-to-mouth contact, dermal contact, and inhalation of airborne particles or vapors from soil.

In accordance with the PCB Cleanup Plan (E & E 2023), the site is proposed to be remediated through the installation of a 12-inch cover system to reduce contact with PCB contaminated soils and prevent soil erosion. The remedial construction of the cover system will involve the placement of a demarcation layer and cover material atop of the existing soils in uncovered areas. Accordingly, it is assumed

that the construction workers installing the cover system could be exposed to site contamination via direct contact with surface soils (0 to 6-inches bgs) and potentially subsurface soils, > 6-inches bgs. All soil data collected from the site was used to evaluate exposure for adult construction works at the site under current conditions. Exposure could occur through incidental ingestion via hand-to-mouth contact, dermal contact, and inhalation of airborne particles or vapors from soil.

At present, there are no plans to develop the site for other uses and it is likely that the site will remain undeveloped in the future. It is reasonably assumed that the site use will remain low occupancy as indicated in the PCB Cleanup Plan (E & E 2023), and the site will be managed in accordance with the final SMP. The cover system will require routine maintenance to mitigate and prevent deficiencies. It is assumed that maintenance workers performing corrective action to address potential deficiencies could be exposed to existing surface and subsurface soils that will be located below the cover system under future conditions through direct contact (incidental ingestion via hand-to-mouth contact, dermal contact, and inhalation of airborne particles or vapors from the soil). All data collected from the site was used to evaluate this future scenario.

Adjacent residents may trespass on the site following the installation of a cover system. The cover system will prevent and reduce any potential exposure to PCB contaminated soils. It is highly unlikely that trespassers will be exposed to residual contamination below the cover system, mitigating this exposure pathway under future conditions.

4.3 Exposure Point Concentration

The lesser of the 95% upper confidence limit (UCL) or the maximum detected concentration was used as the exposure point concentration for area-wide risk estimates. The 95% UCLs were determined statistical tools available in the USEPA's ProUCL 5.1 freeware package. ProUCL 5.1 includes computational methods capable of handling data sets with non-detect observations, including the Kaplan-Meir (KM) method. The sample detection limit was utilized to identify non-detect values in the exposure point concentrations computations, as in accordance with the *ProUCL Version 5.1.002 Technical Guide* (USEPA 2015), it is recommended that the DL/2 substitution method is not used on the account of historic poor performance. Exposure point concentrations are provided in Table B-3 in Appendix B.

There is uncertainty associated with the Aroclor data due to the limited sample count in surface soil data and frequency of non-detect observations. However, ProUCL 5.1 provides computation methods accustomed to handling non-detect observations.

4.4 Quantification of Exposure

Risk estimates were prepared for the receptors and exposure pathways identified in the conceptual site model using default and assumed exposure factors and daily intake equations.

Default exposure factor values recommended in various EPA risk assessment guidance documents and the USEPA RSL Calculator were used in the computations when available and appropriated. Some exposure factors were customized to reflect site conditions under the subject exposure scenarios. In general, the majority of exposure factors were assumed to the default value with the exception of the following:

- Exposure Duration (ED) for the current construction work scenario;
- Exposure Frequency (EF) for the future maintenance worker scenario;
- Exposure Time (ET) for current trespasser scenario; and,
- Particulate Emissions Factor (PEF) the current construction work scenario.

These specific cases are discussed in the following sections. Exposure factors utilized are outlined in Table B-4a and B-4b in Appendix B.

Exposure factors, specifically the frequency and extent of exposure, are difficult to project. This is especially true in characterizing the exposure setting of trespassers. The frequency, duration and extent of trespassing is unknown and difficult to define. The exposure factors assumed to quantify risk associated with the trespassing scenario were conservative and reasonably assumed protective of human health. Trespassers were assumed to be exposed to surface soil only. In accordance with the Human Health Risk Assessment completed as part of the SA-13 RI report (E & E 2012c), 40 years was assumed for residential recreators at the site. This exposure frequency was assumed to be reasonably conservative and health protective for trespassers at the site under current and future conditions. An exposure time of (1) hour was assumed for trespassers, as it is reasonably assumed that trespassers will not loiter on the site at durations in excess of one hour.

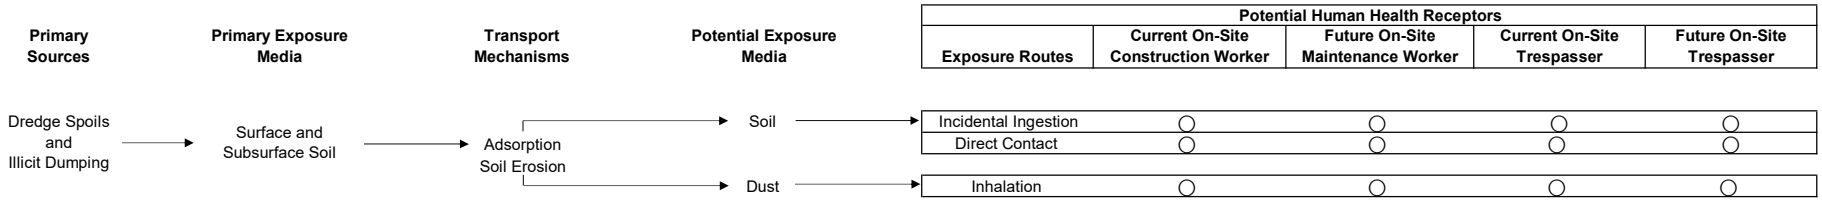
It is conservatively assumed that the remedial construction to install the cover system will take up to one years to complete. This duration is considered subchronic in accordance with USEPA RAGS Part A, being more than one day and less than seven years. As such, the subchronic reference dose (RfD) for Aroclor 1254 was utilized to evaluate non-cancer hazard associated with this current scenario no other subchronic RfDs were available. Chronic RfDs were used where subchronic RfDs were not available (See Section 5.1). Considering the wide range of construction activities that may occur, it was required that the PEF utilized to determine the concentration of contamination in the air as part of the inhalation risk assessment, is calculated to account for site specific parameters. As such, the PEF for the current construction scenario was calculated assuming conservative site conditions. The PEF calculations are provided in Table B-4b in Appendix B.

Future maintenance workers were assumed to be exposed to existing surface and subsurface soils that will be located beneath the cover system under future conditions. It is assumed that the maintenance workers will mow the covered portion of the site two times per month, six months out of the year. In addition to regular

mowing required during the growing season, it is assumed that additional maintenance needs will be required under the final SMP. The extent of required maintenance is to be determined but is reasonably assumed to include repairing the cover system to design conditions. Both scenarios inevitably present opportunity for potential exposure to residual PCB contamination in surface and subsurface soils. Considering, exposure to both surface and subsurface soils was estimated for future maintenance workers. Therefore, the exposure frequency was estimated at 17-days to account for regular mowing and potential maintenance needs required under the final SMP.

Equations used to estimate daily intake were determined in accordance with Section 6.4 of USEPA RAGS Part A, and USEPA's *Memorandum – Human Health Evaluation Manual, Supplemental Guidance* (USEPA 2014). Equations and assumptions utilized to compute daily intake are presented in Table B-4a and Table B-4b in Appendix B.

Figure 4-1 **Risk Assessment Conceptual Site Model**
SA 13 Dredge Spoil Disposal Area, Second Fill Area



Key:
◯ = Potential exposure pathway exist and is considered in risk assessment

5 Toxicity Assessment

5.1 Toxicity Values

Quantitative toxicity values – oral cancer slope factors, inhalation unit risk factors and non-cancer reference doses – provided in USEPA RSL summary table (target risk of 10^{-6} and a HQ of 0.1) for individual Aroclors and available from the EPA's Integrated Risk Information System (IRIS) for total PCBs were used in assessing risk and hazard associated with residual PCB contamination at the site. Toxicity values utilized to assess risk and hazard at the site under current and future site conditions are provided in Table B-5 in Appendix B. In accordance with USEPA 1996 PCB Cancer Assessment, and the NYSDEC PAR template (Appendix A), the noncancer RfD for Aroclor 1016 was applied to Aroclor 1242, and the Aroclor 1254 RfD was applied to Aroclor 1248 to compute hazard computations. The construction worker scenario is subchronic as the exposure duration is less than seven years. As such, the subchronic RfD was used to evaluate non-carcinogenic hazard associated with exposure to Aroclor 1254 in surface and subsurface soils for the construction worker scenario. No other subchronic RfDs were available, therefore, chronic RfDs were utilized to perform the toxicity assessment.

5.2 Risk Estimates

A summary of the areawide risk estimates for all receptor groups is provided in Table B-6a through B-6b in Appendix B.

The potential carcinogenic risk posed by site COCs was estimated by multiplying the chemical intake by the applicable oral cancer slope factor or the Inhalation Unit Risk (IUR) for inhalation risk estimates, as shown in the following equation:

Ingestion Risk = SF x CDI
Dermal Risk = SF x DAD
Inhalation Risk = EC x IUR

Where:

CDI	=	Chronic Daily Intake (mg/kg-day)
DAD	=	dermally absorbed dose (mg/kg-day)
EC	=	Exposure Concentration (mg/m^3-day)
SF	=	Oral Cancer Slope Factor $(mg/kg\text{-}day)^{-1}$
IUR	=	Inhalation Unit Risk $(ug/m^3\text{-}day)^{-1}$

The non-cancer toxicity HQ posed by site COCs was estimated by dividing the chemical intake by the applicable RfD, as shown in the following equation:

$$HQ_{ingestion} = CDI / RfD$$
$$HQ_{dermal} = DAD / RfD$$

Where:

CDI	=	Chronic Daily Intake (mg/kg-day)
DAD	=	dermally absorbed dose (mg/kg-day)
RfD	=	Non-cancer reference dose (mg/kg-day)

The total hazard index (HI) is calculated by summing individual HQs of each receptor for each respective complete exposure pathway.

5.3 Toxicity Assessment Summary

Human health excess cancer risk and non-cancer hazard estimates were calculated for current and potential future users of the site. Current human site users include adult and child trespassers and adult construction workers. Current site trespassers were assumed to be exposed only to surface soil at the site. If the site is remediated in accordance with the ROD and the PCB cleanup plan (E & E 2023), potential temporary construction workers were assumed to be exposed to surface and subsurface soils at the site during the course of remedial construction. If the site is remediated, the site will require maintenance to ensure the adequacy of the cover system. As such, it is assumed that potential future maintenance workers will be exposed to existing site soils located below the cover system when performing repairs or miscellaneous maintenance of the cover system. Exposure to groundwater or surface water was not considered for current or future receptors.

Current Site Use

As shown in Table 6-1 and 6-2, total excess cancer risk estimates associated with the current COCs for current site users are within the 10^{-4} to 10^{-6} range generally considered acceptable by USEPA and NYSDEC/NYSDOH. Likewise, non-cancer hazard estimates for adult and child trespassers and adult construction workers are at or below level of potential concern – a non-cancer hazard index of 1.

Future Site Use

As shown in Table B-6c and Table B-6d in Appendix B, total excess cancer risk estimates for future site users exposed to the identified COCs are within or below the 10^{-4} to 10^{-6} range generally considered acceptable by the USEPA and NYSDEC/NYSDOH. Likewise, non-cancer hazard estimates for future site users are below a level of potential concern.

6 Exposure Assessment Summary

6.1 Exposure Assessment Results

Site contaminants designated as COCs were identified to be present in site soils at levels exceeding appliable regulatory standards and guidance values. As described in previous sections, it is possible that trespassers, construction workers and maintenance workers may come in contact with residual PCB contamination present at the site under current conditions. Though nearly all of these exposure pathways will be mitigated through the implementation of the cover system as described in Section 2.5. The only complete exposure pathway that will remain after implementation of the site remedy is the potential for future maintenance works to come in contact with residual PCB contamination while performing maintenance on the cover system. The risk associated with this exposure pathway will be reduced through the implementation of the SMP, health and safety precautions, and the use of personal protective equipment.

6.2 Toxicity Assessment Results

The toxicity assessment described in the previous sections qualitatively characterized risk associated with the residual PCB contamination present at the site under current and future site conditions. In accordance with results of the toxicity assessment, total excess cancer risk and non-cancer estimates indicate residual PCB contamination does not pose a significant threat to potential receptors and are generally considered acceptable by the USEPA and NYSDEC/NYSDOH. The greatest risk posed by residual contamination at the site is associated with potential exposure of construction workers and trespassers to Aroclor 1248 contamination in surface soils under current site conditions. The excess cancer risk for this exposure pathway was estimated to be 1.10×10^{-6}. This risk estimate is within the acceptable range as determined by USEPA and NYSDEC/NYSDOH and does not take into account any personal protective equipment or health and safety precautions that will be implemented by construction workers at the time of construction.

6.3 Proposed Institutional and Engineering Controls

As indicated in Section 2.5, the proposed site remedy includes the installation of a soil cover system on currently uncovered areas of the site. The cover system is proposed to consist of a demarcation layer above the dredge spoil material, and 12-inches of cover material meeting standards set forth in 6 NYCRR part 375-6.7(d). The Design will prevent the direct contact with residual PCB contamination at the site. In accordance with the ROD, long-term monitoring and

maintenance will be performed as indicated in the final NYSDEC approved SMP to ensure imposed engineering and institutional controls remain in place and protective of human health and the environment. As such, it is reasonably assumed that the site will pose minimal risk to potential receptors following the completion of the proposed site remedy.

In accordance with the ROD, an institutional control in the form of an environmental easement or an environmental notice will be imposed to restrict the use of the property to commercial use only and provide perpetual notification to potential future purchasers of the existing remedial site conditions. Details regarding the content of the institutional controls are provided in the PCB Cleanup Plan (E & E 2023).

A NYSDEC PAR Template

PATHWAY ANALYSIS REPORT
NEW YORK TSCA PCB SITES

The Pathway Analysis Report (PAR) will be developed in accordance with the EPA Risk Assessment Guidelines for Superfund (RAGS; USEPA 1989, 2001, 2004, 2009) and more recent applicable guidance (e.g., USEPA 2014, 2018). It will include the following four steps that will be described in text and detailed in tables, to be provided in the format of USEPA RAGS, Part D (USEPA 2001) Tables 1 through 6:

1. Hazard Identification:

o Identify the purpose of the PAR.

o Describe the Site location, history and contamination.

o Describe the collection and preparation of the data set for evaluation in the PAR.

o The PAR will evaluate Site-wide data and focus on residual PCB concentration ranges specific to your site's risk-based application (e.g. greater than 1 mg/kg and less than or equal to 25 mg/kg).

o Identify constituents of potential concern (COPCs) by comparison of the maximum detected PCB Aroclor concentrations to applicable standards and risk-based screening levels:

- USEPA TSCA Bulk PCB Remediation Waste Cleanup Levels for High Occupancy and Low Occupancy Areas

- USEPA Regional Screening Levels (RSLs), Residential and Non-Residential Soil RSLs for Aroclors and Total PCBs at a target risk of 1E-06 and an HI of 0.1 (most current version found at https://www.epa.gov/risk/regional-screening-levels-rsls-generic-tables

- 6 NYCRR Part 375, Industrial Restricted Use Soil Cleanup Objective of 25 mg/kg for Total PCBs (NYSDEC 2006)

2. Exposure Assessment:

o Develop a risk assessment conceptual site model (CSM) that presents the contamination sources, fate and transport, exposure pathways, and receptors for the site in a schematic format, similar to that shown in attached Figure 1. The CSM allows for a broader understanding of the potential exposure pathways and receptors and how contaminants migrate between environmental media. It also helps to focus what data is needed for the evaluation.

o Identify potential current and future site exposure pathways and human receptors based on the Site history, current Site conditions and use, adjacent land uses, and proposed redevelopment. Please note that a variety of cleanup scenarios can be evaluated, along with the use of engineering and institutional controls. The nature and extent of contamination information as well as from direct observations resulting from a Site visit will also be considered.

o Calculate statistical exposure point concentrations (EPCs). EPCs are the 95 percent upper confidence limit (UCL) of the arithmetic mean or maximum observed concentration of an individual COPC, whichever is lower.

o Identify the exposure factors that detail receptors' exposure to the COPCs, e.g., exposure duration, incidental soil ingestion rate (USEPA 2011, 2014).

o Present the equations to calculate exposure doses.

3. Toxicity Assessment:

o Identify the current toxicity values for the COPCs using the EPA RSL table, which provides values from a hierarchy of established sources (USEPA 2003, 2018).

o While there are cancer toxicity values for the individual Aroclors, noncancer oral reference doses (RfD) are available only for Aroclor 1016 and 1254. The noncancer RfD for PCB-1016 will be applied for PCB-1221, 1232 and 1242 while the PCB-1254's RfD will be applied for PCB-1248, 1260, 1262 and 1268. This is based on information from the USEPA 1996 PCB Cancer Assessment document and is consistent with methodology used for risk assessments on Superfund sites in Region 2. Subchronic toxicity values will be used when available for a construction worker scenario.

4. Hazard Identification

o Compare the calculated EPCs with the applicable NYSDEC and EPA risk-based screening levels mentioned above.

o Detail how the engineering and institutional controls will address the PCBs found at the site for each medium.

NOTES

● Pathway assumed to be complete.

O Pathway assumed to be incomplete.

+ Pathway will be evaluated qualitatively.

(a) A on-site worker and resident assumes exposure to 0-2 ft soil while a construction worker assumes 0-10 ft soil

(b) Although bottled water is supplied at the facility, there is potential for dermal contact with groundwater.

(c) The exposure factors for a wader's dermal contact with surface water and sediment will be incorporated.

B RAGS Part D Planning Tables

Table B-1 Selection of Exposure Pathways

Scenario Timeframe	Primary Source	Receptor Population	Receptor Age	Exposure Medium	Exposure Point	Exposure Route	Type of Analysis	Rationale for Selection or Exclusion of Exposure Pathway
Current	Dredged Spoils and Illicit Dumping	Construction Worker	Adult	Soil	Surface Soil (0 to 6 inches bgs) Subsurface Soil (> 6 inches bgs) Dust	Ingestion Inhalation	Quantitative	In accordance with the ROD and PCB Cleanup Plan, the site remedy includes the construction of a cover system. Potential exposure pathways exist related to general construction activities including exposure to surface and subsurface soils.
Current	Dredged Spoils and Illicit Dumping	Trespassers	Adult & Child	Soil	Surface Soil (0 to 6 inches bgs) Dust	Ingestion Inhalation	Quantitative	Although preventative measures are in place, it is possible that trespassers may access the site in an unauthorized manner. As such, the potential exposure pathway of trespassers coming in direct contact with site surface soils under current site conditions was considered. Following the installation of a cover system, this exposure pathway will be mitigated and no longer present at the site.
Future	Dredged Spoils and Illicit Dumping	Maintenance Worker	Adult	Soil	Surface Soil (0 to 6 inches below covers system) Subsurface Soil (> 6 inches below cover system) Dust	Ingestion Dermal Inhalation	Quantitative	Future maintenance needs will include mowing (consistent with existing requirements), but will also include the O&M of the proposed cover system. As such, the potential exposure pathway for maintenance workers to come in direct contact with surface and subsurface soils to perform repairs and maintenance as required was considered.

Table B-2 Occurrence, Distribution, and Selection of Constituent of Concern

Exposure Point	CAS Number	Constituent Group	Chemical	Total Sample Count	Detection Frequency	Minimum Detected Concentration (mg/kg)	Maximum Detected Concentration (mg/kg)	Location of Maximum Concentration	Range of Reporting Limits for ND Results (mg/kg)	Concentration Used for Screening	NYSDEC Commercial Use (Low Occupancy) SCO (mg/kg)[2]	USEPA RSL Industrial Soil (mg/kg)[3]		COC Flag (Y/N)	Rationale

	11097-69-1	PCB	Aroclor 1254	84	8/84	0.019	2.1	OM-TP-26-04	0.021 - 3.7	2.1	--	0.97	c**	Y	Exceeds USEPA RSL
	1336-36-3	PCB	Total PCB [1][4]	117	66/117	0.013	55	OM-62	0.02 - 2.0	55	1	0.94	c	Y	Exceeds USEPA RSL and NYSDEC SCO

Notes:

1. Total PCB is equal to the summation of all detected Aroclors.
2. 6 NYCRR Part 375 Commercial Use (Low Occupancy) Soil Cleanup Objective (SCO).
3. USEPA Regional Screening Level (RSL) Summary Table (TR=1E-06, HQ=0.1), released May 2023.
4. Individual Aroclor data was not available for a number of samples collected at the site where Total PCB results were. See report text for data usability and uncertainty associated with sample set size.

Key:

mg/kg = micrograms per kilograms (for all soil sample results)
c= cancer
n=noncancer
* = where: nc SL < 100X ca SL; ** = where nc SL
-- = not applicable/not available

Table B-3 Exposure Point Concentration Summary

Exposure Point	COC	Units	Mean	Mean Statistical Method	95% UCL	Statistic	Maximum Concentration	Exposure Point Concentration		
								Value	Unit	Rationale
	Aroclor 1248	mg/kg	0.498	KM Mean	2.19	KM H-UCL	5.4	2.192	mg/kg	Lower of max and UCL
	Aroclor 1254	mg/kg	0.211	KM Mean	0.317	Adjusted Gamma KM UCL	1.2	0.317	mg/kg	Lower of max and UCL
Surface Soil	Total PCB [(1)]	mg/kg	0.783	KM Mean	1.409	Adjusted Gamma KM UCL	5.4	1.409	mg/kg	Lower of max and UCL
	Aroclor 1242	mg/kg	0.668	KM Mean	1.119	KM (t) UCL	14	1.119	mg/kg	Lower of max and UCL
	Aroclor 1248	mg/kg	3.21	KM Mean	6.8	KM (Chebyshev) UCL	46	6.8	mg/kg	Lower of max and UCL
	Aroclor 1254	mg/kg	0.0957	KM Mean	0.161	KM Apprx. Gamma UCL	2.1	0.161	mg/kg	Lower of max and UCL
Subsurface Soil	Total PCB[(1)]	mg/kg	5.94	KM Mean	10.25	KM (Chebyshev) UCL	55	10.25	mg/kg	Lower of max and UCL

Notes:

1. Total PCB is equal to the summation of all detected Aroclors
2. KM - Kaplan Meier Statistics (see ProUCL output, Appendix C)

Table B-4a Risk Factors Used for Daily Intake Calculations

Exposure Route	Receptor Population	Receptor Age	Exposure Point	Parameter Code	Parameter Definition	Value	Units	Rationale	Intake Equation

Subsurface Soil	*Total PCB* [1]	10.25	1.36E+09	5.32E+05	7.54E-09	1.36E+09	5.32E+05	7.54E-09	2.56E+05	1.15E+05	2.76E-05

Notes:

1. Total PCB is equal to the summation of all detected Aroclors
2. USEPA Regional Screening Level (RSL) Calculator for *Resident Scenario*
3. USEPA Regional Screening Level (RSL) Calculator for *Composite Worker*
4. USEPA Regional Screening Level (RSL) Calculator for *Construction Worker*
5. *Equation 5-5* for Particulate Emission Factor for Construction Worker, USEPA. 2002. *Supplemental Guidance for Developing Soil Screening Levels for Superfund Sites*

PEF = $Q/_{Csr} \times \frac{1}{Fd} \times \left\lfloor \frac{T \times Ar}{556 \times W/3^{0.4} \times CF\ x\ \sum VKT} \right\rfloor$

where:

$Q/_{Csr}$ = 23.02 *(default)*

$\frac{1}{Fd}$ = 0.185 *(default)*

T = 2.16E7 sec

Ar = 929 m2

W = 11 tons

*CF = [(*365d/yr+ P)/(365d/yr)]

P = 140 days per year *(Exhibit 5-2)*

$\sum VKT$ =257.56 km

6. CA = Chemical Concentration in Air (mg/m^3) = CS/(PEF+VF)

where:

CS = Chemical concentration in soil

PEF Particulates Emissions Factor

VF - Volatilization Factor

Table B-5 Toxicity Assessment Factors

COC Group	COC	CAS Number	Chronic/ Subchronic	Ingestion		Dermal		Inhalation	
				RfD	SF	RfD	SF	RfD	IUR

References:

1. Reference Dose (RfD) values for individual Aroclors were obtained from USEPA Regional Screening Level (RSL) Summary Table (TR=1E.06, HQ=0.1) May 2023. In accordance with USEPA 1996 PCB Cancer Assessment document, the RfD for Aroclor 1016 was applied to Aroclor 1242, and the RfD for Aroclor 1254 was applied to Aroclor 1248.
2. Slope Facotors (SF) for individual Aroclors were obtained from from USEPA Regional Screening Level (RSL) Summary Table (TR=1E.06, HQ=0.1) May 2023 . SF for Total PCB was obtained from IRIS.
3. Inhalation Unit Risk (IUR) for individual Aroclors were obtained from from USEPA Regional Screening Level (RSL) Summary Table (TR=1E.06, HQ=0.1) May 2023. IUR for Total PCBs was obtained from IRIS.
4. Total PCB is equal to the summation of all Aroclors
5. The subchronic reference dose available for Aroclor 1254 per the USEPA RSL Calcualtor for Construction Scenerio(Subchronic) is to be used to assess non-cancer toxicity HQ for the current construction worker exposure pathway.

Mean (detects)	0.665		

Gamma ROS Statistics using Imputed Non-Detects

GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs

54	GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)										
55	For such situations, GROS method may yield incorrect values of UCLs and BTVs										
56	This is especially true when the sample size is small.										
57	For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

Technical Memorandum

Review of Sample Size Sufficiency for Special Area 13 Risk-Based Remediation Design

---

1. Purpose and Scope

According to 40 CFR 761.61(a)(2) and 40 CFR 761 Subpart N, PCB remediation waste cleanup sites should follow a sample collection on a 10-foot grid system. However, the EPA often allows flexibility from this requirement for larger sites. This attachment assesses the adequacy of the existing site characterization data to support a risk-based remediation plan for Special Area 13 (SA-13).

SA-13 has been divided into four areas for remedial design, including main dredged disposal area, first fill area, second fill area and third fill area. The main dredge disposal area and the first fill area have already been covered with an approved cover/cap by NYSDEC and EPA. Therefore, this attachment excludes evaluating the adequacy of data for these areas. The third fill area, the residential section of SA-13, will have soils with PCB concentrations exceeding 1 ppm excavated and removed. Post-excavation confirmation sampling will ensure that the material left contains less than 1 ppm of PCB, thus not requiring an evaluation of existing site characterization data.

The focus of this sample size evaluation is on the SA-13 second fill area, both covered and uncovered, where a risk-based remediation approach is proposed. This approach involves installing a soil/clay cover and restricting access to eliminate direct contact exposure pathways, as per the TSCA regulation for low occupancy areas.

2. Existing Site Data

The SA-13 second fill area covers approximately 274,400 square feet (ft²). Approximately 187,300 ft^2 is currently uncovered and approximately 87,100 ft^2 is covered with an asphalt parking lot. Soil samples were collected during the 1992 Malcolm Pirnie, Inc. (MPI) investigation, the 2002 NYSDEC investigation (NYSDEC 2003) and the 2005 Remedial Investigation (RI). Figures 2-2 and 2-3 from the main pathway analysis report shows the locations of surface samples, soil borings, MW borings and test pits. A total of 52 surface soil samples and 117 subsurface soil samples were collected from 97 locations, resulting in a sample density of roughly one location per 2,830 ft², which approximates a 50 by 50-foot grid.

Total PCB (TPCB) concentration for each sample was calculated as sum of Aroclors. When one or more Aroclors were detected, the TPCB was the sum of all detected Aroclor concentrations. When no Aroclors were detected, the TPCB was set to the highest reporting limit among the Aroclors. For a subset of RI samples, a screening method was used for Aroclor analysis. In such cases, the TPCB concentrations were adjusted to be comparable to TPCB from standard Aroclor analysis method (8082) using the formula established in RI (E & E 2012):

$$TPCB_{8082} = 1.3714 \times TPCB_{screening}{}^{1.0104}$$

Figure 1 shows the distribution of TPCB concentrations in both surface and subsurface soil samples. TPCB concentrations varied from non-detect to 55 mg/kg, with an arithmetic mean (*i.e.*, average) at 4.9 mg/kg. Notably, 83% of samples had concentrations below 10 mg/kg, and 92% of the samples exhibited concentrations lower than 20 mg/kg.

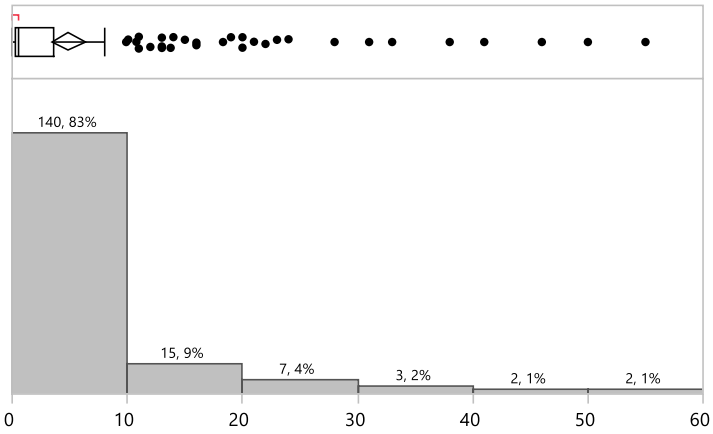

Figure 1 Distribution of TPCB concentrations in surface and subsurface soil samples collected in SA-13 second fill area. Text shown on each bar represents the total number and percentage of samples within the specified concentration range.

3. Sample Size Evaluation

A risk-based approach requires accurately estimating the arithmetic mean concentration. The goal of this evaluation is to determine the minimum number of samples required to provide a precise estimate of the mean based on site data variability. High data variability demands a larger sample size. To ensure a conservative estimate of the sample size, both surface and subsurface data were considered as they captured the possible range of TPCB concentrations.

The accuracy on the mean can be assessed by the relative error on the mean. To find the appropriate sample size, bootstrap resampling was used to establish the relationship between the relative error on the mean and sample size. The process involved:

1) Randomly selecting N samples from the existing site data set with replacement
2) Calculating the arithmetic mean concentration using the selected N samples
3) Repeating the above steps 10,000 times to yield 10,000 arithmetic mean values
4) Calculating the relative error on the mean as: Relative Error = (95% UCL - μ) / μ

Where, μ is the mean of 10,000 means, and 95% Upper Confidence Limit (UCL) of the mean is the 97.5th percentile value of the 10,000 means.

This calculation of relative error at sample size N was repeated for sample sizes ranging from 20 to 250. Figure 2 depicts the relationship between relative error and sample size based on bootstrap analysis. These results show that relative error decreases as sample size increases. With the existing number of samples (N=169), the relative error of the mean is approximately 35 %. The figure further demonstrates that with increasing sample size provides limited benefit in reducing the error on the mean.

A relative error on the mean of about 35% implies that the estimated mean concentration of TPCB, based on the existing site data, could deviate by approximately 35% from the true mean. In the context of an average TPCB concentration of 4.9 mg/kg, this level of uncertainty suggests that the actual mean concentration could range from approximately 3.2 mg/kg to 6.6 mg/kg.

For the remedial design for the second fill area, a 35% relative error on the mean is deemed acceptable, particularly when evaluating the site mean (4.9 mg/kg) against the concentration thresholds established by TSCA to determine varying design requirements, as detailed in the main text. As a result, the existing data can reasonably guide the remedial design decision for this area.

For risk assessment, the 95% UCL of the mean was used in the evaluation. The 95% UCL represents an upper bound estimate of the true mean. While additional sample collection can lead to a more precise mean estimate, it's important to note that even with more data, the mean would fall below the 95% UCL value in 95% of instances. Therefore, the 95% UCL serves as a conservative estimate of the mean, and essentially addressed the uncertainty on the mean with existing site data.

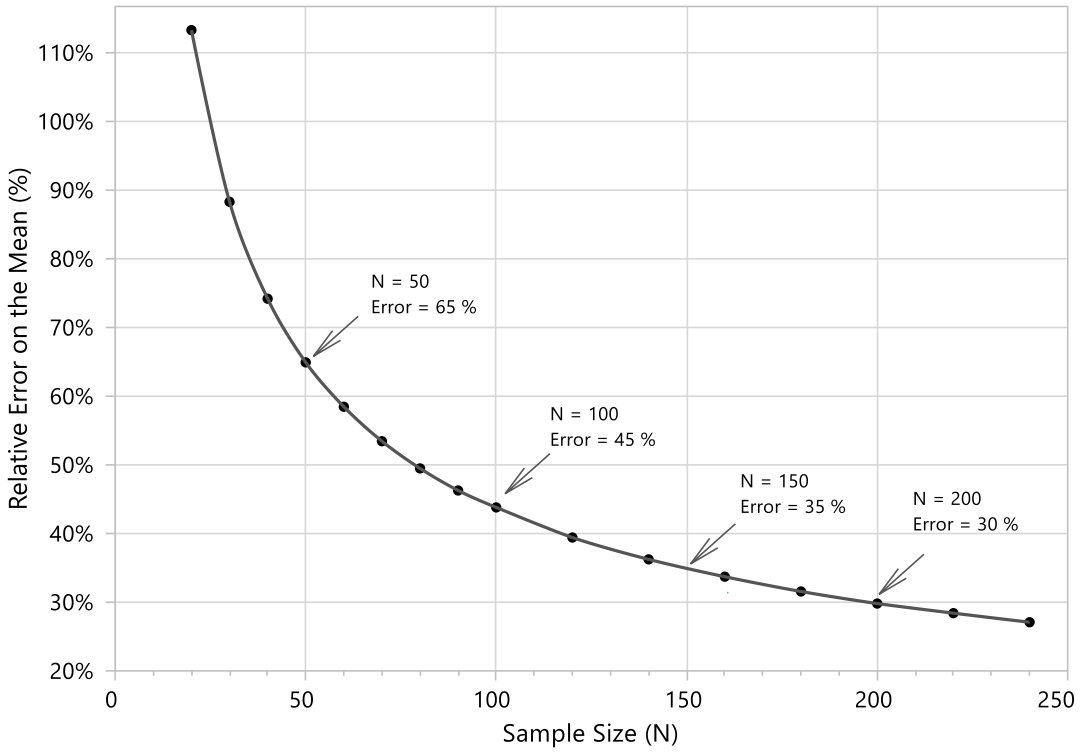

Figure 2 The relationship between relative error and sample size from bootstrap analysis using samples collected within the SA-13 second fill area. Simulated results are shown as black data points, with a smoothing line connecting these points for visualization.

4. Conclusion

The adequacy of the existing data and the level of relative error acceptable for site decisions will depend on the data quality objectives and risk tolerance of the project. In light of the sample size evaluation for the SA-13 second fill area, it is evident that the existing data, with a relative error of approximately 35% on the mean, are sufficient to guide the remedial design decision, particularly when considering the TSCA's specified concentration thresholds for different design requirements. For the purpose of risk assessment, 95% UCL of the mean was used in the evaluation, essentially addresses the uncertainty on the mean with existing site data.
