CERTIFICATION

This certification, prepared in accordance with Title 40 of the Code of Federal Regulations 761.61, certifies that the New York State Department of Environmental Conservation (NYSDEC) is performing the cleanup of the Special Area 13 (SA-13) Dredge Spoils Disposal Site (Second and Third Fill Areas). NYSDEC provides this certification in accordance with 40 CFR 761.61(a)(3)(i)(e) and hereby certifies, to the best of its knowledge, information and belief, that all sampling plans, sample collection procedures, sample preparation procedures, extraction procedures, and instrumental/chemical analysis procedures used to assess or characterize the PCB contamination at the SA-13 site, are on file at 625 Broadway, Albany, NY 12233, and are available for EPA inspection. These files are also available in NYSDEC's Environmental Remediation Database – DECInfoLocator (https://extapps.dec.ny.gov/cfmx/extapps/derexternal/haz/details.cfm?ProgNo=546041).

1 Introduction

On behalf of the New York State Department of Environmental Conservation (NYSDEC), Ecology and Environment Engineering and Geology, P.C. (E & E) has prepared this hybrid Self-Implementing cleanup plan to address polychlorinated biphenyls (PCBs) contaminated soils present at the Special Area 13 Dredge Spoil Disposal Area (SA-13) site, NYSDEC Site No. 546041, a Class 2 inactive hazardous waste disposal site. The SA-13 site is located along the western shore of the Hudson River in the town of Moreau, Saratoga County, New York (see Figure 1-1). This plan presents the results of previous site investigations performed to characterize PCB contamination at the site and describes the proposed remedial activities to address site contamination.

1.1 Cleanup Plan Objectives

The objective of this hybrid self-implementing plan is to describe the Department's approach to remediate PCBs that remain on site at concentrations that exceed the NYSDEC Soil Cleanup Objective (SCO) for commercial and residential use of one ppm (NYSDEC 2006a) as described in the Record of Decision (ROD). To achieve this objective, the plan documents previous investigations, including the remedial investigation (RI) completed prior to issuance of the ROD by NYSDEC.

NYSDEC's December 2012 ROD determined the remedial actions for the different areas of the site (see Appendix A). This Plan describes the remedies defined in the ROD for areas of the site where current surficial PCB concentrations exceed one part per million (ppm) for the commercial portions of the site (Second Fill Area) and for the removal of PCB-contaminated soils above one ppm in the residential portions of the site (Third Fill Area). See Figure 1-2 for extent of these areas. This includes the excavation and off-site disposal of PCB-contaminated soils above 50 ppm and installation of a soil cover in the Second Fill Area, and excavation and off-site disposal of PCB-contaminated soils from the Third Fill Area. Remedial activities were previously performed at the Main Dredge Disposal Area and the First Fill Area, and as such those areas are not included as part of this Plan.

The remedial action goal for the Second Fill Area is to remediate and restore the PCB affected area for low occupancy use as defined by 40 CFR 761.3. The following actions will be performed to achieve this goal:

- Excavation and off-site disposal of PCB-contaminated soils above 50 ppm (see Figure 1-3) in accordance with 40 CFR 761.61(a)(5)(i)(B)(2)(iii);
- Installation of a clean soil cover over the uncovered portions (see Figure 1-3) of the site to prevent contact with remaining PCB contaminated soils and limit soil erosion;
- Installation of a fence and appropriate signage around the area in accordance with 40 CFR 761.61(a)(4)(i)(B)(2);
- Implementation of a Site Management Plan (SMP) including operations, maintenance, and monitoring of engineering controls and institutional controls; and
- Filing of an Environmental Notice (EN) that meets the requirements of 40 CFR 761.61(a)(8) to limit future use of the site to low occupancy use as defined in 40 CFR 761.3.

The remedial action goal for the Third Fill Area is to remediate and restore the PCB affected areas for residential use. The following actions will be performed to achieve this goal:

- Excavation of all site soils with PCB concentrations above the NYSDEC residential SCO of one ppm (see Figure 1-4);
- Post-excavation verification sampling to confirm that the SCO has been met at all vertical and horizontal extents of the remedial area (see Figure 1-4);
- Backfill of the excavated area with clean fill and topsoil meeting NYSDEC requirements for residential use; and
- Restoration of the affected areas in kind.

2 Site Background

2.1 Site Description

The SA-13 site is located along the western shore of the Hudson River approximately 1,200 feet south of Champlain Canal Lock 7 and near Buoy 219 that marks the western margin of the navigation channel of the Champlain Canal within the Hudson River. The site consists of four distinct areas over approximately 25.3 acres (see Figure 1-2).

A series of unlined, transient settling basin and baffle systems were constructed at the main part of this site by the NYSDOT and were used to dewater and hold dredge spoil material removed from the Champlain Canal/Hudson River navigation channel south of Champlain Canal Lock 7 in conjunction with routine and emergency maintenance dredging operations of the Canal System. Available NYSDOT records report that the site was used between 1952 and 1979 for the disposal of up to 802,000 cubic yards of dredge spoil material during canal maintenance operations. These settling basin systems were initially constructed by excavating the soils across this area slightly and grading the displaced materials outward and upward to form the various containment berms. During subsequent maintenance operations, it is likely that some of the older dredge spoil materials were re-graded to deepen or modify the established settling basin to accommodate the disposal of additional dredge spoil materials. During one or more of these re-grading activities in the 1970s, it is believed that spoils from the basin and containment berm complex were pushed outward and into the three identified shallow depression areas adjacent to the main dredge disposal area as fill material.

2.1.1 Main Dredge Disposal Cell

The main dredge disposal area covers approximately 14 acres and consists of an EPA approved, TSCA regulated closed and covered basin, constructed by the Waterways Maintenance Division of NYSDOT to initially dewater and hold drainage network sediment as detailed in the Construction Summary report (NYSDOT 1992). In 1979, this area was covered with six- to 24-inches of sand/topsoil and seeded, monitoring wells were installed, and a monitoring program was established in compliance with TSCA requirements imposed by the EPA when an approval for the temporary storage/disposal of PCB-laden material at this site was issued in September 1979. In 1991, an EPA approved clay cover/cap was added over the existing “turf” cover by NYSDOT and the earlier monitoring wells were replaced (NYSDOT 1992). The new cover added a six-inch to five-foot-thick layer of clay over the entirety of the main disposal area. The combination of the

two cover layers put the top surface of the potentially contaminated dredge spoil materials at depths ranging between about one foot and nearly five feet below ground surface (BGS). This area is capped, fenced and has an ongoing monitoring plan in place maintained by NYSDOT as required by the 1994 Consent Decree issued by EPA (EPA 1994).

Sampling performed during the 2006 Remedial Investigation for the SA-13 site indicated remaining subsurface PCB contamination under the capped cell of up to 49 ppm total PCBs. Surface soils collected within the capped area were all non-detect for PCBs. Groundwater samples collected from monitoring wells at the Site in 2005 and 2006 as part of the RI were all non-detect for PCBs.

2.1.2 First Fill Area

The First Fill Area covers approximately three acres and consists of a closed and covered shallow depression fill area north of the main disposal area. This area was covered with a soil cover in 2008 by NYSDEC that consists of filter fabric, a demarcation layer, one-foot of clean soil meeting the requirements of 6 NYCRR Part 375 6.7(d), and a vegetated surface to limit the potential for human exposure to the dredge spoils below the soil cover.

Sampling performed during the 2006 Remedial Investigation for the SA-13 site indicated remaining surface and subsurface PCB contamination within this area of up to 12 ppm total PCBs. No groundwater monitoring wells are located within this area.

2.1.3 Second Fill Area

The Second Fill Area covers approximately 6.3 acres farther north beyond the First Fill Area and consists of both covered and uncovered areas. Approximately two acres of the Second Fill Area is covered with clean fill and pavement that was installed in 2008 as a Work Support Marina Facility for the Hudson River PCBs Site remedial dredging project. The remaining 4.3 acres is uncovered and consists of areas of varying vegetative growth.

2.1.4 Third Fill Area

The Third Fill Area is approximately two acres and consists of another shallow depression fill area and is zoned for residential and agricultural use located southwest of the main dredge disposal area. PCB contaminated dredge spoils were used to fill shallow depression areas across the properties. This area is covered by two parcels, one of which is occupied by a single dwelling that is uninhabited and in disrepair.

2.2 Investigation and Delineation Activities

Previous investigations were performed at the site to define the nature and extent of PCB contamination. Subsurface and surface soil sampling events and groundwater sampling events were performed.

2.2.1 Soil Sampling

In 1992 Malcolm Pirnie, Inc. conducted investigations of eight Hudson River upland dredge spoil sediment sites, including PCB sampling at the SA-13 site (MPI 1992). As part of this investigation, boreholes were installed across what is now the Second Fill Area of the site and soil samples were collected for analysis of PCBs. Total PCB concentrations in these samples ranged from non-detect to 55 ppm. Surface soil samples (0 to 6-inches bgs) were also collected, and concentrations of PCBs ranged from non-detect to 5.5 ppm.

In 2002 on behalf of NYSDEC, E & E conducted a study of the Third Fill Area (Morrison Property) under an Immediate Investigation Work Assignment to determine the extent of PCB contamination. Surface and subsurface soil samples were collected and analyzed for Total PCBs. Surface soil concentrations ranged from non-detect to 13 ppm, and subsurface soil concentrations ranged from non-detect to 30 ppm (E & E 2012g).

In 2002, NYSDEC conducted additional surface soil samples within the Second Fill Area. A 100-foot by 200-foot sampling grid was established across the site, with sample collection prioritized at publicly assessable areas. All surface soil samples were grab samples collected from the 0- to 2-inch depth interval and submitted for PCB analysis. PCB concentrations ranged from non-detect to 5.5 ppm.

In 2005 E & E performed a RI at the Site to define the nature and extent of PCB contamination in surface soils, subsurface soils, surface drainage water, and groundwater at the site and assess if site conditions posed a potential threat to human health or the environment (E & E 2012a). Investigations included the collection of surface soil and subsurface soil samples at the Second Fill Area. Surface soil concentrations ranged from non-detect to 7.2 ppm, and subsurface soil concentrations ranged from non-detect to 15 ppm.

In 2021 E & E collected soil samples from an additional four sampling locations within the northern section of the Third Fill Area. Soil borings were extended 10 to 15 feet bgs, and multiple samples were collected from each borehole location. PCB concentrations in these samples ranged from non-detect to 14 ppm.

2.2.2 Groundwater Sampling

Groundwater sampling was performed during the RI at five monitoring wells located within and adjacent to the Second Fill Area (see Figure 1-2 for monitoring well locations). Four rounds of groundwater samples were collected from the wells in March, June, September, and December 2006. All samples collected were unfiltered with turbidity of 43 nephelometric turbidity units or less. All samples collected from these wells came back non-detect for PCBs (E & E 2012a). The laboratory analytical reports for this sampling are included in Appendix B.

Additional groundwater sampling was performed in 2008 as part of supplemental sampling completed as part of the RI. Two monitoring wells within the Second

Fill Area were sampled. All samples collected from the two wells as part of this supplemental sampling event were non-detect for PCBs (E & E 2012h).

In July 2023, E & E conducted additional groundwater sampling at the monitoring wells located in the Second Fill Area. Both filtered and unfiltered samples were collected from four monitoring wells and analyzed for PCBs using method SW846 8082A. All sample results were non-detect for PCBs. The laboratory analytical reports for this sampling is included in Appendix B.

2.2.3 Sample Analysis

Samples collected during the MPI investigation were submitted to Upstate Laboratory, Inc. for analysis of PCBs by USEPA method 846 Third Edition (MPI 1992). The data quality assurance measures, validation and usability considerations for analytical data gathered during the MPI investigation are unknown as sampling collection, analysis and validation were completed by others.

Samples collected at the site during the E & E RI were submitted to Severn Trent Laboratories (STL) of Buffalo, New York for laboratory analysis. In an effort to reduce analytical costs, PCBs in soil samples were analyzed using two similar analytical methods, standard EPA Method 8082 and a screening level analysis based on EPA Method 8082, which primarily differ only in the method used to extract PCBs from the sample matrix. All samples were analyzed using the screening method (EPA Method 8082-screen) and approximately 20% of the samples were analyzed using standard EPA Method 8082. All groundwater samples collected at the site were analyzed for PCBs using the standard EPA Method 8082 analysis. Sample collection and analysis completed during the E & E RI was conducted in accordance with the NYSDEC approved Quality Assurance Plan (QAPP), provided in the E & E Remedial Investigation Work Plan (E & E 2005). The procedures described in the QAPP were consistent with the current updates of the EPA SW-846 sampling procedures at the time of sampling. STL followed NYSDEC Analytical Services Protocol (ASP) of June 2000 for all analytical methods, quality assurance (QA)/quality control (QC), holding times, and reporting requirements. Any deviations from acceptable QC specifications are discussed in the applicable Data Usability Summary Report (DUSR), provided in the respective RI reports (E & E 2012a,b,c). Appropriate qualifiers were added to the data by the E & E data validators to indicate potential concerns with data usability. Further details regarding the comparability of PCB screen results can be found in the Pathway Analysis Report (PAR) developed for the site (Appendix C).

3 Sample Results and Risk Evaluation

3.1 Data Evaluation

In accordance with provisions of 40 CFR 761.61 (a)(2), 40 CFR 761 Subpart N, sample collection for a site characterization is generally intended to be on a 10-foot grid system (one sample every 100 square feet). Departure from this requirement is common as it proves to be expensive during the investigative phase for large sites such as this. The Second Fill Area comprises approximately 6 acres and to perform investigation sampling in accordance with these guidelines would have proved cost prohibitive. Statistical analysis was performed to evaluate the adequacy of the sample set available for the site study area to support a hybrid self-implementing corrective action. Results indicate that the current sample set consisting of both surface and subsurface soil samples are statistically acceptable for risk-based analysis and remedial design decision, and additional samples would provide limited benefit in reducing relative error on the mean. The statistical analysis is described in a technical memo submitted as Appendix D in the PAR (see Appendix C). Soil sampling locations (surface soil and borehole) from the previous site investigations can be found in Figures 3-1 through 3-4 for the different sections of the Site.

The Third Fill Area comprises approximately two acres. Investigative sampling was originally proposed on a 50-ft grid, but due too accessibility issues caused by significant overgrowth at the Site, sample points were located where they could be accessed by sampling equipment. Again, statistical analysis indicates that the current sample set for the Third Fill Area is sufficient for site characterization and additional sampling would not significantly refine the analysis. Additionally, the remedial goal for this portion of the Site is excavation and offsite disposal of all site soils with PCB concentrations greater than one ppm and post-excavation verification sampling will be performed to confirm that the SCO is reached (see Section 4.2 below for further details).

3.2 Sample Results

Sampling results from soil and groundwater sampling performed during the site investigations are presented in Tables 3-1 through 3-6. Soil sampling locations and results are shown on Figures 3-1 through 3-4. The sum of the individual Aroclor detections represent the total PCB concentrations shown in the Tables. The

total PCB concentrations greater than the SCO of one ppm form the basis of the remediation plans.

3.2.1 Surface Soil

In the Second Fill Area, total PCB concentrations above one ppm were detected in nine of the 39 surface soil samples collected during the 2002 NYSDEC investigation and the 2005 RI. The highest total PCB concentration was detected during the 2005 RI sampling at 7.2 ppm. No surface soil samples contained PCBs above 10 ppm.

In the Third Fill Area, total PCB concentrations above one ppm were detected in 14 of the 23 surface soil samples collected. The highest total PCB concentration in these samples was 11 ppm.

3.2.2 Subsurface Soil

In the Second Fill Area, 66 borehole and 32 test pit subsurface soil samples were collected. Total PCB concentrations above one ppm were detected in 28 of the borehole samples collected and 14 of the test pit samples collected. The highest total PCB concentration detected (55 ppm) was at borehole location OM-62 at a depth interval of 2 – 3 feet bgs during the 1992 MPI investigation. Samples with PCB concentrations above the one ppm SCO ranged from 0.3 to 8 feet bgs.

In the Third Fill Area, total PCB concentrations above one ppm were detected in 23 of the 32 subsurface soil samples collected. The highest total PCB concentration in these samples was 30 ppm at a depth of approximately one foot bgs collected during the 2002 investigation work. Samples with PCB concentrations above the one ppm SCO ranged from 0.5 to two feet bgs.

3.2.3 Groundwater

Groundwater sampling was conducted during the RI (E & E 2012b) and additional monitoring was performed in 2023 (see analytical results in Appendix B) in order to evaluate potential groundwater impacts. PCBs have not been identified in groundwater at concentrations above the TSCA decontamination standard for water containing PCBs (less than or equal to 0.5 µg/L for unrestricted use) per 40 CFR 761.79(b)(1)(iii) and therefore groundwater impacts are not a concern for this Site.

3.3 Qualitative Risk Assessment

3.3.1 Surface Water Flow

Surface water flow can be a mechanism that allows migration of contaminants if those contaminants are present in surface soils or other uncontrolled debris piles. Surface water flow at the SA-13 site is a mechanism that potentially allows lateral migration of contaminants from surficial soil into on-site drainageways and ultimately into the Hudson River. Surface water flow at the site occurs primarily during heavy precipitation events or spring snow melts as surface runoff. The majority of the Site is vegetated with the exception of the paved portion of the Second Fill Area and a small percentage of unpaved roads. During heavy

precipitation events, surface water from the Second Fill Area flows south into the drainage ditches and swale along the southern border of the fill area that ultimately discharges to the Hudson River and accumulates in topographic low areas and/or infiltrates the ground. Although erosional features are not prevalent on site due to vegetative cover, PCB contamination identified in drainage network soil samples collected off-site show that migration of contaminants via surface water runoff occurs at the site, however the drainage network is part of a neighboring NYSDEC Superfund site and is beyond this scope. Installation of a soil cover as described in Section 4.1 will prevent exposure of existing surface soils to surface water flow and thus migration offsite into the surrounding drainage network. The Site Management Plan as described in Section 5 will require periodic inspection of the Site for signs of erosion or deterioration of the installed soil cover.

3.3.2 Infiltration

PCBs present in soils will likely remain absorbed to soil particles at the site. PCBs are relatively insoluble in water and are not expected to appreciably leach into groundwater or runoff, if present. Sampling has shown that PCBs have not leached into the groundwater below the site. The potential for leaching is further reduced by the presence of organic carbon in the soil because PCBs may bind to the carbon. Once bound, PCBs are much less likely to leach from the carbon, thus limiting the potential for transport to groundwater. Based on the analytical data, total organic carbon (TOC) concentrations in the samples ranged from 1% to 5% indicating that PCBs would most likely remain adsorbed to soil and not leach appreciably (E & E 2012 a,b,c). Additionally, since PCBs were not detected in groundwater; PCBs that have been present in site soils for greater than 35 years have not migrated to the groundwater monitoring well locations. This further demonstrates that it is unlikely for absorbed PCBs to leach from contaminated soils into groundwater under current or future conditions.

3.3.3 Human Health Risk Evaluation

As part of the RI (E & E 2012a, b, c), human health excess cancer risk and non-cancer hazard estimates were calculated for current and potential future users of the Site. E & E completed an additional PAR (see Appendix C) to further evaluate the human-health exposure and toxicity risks within the Second Fill Area where a soil cover will be installed to limit contact with remaining PCB contaminated soils. As all contaminated soils above the SCO will be removed and disposed of off-site in the Third Fill Area, no remaining human health risks are anticipated. PCB levels in soils at the site exceed applicable regulatory standards and guidance values. It is possible that trespassers, construction workers and maintenance workers may come in contact with residual PCB contamination present at the site under current conditions. The installation of the soil cover system will mitigate nearly all of these exposure pathways. The only complete exposure pathway that will remain after implementation of the site remedy is the potential for future maintenance workers to come in contact with residual PCB contamination while performing maintenance on the cover system. The risk associated with this exposure pathway will be reduced through the implementation of the Site Management

Plan (SMP), health and safety precautions, and the use of personal protective equipment.

The toxicity assessment qualitatively characterized risk associated with the residual PCB contamination present at the site under current and future site conditions. In accordance with results of the toxicity assessment, total excess cancer risk and non-cancer estimates indicate residual PCB contamination does not pose a significant threat to potential receptors and are generally considered acceptable by the USEPA and NYSDEC/NYSDOH. The greatest risk posed by residual contamination at the site is associated with potential exposure of construction workers and trespassers to Aroclor 1248 contamination in surface soils under current site conditions. The excess cancer risk for this exposure pathway was estimated to be 1.10×10^{-6}. This risk estimate is within the acceptable range as determined by USEPA and NYSDEC/NYSDOH and does not take into account any personal protective equipment or health and safety precautions that will be implemented by construction workers at the time of construction. Installation of the soil cover and implementation of the SMP would mitigate this risk.

3.3.4 Ecological Risk Assessment

The Ecological Risk Assessment evaluated potential impacts of site-related contaminants on the ecological resources at the site. The assessment was limited to terrestrial and aquatic habitats that lie on the site and does not include the Hudson River, which lies adjacent to the site. The following information summarizes these results.

- Risks to plant communities from contaminants in soil at the site appear to be minimal.
- No chemicals exceeded the available soil-fauna screening benchmarks. Overall, these results suggest that risks to the soil invertebrate community at the site from chemicals in the soil are minimal.
- Based on food-chain modeling results, total PCBs in soil are likely to pose a risk to songbirds, such as the American robin, and small mammals, such as the short-tailed shrew, that feed extensively on soil invertebrates. Risks to carnivorous birds and mammals and other wildlife species with large home ranges appear to be minimal.
- Benthic invertebrates using the on-site ditch may be at risk from total PCBs based on exceedances of low-level effect benchmarks in one or more samples.

As part of the RI, the New York State Natural Heritage Program (NHP) was contacted for information on species and habitats of concern in the site vicinity. The NHP indicated that the below species have been observed within a 2-mile radius of the site.

- Birds
  - Short-eared owl (*Asio flammeus*); New York State legal status: endangered
  - Northern harrier (*Circus cyaneus*); New York State legal status: threatened
- Plants
  - Small whorled pogonia (*Isotria medeoloides*); New York State legal status: endangered.
  - Hooker's orchid (*Platanthera hookeri*); New York State legal status: endangered.

These species were not observed at the site during RI site reconnaissance in December 2005; however, it is unlikely that the small whorled pogonia or Hooker's orchid would have been evident at this time of year. Consequently, the occurrence of these two plant species at the site cannot be definitively ruled out, however it is unlikely that they would be found at the Site, given that it is elevated and regularly mowed and both plant species prefer shaded, swampy habitats. Additionally, the NHP indicated that Dead Creek Valley, which lies approximately 1 mile east of the site, is considered a raptor winter conservation area.

Based on discussions with the U.S. Fish and Wildlife Services (USFWS), there are no federal threatened or endangered species associated with this site. Wintering bald eagles my migrate through the area but are not known to use the site.

Overall, the current levels of environmental contamination at the site pose only minimal risks to communities of terrestrial plants and soil invertebrates, but may threaten some wildlife species, amphibians, and benthic invertebrates.

4 Description of PCB Cleanup Approach

This hybrid self-implementing cleanup approach for PCBs at the Site has been prepared to be in accordance with the Self-Implementing requirements of 40 CFR 761.61(a) with some modifications consistent with 40 CFR 761.61(c). The cleanup plan is designed to be protective of human health and the environment. To meet this objective, areas of potential exposures to PCB-affected media at the site were identified based on known or anticipated uses of the site. Additionally, the proposed site remedies account for the restoration of the site to promote green remediation practices. In accordance with 40 CFR 761.61(a)(3)(ii) the Director of Land, Chemicals, and Redevelopment will be notified of any deviations from the cleanup approach as described in this Plan 14 days prior to implementation of the changes.

4.1 Second Fill Area

The Second Fill Area is owned by New York State. It currently consists of the asphalt parking lot built for use during dredging of the Hudson River and a vegetated area. Soils with PCB concentrations above 50 ppm will be excavated and disposed of off-site in accordance with 40 CFR 761.61(a)(5)(i)(B)(2)(iii). PCB concentrations up to 50 ppm will remain onsite covered by a clean soil cover as per 40 CFR 761.61(a)(4)(i)(B). The Second Fill Area will be managed for low occupancy use with a fence and signage in accordance with 40 CFR 761.61(a)(4)(i)(B)(2). An Environmental Notice (EN) will be filed for the property identifying the presence of the remaining PCB waste, the presence of the soil cover and fence, and restrict site use to low occupancy as per 40 CFR 761.61(a)(8). The EN will specify that the constructed soil cover and fence must be maintained in perpetuity in accordance with the Site Management Plan.

Within 60 days of completion of cleanup activities, NYSDEC will record the EN which will in perpetuity notify any potential purchaser of the property:

1. That the land, identified as the Second Fill Area parcel, has been used for PCB remediation waste disposal, and that the area is restricted to use as a low occupancy area as defined in 40 CFR 761.3;
2. Of the existence of the soil cover and fence, and the requirement to maintain the soil cover and fence; and

3. The applicable cleanup levels left at the site, including under the soil cover.

NYSDEC will submit a signed certification that they have recorded the above notation in an EN to the EPA Director of Land, Chemicals, and Redevelopment division.

Based on the potential exposure pathways for PCBs in the Second Fill Area, the primary concern is the potential for exposure to PCBs through direct contact with contaminated soils. To remedy this risk, a clean soil cover will be installed in unpaved areas in accordance with 40 CFR 761.61(a)(4)(i)(B) and 761.61(a)(7) with some modifications to prevent direct contact with PCB-contaminated soils (see Figure 1-3 for extent of clean soil cover). An area of the Second Fill Area where PCB concentrations are greater than 50 ppm will be excavated and disposed of offsite (see Figure 1-3 for excavation area). The excavation will consist of a 10-ft by 10-ft area around sample point OM-62 to a depth of 3-ft. Post-excavation verification samples will then be collected at the bottom of the excavation and on each sidewall to confirm that remaining PCB concentrations in this area are below 50 ppm. Verification samples will be analyzed for PCBs using EPA SW-846 Method 8082A. If samples indicate that PCB concentrations remain above 50 ppm, additional excavation will be completed and verification samples collected until results indicate that remaining PCB concentrations are below 50 ppm.

Due to the lack of PCB migration from site soil into groundwater and in effort to incorporate green remediation best practices, the cover will consist of clean common fill and topsoil. In accordance with the ROD, the proposed cover will include a minimum of six inches of compacted clean soils and six inches of topsoil (total of 12-inches of cover material) to promote growth of selected vegetation. All imported materials will meet the requirements of 6 NYCRR 375 Table 375-6.8(b) for commercial use. These materials will not meet all of the permeability, sieve, liquid limit, and plasticity index parameters in 40 CFR 761.75(b)(1)(ii) through (v) as the analytical data from the RI demonstrated that it is unlikely for PCBs in site soils to leach from contaminated soils into groundwater and thus preventing infiltration of stormwater through the cover is not of concern. While the soil cover will not be constructed to prevent infiltration of water, it will function with minimal maintenance, promote drainage, and minimize erosion of the cover surface.

A portion of the Second Fill Area was previously covered with an asphalt parking lot during remedial dredging of the Hudson River as part of a support marina facility. This area will be maintained as is and is considered sufficient cover in accordance with NYSDEC Part 375 regulations for a cover system.

Work on the Second Fill Area will consist of three phases. In the first phase, soils with PCB concentrations above 50 ppm will be excavated and disposed of off-site at a TSCA regulated facility as described in Section 4.3. In the second phase, the existing surface will be graded to establish slopes for proper drainage prior to

placement of cover materials. After that, a demarcation layer will be placed on top of the graded surface to provide a visual separation between the dredge spoils and the final cover layer. The clean common fill will then be placed and compacted to a minimum 90% of the maximum dry density. The topsoil layer will then be placed and the final cover surface will be hydroseeded.

The vegetative cover planned for the Second Fill Area is intended to protect the final cover surface from wind and water erosion as well as to reduce runoff and enhance evapotranspiration. Hydroseeding will be completed following the placement of topsoil at the appropriate time for successful germination and growth. The vegetative cover will consist of a wide variety of grasses specifically selected to provide protection of the soil surface against erosion, preserve the integrity of the soil cover, enhance evapotranspiration, provide stormwater management, provide ecological habitat for soil fauna, and improve the appearance of the final land surface.

Following completion of the site work in the Second Fill Area, a fence and signage including the M_L mark will be installed around the area to limit access in accordance with 40 CFR 761.61(a)(4)(i)(B)(2). The fence will be 6-ft tall chain link with a locked access gate.

This soil cover will limit direct contact with PCB contaminated soils for potential site users and wildlife and prevent PCB contaminated soils from migrating offsite due to erosion. An Environmental Notice will be in place to limit future site use and development to low occupancy (as per 40 CFR 761.61(a)(8)), describe the presence of the soil cover and fence, and prevent use of site groundwater for drinking water purposes without proper treatment approved by NYSDOH. A NYSDEC approved SMP will be implemented for the site that provides descriptions of the engineering and institutional controls, and prescribes maintenance, monitoring, and reporting requirements in accordance with NYSDEC DER-10. The SMP will also include a soil management plan to guide any disturbance of materials containing greater than one ppm of total PCBs.

4.2 Third Fill Area

The Third Fill Area is comprised of two privately owned residential parcels. One parcel includes an abandoned residential structure that is proposed to be demolished as part of the remedial cleanup, and the second parcel is zoned agricultural. Based on the site's current use and zoning designation, the reasonable anticipated future land use will remain unchanged.

4.2.1 Excavation

The Third Fill Area will be excavated to remove all PCB-contaminated soils above the residential SCO of one ppm as per the ROD. The horizontal and vertical limits of excavation were established based on the information provided in the RI report (E & E 2012a) and are shown on Figure 1-4. Results of soil samples collected during site investigations demonstrate that the soil does not contain PCBs greater than 50 ppm. Excavated soil will be direct-loaded into labeled roll-

off containers for disposal as non-TSCA waste. Verification sampling will be performed to confirm that the SCO has been met.

4.2.2 Verification Sampling

After completion of soil excavation, verification samples will be collected in accordance with 40 CFR 761 Subpart O (with some modifications to spacing) and NYSDEC DER-10 with a grid spacing of 30-foot by 30-foot to verify that the SCO has been met. Both bottom of excavation and sidewall samples will be collected. At the outer limits of the excavation area, sidewalls samples will be collected every 30-feet at a minimum of one sample for every foot of excavation depth and analyzed for total PCBs. Verification samples will be analyzed for PCBs using EPA SW-846 Method 8082A. Post-excavation verification sample locations are shown on Figure 1-4.

If PCBs are detected in bottom verification samples above the SCO, material will be excavated an additional one foot in that grid and a second round of verification samples will be collected. Additional excavation will occur in one-foot increments until verification sampling confirms that the SCO has been met.

If sidewall verification sampling indicates the presence of PCBs above the SCO, the excavation area will be expanded by one 10-foot grid interval followed by additional verification sampling of the bottom of excavation and along the new perimeter. This process will continue until the perimeter verification samples have met the SCO.

Bulk PCB remediation waste will be stored at the site (if necessary) for less than 180 days in accordance with 40 CFR 761.65(c)(9). Excavated soils will be disposed of off-site at an approved landfill in accordance with 40 CFR 761.61(a)(5)(i)(B) and as described in Section 4.3.

4.2.3 Backfill

After excavation and verification sampling show PCB concentrations less than the SCO, the excavated area will be restored to the proposed grading surface with imported common fill and topsoil meeting the satisfactory soil criteria including analytical sampling to meet NYSDEC DER-10 residential standards.

4.2.4 Vegetation

Topsoil, seeding and planting will be completed in coordination with the property owners and NYSDEC Fish and Wildlife.

In addition to seeding, tree species will be installed within the Third Fill Area footprint to increase soil stability as well as provide riparian wildlife habitat. Plant species will be selected based on various factors, including direct observations of current vegetation structure and composition, historical cover types, soil characteristics, hydrology, exposure, aspect, bioengineering and soil stabilization capabilities, biological performance, biodiversity, and compatibility, or sustainability within the existing riparian plant communities.

4.3 Management of PCB-Affected Media

Excavated materials from the hotspot removal in the Second Fill Area are expected to contain PCB concentrations above 50 ppm and as such will be handled as TSCA hazardous waste. These materials will be disposed of at a TSCA regulated facility in accordance with 40 CFR 761.61(a)(5)(i)(B)(iii).

Excavated materials from the Third Fill Area are not expected to contain concentrations of PCBs greater than 50 ppm based on the historical sampling performed at the Third Fill Area, and as such it is anticipated that these materials will be disposed of at a non-TSCA facility.

Soil containing less than 50 ppm PCBs will be directly loaded into roll-off containers. Bulk PCB remediation wastes will be disposed of at an approved PCB disposal facility, a permitted municipal solid waste, or non-municipal non-hazardous waste facility under 40 CFR 761.61(a) or (c). Manifesting and recordkeeping requirements will be followed as per 40 CFR 761.207(e).

If during waste characterization sampling performed for disposal PCB concentrations are found above 50 ppm, the materials will be handled as TSCA hazardous waste and will be disposed of in a RCRA Section 3004 or 3006 permitted hazardous waste landfill. If disposal in a TSCA permitted facility is required, final disposal will likely be at Chemical Waste Management's facility near Emelle, Alabama.

In accordance with 40 CFR 761.208, a Uniform Hazardous Waste Manifest will accompany the TSCA hazardous waste. A signed copy of each manifest will be retained for at least 3 years (40 CFR 761.209(a)). For any PCB waste shipment that requires a manifest, NYSDEC or E & E (acting as the authorized agent for NYSDEC) will comply with the following:

- Sign the manifest certification by hand
- Obtain the handwritten signature of the initial transporter and date of acceptance on the manifest
- Retain one copy and provide the copy to NYSDEC for its records
- Give the transporter the remaining copies of the manifest that will accompany the shipment of TSCA waste
- Collect completed manifests and disposal certificates from disposal facility

Liquid wastes including free liquids, decontamination fluids, and precipitation that accumulates in the excavation areas will be collected in drums, characterized, and disposed of offsite at a properly permitted facility as either a TSCA or non-TSCA waste.

4.4 Health and Safety

4.4.1 Health and Safety Plan

A Site-specific HASP will be prepared for the work which will comply with 29 CFR 1910.120, the Hazardous Waste Operations and Emergency Response regulations. All subcontractors will be required to prepare and follow their own HASP that is commensurate with the work and activities. The HASP will include specifications for appropriate PPE, site controls, and medical surveillance to ensure that workers are not exposed to contaminants of concern above applicable OSHA thresholds.

The primary anticipated hazards include potential worker and public exposure to construction hazards and potential chemical exposure. Worker and public safety hazards will include those typically found at a construction site using heavy equipment. Potential chemical exposures are anticipated to derive from inhalation of particulates containing PCBs, and direct dermal contact with soil containing PCBs. The following engineering controls will be established to minimize these exposures:

- Excavation surfaces will be maintained damp to minimize dust generation
- Continuous air monitoring will be conducted while work is being performed to reliably measure airborne contaminants, to delineate areas where respiratory protection is required, and to verify that control measures are adequate
- Work zones will be established, including exclusion zones, contaminant reduction zones, and support zones, and workers will wear personal protective equipment as specified in the HASP.

4.4.2 Community Air Monitoring Plan

A site-specific CAMP will be prepared for the work outline in this plan. The CAMP will identify measures and/or actions to ensure that the public living and working near the Site as well as employees or visitors to the site are protected from exposure to site contaminants during remedial activities. Continuous particulate (dust) monitoring will be conducted during any remedial activities where PCB-impacted materials are disturbed to ensure that particulate matter is below OSHA exposure limits for remedial workers. Additionally, a community air monitoring program for particulates will be implemented during remedial work to ensure that off-site exposure of PCB-impacted materials does not occur.

4.4.3 Waste Characterization and Profiling

PCB remediation waste will be characterized for offsite disposal based on its as-found PCB concentrations. Where existing in-situ characterization data has already been collected during previous investigations, it will be used to profile PCB remediation waste for disposal. Additional waste characterization samples will be collected and analyzed for other site constituents of concern as needed to meet profile requirements of the designated waste disposal facility.

4.5 Decontamination

Equipment used during remedial work on the Second and Third Fill Areas will be decontaminated in accordance with 40 CFR 761.79(c)(2)(ii). All moveable equipment, tools, and sampling equipment that may have come in contact with PCB contaminated materials will be decontaminated using a double wash/rinse as defined in Subpart S of 40 CFR 761. All decontamination waters will be containerized onsite and sampled to determine appropriate disposal.

4.6 Environmental Notice

After completion of the remedial activities and installation of engineering controls, an Environmental Notice will be recorded for the Second Fill Area that will meet the requirements of 40 CFR 761.61(a)(8) and will in perpetuity notify any potential purchaser of the property:

- That the land has been restricted to low occupancy use (as defined in 40 CFR 761.3);
- That the land has been used for PCB remediation waste disposal pursuant to a cleanup plan approved under 40 CFR 761.61(a) and 40 CFR 761.61(c);
- Of the soil cleanup level used for PCBs in soils at the Site;
- Of the existence of the soil cover and fencing installed to prevent exposure to the PCB-containing materials remaining on site;
- Restrict the use of groundwater as a source of potable or process water (due to the presence of metals contamination above applicable screening criteria) unless necessary water quality treatment has been completed as determined by the NYSDOH or County DOH;
- Of the applicable PCB concentrations left at the Site under the soil cover, including detailed information about the concentration and physical location of the materials; and
- Of the long-term monitoring and maintenance requirements at the Site, including the site management plan (SMP) to be implemented.

No Environmental Notice/Easement will be required for the Third Fill Area as this portion of the site will be remediated to the residential SCO.

Any proposed redevelopment would be subject to the NYSDEC's Change of Use requirements and 40 CFR 761 and would be limited to instances where constructions workers breach the soil cover during redevelopment pursuant to requirements of a soil management plan. A SMP will be implemented for the site that provides descriptions of the engineering and institutional controls, and prescribes maintenance, monitoring, and reporting requirements in accordance with the NYSDEC DER-10

4.7 Green and Sustainable Remediation

The selected remedy for this Site will incorporate Green Remediation principles and techniques during design and construction in accordance with NYSDEC DER-31 (NYSDEC 2011) and as required per the ROD. Pursuant to DER-31, SiteWise version 3.2 was utilized during the remedial design to quantitatively evaluate the environmental footprint of the selected remedy. A thorough evaluation of Best Management Practice (BMP) was also performed to identify opportunities to implement green and sustainable techniques throughout construction and to improve the overall sustainability of the design. Green and sustainable remediation components incorporated into the remedial design include the following: a thicker, two-foot cover system to enhance biodiversity and ecological habitat; a pervious cover in lieu of a conventional clay cover to promote infiltration and preserve habitat; and a vegetative cover to reduce erosion and runoff as well as promote stormwater drainage and evapotranspiration. These design elements will also reduce the frequency of grass mowing, ultimately reducing greenhouse gas emissions generated by the Site. Additionally, by installing a cover system in lieu of excavation and removal of PCB contamination from all areas, waste generation and emissions associated with trucking material to an off-site waste facility are avoided.

A climate vulnerability assessment was performed to evaluate the remedy's capacity to adapt to climate change and ensure long-term effectiveness. Resources such as New York State Energy Research and Development Authority ClimAID projections were utilized to evaluate the Site's vulnerability to increased extreme storm frequency and precipitation. Results of this assessment indicated the design incorporates sufficient measures to withstand increased precipitation and frequency of extreme storm events provided final grades are constructed in accordance with the design and the vegetative covering is maintained per the SMP.

During remedial construction, the selected contractor will be required to conform with the requirements of DER-31 and meet the Green Remediation metrics and environmental performance requirements set forth in the remedial contract. Per design specification Section 01 89 29 – Green Remediation Practices, the contractor is required to maintain tracking sheets to monitor quantities of materials brought to the site, waste generation, recycled and bio-based materials, solid waste disposal, energy usage, water usage, emissions, and lang/ecosystem quantities disturbed. Following the completion of restoration work, the tracked metrics will be applied to Sitewise to quantify actual environmental impact of the project. Select BMPs will also be implemented throughout construction to the extent possible, including sourcing imported materials and equipment rentals from local suppliers, renting newer equipment with emission control technology (specifically for diesel-powered vehicles), performing routine maintenance of vehicles, and avoiding idling of vehicles and equipment.

5 Monitoring and Maintenance of Engineering Controls

5.1 Site Management Plan

A detailed SMP will be developed for the institutional and engineering controls used to prevent direct exposure to PCB-contaminated materials in the Second Fill Area. This plan will be developed in accordance with the requirements of NYSDEC DER-10 and 40 CFR 761.61, and will include the following general components:

- Visual inspection: The engineering controls will be inspected at the frequency described in the SMP. The inspection will focus on exposed surfaces and physical barriers, and will identify any visual signs of wear, damage, or other evidence of threats to integrity of the engineering controls.
- Long-term Groundwater Monitoring (LTGM): A LTGM program will be implemented at the site in accordance with NYSDEC DER-10.
- Corrective measures: If inspections indicate any deficiency in the engineering controls, corrective measures will be initiated within 72 hours to address the deficiency.
- Documentation and reporting: Details of visual inspections will be documented as they are performed. Any deficiencies discovered and corrective measures taken will also be documented. This information will be compiled into an annual report that will be maintained by NYSDEC.

[1] Field duplicate samples listed in parentheses are from confirmation samples.

[2] Bold and shaded values exceed soil cleanup objective of 1 mg/Kg, while

[3] 2002 samples collected by NYSDEC

Key:

mg/Kg = Milligrams/Kilogram.

ND = All Aroclors were non-detect.

U = Not detected at the reporting limit shown.

UJ = Not detected at the estimated reporting limit shown.

Blank spaces indicate PCBs were not analyzed for confirmation or field duplicate samples.

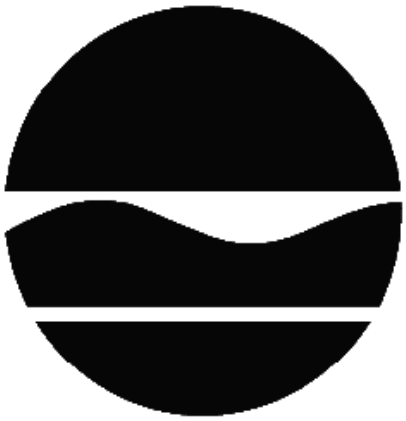
A Record of Decision

RECORD OF DECISION

Special Area 13 Dredge Spoil Disposal Area
State Superfund Project
Moreau, Saratoga County
Site No. 546041
December 2012



Prepared by
Division of Environmental Remediation
New York State Department of Environmental Conservation

DECLARATION STATEMENT - RECORD OF DECISION

Special Area 13 Dredge Spoil Disposal Area
State Superfund Project
Moreau, Saratoga County
Site No. 546041
December 2012

Statement of Purpose and Basis

This document presents the remedy for the Special Area 13 Dredge Spoil Disposal Area site, a Class 2 inactive hazardous waste disposal site. The remedial program was chosen in accordance with the New York State Environmental Conservation Law and Title 6 of the Official Compilation of Codes, Rules and Regulations of the State of New York (6 NYCRR) Part 375, and is not inconsistent with the National Oil and Hazardous Substances Pollution Contingency Plan of March 8, 1990 (40CFR300), as amended.

This decision is based on the Administrative Record of the New York State Department of Environmental Conservation (the Department) for the Special Area 13 Dredge Spoil Disposal Area site and the public's input to the proposed remedy presented by the Department. A listing of the documents included as a part of the Administrative Record is included in Appendix B of the ROD.

Description of Selected Remedy

The elements of the selected remedy are as follows:

1. Remedial Design

A remedial design program will be implemented to provide the details necessary for the construction, operation, maintenance, and monitoring of the remedial program. Green remediation principles and techniques will be implemented to the extent feasible in the design, implementation, and site management of the remedy as per DER-31. The major green remediation components are as follows;

- Considering the environmental impacts of treatment technologies and remedy stewardship over the long term;
- Reducing direct and indirect greenhouse gas and other emissions;
- Increasing energy efficiency and minimizing use of non-renewable energy;
- Conserving and efficiently managing resources and materials;
- Reducing waste, increasing recycling and increasing reuse of materials which would otherwise be considered a waste;
- Maximizing habitat value and creating habitat when possible;
- Fostering green and healthy communities and working landscapes which balance ecological, economic and social goals; and

- Integrating the remedy with the end use where possible and encouraging green and sustainable re-development.

2. Maintain the existing isolation cap/cover, which has been constructed, over the main dredge spoil disposal area at the Special Area 13 site to satisfy Toxic Substances Control Act requirements imposed by the United States Environmental Protection Agency.

3. Maintain the isolation soil covers that have been established beyond the margins of the main dredge spoil disposal area that are part of the TSCA-approved dredge spoil containment structure. These areas include those portions of the first fill area (NYSDEC Boat Launch in Moreau) that were subject to the installation of a soil cover and those areas within the second fill area at the northern extent of the site that are adequately covered by materials placed in association with the construction of General Electric's Work Support Marina Facility for the Hudson River PCBs Site remedial dredging project.

4. Installation of a cover system where current surficial PCB concentrations exceed 1 part per million for the commercial portions of the site (the main dredge spoil disposal area, fill area 1, and fill area 2). These areas include all portions of the Special Area 13 site where PCB-contaminated dredge spoils are exposed at the surface - and - that are not covered by an adequate cover at the present time - but excludes all of the residential use portion of the site. This currently includes two small areas adjacent to the river-side of the main dredge spoil disposal area, a small flood plain soil area south and east of the southeastern margin of the main dredge spoil disposal area, and those areas within the second fill area at the northern extent of the site that are outside of the adequate cover materials placed in association with the construction of General Electric's Work Support Marina Facility for the Hudson River PCBs Site remedial dredging project.

5. For the commercial portions of the site that are not covered by an adequate cover at the present time - a cover will be required to allow for commercial use of these areas of the site. Applicable cover will consist either of the structures such as buildings, pavement, sidewalks comprising any site development or a soil cover in areas where the upper one foot of exposed surface soil will exceed the applicable soil cleanup objectives (SCOs). Where a soil cover is required it will be a minimum of one foot of soil, meeting the SCOs for cover material as set forth in 6 NYCRR Part 375-6.7(d) for commercial use. The soil cover will be placed over a demarcation layer, with the upper six inches of the soil of sufficient quality to maintain a vegetation layer. Any fill material brought to the site will meet the requirements for the identified site use as set forth in 6 NYCRR Part 375-6.7(d).

6. For the residential use portion of the site and those areas immediately adjacent to it, removal and off-site disposal of contaminated soils to meet the residential use SCO of 1 ppm total PCBs in Part 375. This area adjoins the capped landfill cell to the west at the southern end and consists of shallow depression fill area which is oblate in shape with a maximum width of about 220 feet and a long axis length of around 500 feet that covers nearly 2.0 acres.

Approximately 17,500 cubic yards of soil will be removed. Clean fill meeting the requirements of 6 NYCRR Part 375-6.8 will be brought in to replace the excavated soil and establish the

designed grades at the site.

7. Imposition of an institutional control in the form of an environmental easement or an environmental notice for the controlled property that:

(a) requires the remedial party or site owner to complete and submit to the Department a periodic certification of institutional and engineering controls in accordance with Part 375-1.8(h)(3);
(b) allows the use and development of the controlled property for residential (parcels zoned residential) or commercial (parcels not zoned residential) use as defined by Part 375-1.8(g), although land use is subject to local zoning laws;
(c) restricts the use of groundwater as a source of potable or process water, without necessary water quality treatment as determined by the NYSDOH or County DOH;
(d) prohibits agriculture or vegetable gardens on the portions of the controlled property which were subject to remediation; and
(e) requires compliance with the Department approved Site Management Plan.

8. A Site Management Plan is required, which includes the following:

(a) an Institutional and Engineering Control Plan that identifies all use restrictions and engineering controls for the site and details the steps and media-specific requirements necessary to ensure the following institutional and/or engineering controls remain in place and effective:

    Institutional Controls: The Environmental Easements and Environmental Notices discussed in Paragraph 7 above.

    Engineering Controls: The existing isolation cap/cover discussed in Paragraph 2 above, the existing isolation covers discussed in Paragraph 3 above, and the soil covers discussed in Paragraph 4 and 5 above.

    This plan includes, but may not be limited to: (i) Excavation Plan which details the provisions for management of future excavations in areas of remaining contamination; (ii) descriptions of the provisions of the environmental easement including any land use and/or groundwater use restrictions; (iii) provisions for the management and inspection of the identified engineering controls; (iv) maintaining site access controls and Department notification; and (v) the steps necessary for the periodic reviews and certification of the institutional and/or engineering controls; and

(b) a Monitoring Plan to include, but not be limited to: (i) monitoring of groundwater to assess the performance and effectiveness of the remedy; and (ii) a schedule of monitoring and frequency of submittals to the Department.

New York State Department of Health Acceptance

The New York State Department of Health (NYSDOH) concurs that the remedy for this site is protective of human health.

Declaration

The selected remedy is protective of human health and the environment, complies with State and Federal requirements that are legally applicable or relevant and appropriate to the remedial action to the extent practicable, and is cost effective. This remedy utilizes permanent solutions and alternative treatment or resource recovery technologies, to the maximum extent practicable, and satisfies the preference for remedies that reduce toxicity, mobility, or volume as a principal element.

Robert W. Schick, P.E., Director
Division of Environmental Remediation

RECORD OF DECISION

Special Area 13 Dredge Spoil Disposal Area
Moreau, Saratoga County
Site No. 546041
December 2012

SECTION 1: SUMMARY AND PURPOSE

The New York State Department of Environmental Conservation (the Department), in consultation with the New York State Department of Health (NYSDOH), has selected a remedy for the above referenced site. The disposal of hazardous wastes at the site has resulted in threats to public health and the environment that would be addressed by the remedy. The disposal or release of hazardous wastes at this site, as more fully described in this document, has contaminated various environmental media. The remedy is intended to attain the remedial action objectives identified for this site for the protection of public health and the environment. This Record of Decision (ROD) identifies the selected remedy, summarizes the other alternatives considered, and discusses the reasons for selecting the remedy.

The New York State Inactive Hazardous Waste Disposal Site Remedial Program (also known as the State Superfund Program) is an enforcement program, the mission of which is to identify and characterize suspected inactive hazardous waste disposal sites and to investigate and remediate those sites found to pose a significant threat to public health and environment.

The Department has issued this document in accordance with the requirements of New York State Environmental Conservation Law and 6 NYCRR Part 375. This document is a summary of the information that can be found in the site-related reports and documents.

SECTION 2: CITIZEN PARTICIPATION

The Department seeks input from the community on all remedies. A public comment period was held, during which the public was encouraged to submit comment on the proposed remedy. All comments on the remedy received during the comment period were considered by the Department in selecting a remedy for the site. Site-related reports and documents were made available for review by the public at the following document repositories:

New York State Department of Environmental Conservation
Attn: William Shaw
625 Broadway
Albany, NY 12233
Phone: (518) 402-9676

USEPA - Hudson River PCB Project Field Office
421 Lower Main Street
Hudson Falls, NY 12839
Phone: (518) 747-4389

Town of Moreau Office Building
61 Hudson Street
South Glens Falls, NY 12803
Phone: (518) 792-1030

A public meeting was also conducted. At the meeting, the findings of the Remedial Investigation (RI) and the Feasibility Study (FS) were presented along with a summary of the proposed remedy. After the presentation, a question-and-answer period was held, during which verbal or written comments were accepted on the proposed remedy.

Comments on the remedy received during the comment period are summarized and addressed in the responsiveness summary section of the ROD.

Receive Site Citizen Participation Information By Email

Please note that the Department's Division of Environmental Remediation (DER) is "going paperless" relative to citizen participation information. The ultimate goal is to distribute citizen participation information about contaminated sites electronically by way of county email listservs. Information will be distributed for all sites that are being investigated and cleaned up in a particular county under the State Superfund Program, Environmental Restoration Program, Brownfield Cleanup Program, Voluntary Cleanup Program, and Resource Conservation and Recovery Act Program. We encourage the public to sign up for one or more county listservs at http://www.dec.ny.gov/chemical/61092.html

SECTION 3: SITE DESCRIPTION AND HISTORY

Location:

The Special Area 13 (Dredge Spoil Disposal Area) site is located along the western shore of the Hudson River in the Town of Moreau (Saratoga County), about 1,200 feet down-river (south) of Champlain Canal Lock 7 and near Buoy 219 that marks the western margin of the navigation channel of the Champlain Canal within the Hudson River.

Site Features:

The 25.3 acre site consists of four distinct areas. The main dredge spoil disposal area consists of a closed and covered basin and earthen containment berm complex built by the New York State Department of Transportation (NYSDOT) to dewater and hold sediment removed from the Champlain Canal/Hudson River navigation channel south of Canal Lock 7 and from around Rogers Island. In its present closed and covered state, this dredge spoil disposal structure ranges between 175 and 300 feet wide and extends about 1,750 feet along the shore of the Hudson River

with a foot-print covering nearly 14 acres. PCB-contaminated dredge spoils from the main dredge spoil disposal area were graded out onto three adjoining areas prior to its closure. The first fill area adjoins the main dredge spoil disposal area to the north and consists of a closed and covered shallow depression fill area which ranges between 200 and 250 feet wide and extends about 550 feet along former County Route 29 with a foot-print covering nearly 3 acres. This area was covered with a soil cover (consisting of filter fabric, a marker layer, one foot of clean soil, and a vegetated surface) to limit the potential for human exposure to the dredge spoil found here. A second fill area is located in a shallow depression further north beyond the first fill area and is about 550 feet wide and about 500 feet long with a foot-print covering around 6.3 acres. A large portion of the second fill area is covered with clean fill and pavement placed during the construction of a Work Support Marina Facility for the Hudson River PCBs Site remedial dredging project, however the remaining portions of this area are not covered at present. The third fill area adjoins the main dredge spoil disposal area to the west at the southern end and consists of another shallow depression fill area which is oblate in shape with a maximum width of about 220 feet and a long axis length of around 500 feet that covers nearly 2.0 acres on a parcel classified for residential use. This residential use property is occupied by a single dwelling and a few out-buildings. There is a private well on the property that draws water from the shallow overburden aquifer.

Current Zoning/Use:

The main dredge spoil disposal area at the site is the location of a Toxic Substances Control Act approved dredge spoil containment structure and is currently zoned for manufacturing. The first fill area is zoned as a marina and is being used as a State-owned recreational boat launch site. The second fill area is zoned Hudson River Regulatory and is now the location of an active Work Support Marina Facility for the Hudson River PCBs Site remedial dredging project. The third fill area is zoned for general manufacturing and industrial distribution, but retains a property use classification as a single family residence - property used for human habitation, in the Tax Records for the Town of Moreau in Saratoga County. This residential use property appears to be unoccupied.

Historic Use:

A series of unlined, transient settling basin and baffle systems were constructed at the main part of this site by the NYSDOT and were used to dewater and hold dredge spoil material removed from the Champlain Canal/Hudson River navigation channel south of Champlain Canal Lock 7 in conjunction with routine and emergency maintenance dredging operations of the Canal System. These settling basin systems were initially constructed by excavating the soils across this area slightly and grading the displaced materials outward and upward to form the various containment berms. During subsequent maintenance operations, it is likely that some of the older dredge spoil materials were re-graded in order to deepen or modify the established settling basin to accommodate the disposal of additional dredge spoil materials. During one or more of these re-grading activities in the 1970s, it is believed that spoils from the basin and containment berm complex were pushed outward and into the three identified shallow depression areas adjacent to the main disposal area as fill material.

Available NYSDOT records report that the Special Area 13 dredge spoil disposal area was used between 1952 and 1979 for the disposal of up to 802,000 cubic yards of dredge spoil material during canal maintenance operations. In 1979, it was covered with between six and 24-inches of sand and seeded. Monitoring wells were also installed and a monitoring program was established. These actions were taken to comply with Toxic Substances Control Act (TSCA) requirements imposed by the USEPA when they issued an approval for the interim storage/disposal of PCB laden material at this site in September of 1979. In 1991, a TSCA-approved clay cover/cap was added over the existing 'standard turf' cover. The new cover was constructed by the NYSDOT and the earlier monitoring wells were replaced. The new cover added a six-inch to five-foot thick layer of clay over the entire closed main structure. The combination of the two cover layers put the top surface of the potentially contaminated dredge spoil materials at depths ranging between about one-foot and nearly five-feet below the ground surface. Following the installation of the TSCA-approved cap, subsequent monitoring demonstrated that PCB levels in the local groundwater diminished such that PCBs were no longer detected in the groundwater. Personnel from the NYSDOT inspect and sample the groundwater monitoring wells and maintain the site under the TSCA program. The latest TSCA program inspection occurred on May 20, 2010.

The first fill area adjoining the main disposal area to the north has been closed and covered and now serves as part of a State-owned public recreational boat launch site. As mentioned previously, a large portion of the second fill area is covered with clean fill and pavement placed during the construction of a Work Support Marina Facility for the Hudson River PCBs Site remedial dredging project, however the remaining portions of this area are not covered at present.. The third fill area on the residential use property that adjoins the main disposal site to the west along the southern margin has not been covered.

Site Geology and Hydrogeology:

The geologic setting for the Special Area 13 site has a varied mixture of silts, sands, gravel, and clay and that were placed over bedrock by natural processes and a varied mixture of sand, silt, shale fragments, and debris that were placed over the earlier lacustrine and alluvial deposits by unnatural processes a relatively short time ago.

The overburden materials in the natural setting are located in most areas outside of the basin and berm system at the site. The overall thickness of these native soils at Special Area 13 is not known, but earlier work by others report similar undisturbed silts, sands, gravel, and clay to a depth about 30 feet lower than the bottom of the Special Area 13 dredge spoil disposal structure.

The overburden materials in the unnatural setting are best described as mechanically reworked native soil mixed with dredge spoil materials in the closed and covered dredge spoil disposal structure. The dredge spoils are typically dark gray to black, fine to medium sands with varying amounts of silt, black shale fragments, pebble gravel, brick fragments, coal fragments, fused slag, glass shards, and wood debris. Dredge spoils vary in thickness from a few inches to nearly 13.5 feet within the closed and covered main disposal area, from a few inches to 6.7 feet within the closed and covered first fill area, from a few inches to 6.5 feet within the second fill area, and from a few inches to about 7 feet within the third fill area.

Groundwater flow in this area typically moves away from the slight topographic rise on the west and toward the Hudson River in a general east-southeast direction.

A site location map is attached as Figure 1.

SECTION 4: LAND USE AND PHYSICAL SETTING

The Department may consider the current, intended, and reasonably anticipated future land use of the site and its surroundings when evaluating a remedy for soil remediation. For this site, alternatives that restrict the use of the site to commercial use (which allows for industrial use) as described in Part 375-1.8 (g) were evaluated in addition to an alternative which would allow for unrestricted use of the site.

A comparison of the results of the RI to the appropriate standards, criteria and guidance values (SCGs) for the identified land use and the unrestricted use SCGs for the site contaminants is included in the Tables for the media being evaluated in Exhibit A.

SECTION 5: ENFORCEMENT STATUS

Potentially Responsible Parties (PRPs) are those who may be legally liable for contamination at a site. This may include past or present owners and operators, waste generators, and haulers.

The PRPs for the site, documented to date, include:

NYS Department of Transportation

General Electric Company

The PRPs for the site declined to implement a remedial program when requested by the Department. Now that the remedy has been selected, the PRPs will again be contacted to assume responsibility for the remedial program. If an agreement cannot be reached with the PRPs, the Department will evaluate the site for further action. The PRPs are subject to legal actions by the state for recovery of all response costs NYSDEC has incurred. NYSDOT is required to continue all operation, maintenance and monitoring activities at those portions of this site that are governed under the TSCA authorization for the Special Area 13 Dredge Spoil Disposal Area.

SECTION 6: SITE CONTAMINATION

6.1: Summary of the Remedial Investigation

A Remedial Investigation (RI) has been conducted. The purpose of the RI was to define the nature and extent of any contamination resulting from previous activities at the site. The field activities and findings of the investigation are described in the RI Report.

The following general activities are conducted during an RI:

- Research of historical information,
- Geophysical survey to determine the lateral extent of wastes,
- Test pits, soil borings, and monitoring well installations,
- Sampling of waste, surface and subsurface soils, groundwater, and soil vapor,
- Sampling of surface water and sediment,
- Ecological and Human Health Exposure Assessments.

The analytical data collected on this site includes data for:

- groundwater
- surface water
- drinking water
- soil

6.1.1: Standards, Criteria, and Guidance (SCGs)

The remedy must conform to promulgated standards and criteria that are directly applicable or that are relevant and appropriate. The selection of a remedy must also take into consideration guidance, as appropriate. Standards, Criteria and Guidance are hereafter called SCGs.

To determine whether the contaminants identified in various media are present at levels of concern, the data from the RI were compared to media-specific SCGs. The Department has developed SCGs for groundwater, surface water, sediments, and soil. The NYSDOH has developed SCGs for drinking water and soil vapor intrusion. The tables found in Exhibit A list the applicable SCGs in the footnotes. For a full listing of all SCGs see: http://www.dec.ny.gov/regulations/61794.html

6.1.2: RI Results

The data have identified contaminants of concern. A "contaminant of concern" is a hazardous waste that is sufficiently present in frequency and concentration in the environment to require evaluation for remedial action. Not all contaminants identified on the property are contaminants of concern. The nature and extent of contamination and environmental media requiring action are summarized in Exhibit A. Additionally, the RI Report contains a full discussion of the data. The contaminant(s) of concern identified at this site is/are:

Polychlorinated Biphenyls (PCBs)

As illustrated in Exhibit A, the contaminant(s) of concern exceed the applicable SCGs for:

- soil

6.2: Interim Remedial Measures

An interim remedial measure (IRM) is conducted at a site when a source of contamination or exposure pathway can be effectively addressed before issuance of the Record of Decision.

There were no IRMs performed at this site during the RI.

6.3: Summary of Environmental Assessment

This section summarizes the assessment of existing and potential future environmental impacts presented by the site. Environmental impacts may include existing and potential future exposure pathways to fish and wildlife receptors, wetlands, groundwater resources, and surface water.

The Fish and Wildlife Resources Impact Analysis (FWRIA) for OU 01, which is included in the RI Report, presents a detailed discussion of the existing and potential impacts from the site to fish and wildlife receptors.

Based upon investigations conducted to date, the primary contaminants of concern for the proposed Special Area 13 site are PCBs in soils. Groundwater monitoring data demonstrates that groundwater is not being impacted by this site.

Main Dredge Spoil Disposal Area (Closed and Covered)

PCBs were found in many of the subsurface soil samples collected below the established cover at concentrations up to 49 ppm which exceeds the soil cleanup objectives (SCOs) for unrestricted use (0.1 ppm), residential use (1 ppm), commercial use (1 ppm), and industrial use (25 ppm).

First Fill Area - State-owned Recreational Boat Launch (Closed and Covered)

PCBs were found at concentrations up to 12 ppm in soil samples collected at locations that are now beneath the established cover. These PCB concentrations exceed the SCOs for unrestricted use (0.1 ppm), residential use (1 ppm), and commercial use (1 ppm).

Second Fill Area - Land East of the Moreau Dredge Spoil Disposal Area (Partially Covered)

PCBs were found in many of the soil samples collected at locations below the established cover at concentrations up to 25 ppm which exceeds the SCOs for unrestricted use (0.1 ppm), residential use (1 ppm), and commercial use (1 ppm).

Third Fill Area - Residential Use Property

PCBs were found in many of the soil samples collected from all parts of the third fill area at concentrations up to 30 ppm which exceeds the SCOs for unrestricted use (0.1 ppm), residential use (1 ppm), commercial use (1 ppm), and restricted industrial use (25 ppm).

Special Resources Impacted/Threatened:

A Fish and Wildlife Impact Analysis was conducted which concluded that environmental contamination attributable to the dredge spoil materials at the site poses little or no risk to communities of terrestrial plants, invertebrates in soil, or carnivorous birds and mammals.

6.4: Summary of Human Exposure Pathways

This human exposure assessment identifies ways in which people may be exposed to site-related contaminants. Chemicals can enter the body through three major pathways (breathing, touching or swallowing). This is referred to as *exposure.*

People will not come in contact with contamination unless they dig below the cover layer. In areas where dredge spoils are present at the surface beyond the fenced enclosure, people could come in contact with contamination by digging or otherwise disturbing the soil below the vegetated layer.

6.5: Summary of the Remediation Objectives

The objectives for the remedial program have been established through the remedy selection process stated in 6 NYCRR Part 375. The goal for the remedial program is to restore the site to pre-disposal conditions to the extent feasible. At a minimum, the remedy shall eliminate or mitigate all significant threats to public health and the environment presented by the contamination identified at the site through the proper application of scientific and engineering principles.

The remedial action objectives for this site are:

Groundwater

RAOs for Environmental Protection

- Prevent the discharge of contaminants to surface water.

Soil

RAOs for Public Health Protection

- Prevent ingestion/direct contact with contaminated soil.

RAOs for Environmental Protection

- Prevent migration of contaminants that would result in groundwater or surface water contamination.
- Prevent impacts to biota from ingestion/direct contact with soil causing toxicity or impacts from bioaccumulation through the terrestrial food chain.

SECTION 7: SUMMARY OF THE SELECTED REMEDY

To be selected the remedy must be protective of human health and the environment, be cost-effective, comply with other statutory requirements, and utilize permanent solutions, alternative technologies or resource recovery technologies to the maximum extent practicable. The remedy

must also attain the remedial action objectives identified for the site, which are presented in Section 6.5. Potential remedial alternatives for the Site were identified, screened and evaluated in the FS Report.

A summary of the remedial alternatives that were considered for this site is presented in Exhibit B. Cost information is presented in the form of present worth, which represents the amount of money invested in the current year that would be sufficient to cover all present and future costs associated with the alternative. This enables the costs of remedial alternatives to be compared on a common basis. As a convention, a time frame of 30 years is used to evaluate present worth costs for alternatives with an indefinite duration. This does not imply that operation, maintenance, or monitoring would cease after 30 years if remediation goals are not achieved. A summary of the Remedial Alternatives Costs is included as Exhibit C.

The basis for the Department's remedy is set forth at Exhibit D.

The selected remedy is referred to as the No Further Action - Soil Cover - Soil Removal - Site Management remedy.

The estimated present worth cost to implement the remedy is $5,391,000. The cost to construct the remedy is estimated to be $4,866,000 and the estimated average annual cost is $36,000.

The elements of the selected remedy are as follows:

1. Remedial Design
A remedial design program will be implemented to provide the details necessary for the construction, operation, maintenance, and monitoring of the remedial program. Green remediation principles and techniques will be implemented to the extent feasible in the design, implementation, and site management of the remedy as per DER-31. The major green remediation components are as follows;

- Considering the environmental impacts of treatment technologies and remedy stewardship over the long term;
- Reducing direct and indirect greenhouse gas and other emissions;
- Increasing energy efficiency and minimizing use of non-renewable energy;
- Conserving and efficiently managing resources and materials;
- Reducing waste, increasing recycling and increasing reuse of materials which would otherwise be considered a waste;
- Maximizing habitat value and creating habitat when possible;
- Fostering green and healthy communities and working landscapes which balance ecological, economic and social goals; and
- Integrating the remedy with the end use where possible and encouraging green and sustainable re-development.

2. Maintain the existing isolation cap/cover, which has been constructed, over the main dredge spoil disposal area at the Special Area 13 site to satisfy Toxic Substances Control Act requirements imposed by the United States Environmental Protection Agency.

3. Maintain the isolation soil covers that have been established beyond the margins of the main dredge spoil disposal area that are part of the TSCA-approved dredge spoil containment structure. These areas include those portions of the first fill area (NYSDEC Boat Launch in Moreau) that were subject to the installation of a soil cover and those areas within the second fill area at the northern extent of the site that are adequately covered by materials placed in association with the construction of General Electric's Work Support Marina Facility for the Hudson River PCBs Site remedial dredging project.

4. Installation of a cover system where current surficial PCB concentrations exceed 1 part per million for the commercial portions of the site (the main dredge spoil disposal area, fill area 1, and fill area 2). These areas include all portions of the Special Area 13 site where PCB-contaminated dredge spoils are exposed at the surface - and - that are not covered by an adequate cover at the present time - but excludes all of the residential use portion of the site. This currently includes two small areas adjacent to the river-side of the main dredge spoil disposal area, a small flood plain soil area south and east of the southeastern margin of the main dredge spoil disposal area, and those areas within the second fill area at the northern extent of the site that are outside of the adequate cover materials placed in association with the construction of General Electric's Work Support Marina Facility for the Hudson River PCBs Site remedial dredging project.

5. For the commercial portions of the site that are not covered by an adequate cover at the present time - a cover will be required to allow for commercial use of these areas of the site. Applicable cover will consist either of the structures such as buildings, pavement, sidewalks comprising any site development or a soil cover in areas where the upper one foot of exposed surface soil will exceed the applicable soil cleanup objectives (SCOs). Where a soil cover is required it will be a minimum of one foot of soil, meeting the SCOs for cover material as set forth in 6 NYCRR Part 375-6.7(d) for commercial use. The soil cover will be placed over a demarcation layer, with the upper six inches of the soil of sufficient quality to maintain a vegetation layer. Any fill material brought to the site will meet the requirements for the identified site use as set forth in 6 NYCRR Part 375-6.7(d).

6. For the residential use portion of the site and those areas immediately adjacent to it, removal and off-site disposal of contaminated soils to meet the residential use SCO of 1 ppm total PCBs in Part 375. This area adjoins the capped landfill cell to the west at the southern end and consists of shallow depression fill area which is oblate in shape with a maximum width of about 220 feet and a long axis length of around 500 feet that covers nearly 2.0 acres.

Approximately 17,500 cubic yards of soil will be removed. Clean fill meeting the requirements of 6 NYCRR Part 375-6.8 will be brought in to replace the excavated soil and establish the designed grades at the site.

7. Imposition of an institutional control in the form of an environmental easement or an environmental notice for the controlled property that:

(a) requires the remedial party or site owner to complete and submit to the Department a periodic certification of institutional and engineering controls in accordance with Part 375-1.8(h)(3);

(b) allows the use and development of the controlled property for residential (parcels zoned residential) or commercial (parcels not zoned residential) use as defined by Part 375-1.8(g), although land use is subject to local zoning laws;
(c) restricts the use of groundwater as a source of potable or process water, without necessary water quality treatment as determined by the NYSDOH or County DOH;
(d) prohibits agriculture or vegetable gardens on the portions of the controlled property which were subject to remediation; and
(e) requires compliance with the Department approved Site Management Plan.

8. A Site Management Plan is required, which includes the following:
(a) an Institutional and Engineering Control Plan that identifies all use restrictions and engineering controls for the site and details the steps and media-specific requirements necessary to ensure the following institutional and/or engineering controls remain in place and effective:

Institutional Controls: The Environmental Easements and Environmental Notices discussed in Paragraph 7 above.

Engineering Controls: The existing isolation cap/cover discussed in Paragraph 2 above, the existing isolation covers discussed in Paragraph 3 above, and the soil covers discussed in Paragraph 4 and 5 above.

This plan includes, but may not be limited to: (i) Excavation Plan which details the provisions for management of future excavations in areas of remaining contamination; (ii) descriptions of the provisions of the environmental easement including any land use and/or groundwater use restrictions; (iii) provisions for the management and inspection of the identified engineering controls; (iv) maintaining site access controls and Department notification; and (v) the steps necessary for the periodic reviews and certification of the institutional and/or engineering controls; and

(b) a Monitoring Plan to include, but not be limited to: (i) monitoring of groundwater to assess the performance and effectiveness of the remedy; and (ii) a schedule of monitoring and frequency of submittals to the Department.

Special Area 13 Dredge Spoil Disposal Area
State Superfund Project
Town of Moreau, Saratoga County
Site No. 546041
December 2012

Exhibit A

Nature and Extent of Contamination

This section describes the findings of the Remedial Investigation for all environmental media that were evaluated. As described in Section 6.1, samples were collected from various environmental media to characterize the nature and extent of contamination.

For each medium, a table summarizes the findings of the investigation. The tables present the range of contamination found at the site in the media and compares the data with the applicable SCGs for the site. The contaminants are arranged into one category; polychlorinated biphenyls (PCBs. For comparison purposes, the SCGs are provided for each medium that allows for unrestricted use. For soil, if applicable, the Restricted Use SCGs identified in Section 6.1.1 are also presented.

Waste/Source Areas

As described in the RI report, waste/source materials were identified at the site which were the original source of PCB at the site.

Wastes are defined in 6 NYCRR Part 375-1.2 (aw) and include solid, industrial and/or hazardous wastes. Source Areas are defined in 6 NYCRR Part 375 (au). Source areas are areas of concern at a site were substantial quantities of contaminants are found which can migrate and release significant levels of contaminants to another environmental medium. Wastes and Source areas that were identified at the site include all areas used by the NYSDOT to dispose of nearly 802,000 cubic yards of dewatered dredge spoil materials that were removed from the Champlain Canal/Hudson River navigation channel during routine and emergency maintenance dredging operations between 1952 and 1979. These areas include the unlined settling basins of the main dredge spoil disposal area (now part of the TSCA-approved dredge spoil containment structure at the site) and three nearby shallow depression areas that received dredge spoil materials from the main disposal area as fill during re-grading operations in the 1970s. The first of these fill areas is adjacent to the main dredge spoil disposal area to the north, the second fill area is at the northern extent of the site beyond the first fill area, and the third fill area is located on the residential use property that adjoins the main dredge spoil disposal site to the west along the southern margin of the site. Sampling has confirmed that the dredge spoil materials placed in the main disposal area and the identified fill areas of site are contaminated with PCBs.

The waste/source areas identified will be addressed in the remedy selection process.

Groundwater

Four rounds of groundwater samples were collected from six new monitoring wells installed at the site and from five existing monitoring wells located around the cell. PCBs were not detected in groundwater collected from the 11 on-site monitoring wells during the four sampling rounds.

Table 1 - Groundwater

Detected Constituents	Concentration Range (ppb)[a]	SCG[b] (ppb)	Frequency Exceeding SCG
Pesticides/PCBs			
Total PCB	ND	0.09	(No exceedances)

a - ppb: parts per billion, which is equivalent to micrograms per liter, ug/L, in water.
b- SCG: Standard Criteria or Guidance - Ambient Water Quality Standards and Guidance Values (TOGs 1.1.1), 6 NYCRR Part 703, Surface water and Groundwater Quality Standards, and Part 5 of the New York State Sanitary Code (10 NYCRR Part 5).

No site-related groundwater contamination of concern was identified during the RI. Therefore, no remedial alternatives need to be evaluated for groundwater.

Soil

Surface Soil. During all related project investigations, surface soil samples (less than 2 inches below grade) were collected from 140 locations, including 36 locations upon the main dredge spoil disposal area (disposal cell), 18 locations along the margins of the disposal cell, 15 locations within Fill Area 1 to the north of the disposal cell, 22 locations within Fill Area 2 at the northern part of the Special Area 13 site beyond Fill Area 1, and 41 locations within Fill Area 3 (the residential use property) near the southwest corner of the disposal cell. PCBs were found in this series of surface soil samples at concentrations up to 0.083 parts per million (ppm) over the footprint of the closed and covered disposal cell, up to 8.4 ppm along the margins of the disposal cell, up to 12 ppm within Fill Area 1, up to 3.2 ppm within Fill 2 , and up to 15 ppm within Fill Area 3.

In addition, seven soil samples were collected from shallow depressions and ditches along the western and southern borders of the disposal cell along with one soil sample that was collected at the mouth of a drainage swale that traverses the disposal cell and leads to the Hudson River. Five of the eight samples contained PCBs at concentrations ranging from 0.05 to 2 ppm. The samples with the highest concentrations were located along the southern border of the disposal cell. As these samples were taken from areas where there is only occasional water associated with runoff events, these areas will be managed as soils in the remedy for the site.

Subsurface Soil. During all related project investigations, 255 subsurface soil samples were collected from 121 locations, including 43 samples from 10 locations within the footprint of the disposal cell, 57 samples from 24 locations along the margins of the disposal cell, 32 samples from 15 locations within Fill Area 1, 81 samples from 31 locations within Fill Area 2, and 42 samples from 41 locations within Fill Area 3. PCBs were found in this series of subsurface soil samples at concentrations up to 49 ppm within the footprint of the closed and covered disposal cell, up to 15 ppm along the margins of the disposal cell, up to 12 ppm within Fill Area 1, up to 23 ppm within Fill 2 , and up to 30 ppm within Fill Area 3.

SCOs were exceeded in all areas where dredge spoil materials were placed.

The results for the soil samples that were collected form Fill Area 3 (the residential use property) were appropriately compared to the residential use (1 ppm) SCO for PCBs, as the parcel retains a property use classification as a single family residence - property used for human habitation in the Tax Records for the Town of Moreau in Saratoga County. The other areas where dredge spoil materials were placed or where PCBs were found in soils related to dredge spoil deposition at the Special Area 13 site are not classified as residential, but rather represent a commercial exposure and were compared to the commercial/recreational SCO.

Table 2 - Soil

Detected Constituents	Concentration Range (ppm)[a]	Unrestricted SCG[b] (ppm)	Frequency Exceeding Unrestricted SCG	Restricted Use SCG[c] (ppm)	Frequency Exceeding Restricted SCG
Pesticides/PCBs					
Total PCBs - Disposal Cell	ND to 49	0.1 ppm	30/85	1 ppm	27/85
Total PCBs - Outside Cell	ND to 15	0.1 ppm	24/77	1 ppm	16/77
Total PCBs - Fill Area 1	ND to 12	0.1 ppm	34/47	1 ppm	26/47
Total PCBs - Fill Area 2	ND to 23	0.1 ppm	55/103	1 ppm	43/103
Total PCBs - Fill Area 3	ND to 30	0.1 ppm	45/83	1 ppm	33/83
Total PCBs - Whole Site	**ND to 49**	**0.1 ppm**	**188/395**	**1 ppm**	**145/395**

a - ppm: parts per million, which is equivalent to milligrams per kilogram, mg/kg, in soil;
b - SCG: Part 375-6.8(a), Unrestricted Soil Cleanup Objectives.
c - SCG: Part 375-6.8(b), Restricted Use Soil Cleanup Objectives for the Protection of Public Health for Residential or Commercial Use, unless otherwise noted.

PCBs are the primary contaminants of concern found in the surface and subsurface soil at the Special Area 13 site. PCBs were found within the closed and covered disposal cell, along the margins of the disposal cell, within Fill Area 1 (the NYSDEC Boat Launch) to the north of the disposal cell, within Fill Area 2 (property currently being used as the support marina for the ongoing EPA Hudson River dredging project) at the northern part of the Special Area 13 site beyond Fill Area 1, and within Fill Area 3 (the residential use property) near the southwest corner of the disposal cell. No other significant contaminants requiring remediation were identified in the soil at this site.

Based on the findings of the Remedial Investigation, the presence of PCBs from the placement of dredge spoil materials has resulted in the contamination of soil. The site contaminants identified in soil which are considered to be the primary contaminants of concern, to be addressed by the remedy selection process are PCBs.

Surface Water

No surface water contamination was measured in samples collected during the site Remedial Investigation. Samples were collected in drainage areas leading away from the dredge disposal site and in the vicinity of other areas were dredge spoil was placed. No site-related surface water contamination of concern was identified during the RI. Therefore, no remedial alternatives need to be evaluated for surface water.

Exhibit B

Description of Remedial Alternatives

The following alternatives were considered based on the remedial action objectives (see Section 6.5) to address the contaminated media identified at the site as described in Exhibit A. Three sets of alternatives were developed to address three substantially different portions of the site: (1) the closed and clay capped portion of the Special Area 13 site (disposal cell); (2) the portions of the site outside of the closed and clay capped disposal cell that have already had a soil cover placed over dredge spoils; and (3) those areas outside of the closed and clay capped disposal cell where dredge spoils have been placed, or where soils have been impacted by dredge spoil placement, that have not been covered.

Alternatives to address the Disposal Cell (Closed and Clay Capped)

Disposal Cell Alternative 1: No Further Action

The No Further Action Alternative recognizes the remediation of the site completed by the capping work described in the site history. This alternative leaves the site in its present condition and does not provide any additional protection of the environment.

Disposal Cell Alternative 2: No Further Action with Site Management

The No Further Action with Site Management Alternative recognizes the remediation of the site completed by the installation of the clay cap described in the site history. Site Management and Institutional Controls and Engineering Controls are necessary to confirm the effectiveness of this action. This alternative maintains engineering controls which were part of this action, and includes institutional controls (in the form of an environmental easement or environmental notice in the deed for State owned land) and site management plan, necessary to protect public health and the environment from contamination remaining at the site after the cap was placed.

Present Worth: *$302,000*
Capital Cost: *$8,000*
Annual/Periodic Costs: *$20,000*

Disposal Cell Alternative 3: Restoration to Pre-Disposal or Unrestricted Conditions by Excavation and On-Site Treatment by High Temperature Thermal Desorption

This alternative achieves all of the SCGs discussed in Section 6.1.1 and Exhibit A and soil meets the unrestricted soil clean objectives listed in Part 375-6.8 (a). This alternative would include the excavation and on site treatment of all soils exceeding SCGs within the already closed and clay capped disposal cell. This treatment would be accomplished by the use of high temperature thermal desorption. Under this alternative, the use of the treatment technology requires construction and operation of a treatment system at the site, or mobilization of a transportable treatment unit. The substantive requirements of all applicable regulations are met through the proper implementation of the treatment technology. The remedy will not rely on institutional

or engineering controls to prevent future exposure. There is no Site Management, no restrictions, and no periodic review. This remedy will have no annual cost, only the capital cost.

Capital Cost:.....$32,821,000

Disposal Cell Alternative 4: Restoration to Pre-Disposal or Unrestricted Conditions by Excavation and Off-Site Disposal of the Dredge Spoils and Impacted Soils

This alternative achieves all of the SCGs discussed in Section 6.1.1 and Exhibit A and soil meets the unrestricted soil clean objectives listed in Part 375-6.8 (a). This alternative would include the excavation and proper off site disposal of all dredge spoils and soils exceeding the SCOs within the already closed and clay capped disposal cell. The excavated soils and dredge spoils under this alternative are disposed in properly permitted off site disposal facilities. The remedy will not rely on institutional or engineering controls to prevent future exposure. There is no Site Management, no restrictions, and no periodic review. This remedy will have no annual cost, only the capital cost.

Capital Cost:.....$28,344,000

Alternatives to address the Covered Spoils within Fill Area 1 and Fill Area 2

Covered Spoils Alternative 1 - No Further Action

The No Further Action Alternative recognizes the remediation of the site completed by the previous soil cover work described above. This alternative leaves the site in its present condition and does not provide any additional protection of the environment.

Covered Spoils Alternative 2 – No Further Action with Site Management

The No Further Action with Site Management Alternative recognizes the remediation of the site completed by the installation of the soil covers described in the site history. Site Management and Institutional Controls and Engineering Controls are necessary to confirm *the effectiveness of this action. This alternative maintains engineering controls which were part of this action, and includes institutional controls (in the form of an environmental easement or notice in deed) and site management plan, necessary to protect public health and the environment from contamination remaining at the site after the cap was placed.*

Present Worth:.....$238,000
Capital Cost:.....$78,000
Annual/Periodic Costs:.....$11,000

Covered Spoils Alternative 3 - Excavation and Off-Site Disposal of all Covered Spoils

This alternative achieves all of the SCGs discussed in Section 6.1.1 and Exhibit A and soil meets the unrestricted soil clean objectives listed in Part 375-6.8 (a). This alternative includes the excavation and proper

off-site disposal of all dredge spoils and soils exceeding the SCOs within the areas containing dredge spoils or impacted soils (outside of the closed and clay capped disposal cell) which had been previously covered. The excavated soils and dredge spoils under this alternative are disposed in properly permitted off-site disposal facilities. The remedy will not rely on institutional or engineering controls to prevent future exposure. There is no Site Management, no restrictions, and no periodic review. This remedy will have no annual cost, only the capital cost.

Capital Cost:.....$9,476,000

Alternatives to address the site areas containing exposed dredge spoils or impacted soils upon and near the Disposal Cell and within Fill Areas 2 and 3

Uncovered Spoils Alternative 1 - No Action

The No Action Alternative is evaluated as a procedural requirement and as a basis for comparison. This alternative leaves the site in its present condition and does not provide any additional protection to public health and the environment.

Uncovered Spoils Alternative 2 - Cover all Uncovered Spoils in Place

Under this alternative, soil covers to prevent direct contact and erosion would be placed over all currently uncovered areas where dredge spoils or impacted soils exceed SCOs. Site Management and Institutional Controls and Engineering Controls are necessary to confirm the effectiveness of this action. This alternative includes engineering controls and institutional controls (in the form of an environmental easement or notice in deed) and site management plan, as necessary to protect public health and the environment from contamination remaining at the site after the soil cover is placed.

Present Worth:.....$589,000
Capital Cost:.....$506,000
Annual/Periodic Costs:.....$5,400

Uncovered Spoils Alternative 3
Excavation and Off-Site Disposal to meet Residential SCOs in Fill Area 3 (Residential Use Property),
Soil Cover with Site Management for Uncovered Impacted Areas upon and near the Disposal Cell and within Fill Area 2

This alternative includes meeting the residential SCO of 1 ppm total PCBs in the residential use property by excavation and off-site disposal, along with the placement of soil covers on the other uncovered areas containing dredge spoils or impacted soils above applicable SCOs. For the residential use property, no further site management or monitoring is required after the action. Site Management and Institutional Controls and Engineering Controls are necessary to confirm the effectiveness of this action where the soil covers are placed. This alternative includes engineering controls and institutional controls (in the form of an environmental easement or notice in deed) and site management plan, as necessary to protect public health and the

environment from contamination remaining at the site after the soil cover is placed.

Present Worth: *$4,851,000*
Capital Cost: *$4,780,000*
Annual/Periodic Costs: *$5,000*

Uncovered Spoils Alternative 4
Excavation and On-Site Treatment to meet Residential SCOs
in Fill Area 3 (Residential Use Property),
Soil Cover with Site Management for Uncovered Impacted Areas
upon and near the Disposal Cell and within Fill Area 2

This alternative is the same as Alternative 4, except that the soils excavated from the residential use property are treated on-site. This treatment would be accomplished by the use of high temperature thermal desorption. Under this alternative, the use of the treatment technology requires construction and operation of a treatment system at the site, or mobilization of a transportable treatment unit. The substantive requirements of all applicable regulations are met through the proper implementation of the treatment technology.

Present Worth: *$6,751,000*
Capital Cost: *$6,687,000*
Annual Periodic Costs: *$4,200*

Uncovered Spoils Alternative 5 - Excavation and Off-Site Disposal of all Uncovered Spoils

This alternative achieves all of the SCGs discussed in Section 6.1.1 and Exhibit A and soil meets the unrestricted SCOs listed in Part 375-6.8 (a). This alternative would include the excavation and proper off-site disposal of all dredge spoils and soils exceeding the SCOs within the currently uncovered soils. The excavated soils and dredge spoils under this alternative are disposed in properly permitted off-site disposal facilities. The remedy will not rely on institutional or engineering controls to prevent future exposure. There is no Site Management, no restrictions, and no periodic review. This remedy will have no annual cost, only the capital cost.

Capital Cost: *$9,479,000*

Exhibit C

Remedial Alternative Costs

Remedial Alternative	Capital Cost ($)	Annual/Periodic Costs ($)	Total Present Worth ($)
Disposal Cell Alternative 1 No Action	$0	$0	$0
Disposal Cell Alternative 2 Site Management	$8,000	$20,000	$302,000
Disposal Cell Alternative 3 Excavation and On-Site Treatment	$32,821,000	$0	$32,821,000
Disposal Cell Alternative 4 Excavation and Off-Site Disposal	$28,344,000	$0	$28,344,000
Uncovered Spoils Alternative 1 No Action	$0	$0	$0
Uncovered Spoils Alternative 2 Cover Uncovered Spoils In Place with Site Management	$506,000	$5,400	$589,000
Uncovered Spoils Alternative 3 Excavation and Off-Site Disposal in Fill Area 3 (Residential Use Property), Cover Uncovered Spoils in Place, with Site Management	$4,780,000	$5,000	$4,851,000
Uncovered Spoils Alternative 4 Excavation and On-Site Treatment in Fill Area 3 (Residential Use Property), Cover Uncovered Spoils in Place, with Site Management	$6,687,000	$4,200	$6,751,000
Uncovered Spoils Alternative 5 Excavation and Off-Site Disposal	$9,479,000	$0	$9,479,000
Covered Spoils Alternative 1 No Further Action	$0	$0	$0
Covered Spoils Alternative 2 Site Management	$78,000	$11,000	$238,000
Covered Spoils Alternative 3 Excavation and Off-Site Disposal	$9,476,000	$0	$9,476,000

Exhibit D

SUMMARY OF THE PROPOSED REMEDY

The Department has selected Disposal Cell Alternative 2 (*No Further Action with Site Management*), Covered Spoils Alternative 2 (*No Further Action with Site Management*), and Uncovered Spoils Alternative 3 (*Excavation and Off-Site Disposal to meet Residential SCOs in Fill Area 3 (Residential Use Property), Soil Cover with Site Management for Uncovered Impacted Areas upon and near the Disposal Cell and within Fill Area 2*), as the remedy for this site. This set of alternatives would achieve the remediation goals for the site by preventing any further direct contact exposures or potential for erosion and transport of the dredge spoils or impacted soils. The elements of this remedy are described in Section 7. The selected remedy is depicted in Figure 2.

Basis for Selection

The selected remedy is based on the results of the RI and the evaluation of alternatives. The criteria to which potential remedial alternatives are compared are defined in 6 NYCRR Part 375. A detailed discussion of the evaluation criteria and comparative analysis is included in the FS report.

The first two evaluation criteria are termed "threshold criteria" and must be satisfied in order for an alternative to be considered for selection.

1. Protection of Human Health and the Environment. This criterion is an overall evaluation of each alternative's ability to protect public health and the environment.

All remedial alternatives, other than the No Action alternatives, would be protective of human health and the environment. Therefore, the No Action alternatives will not be considered further in this evaluation.

2. Compliance with New York State Standards, Criteria, and Guidance (SCGs). Compliance with SCGs addresses whether a remedy will meet environmental laws, regulations, and other standards and criteria. In addition, this criterion includes the consideration of guidance which the Department has determined to be applicable on a case-specific basis.

All Disposal Cell and Covered Spoils Alternatives currently comply with SCGs; for the Uncovered Spoils the retained alternatives all comply.

The next six "primary balancing criteria" are used to compare the positive and negative aspects of each of the remedial strategies.

3. Long-term Effectiveness and Permanence. This criterion evaluates the long-term effectiveness of the remedial alternatives after implementation. If wastes or treated residuals remain on-site after the selected remedy has been implemented, the following items are evaluated: 1) the magnitude of the remaining risks, 2) the adequacy of the engineering and/or institutional controls intended to limit the risk, and 3) the reliability of these controls.

For the Disposal Cell Alternatives, all alternatives have good long term effectiveness and permanence. The alternatives which involve excavation and treatment, or excavation and off-site disposal, rank higher than allowing the already clay capped dredge spoils to remain in place per Disposal Cell Alternative 2. However, Alternative 2 still ranks well as the remaining risks are small, the cap system is a proven and reliable technology to contain these dredge spoils, and the existing system has shown for several years to be effective in containing the spoils.

For the Covered Spoils Alternatives, the rationale is the same as for the Disposal Cell Alternatives. Allowing the existing soil covers to address exposures to the surficial contaminants within the spoils or impacted soils has been shown to be effective at this site. The alternatives involving removal of the covered spoils with either treatment or off-site disposal would result in only modest improvements in long term effectiveness.

For the Uncovered Spoil Alternatives, installation of the soil covers in the non-residential areas results in the same level of long term effectiveness as with the areas with existing soil covers. Removal of the uncovered spoils with either, treatment or off-site disposal results in only modest improvements in long term effectiveness over installation of a soil cover. For the residential use property, alternatives which would not meet the residential SCOs have low long term effectiveness, as future controls would not prevent residential exposures to soils exceeding the residential SCOs. Alternatives which result in meeting the Unrestricted SCOs provide the greatest long term effectiveness and permanence.

4. Reduction of Toxicity, Mobility or Volume. Preference is given to alternatives that permanently and significantly reduce the toxicity, mobility or volume of the wastes at the site.

For the Disposal Cell Alternatives, the highest ranking alternative is excavation and treatment (Disposal Cell Alternative 3), followed by excavation and off-site disposal (Disposal Cell Alternative 4) and allowing the area to remain capped (Disposal Cell Alternative 2). The reductions in mobility associated with Disposal Cell Alternatives 2 and 4 are comparable. For the Covered Spoils Alternatives and the Uncovered Spoils Alternatives, each alternative except No Action for the uncovered spoils results in the same reduction in mobility, as the soil covers would prevent erosion and migration via surface water, the only significant migration pathway for these areas.

5. Short-term Impacts and Effectiveness. The potential short-term adverse impacts of the remedial action upon the community, the workers, and the environment during the construction and/or implementation are evaluated. The length of time needed to achieve the remedial objectives is also estimated and compared against the other alternatives.

Among the Disposal Cell Alternatives, the best short term effectiveness and permanence is with Alternative 2, as there are little or no negative short term impacts and these can be implemented immediately. Alternatives 3 and 4 require design elements to control releases during excavation and, for Disposal Cell Alternative 4 (utilizing on-site treatment) requires specialized monitoring to ensure control of potential releases from the treatment process. Disposal Cell Alternatives 3 and 4 reflect a lesser degree of green remediation as they include significant expenditure of energy and resources.

For the Covered Spoils Alternatives, the analysis is the same as for the Disposal Cell Alternatives. The alternatives involving excavation and off-site disposal require design elements to control releases during excavation.

For the Uncovered Spoils Alternatives, the analysis is also similar. Alternatives which involve excavation and removal or treatment require design elements to control releases during construction, resulting in lower short term effectiveness. Alternative 2 has the highest short term effectiveness, as no intrusive work would be done to cause potential releases to be controlled.

6. Implementability. The technical and administrative feasibility of implementing each alternative are evaluated. Technical feasibility includes the difficulties associated with the construction of the remedy and the ability to monitor its effectiveness. For administrative feasibility, the availability of the necessary personnel and materials is evaluated along with potential difficulties in obtaining specific operating approvals, access for construction, institutional controls, and so forth.

For the Disposal Cell Alternatives, Alternative 2 has the highest implementability, as no approvals or access agreements are required. Excavation and treatment requires the highest level of controls and approvals, which result in lower implementability. Excavation and off-site disposal requires lesser but still significant controls. For all alternatives, the personnel and engineering expertise is available.

For the Covered Spoils Alternatives, a similar evaluation results, where the alternative utilizing the existing soil covers have the best implementability, while excavation and off-site disposal requires access, personnel, and monitoring resulting in somewhat lower implementability.

For the Uncovered Spoils Alternatives, again a similar evaluation results under which the alternatives involving greater amounts of excavation and either treatment or off-site disposal having somewhat lower implementability. The excavation and treatment alternative would require greater difficulties in achieving the applicable controls on releases during treatment, and in finding available treatment vendors.

7. Cost-Effectiveness. Capital costs and annual operation, maintenance, and monitoring costs are estimated for each alternative and compared on a present worth basis. Although cost-effectiveness is the last balancing criterion evaluated, where two or more alternatives have met the requirements of the other criteria, it can be used as the basis for the final decision.

For the Disposal Cell Alternatives, the costs vary significantly between the alternatives which involve excavation and either treatment or off-site disposal, and Alternative 2 under which the Disposal Cell would remain in place under the existing clay cap. The significant difference in cost, however, does not appear to be proportional to any increase in protectiveness, implementability, or effectiveness.

For the Covered Spoils Alternatives, there is again a significant difference in costs between the alternatives which involve excavation and either treatment or off-site disposal, and Alternative 2 under which the Disposal Cell would remain in place under the existing soil covers. The significant difference in cost, however, also does not appear to be proportional to any increase in protectiveness, implementability, or effectiveness.

For the Uncovered Spoils Alternatives, there is a wide range in costs between the alternatives under which some, versus all of the uncovered dredge spoils and impacted soils are excavated and either disposed off-site or treated on site. The increase in cost between Alternatives 2 and 3 appears proportional to the increased protectiveness, as Alternative 3 would achieve the SCOs in the residential use property when Alternative 2 would not. The significant increases in cost between Alternative 3 and the alternatives under which all of the uncovered spoils would be excavated and either treated on-site or disposed off-site do not appear to be proportional to any increase in protectiveness, implementability, or effectiveness.

8. Land Use. When cleanup to pre-disposal conditions is determined to be infeasible, the Department may consider the current, intended, and reasonable anticipated future land use of the site and its surroundings in the selection of the soil remedy.

For the Disposal Cell Alternatives, the current land use is not anticipated to change. The surrounding land use will be governed by the site management plans associated with the areas which will receive soil covers, which could be recreational or commercial. The presence of the Disposal Cell will not impair commercial or recreational use of the adjacent areas.

The Covered Spoils alternatives, and the portions of the Uncovered Spoils alternatives, the current and anticipated land use (except for the residential use property) is commercial or recreational.

The current land use of the residential parcel is expected to remain residential.

The final criterion, Community Acceptance, is considered a "modifying criterion" and is taken into account after evaluating those above. It is evaluated after public comments on the Proposed Remedial Action Plan have been received.

9. Community Acceptance. Concerns of the community regarding the investigation, the evaluation of alternatives, and the PRAP are evaluated. A responsiveness summary will be prepared that describes public comments received and the manner in which the Department will address the concerns raised. If the selected remedy differs significantly from the proposed remedy, notices to the public will be issued describing the differences and reasons for the changes.

Disposal Cell Alternative 2 (*No Further Action with Site Management*), Covered Spoils Alternative 2 (*No Further Action with Site Management*), and Uncovered Spoils Alternative 3 (*Excavation and Off-Site Disposal to meet Residential SCOs in Fill Area 3 (Residential Use Property), Soil Cover with Site Management for Uncovered Impacted Areas upon and near the Disposal Cell and within Fill Area 2*) has been selected as the remedy because, as described above, it satisfies the threshold criteria and provides the best balance of the balancing criterion.

APPENDIX A

RESPONSIVENESS SUMMARY

RESPONSIVENESS SUMMARY

Special Area 13 Dredge Spoil Disposal Area

State Superfund Project

Town of Moreau – Saratoga County - New York

Site No. 546041

December 2012

The Proposed Remedial Action Plan (PRAP) for the Special Area 13 Dredge Spoil Disposal Area (Special Area 13) was prepared by the New York State Department of Environmental Conservation (the Department) in consultation with the New York State Department of Health (NYSDOH) and was issued to the document repositories on February 24, 2012. The PRAP outlined the remedial measures proposed for contaminated soil at the Special Area 13 site.

The release of the PRAP was announced by sending a notice to the public contact list and served to invite the public to comment on the proposed remedy.

A public meeting was held on March 6, 2012, which provided information about the Remedial Investigation (RI) and the Feasibility Study (FS) for the Special Area 13 site and discussed elements of the proposed remedy. The meeting also provided citizens with an opportunity to discuss concerns, ask questions, and comment on the proposed remedy. All questions and comments received during the public comment period have become part of the Administrative Record for this site. The public comment period for the Special Area 13 PRAP ended on May 10, 2012 instead of March 26, 2012, as provided in the PRAP in response to General Electric's March 6, 2012 request for an extension to the public comment period.

This responsiveness summary responds to all questions and comments raised during the public comment period. The following passages provide the narrative of each question/comment received and the Department's response.

The following questions and comments were made and answered during the public meeting held on March 6, 2012:

COMMENT 1: Are the plants on the site removing contamination from the soil and if so, could pollen present exposure concerns?

RESPONSE 1: Generally, the uptake of PCBs in plants is low and is not expected to contribute substantially to a reduction of PCBs in soil. Any PCBs that may transfer from site soils into site plants are expected to mostly persist in roots, leaves and/or shoots, and are expected to return to

nearby soil after the plants shed leaves or die. New York State does not believe that pollen is a PCB exposure concern for people using the site.

COMMENT 2: If the State was to dig up the entire site and remove all of the PCB contamination, would the PCBs have to be destroyed or could they be placed in a landfill?

RESPONSE 2: PCB-contaminated soil from this site could be disposed of in an appropriately permitted landfill.

COMMENT 3: What technology would be used to treat the soil at the site?

RESPONSE 3: PCB-contaminated soil from this site could be treated by thermal and/or chemical means. One of the alternatives considered involved treatment by turning the soil material into glass also known as vitrification. However, the high costs associated with the vitrification process and extraordinarily high energy demands made that alternative infeasible.

COMMENT 4: Who is responsible for the cost?

RESPONSE 4: After the remedy is selected, all potential responsible parties (PRPs) will be approached about assuming responsibility for the remedial program. If an agreement cannot be reached with the PRPs, the Department will evaluate funding alternatives.

COMMENT 5: Has traffic from the Hudson River PCBs Site remedial dredging project potentially impacted any of these sites and have those potential impacts been considered?

RESPONSE 5: While some PCB contamination may be present under the roadways leading to the Work Support Marina and the Backfill Storage and Offloading Area associated with the Hudson River PCBs Site remedial dredging project, the roadways are covered with clean material including an adequate thickness of either pavement or crushed stone. These materials provide an adequate barrier and it is unlikely that any travel use of these roadways would result in the migration of the PCB contaminated soils underneath. In addition, these cover materials will be maintained over the roadways after the dredging project is completed.

COMMENT 6: Could the remedy be implemented while the dredging project is underway or would the roadways need to stay clear for Hudson River dredging-related traffic?

RESPONSE 6: The remedy could be implemented while the dredging project is underway. For example, the application of the soil cover over the adjacent Old Moreau Dredge Spoil Disposal Area would be timed so that it would not interfere with access to the Backfill Storage and Offloading Area associated with the dredging project.

COMMENT 7: When do you anticipate issuing the Record of Decision (ROD) documents for the three Dredge Spoil Sites in Moreau?

RESPONSE 7: At the public meeting, the public was told that the Department expected to have all three RODs out by May 2012. The Moreau and Old Moreau RODs were issued in March 2012.

John G. Haggard, Executive Director of the Remediation and Hudson Programs for General Electric, submitted a comment letter on May 8, 2012, which is included in the Administrative Record (Appendix B).

COMMENT 8: The administrative record for the key Special Area 13 site documents is incomplete and, as a result, NYSDEC has compromised the public participation process that is required as part of remedy selection. Even though the public comment period was extended an additional 45 days and certain key documents were provided directly to GE upon request, the administrative record provided for public review at two of the three public repositories is still incomplete. Key documents regarding sampling conducted at the Morrison Property were not placed in the public repositories and made available to the public for review. In addition, information contained in the FS regarding costing conflicts with information contained in the Proposed Remedial Action Plan (PRAP), which remains unexplained. The unavailability of key administrative documents for review during the public comment period compromises the process.

RESPONSE 8: It is accurate that the formal report for the results of the soil sampling program conducted at the Morrison Property were made available to the public for review as a stand alone document, after the start of the comment period, however these results were also included in the Special Area 13 Remedial Investigation Study Report which was available to the public at the start of the comment period. These results are depicted on several of the figures and discussed in the narratives of the RI and were also incorporated into the discussion in the Exhibits and figures in the PRAP provided to the public repositories as part of the public participation process. While the data for the sampling conducted at the Morrison Property has always been reflected in the RI, the formal report for the results of the soil sampling program has since been incorporated into the Appendix of the Special Area 13 Remedial Investigation Study Report as a supplement and provided to the public repositories. The minor editorial error in the PRAP showing the estimated alternative costs does not change the overall evaluation of alternatives and has been corrected in this ROD.

COMMENT 9: The Fact Sheet for the proposed remedial action at the Special Area 13 Disposal Site incorrectly states that the remedial investigation and feasibility study for the site were submitted to the NYSDEC by New York State Department of Transportation (NYSDOT) and General Electric (GE).

RESPONSE 9: Comment noted.

COMMENT 10: The PRAP presented a proposed remedy cost that is 1.2 times lower than the costs provided in the FS Report, and NYSDEC's failure to explain this significant cost difference further compromises any meaningful review during the public comment period.

The estimated present value (PV) cost to implement the proposed remedy set forth in the PRAP is $4,599,000. The PV cost of the remedial alternative in the FS that represents the proposed remedy is $5,391,000. This cost difference is unexplained by NYSDEC and complicates the review process during the public comment period.

RESPONSE 10: The costs in the Special Area 13 Feasibility Study Report are correct and the appropriate corrections have been made in the ROD narrative. (See Response 8.)

COMMENT 11: The Special Area 13 Dredge Spoil Disposal Area is not an "Inactive Hazardous Waste Disposal Site" as defined by the Environmental Conservation Law (ECL), and therefore the NYSDEC has no authority to issue a ROD or to take any other action under the State Superfund Program regarding the Special Area 13 disposal area.

The Special Area 13 disposal area site does not meet the definition of an "inactive hazardous waste disposal site" that is found in ECL Section 27-1301(2) and in 6 NYCRR Section 375-1.2(y) in that it is not "an area or structure [as to which] no permit or authorization issued by the department or a federal agency for the disposal of hazardous waste was in effect after the effective date of this title." As a result, NYSDEC is not authorized to expend hazardous waste remedial program funds to implement the proposed remedy under the ECL and 6 NYCRR Part 375, nor does it have the authority to order the implementation of the selected remedy.

The purpose of the above-quoted language is to avoid the imposition of multiple sets of regulatory requirements governing response actions at inactive hazardous waste disposal sites. As the Division of the Budget made clear at the time the legislation establishing the inactive hazardous waste disposal site program was enacted, permits covering sites would effectively address the disposal and containment of released materials, but a new statute would be needed to address otherwise unregulated "inactive sites." Thus, creating an exception to the definition of "inactive hazardous waste disposal site" for a site at which a "permit or authorization issued by the department or a federal agency" has been issued fulfills the goal of ensuring that environmental protection will be achieved at an inactive hazardous waste site while at the same time also ensuring that duplicative or contradictory remedial measures will not be required at such site.

The Special Area 13 disposal area site was authorized by the U.S. Environmental Protection Agency (USEPA) for the disposal of dredge spoils under the Toxic Substance Control Act (TSCA) in the letter dated September 6, 1979 from the USEPA Region 2 Administrator to the Commissioner of the NYSDOT. This letter, and the subsequent, ongoing maintenance of the Special Area 13 disposal area site under TSCA, constitute a "permit or authorization" issued by a Federal agency, and therefore remove the Special Area 13 disposal area site from the definition of "inactive hazardous waste disposal site." As a result of the fact that the Special Area 13 disposal area site is not an "inactive hazardous waste disposal site," as the term is defined in the ECL and in 6 NYCRR Part 375, NYSDEC is precluded from seeking any form of relief under the statutory and regulatory program established to address such sites.

Thus, pursuant to the provisions of Subparagraph 3(a) of Section 97-b of the State Finance Law, establishing the State's hazardous waste remedial fund, NYSDEC may not spend moneys from such fund for the inactive hazardous waste disposal site remedial program. Consequently, the provision in State Finance Law Section 97-b - Subdivision 6 - requiring NYSDEC to "make all reasonable efforts to recover the full amount of any funds expended from the fund pursuant to [the above-cited subparagraph] through litigation or cooperative agreements with responsible persons" is

inapplicable. Without the legal authority to expend any such moneys, a recovery obligation is irrelevant.

Relief under the so-called enforcement language of ECL Section 27-1313, found in Subparagraph 3(a) thereof, is similarly unavailable to NYSDEC. That provision states:

Whenever the commissioner finds that hazardous wastes at an inactive hazardous waste disposal site constitute a significant threat to the environment, he may order the owner of such site and/or any person responsible for the disposal of hazardous wastes at such site (i) to develop an inactive hazardous waste disposal site remedial program, subject to the approval of the department, at such site, and (ii) to implement such program within reasonable time limits specified in the order.

That provision too hinges on the definition of "inactive hazardous waste disposal site." Because the Special Area 13 disposal area site is outside that category, NYSDEC lacks the authority to seek enforcement relief under Section 27-1313(3) (a) of the ECL.

In a June 2001 report titled "Dredge Spoils Investigation in the Upper Hudson River Valley," NYSDEC stated that Special Area 13 is not an Inactive Hazardous Waste Disposal Site and should not be placed on the Registry. "[Special Area 13] was previously a Class 2 Inactive Hazardous Waste Disposal Site, but has been delisted by NYSDEC because TSCA facilities do not meet the definition of 'inactive' sites." Nonetheless, on December 8, 2011, NYSDEC re-listed Special Area 13 on the Registry of Inactive Hazardous Waste Disposal Sites (the "Registry"). By virtue of the analysis provided above, as well as NYSDEC's own legal conclusion as set forth in its June 2001 report, NYSDEC was without legal justification to re-list Special Area 13. Therefore, Special Area 13's listing on the Registry is a legal nullity without effect.

RESPONSE 11: The site is a Class 2 site and as such in accordance with 6NYCRR375-2.8(e) the Department has documented the process of selecting a remedy in a Record of Decision.

COMMENT 12: A total of 368 soil samples were collected during the RI activities from the Special Area 13 boundaries as defined in the FS report. None of the RI samples contained PCB concentrations greater than 50 ppm; hence, the presence of hazardous waste has not been confirmed at the Site. Therefore, following the RI, the Department should have removed the Site from the Inactive Hazardous Waste Disposal Site Registry or at a minimum, reclassified it as a Class 3 site**.**

With a few exceptions that do not apply to this Site, hazardous waste in New York State (NYS) is defined as a waste that appears on the list or satisfies the characteristics promulgated by the commissioner. Current regulation identifies 50 ppm as the concentration which defines PCBs as a hazardous waste. All RI soil sample results exhibited PCB concentrations less than 50 ppm. As such, the RI sampling has not confirmed the presence of hazardous waste at the Site. As a result, even assuming that NYSDEC had any authority to list the Special Area 13 site in the first instance, the Department should have removed the Site from the Registry or at a minimum, reclassified it as a Class 3 site.

RESPONSE 12: The Department disagrees. Regulations provided in 6 NYCRR Part 375-1.2(w) define *"hazardous waste"* as *"a waste which appears on the list or satisfies the characteristics promulgated by the Commissioner pursuant to Environmental Conservation Law (ECL) 27-0903 and any substance which appears on the list promulgated pursuant to ECL 37-0103."* PCBs are on the list promulgated pursuant to ECL 37-0103. The definition does not include any applicable, minimum concentration value. The 50 ppm level is relevant to the classification of PCB waste as a B waste pursuant to 6NYCRR Part 371 and thus subject to regulation as a hazardous waste pursuant to 6 NYCRR Part 375.

COMMENT 13: NYSDEC failed to define the inputs used to calculate key statistical values that were relied upon for making risk management decisions. Furthermore, the key statistical values appear to have excluded site sample results as some were grouped with data from the adjacent New Moreau site.

There are three contiguous dredge spoil material disposal sites. The Special Area 13 site shares common boundaries with the New Moreau site. The clearest site boundaries for the Special Area 13 were provided in the FS report. Based on these boundaries, data clearly within the Special Area 13 site was not included in its RI Report. Consequently, the data evaluation conducted for the Special Area 13 RI likely did not include all site data and it appears the information relied upon by NYSDEC in selecting a proposed remedy was therefore flawed and biased.

RESPONSE 13: As the comment points out, there are three contiguous dredge spoil disposal sites in this area and the Special Area 13 Dredge Spoil Disposal Area shares common boundaries with the Moreau Dredge Spoil Disposal Site and the Old Moreau Dredge Spoil Disposal Area. These common boundaries may or may not be coincident with the established tax map property boundaries for any one of the given sites. The selected remedy for the Special Area 13 Dredge Spoil Disposal Area is based on an interpretation of those data point results deemed to be associated with and pertinent to the Special Area 13 Dredge Spoil Disposal Area regardless of location with respect to established tax map property boundaries. (This approach is echoed in the selection of the remedy provided in the ROD documents for the Old Moreau Dredge Spoil Disposal Area and the Moreau Dredge Spoil Disposal Site.) This issue was also discussed during the public meeting.

COMMENT 14: Data used to assess the remedial approach for the Morrison Property, which represents over 87% of the total remedial action costs, were not included in the RI report. Furthermore, these data, which were only provided to GE upon request after the comment period had commenced, were in a form that was inconsistent with the requirements of DER-10 and 40 CFR § 300.810, Contents of the Administrative Record File**.**

The RI report for Special Area 13 does not contain results for the sampling conducted on the Morrison Property; however, this information was used to develop an excavation and off-site disposal remedial component for this portion of the Special Area 13 site. The sampling results for the Morrison Property were provided to GE in two documents. One is a set of standalone data tables and the other a draft letter to NYSDEC from Ecology & Environment Engineering, PC (EEE), dated 27 February 2004. The documentation related to the Morrison Property sampling does not specify the analytical methodology or the data quality objectives (DQOs) for the effort. In addition,

insufficient documentation is available regarding the laboratory reports, data validation reports, description of qualifiers and interpretation of results. The presentation of this information is inconsistent with the requirements of DER-10 and 40 CFR § 300.810, Contents of the Administrative Record File. 40 CFR § 300.810 provides for the administrative record to include documents that form the basis for the selected response action, including but not limited to, verified sampling data, quality control and quality assurance documentation and chain of custody forms. Without this information, it is not possible to assure the quality or validity of these data. Furthermore, as this data is neither included in the RI report nor the administrative record, there is no basis in the administrative record upon which to base a remedial action at the Morrison Property portion of the site.

RESPONSE 14: See Response 8.

COMMENT 15: There is no basis to support a conclusion that attainment of a 0.1 ppm cleanup goal for PCBs could be achieved with a modest volume increase when the remedial alternatives in the FS were based on a PCB cleanup goal of 1 ppm. The estimated 20% volume increase that was assumed to occur from a more stringent cleanup goal of 0.1 ppm PCB is arbitrary given the detection limits of the existing data exceeds 0.1 ppm.

RESPONSE 15: The Record of Decision clarifies that the PCB cleanup level to be applied will be 1 ppm total PCB, the residential SCO without restrictions.

COMMENT 16: The absence of any Data Quality Objectives (DQOs) to inform the Department's decision to rely on PCB screening results impedes the ability of the Feasibility Study to develop and evaluate remedial alternatives in accordance with DER-10 (§2.1(c)(1)) and the NCP (40 CFR § 300.430(e)) and justify the proposed remedy.

Approximately 80% of the RI sample results were derived from a PCB screening approach. The other 20% of the results were derived from conventional laboratory analysis. Although screening approaches can be common components of an RI, especially when combined with more conventional laboratory analysis, both DER-10 (§3.5.1 (d)) and the NCP (40 CFR § 300.430(e)) contemplate that DQOs are established to ensure the data collected are of known quality and suitable for their intended purpose. Moreover, DER-10 (§2.1 (c) (1) contemplates that data obtained using field-screening methods, even when supported by ELAP approved methods, should "…not be used to make final determinations relative to impacts from contamination on the public health". The administrative record for the Site fails to establish that proper DQOs were established and adhered to in the RI/FS process for all areas of the site including the Morrison Property. Hence, there is no basis to objectively evaluate the uncertainty around the PCB remedial goal adopted by the Department which significantly influences the scope of the proposed remedy.

RESPONSE 16: The Department utilized both screening results and more rigorously developed analytical protocols, in developing its understanding of conditions at the site. As noted the use of screening approaches is detailed in DER 10 at subdivision 1.2(c), and the required analytical sample analysis for field screening is 10% so the 20% analytical identified in the comment is well within the acceptable range.

The commenter also notes that these methods should "…not be used to make final determinations relative to impacts from contamination on the public health". Appendix 2A of DER-10 defines final determinations as those made at the end of the remedial action to confirm compliance with cleanup target concentrations; this clearly is not the point in the process, in remedy selection, where this comment would apply.

The RI/FS work plan included conventional laboratory analytical results, developed with DQOs, which primarily informed the Department on the extent of contamination at the site. Given the clarification of the remedial goal for the site (see response to Comment 15, above), the portion of the comment pertaining to uncertainty about the remedial goal no longer applies.

COMMENT 17: If residential occupation of the Morrison Property resumes, a risk-based cleanup level for PCBs would be more appropriate to evaluate potential remedial actions for the Morrison Property portion of Special Area 13. The use of the SCO for ecological receptors is not appropriate as the SLERA did not conclusively demonstrate ecological risks (see comment below).
Currently, there is an unoccupied home in a state of disrepair located on the Morrison Property. The house does not appear to have been occupied for some time. Should residential use of the property resume, a risk-based cleanup level would be appropriate for this portion of the site. As discussed in Comment 16, Subpart 375 for the use of risk-based cleanup levels in lieu of SCOs. Should NYSDEC choose to rely solely on the existing SCOs, the residential SCO of 1 ppm would be more appropriate if the residential use resumes at the property. It should however be noted that this portion of the site, in fact, is zoned M-1 Industrial and therefore the industrial SCO would be more consistent with that use. Furthermore, the use of the SCO for ecological receptors (as discussed in Comment 19) is not appropriate for this site because the SLERA did not conclusively demonstrate that there are actual risks to ecological receptors at the site.

RESPONSE 17: Neither this Record of Decision, nor did the proposed plan, apply an SCO for ecological receptors as the cleanup level for this site. See Response 15 for a clarification of the cleanup targets for the site.

COMMENT 18: The Human Health Risk Evaluation concluded that there is no unacceptable human health risk. Therefore, there is no basis for NYSDEC to conclude the site poses a significant threat to human health and hence, no basis to support the Class 2 designation or propose a remedy based on protectiveness of human health.

While the human health risk assessment conducted as part of the RI is presented as a *"qualitative"* risk analysis, it is, in fact, a quantitative risk assessment. NYSDEC evaluated five potential exposure scenarios, calculated upper bound exposure point concentrations as either the 95^{th} UCL or the maximum concentration (whichever was lower, as appropriate) for each scenario, conservative exposure parameters and upper-bound toxicity values, and calculated quantitative estimates of risk and hazard. The scenarios evaluated included: 1) Current Adult Maintenance Workers exposed to surface soils throughout the site, 2) Current and Future Adult and Child Recreational Users exposed to surface sediments outside of the fence, 3) Current Adult and Child Residents exposed to surface soil and sediment located outside of the fence, 4) Future Adult Commercial/Industrial Exposure to

soil (0-10 feet) and sediment across the entire site, and 5) Future Construction Workers exposed to soil (0-10 feet) and sediment across the entire site.

The results of that quantitative risk assessment indicated that all cancer risks and all but one of the non-cancer hazard indices were below benchmarks of concern. While the hazard index for a child resident, assumed to be exposed to media in all areas of the site outside of the fenced area, exceeded that benchmark by a factor of 3, EEE stated that "by definition a reference dose has uncertainty that spans an order of magnitude (or one log cycle); thus, hazard indices between 3 and 0.3 cannot be distinguished from 1 indicating that the child resident's hypothetical exposure is not likely to be of concern." Consequently, it was concluded that the site posed no current or future risk to public health.

In addition, while the EEE risk assessment discussed "current" residential exposure, there is no residential exposure currently occurring at the site. There is a residence located on the Morrison property but that home appears to have been abandoned and is in significant disrepair. In addition, the property on which it is located is zoned for industrial use, rather than residential use. Consequently, the residential scenario is a hypothetical scenario and remedial decisions should not be based on that potential use.

Subpart 375 provides target risk and hazard benchmarks that can be used in determining the need for remediation but also provide flexibility in that process. It permits the Department to depart from using SCOs as remedial goals if it can be demonstrated that alternative levels would be protective of public health. Subpart 375(3) (ii) states that a cleanup level that exceeds a one in one million lifetime cancer risk or hazard index of one may be approved by the Department "without requiring the use of institutional or engineering controls to eliminate exposure only upon a site-specific finding by the Commissioner, in consultation with the State commissioner of health, that such level shall be protective of public health and the environment." Because the EEE risk assessment, which was conducted at NYSDEC's request, has demonstrated that there is no unacceptable risk associated with current media concentrations at the site, the proposed remedies are not necessary to protect public health.

RESPONSE 18: The Department disagrees that there is no basis to conclude that the site poses a significant threat to human health. As the commenter has noted, the hazard index for a child resident exceeds the level of concern; this is typically one of the reasons for the Department to take action at residential locations. Exceedances of the SCO for PCB in surface soils, combined with the potential for human exposures to these surface soils, provide a basis for the selected remedy. The 1 ppm level has been consistently applied for cleanups by the Department.

COMMENT 19: The RI finding that the site poses little or no risks to communities of terrestrial plants and soil invertebrates but may pose a risk to some wildlife species, amphibians and benthic invertebrates does not meet the standard to justify a determination of significant threat. Hence, there is no basis to support the Class 2 designation and no basis to propose a remedy based on protection of the environment.

A Screening-Level Ecological Risk Assessment (SLERA) is a conservative vetting tool whose purpose is to eliminate contaminants of concern from any further consideration of potential ecological risk. It is not intended to support a conclusion that contaminants, which are not eliminated by the screen, present a significant threat as per 6 NYCRR Part 375-1.2 (1) (a) (i), (ii), (iii), (iv), (v) (i.e. results in significant adverse impacts and/or acute or chronic effects or contributes to significant adverse ecotoxicity from bioaccumulation in flora or fauna or cause human consumption to be limited). While a SLERA to assess potential impacts to ecological receptors may be a useful first step in the assessment of potential ecological risks, the NYSDEC DER-10, Fish and Wildlife Resource Impact Assessment [FWRIA] guidance, and the US EPA ecological risk assessment guidelines offer more thorough methods (qualitative and quantitative) to assess ecological risks that may arise from the presence of contaminants in various settings. According to USEPA (2001) *Eco Update, The Role of Screening-Level Risk Assessments and Refining Contaminants of Concern in Baseline Ecological Risk Assessments*, SLERAs are not intended to provide definitive estimates of actual risk or generate cleanup goals. Furthermore, the screening values in the SLERA are not based upon site-specific assumptions.

Notwithstanding the fact that remedial decisions should not be based on the results of a SLERA, review of the SLERA indicates that the assumptions made for the following parameters were overly conservative for determining remedial needs: ingestion rates, soil exposure point concentrations, bioaccumulation factors and toxicity reference values. Some specific examples include, but are not limited to:

Dietary Composition: The SLERA includes a conservative assumption that the robin consumes 100% earthworms, yet the studies from which the ingestion rate was taken state that worms comprise a much smaller fraction of the actual robin diet, with other invertebrates and vegetation factored in as well. Worms accumulate PCBs to a greater extent than plants and other invertebrates, therefore, including these other components would reduce the estimated risk to the robin.

Exposure Point Concentration: The SLERA conservatively uses a maximum concentration in the upper six feet for the EPC rather than the 95% UCL on the mean in the upper six inches of soil. Furthermore, the 0-6 inch depth interval would be the appropriate soil profile to consider for exposure to the identified receptors and is consistent with DER-10.

Bioaccumulation Factors: BAFs that were not appropriate for PCBs were assumed. As stated in the cited reference for this value, the authors acknowledge that the equation for PCBs in earthworms overestimated uptake 81 percent of the time (Sample et al, 1998a).

Toxicity Reference Values (TRV): More appropriate TRVs can be found in other documents not utilized in the SLERA, including but not limited to Region 9 BTAG and values used and accepted by USEPA on other large PCB sites.

Use of more appropriate values for the above parameters demonstrates that Site soil does not pose risks in excess of a hazard quotient of 1. In summary, it can be concluded that an ERA conducted in

accordance with the NCP would conclude that there is no need to conduct remedial action at this Site to mitigate ecological risks.

Based on the above, the SLERA is an insufficient basis for NYSDEC to determine the site poses a significant threat. As a consequence the NYSDEC has no basis to assign the site a Class 2 designation or propose a remedial action to protect the environment. Furthermore, as this assessment does not conclude a risk to ecological receptors under current conditions, there is no rationale to include the ecological SCO of 1 ppm as a remedial goal.

RESPONSE 19: The Department disagrees and believes that the available site data, including (as noted and described in Comment 19 above) the risks to wildlife species, support the selection of this remedy.

COMMENT 20: The FS report failed to consider more appropriate and cost effective remedial options for the Morrison Property, including: (1) focused hot spot soil removal; (2) surface cover with use restrictions; or (3) demolition of the vacant house and enforcement of the M-1 Industrial zoning. Specifically, the proposed remedy for the Morrison Property portion of Special Area 13, which represents approximately 87% of the $5.4 MM estimate, is not cost-effective as defined in the NCP (40 CFR Part 300.430(f), March 8, 1990, page 8725.

The NCP states that cost effectiveness is determined by comparing the cost and overall effectiveness to determine whether the costs are proportional to the effectiveness achieved. For the purpose of making this determination, the NCP assesses the long-term effectiveness, reduction of toxicity, mobility or volume through treatment, implementability and short-term effects. The proposed remedy for the Morrison Property is excavation for the purpose of achieving a PCB cleanup goal of 0.1 ppm. As noted above in Comment 14, the basis for estimating the volume and cost associated with achieving a 0.1 ppm PCB cleanup level is arbitrary and unsupported by existing data.

According to the Town of Moreau zoning maps, the Morrison Property is located in an M-1 Industrial zone. As discussed above, a house that is in severe disrepair, which appears to be unoccupied, is currently located on this property. Given the zoning and the state of the house situated on this property, there are a number of alternative remedial actions that could have been considered. These include: (1) hot spot removal; (2) installation of a surface cover; or (3) removal of the building and enforcement of the M-1 Industrial zoning.

Surface Soil Hot Support Removal
The HHRA concluded no unacceptable risks were posed to human health by the Morrison Property soil and the SLERA did not conclusively indicate any unacceptable risks to ecological receptors. As discussed in Comment 16, Subpart 375 provides for the use of risk-based cleanup levels in lieu of SCOs. Should the NYSDEC choose to rely solely on the existing SCOs, the residential SCO of 1 ppm would be more appropriate for residential and commercial receptors. As the interval of soil exposure for resident is 6-inches (as stated in the RI), the SCO for residential receptors can be more than adequately addressed through removal of PCB hot spots on the upper two feet of surface soil. Through removal of soil exhibiting PCB concentrations ranging from 4.4 to 15 ppm and replacement with clean soil a 95% UCL on the mean of less than 1 ppm could be achieved in the upper two feet

of soil. The SCO for commercial workers could then be addressed through engineering controls (e.g., a Soil Management Plan).

Surface Cover
The residential SCO could also be achieved through installation of a surface cover. This is quite similar to the hot spot removal option above; however, there would be no excavation. The cover would be installed over the PCB hot spots to achieve an acceptable 95% UCL on the mean PCB concentration.

Reinstatement of Industrial Use
Based on current market conditions, the value of the unoccupied house is approximately two orders of magnitude less than the estimated cost of the selected remedy for this portion of the site ($4.3 MM). Purchase and removal of the unoccupied house would preserve the current M-1 Industrial Zone classification and since the 95% UCL PCB concentration in surface soil is 4.25 mg/kg, it is well below the 25 ppm PCB SCO for this land use and easily managed through institutional controls.

All of the three above alternative remedies would be more implementable and have fewer short term effects than the proposed remedy while matching the long-term effectiveness and reduction of toxicity, mobility or volume through treatment of the proposed remedy. Hence, the cost of the proposed remedy is not proportional to the effectiveness achieved while the above three alternative remedies meet the requirement of cost-effectiveness in the NCP.
RESPONSE 20: The Morrison Property - Tax Parcel 64.-2-55.2 - is zoned for general manufacturing and industrial distribution, but retains a property use classification as a single family residence - property used for human habitation, in the Tax Records for the Town of Moreau in Saratoga County. This residential use property is occupied by a single dwelling and a few out-buildings. The current or most recent use for this parcel is residential. The anticipated future use for this parcel is residential. The application of the residential SCOs in Part 375 to this parcel are appropriate. The SCO for the residential use property at this site is 1 ppm total PCB.

COMMENT 21: The remediation action objectives (RAOs) in the PRAP are already met under existing conditions and/or can be assured through institutional controls.

The risk assessment concluded that there were no unacceptable human health risks, establishing that this goal is already met. To the extent it is prudent to continue to limit future exposure to surface as well as subsurface soil, institutional controls will effectively meet these goals. Further, the potential risks to biota from the identified contaminants were overstated in the SLERA, which is not intended to be a risk-management decision-making document when selecting a remedy. The assessment included inflated exposure factors (e.g., ingestion rates, bioaccumulation factors), toxicity benchmarks and exposure point concentrations (EPCs).

Finally, the RI data did not indicate any groundwater or surface water impacts.

RESPONSE 21: The Department disagrees. As stated above in Responses 18 and 19, the selected remedy is needed to address site conditions and meet the RAOs.

COMMENT 22: Any of the three alternative remedies discussed above in Comment 20 would meet the threshold criteria pursuant to 6 NYCRR Section 375-1.8.

6 NYCRR Section 375-1.8 (f) (Remedy Selection) sets forth nine factors that the Department considers in selecting a remedy. The first two factors, "overall protectiveness of the public heath and the environment" and "standards, criteria and guidance" (SCGs), are similar to the "threshold criteria" set forth in the NCP. (Threshold criteria are ones a remedy must meet to be eligible for selection.)

With respect to "overall protectiveness of the public health and the environment," as discussed earlier, the HHRA indicates there are no unacceptable risks to humans. In the case of potential ecological risk, a SLERA alone is not the basis upon which risk management decisions should be made in proposing a remedial action.

With respect to "standards, criteria and guidance," the residential and commercial SCOs would be met through either hot spot surface soil removal or installation of a surface cover and institutional controls. In addition, under restored industrial use the 95% UCL on the mean PCB concentration in soil located in Special Area 13 is well below 25 ppm and in fact only 2 of the 268 soil samples exceed this value with a maximum concentration of 30 mg/kg. Thus, the SCOs for human health exposure would be met.

In conclusion, any of the three alternative remedies provides adequate protection of human health and the environment and compliance with SCGs. As such, institutional controls would meet the threshold criteria at significantly less cost than the proposed remedy while achieving the same proportional risk reduction.

RESPONSE 22: The alternatives which do not meet the promulgated SCOs do not pass the threshold evaluation for compliance with SCGs. The applicable SCO, as described above (*see Responses 15 and 20, above*), is 1 ppm total PCB. Use of a soil cover for a residential property to achieve this level does not meet the requirements of 6NYCRR375-1.8(g)(2)(i) since the soil cover represents an engineering control which is not allowable for residential use.

COMMENT 23: Any of the three alternate remedies discussed above in Comment 20 would also satisfy the balancing criteria pursuant to 6 NYCRR Section 375-1.8.

6 NYCRR Section 375-1.8 (f) (Remedy Selection) sets forth the nine factors that the Department considers in selecting a remedy; factors three (3) through nine (9) are similar to the "balancing criteria" set forth in the NCP. The balancing criteria in 6 NYCRR Section 375-1.8 (f) include: long-term effectiveness and permanence; short-term impacts and effectiveness; implementability; reduction in toxicity, mobility or volume through treatment; cost-effectiveness; community acceptance; and land use. (Balancing criteria are considered in weighing the advantages and disadvantages of remedial alternatives that meet the threshold criteria in order to select a preferred remedy for a site).

The soil removal and off-site disposal considered for the uncovered spoils portion of the proposed remedy would not reduce the toxicity, mobility or volume of the materials. Hence, the three alternative remedies would meet this criterion to the same degree as the proposed remedy.

In conclusion, any of the three institutional control remedies would also satisfy the balancing criteria at significantly less cost than the proposed remedy while achieving the same proportional risk reduction. The alternative remedies would also be easier to implement and would have fewer short term impacts.

RESPONSE 23: The Department disagrees. Simply because the selected remedy has a similar reduction in toxicity, mobility, and/or volume as other alternatives does not mean that the other alternatives "satisfy the balancing criteria." The land use criteria would not be satisfied by the soil cover since it would not allow residential use. As described in Response 24 below, NYSDEC believes that an evaluation of overall effectiveness favors the selected alternative. Also see Response 22 above.

COMMENT 24: An alternate remedy that relies on institutional controls would be consistent with 6 NYCRR Part 375-1.8 (a) (5) (i) (ii) (iii) as well as the NCP, which is incorporated by reference in 6 NYCRR Part 375-1.1 (g) (2), while providing a greater degree of overall effectiveness.

Threshold criteria are used to determine whether a specific remedial alternative is eligible to be selected. As demonstrated above, the three alternative remedies would result in the same degree of "overall protectiveness of the public heath and the environment" while meeting "standards, criteria and guidance" as set forth in 6 NYCRR Section 375-1.8(f). Hence, the NYSDEC-proposed remedy offers no proportional benefit with respect to risk reduction or compliance with SCGs.

When evaluating the relative benefits of various remedial alternatives that meet the threshold criteria, the balancing criteria are relied upon to make a selection. When balancing the trade-offs among remedial alternatives, the NCP, which is incorporated by reference in 6 NYCRR Part 375-1.1 (g) (2), compares the costs and overall effectiveness. Overall effectiveness includes long-term effectiveness and permanence, reduction in toxicity, mobility or volume through treatment, and short-term effectiveness. The relationship between overall effectiveness and cost is examined across all alternatives to identify those that provide effectiveness that are proportional to their cost.

As previously stated, the three alternative remedies presented in Comment 20 offer similar benefits in long-term effectiveness and permanence, and reduction in toxicity, mobility or volume through treatment as the proposed remedy. Hence, with respect to these criteria, the overall effectiveness of the proposed remedy is not proportional to the effectiveness that can be achieved via one of the three alternative remedies.

And in the case of short-term impacts and effectiveness, any of the three alternative remedies would have lesser short-term impacts and equal effectiveness as the proposed remedial action.

Any of the three alternative remedies represent a remedy whose overall effectiveness is proportional to its cost given the environmental conditions and current and future Site use.

RESPONSE 24: The Department disagrees. Simply because a remedy has a lower cost does not mean that that remedy is cost effective. The long term effectiveness and permanence of an alternative which leaves behind soils exceeding the promulgated SCOs in a residential setting is significantly lower than an alternative which does not. The higher cost of the selected remedy is offset by the increased long term effectiveness and permanence. Also see Response 22.

COMMENT 25: In its May 8, 2012 letter GE asserts that the company should not be identified as a PRP for this site for various reasons listed in the letter.

RESPONSE 25: The Department and the State take no formal position in this document on comments received regarding the legal liability of any particular party or the applicability of any affirmative defenses to such liability and hereby reserves all rights thereto.

APPENDIX B

ADMINISTRATIVE RECORD

Administrative Record
Special Area 13 Dredge Spoil Disposal Area
Town of Moreau – Saratoga County - New York
Site No. 546041

December 2012

Documents

"Final IIWA Letter Report for the Morrison Property (546046) - Town of Moreau in Saratoga County - 2002 Program" dated July 2012, prepared by Ecology and Environment Engineering.

"Proposed Remedial Action Plan for the Special Area 13 Dredge Spoil Disposal Area - Town of Moreau - Saratoga County - New York - Site No. 546041", dated February 24, 2012, prepared by the Department in consultation with the New York State Department of Health.

"Proposed Remedial Action Plan Fact Sheet and Meeting Announcement for the Special Area 13 Dredge Spoil Disposal Area", dated February 2012, prepared by the Department.

"Feasibility Study for the Special Area 13 Dredge Spoil Disposal Area - Site Number 546041 - Moreau, New York", dated February 2012, prepared for the New York State Department of Environmental Conservation by Ecology and Environment Engineering.

"Remedial Investigation Report for the Special Area 13 Dredge Spoil Disposal Area - Site Number 546041 - Moreau, New York", dated February 2012, prepared for the New York State Department of Environmental Conservation by Ecology and Environment Engineering.

"Final -New York State Registry of Inactive Hazardous Waste Disposal Site Classification Report - New Class 2 Site - Special Area 13 Dredge Spoil Disposal Area - Site ID 546041", dated December 2011, prepared by the Department.

"Final Technical Work Plan for the Remedial Investigation and Feasibility Study at the Special Area 13 Dredge Spoil Disposal Area", dated November 2005, prepared by Ecology and Environment Engineering.

"Revised - Technical Scope of Work for the Remedial Investigation and Feasibility Study at the Special Area 13 Dredge Spoil Disposal Area", dated October 2005, prepared by the Department.

"Technical Scope of Work for the Remedial Investigation and Feasibility Study at the Special Area 13 Dredge Spoil Disposal Area", dated June 2005, prepared by the Department.

"Dredge Spoils Investigation in the Upper Hudson River Valley", Dated July 2001, prepared by the Department.

"Report - Hudson River PCB Project - Dredge Spoil Sites Investigation - Special Area 13 - Buoy 212, Old Moreau - Rogers Island - Site 518 - Buoy 204 Annex - Lock 4 - Lock 1", Volume I, dated December 1992, prepared by Malcolm Pirnie, Incorporated.

"Removal and Encapsulation of PCB-Contaminated Hudson River Bed Materials", dated 1977 - 1979, prepared for the New York State Departments of Transportation and Environmental Conservation by Malcolm Pirnie, Incorporated - includes a paper entitled "Removal and Disposal of PCB-Contaminated River Bed Materials", prepared by Richard Thomas (Malcolm Pirnie, Inc.), Russell Mt. Pleasant (NYSDEC) and Steven Maslansky (Malcolm Pirnie, Inc.), and presented at the 1979 National Conference on Hazardous Material Risk Assessment, Disposal and Management - April 25-27, 1979 - Miami Beach, Florida.

"Migration of PCBs from Landfills and Dredge Spoil Sites in the Hudson River Valley, New York - Final Report", dated November 1978, prepared by Weston Environmental.

Letter dated September 6, 1978 from USEPA Regional Administrator Eckardt Beck to NYSDOT Commissioner William Hennessey - Disposal of PCB Dredge Spoils From the Hudson River - (Approval to Use the Buoy 212 Site and Special Area 13 Along the Hudson River to Dispose of Dredge Spoils Containing PCBs) - (Buoy 212 and Special Area 13 TSCA Authorization Letter).

Letter dated November 29, 1976 from NYSDOT Director of Waterways Maintenance Joseph Stellato to NYSDEC Research Unit's Leo Hetling - Tabulation of Maintenance Dredging Records for the Champlain Canal between Waterford and Fort Edward for 1950 to 1969 inclusive.

Letter dated November 3, 1976 from NYSDOT Director of Waterways Maintenance Joseph Stellato to NYSDEC Research Unit's Leo Hetling - Tabulation of Maintenance Dredging Projects in the Champlain Canal for the period 1970 through 10/1976 inclusive.

"Disposal Area Sampling - Hudson River Sediment Study - Investigation of Conditions Associated with the Removal of the Fort Edward Dam - Fort Edward, New York", dated November 4, 1975, prepared for the New York State Department of Environmental Conservation and Malcolm Pirnie, Incorporated by Mueser, Rutledge, Wentworth and Johnston Consulting Engineers.

Comment Letters

Letter dated May 8, 2012 from John G. Haggard, Executive Director of the Remediation and Hudson Programs for General Electric.

NON-CONFORMANCE SUMMARY

Job#: A05-D983

STL Project#: NY5A9393.3
Site Name: Ecology and Environment NYSDEC Standby

General Comments

The enclosed data may or may not have been reported utilizing data qualifiers (Q) as defined on the Data Comment Page.

Soil, sediment and sludge sample results are reported on "dry weight" basis unless otherwise noted in this data package.

According to 40CFR Part 136.3, pH, Chlorine Residual, Dissolved Oxygen, Sulfite, and Temperature analyses are to be performed immediately after aqueous sample collection. When these parameters are not indicated as field (e.g. pH-Field), they were not analyzed immediately, but as soon as possible after laboratory receipt.

Sample dilutions were performed as indicated on the attached Dilution Log. The rationale for dilution is specified by the 3-digit code and definition.

Sample Receipt Comments

A05-D983
Sample Cooler(s) were received at the following temperature(s); 2.0 °C
All samples were received in good condition.

GC Extractable Data

For Method 8082, one or more of the surrogate Tetrachloro-m-xylene and Decachlorbiphenyl recoveries have percent recoveries outside client control limits, but within laboratory limits. No action required.

For method 8082, the recovery and the relative percent difference for sample NM-MWMPI04-W-0-1205 Matrix Spike Duplicate are outside quality control limits for Aroclor 1016, though the Matrix Spike Blank recoveries are compliant, no action necessary.

Metals Data

The analyte Beryllium was detected in the ICB and severla CCB's at a level above the project established reporting limit. The requested reporting limit for Beryllium is below STL's standard reporting limit and, therefore, no corrective action has been taken for any anomalous detections. It must be noted that results reported below STL's standard reporting limit may result in false positive/false negative results, less accurate quantitation and potential misidentification at the lower concentrations.

The recovery of sample NM-MWMPI04-W-0-1205 Matrix Spike and Matrix Spike Duplicate exhibited results below the quality control limits for Calcium and Iron(MSD). The sample result is more than four times greater than the spike added. The LFB is acceptable.

The recovery of sample NM-MWMPIO4-W-0-1205 Post Spike exhibited results below the quality control limits for Calcium. However, the LFB was acceptable.

The ICSA and ICSAB at 20:51 and 20:55, exhibited results below the quality control limits for Thallium. However the samples were re-analyzed, and therefore not effected. No corrective action is necessary.

Wet Chemistry Data

No deviations from protocol were encountered during the analytical procedures.

****

The results presented in this report relate only to the analytical testing and condition of the sample at receipt. This report pertains to only those samples actually tested. All pages of this report are integral parts of the analytical data. Therefore, this report should be reproduced only in its entirety.

DATA QUALIFIER PAGE

These definitions are provided in the event the data in this report requires the use of one or more of the qualifiers. Not all qualifiers defined below are necessarily used in the accompanying data package.

ORGANIC DATA QUALIFIERS

ND or U	Indicates compound was analyzed for, but not detected.
J	Indicates an estimated value. This flag is used either when estimating a concentration for tentatively identified compounds where a 1:1 response is assumed, or when the data indicates the presence of a compound that meets the identification criteria but the result is less than the sample quantitation limit but greater than zero.
C	This flag applies to pesticide results where the identification has been confirmed by GC/MS.
B	This flag is used when the analyte is found in the associated blank, as well as in the sample.
E	This flag identifies compounds whose concentrations exceed the calibration range of the instrument for that specific analysis.
D	This flag identifies all compounds identified in an analysis at the secondary dilution factor.
N	Indicates presumptive evidence of a compound. This flag is used only for tentatively identified compounds, where the identification is based on the Mass Spectral library search. It is applied to all TIC results.
P	This flag is used for CLP methodology only. For Pesticide/Aroclor target analytes, when a difference for detected concentrations between the two GC columns is greater than 25%, the lower of the two values is reported on the data page and flagged with a "P".
A	This flag indicates that a TIC is a suspected aldol-condensation product.
1	Indicates coelution.
*	Indicates analysis is not within the quality control limits.

INORGANIC DATA QUALIFIERS

ND or U	Indicates element was analyzed for, but not detected. Report with the detection limit value.
J or B	Indicates a value greater than or equal to the instrument detection limit, but less than the quantitation limit.
N	Indicates spike sample recovery is not within the quality control limits.
S	Indicates value determined by the Method of Standard Addition.
E	Indicates a value estimated or not reported due to the presence of interferences.
H	Indicates analytical holding time exceedance. The value obtained should be considered an estimate.
*	Indicates the spike or duplicate analysis is not within the quality control limits.
+	Indicates the correlation coefficient for the Method of Standard Addition is less than 0.995.

NON-CONFORMANCE SUMMARY

Job#: A05-D983

STL Project#: NY5A9393.3
Site Name: Ecology and Environment NYSDEC Standby

General Comments

The enclosed data may or may not have been reported utilizing data qualifiers (Q) as defined on the Data Comment Page.

Soil, sediment and sludge sample results are reported on "dry weight" basis unless otherwise noted in this data package.

According to 40CFR Part 136.3, pH, Chlorine Residual, Dissolved Oxygen, Sulfite, and Temperature analyses are to be performed immediately after aqueous sample collection. When these parameters are not indicated as field (e.g. pH-Field), they were not analyzed immediately, but as soon as possible after laboratory receipt.

Sample dilutions were performed as indicated on the attached Dilution Log. The rationale for dilution is specified by the 3-digit code and definition.

Sample Receipt Comments

A05-D983
Sample Cooler(s) were received at the following temperature(s); 2.0 °C
All samples were received in good condition.

GC Extractable Data

For Method 8082, one or more of the surrogate Tetrachloro-m-xylene and Decachlorbiphenyl recoveries have percent recoveries outside client control limits, but within laboratory limits. No action required.

For method 8082, the recovery and the relative percent difference for sample NM-MWMPI04-W-0-1205 Matrix Spike Duplicate are outside quality control limits for Aroclor 1016, though the Matrix Spike Blank recoveries are compliant, no action necessary.

Metals Data

The analyte Beryllium was detected in the ICB and severla CCB's at a level above the project established reporting limit. The requested reporting limit for Beryllium is below STL's standard reporting limit and, therefore, no corrective action has been taken for any anomalous detections. It must be noted that results reported below STL's standard reporting limit may result in false positive/false negative results, less accurate quantitation and potential misidentification at the lower concentrations.

The recovery of sample NM-MWMPI04-W-0-1205 Matrix Spike and Matrix Spike Duplicate exhibited results below the quality control limits for Calcium and Iron(MSD). The sample result is more than four times greater than the spike added. The LFB is acceptable.

The recovery of sample NM-MWMPIO4-W-0-1205 Post Spike exhibited results below the quality control limits for Calcium. However, the LFB was acceptable.

The ICSA and ICSAB at 20:51 and 20:55, exhibited results below the quality control limits for Thallium. However the samples were re-analyzed, and therefore not effected. No corrective action is necessary.

Wet Chemistry Data

No deviations from protocol were encountered during the analytical procedures.

****

The results presented in this report relate only to the analytical testing and condition of the sample at receipt. This report pertains to only those samples actually tested. All pages of this report are integral parts of the analytical data. Therefore, this report should be reproduced only in its entirety.

Number of Times Calibrated : 303
Description: NEW 7 PT. 1016/1260 CURVE FOR INST #19 11/30/05

Global Sample Information
Default Sample Volume : 1.000 uL
Quantitation Units : ng
Void Time : 0.000 min
Correct amounts during calibration : Yes
Convert unknowns to concentration units : Yes
Reject outliers during calibration : No

An External Standard calibration will be used
Unknown peaks will be quantitated using a response factor of 1.000000e+06
First peak will be relative retention reference

Component Information
TMX
Component Type : Single Peak Component
Retention Time : 1.904 min
Search Window : 3.00 s, 0.00 %
Reference Component :
Find peak closest to expected RT in window
Calibrating Area versus Amount using a 2nd Order Fit
Curve will ignore the origin
Amounts will not be scaled prior to the regression
Weighting factor for the regression: 1
Component standard purity percentage : 100.0000%

Number of Times Calibrated : 277
Description: NEW 7 PT 1016/1260 CURVE FOR INST #19 11/30/05

Global Sample Information
Default Sample Volume : 1.000 uL
Quantitation Units : ng
Void Time : 0.000 min
Correct amounts during calibration : Yes
Convert unknowns to concentration units : Yes
Reject outliers during calibration : No

An External Standard calibration will be used
Unknown peaks will be quantitated using a response factor of 1.000000e+06
First peak will be relative retention reference

NM-MWMPIO6-W-0-1205	A5D98308

Were ICP interelement corrections applied? Yes/No YES

Were ICP background corrections applied? Yes/No YES

If yes-were raw data generated before application of background corrections? Yes/No NO

Comments:

I certify that this data package is in compliance with the terms and conditions of the contract, both technically and for completeness, for other than the conditions detailed above. Release of the data contained in this hardcopy data package and in the computer-readable data submitted on floppy diskette has been authorized by the Laboratory Manager or the Manager's designee, as verified by the following signature.

COMMENTS	JOB NUMBER
WC Reporting Limit < STL Quant Limit	D937, D936
WC Historical confirms within Hold Time	
WC Historical NO confirm & RE outside of HT	
WC Hold Time Exceedance-Dilution required	
WC Hold Time Exceedance-Instrument Failure	
WC Holding Time Exceedance by Date	
WC Holding Time Exceedance by Hours	
WC LCS within ERA limits outside internal	
WC LCS high recovery, sample ND	
WC MBLK hit but samples > 10X blank value	
WC RPD Exceedance for MS / SD	
WC Spike Failure HIGH MS only	
WC Spike Failure LOW MS only	
WC Spike Failure MS and SD	
WC BOD HT met- Oxygen depleted-RE out HT	
WC Carbonate Alkalinity, LCS/MBLK	
WC Reactivity Qualification	
WC TDS/Conductivity ratio outside of range	
WC TOX Breakthrough- no volume for redo	
WC TOX samples were centrifuged	
Other	

DILUTION CODES	REASON
002	Sample matrix effects
003	Excessive foaming
004	High levels of non-target compounds
008	High concentration of target analytes
009	Sample turbidity
010	Sample color
011	Insufficient volume for lower dilution
012	Sample viscosity
013	other

WET CHEMISTRY BATCH SUMMARY

PARAMETER Hardness METHOD 130.2 BATCH A5B19226

COMMENTS	JOB NUMBER
WC Reporting Limit < STL Quant Limit	
WC Historical confirms within Hold Time	D79408
WC Historical NO confirm & RE outside of HT	
WC Hold Time Exceedance-Dilution required	
WC Hold Time Exceedance-Instrument Failure	
WC Holding Time Exceedance by Date	
WC Holding Time Exceedance by Hours	
WC LCS within ERA limits outside internal	
WC LCS high recovery, sample ND	
WC MBLK hit but samples > 10X blank value	
WC RPD Exceedance for MS / SD	
WC Spike Failure HIGH MS only	
WC Spike Failure LOW MS only	
WC Spike Failure MS and SD	
WC BOD HT met- Oxygen depleted-RE out HT	
WC Carbonate Alkalinity, LCS/MBLK	
WC Reactivity Qualification	
WC TDS/Conductivity ratio outside of range	
WC TOX Breakthrough- no volume for redo	
WC TOX samples were centrifuged	
Other	

DILUTION CODES	REASON
002	Sample matrix effects
003	Excessive foaming
004	High levels of non-target compounds
008	High concentration of target analytes
009	Sample turbidity
010	Sample color
011	Insufficient volume for lower dilution
012	Sample viscosity
013	other

ICAL Compliant?	YES	NO	(NA)	IF NO, Why?
LCS/CCV Compliant?	(YES)	NO	NA	IF NO, Why?
CCB Compliant?	(YES)	NO	NA	IF NO, Why?
RPD Compliant?	(YES)	NO	NA	IF NO, Why?
ERA Compliant?	YES	NO	(NA)	IF NO, Why?

WET CHEMISTRY BATCH SUMMARY

PARAMETER TSS METHOD 160.2 BATCH A5B19169

COMMENTS	JOB NUMBER
WC Reporting Limit < STL Quant Limit	D937
WC Historical confirms within Hold Time	D870, D873
WC Historical NO confirm & RE outside of HT	
WC Hold Time Exceedance-Dilution required	
WC Hold Time Exceedance-Instrument Failure	
WC Holding Time Exceedance by Date	
WC Holding Time Exceedance by Hours	
WC LCS within ERA limits outside internal	
WC LCS high recovery, sample ND	
WC MBLK hit but samples > 10X blank value	
WC RPD Exceedance for MS / SD	
WC Spike Failure HIGH MS only	
WC Spike Failure LOW MS only	
WC Spike Failure MS and SD	
WC BOD HT met- Oxygen depleted-RE out HT	
WC Carbonate Alkalinity, LCS/MBLK	
WC Reactivity Qualification	
WC TDS/Conductivity ratio outside of range	
WC TOX Breakthrough- no volume for redo	
WC TOX samples were centrifuged	
Other	

DILUTION CODES	REASON
002	Sample matrix effects
003	Excessive foaming
004	High levels of non-target compounds
008	High concentration of target analytes
009	Sample turbidity
010	Sample color
011	Insufficient volume for lower dilution
012	Sample viscosity
013	other

ICAL Compliant?	YES	NO	(NA)	IF NO, Why?

NON-CONFORMANCE SUMMARY

Job#: A05-D985

STL Project#: NY5A9393.3
Site Name: Ecology and Environment NYSDEC Standby

General Comments

The enclosed data may or may not have been reported utilizing data qualifiers (Q) as defined on the Data Comment Page.

Soil, sediment and sludge sample results are reported on "dry weight" basis unless otherwise noted in this data package.

According to 40CFR Part 136.3, pH, Chlorine Residual, Dissolved Oxygen, Sulfite, and Temperature analyses are to be performed immediately after aqueous sample collection. When these parameters are not indicated as field (e.g. pH-Field), they were not analyzed immediately, but as soon as possible after laboratory receipt.

Sample dilutions were performed as indicated on the attached Dilution Log. The rationale for dilution is specified by the 3-digit code and definition.

Sample Receipt Comments

A05-D985
Sample Cooler(s) were received at the following temperature(s); 4@2.0 °C
All samples were received in good condition.

GC Extractable Data

For Method 8082, samples NM-MW05-W-0-1205, NM-MW06-W-0-1205, the Method Blank and Matrix Spike Blank had Decachlorbiphenyl surrogate recoveries below project control limits, but within laboratory limits. Tetrachloro-m-xylene recoveries were acceptable.

Metals Data

The analyte Beryllium was detected in the Method Blank and several CCB's at a level above the project established reporting limit. The requested reporting limit for Beryllium is below STL's standard reporting limit and, therefore, no corrective action has been taken for any anomalous detections. It must be noted that results reported below STL's standard reporting limit may result in false positive/false negative results, less accurate quantitation and potential misidentification at the lower concentrations.

****

The results presented in this report relate only to the analytical testing and condition of the sample at receipt. This report pertains to only those samples actually tested. All pages of this report are integral parts of the analytical data. Therefore, this report should be reproduced only in its entirety.

STL

DATA QUALIFIER PAGE

These definitions are provided in the event the data in this report requires the use of one or more of the qualifiers. Not all qualifiers defined below are necessarily used in the accompanying data package.

ORGANIC DATA QUALIFIERS

ND or U	Indicates compound was analyzed for, but not detected.
J	Indicates an estimated value. This flag is used either when estimating a concentration for tentatively identified compounds where a 1:1 response is assumed, or when the data indicates the presence of a compound that meets the identification criteria but the result is less than the sample quantitation limit but greater than zero.
C	This flag applies to pesticide results where the identification has been confirmed by GC/MS.
B	This flag is used when the analyte is found in the associated blank, as well as in the sample.
E	This flag identifies compounds whose concentrations exceed the calibration range of the instrument for that specific analysis.
D	This flag identifies all compounds identified in an analysis at the secondary dilution factor.
N	Indicates presumptive evidence of a compound. This flag is used only for tentatively identified compounds, where the identification is based on the Mass Spectral library search. It is applied to all TIC results.
P	This flag is used for CLP methodology only. For Pesticide/Aroclor target analytes, when a difference for detected concentrations between the two GC columns is greater than 25%, the lower of the two values is reported on the data page and flagged with a "P".
A	This flag indicates that a TIC is a suspected aldol-condensation product.
1	Indicates coelution.
*	Indicates analysis is not within the quality control limits.

INORGANIC DATA QUALIFIERS

ND or U	Indicates element was analyzed for, but not detected. Report with the detection limit value.
J or B	Indicates a value greater than or equal to the instrument detection limit, but less than the quantitation limit.
N	Indicates spike sample recovery is not within the quality control limits.
S	Indicates value determined by the Method of Standard Addition.
E	Indicates a value estimated or not reported due to the presence of interferences.
H	Indicates analytical holding time exceedance. The value obtained should be considered an estimate.
*	Indicates the spike or duplicate analysis is not within the quality control limits.
+	Indicates the correlation coefficient for the Method of Standard Addition is less than 0.995.

NON-CONFORMANCE SUMMARY

Job#: A05-D985

STL Project#: NY5A9393.3
Site Name: Ecology and Environment NYSDEC Standby

General Comments

The enclosed data may or may not have been reported utilizing data qualifiers (Q) as defined on the Data Comment Page.

Soil, sediment and sludge sample results are reported on "dry weight" basis unless otherwise noted in this data package.

According to 40CFR Part 136.3, pH, Chlorine Residual, Dissolved Oxygen, Sulfite, and Temperature analyses are to be performed immediately after aqueous sample collection. When these parameters are not indicated as field (e.g. pH-Field), they were not analyzed immediately, but as soon as possible after laboratory receipt.

Sample dilutions were performed as indicated on the attached Dilution Log. The rationale for dilution is specified by the 3-digit code and definition.

Sample Receipt Comments

A05-D985
Sample Cooler(s) were received at the following temperature(s); 4@2.0 °C
All samples were received in good condition.

GC Extractable Data

For Method 8082, samples NM-MW05-W-0-1205, NM-MW06-W-0-1205, the Method Blank and Matrix Spike Blank had Decachlorbiphenyl surrogate recoveries below project control limits, but within laboratory limits. Tetrachloro-m-xylene recoveries were acceptable.

Metals Data

The analyte Beryllium was detected in the Method Blank and several CCB's at a level above the project established reporting limit. The requested reporting limit for Beryllium is below STL's standard reporting limit and, therefore, no corrective action has been taken for any anomalous detections. It must be noted that results reported below STL's standard reporting limit may result in false positive/false negative results, less accurate quantitation and potential misidentification at the lower concentrations.

****

The results presented in this report relate only to the analytical testing and condition of the sample at receipt. This report pertains to only those samples actually tested. All pages of this report are integral parts of the analytical data. Therefore, this report should be reproduced only in its entirety.

Number of Times Edited : 8
Number of Times Calibrated : 277
Description: NEW 7 PT 1016/1260 CURVE FOR INST #19 11/30/05

Global Sample Information
Default Sample Volume : 1.000 uL
Quantitation Units : ng
Void Time : 0.000 min
Correct amounts during calibration : Yes
Convert unknowns to concentration units : Yes
Reject outliers during calibration : No

An External Standard calibration will be used
Unknown peaks will be quantitated using a response factor of 1.000000e+06
First peak will be relative retention reference

Processed by: GRD 12/1/05
Reviewed by: DEC 1 2005

Component Information
TMX
Component Type : Single Peak Component
Retention Time : 1.598 min
Search Window : 3.00 s, 0.00 %
Reference Component :
Find peak closest to expected RT in window
Calibrating Area versus Amount using a 2nd Order Fit
Curve will ignore the origin
Amounts will not be scaled prior to the regression
Weighting factor for the regression: 1
Component standard purity percentage : 100.0000%

Description: NEW 7 PT. 1016/1260 CURVE FOR INST #19 11/30/05

Global Sample Information
Default Sample Volume : 1.000 uL
Quantitation Units : ng
Void Time : 0.000 min
Correct amounts during calibration : Yes
Convert unknowns to concentration units : Yes
Reject outliers during calibration : No

An External Standard calibration will be used
Unknown peaks will be quantitated using a response factor of 1.000000e+06
First peak will be relative retention reference

Component Information
TMX
Component Type : Single Peak Component
Retention Time : 1.904 min
Search Window : 3.00 s, 0.00 %
Reference Component :
Find peak closest to expected RT in window
Calibrating Area versus Amount using a 2nd Order Fit
Curve will ignore the origin
Amounts will not be scaled prior to the regression
Weighting factor for the regression: 1
Component standard purity percentage : 100.0000%

COVER PAGE - INORGANIC ANALYSIS DATA PACKAGE

Contract: NY04-571 SDG No.: A05-D985

Lab Code: STLBFLO Case No.: SAS No.:

SOW No.:

Sample ID.	Lab Sample No.
NM-MW02-W-0-1205	A5D98501
NM-MW03-W-0-1205	A5D98502
NM-MW04-W-0-1205	A5D98503
NM-MW04-W-0-1205\MS	A5D98503MS
NM-MW04-W-0-1205\SD	A5D98503SD
NM-MW05-W-0-1205	A5D98504
NM-MW06-W-0-1205	A5D98505

Were ICP interelement corrections applied? Yes/No YES

Were ICP background corrections applied? Yes/No YES

If yes-were raw data generated before application of background corrections? Yes/No NO

Comments:

I certify that this data package is in compliance with the terms and conditions of the contract, both technically and for completeness, for other than the conditions detailed above. Release of the data contained in this hardcopy data package and in the computer-readable data submitted on floppy diskette has been authorized by the Laboratory Manager or the Manager's designee, as verified by the following signature.

Signature: Tony Bogolin Name: Tony Bogolin

Date: 12/30/05 Title: Project Manager
