**Subject: Addendum A to August 2015 Site Investigation Results and Target Removal Report;  
BASF Corporation Glens Falls, New York Property**

Dear Mr. Jankauskas:

On behalf of BASF Corporation (BASF), AMO Environmental Decisions (AMO) is pleased to submit the following information for your review and files. Our submission is considered *Addendum A to the August 17, 2015 Site Investigation Results and Target Removal Report*, which is prepared in reply to New York Department of Environmental Conservation (NYSDEC) comments of September 10, 2015. NYSDEC provided two comments: 1) request for certification of the August 2015 report pursuant to DER-10 §1.5; and 2) request for description of conditions observed regarding post-excavation conditions.

1. I, John M. Ash, certify that I am currently a Qualified Environmental Professional as defined in 6 NYCRR Part 375 (I have 30 years of relevant professional experience, I am a licensed Professional Geologist (multiple states), and I am a Licensed Site Remediation Professional in the State of New Jersey) and that this Report (*August 17, 2015 Site Investigation Results and Target Removal Report*, including this addendum) was prepared in accordance with all applicable statutes and regulations and in substantial conformance with the DER Technical Guidance for Site Investigation and Remediation (DER-10) and that all activities were performed in full accordance with the DER-approved work plan of April 23, 2014.
2. Soil was excavated from the locations (N002, P004, and P005) between July 15 and 17, 2014 (see Section 3.0 of subject report). Soil lithology in the N002 excavation consisted predominantly of brown silt and fine sand; soil lithology in the P004 excavation consisted predominantly of gray-brown clay with little fine sand; and soil lithology in the P005 excavation consisted predominantly of gray-brown fine to medium sand with little silt. Groundwater was not encountered in any of the excavations. No visual, odoriferous, or other indications of contaminated conditions were observed. Photographs were not collected at the time of excavation(s).

Thank you for your comments. Please feel free to call Steve Havlik (973-245-5271) or me (215-230-8282) if you have any questions regarding this addendum to our report.

Respectfully,

*AMO Environmental Decisions*

**Subject: Site Investigation Results and Target Removal Report; BASF Corporation  
Glens Falls, New York Property**

Dear Mr. Jankauskas:

On behalf of BASF Corporation (BASF), AMO Environmental Decisions (AMO) is pleased to submit the subject report for your review and files.

BASF directed a statistically-based soil investigation of the North Lot and Pre-Treatment Plant (PTP) Parcel in 2013. Investigative results identified one location at the North Lot where a cadmium level exceeded its NYSDEC Commercial *Soil Cleanup Objective* (SCO); and two locations at the PTP Parcel where cadmium or barium, cadmium, lead, and mercury levels exceeded their respective Commercial SCOs. These locations were delineated horizontally and vertically to the most stringent NYSDEC Commercial and Industrial SCOs prior to excavation and removal of soil. AMO oversaw removal of approximately 83 yards<sup>3</sup> of soil from the isolated, pre-defined areas in July 2014.

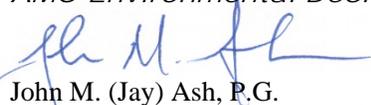

A community air monitoring program was implemented to protect workers and potential downwind receptors from unnecessary exposure associated with dust that might have occurred during the target removals. Related action limits were never reached and no unacceptable risks were identified during this work.

AMO's investigative work was conducted for purposes of assessing soil conditions relative to potential redeployment options BASF might consider for certain parcels of the subject property in the future. Our work scope was not designed to meet requirements of, or fall under the purview of, NYSDEC's *Hazardous Waste Management (HWM) Permit* for the site. However, related findings might be of value if/when conditions might favor divestiture of some parcels from the HWM Permit.

Please feel free to call Steve Havlik (973-245-5271) or me (215-230-8282) if you have any questions regarding this work.

Respectfully,

*AMO Environmental Decisions*

## **1.0 INTRODUCTION:**

### **1.1 Site Description & Background**

BASF Corporation's (BASF's) Glens Falls site is located in the Town of Queensbury, immediately east of the City of Glens Falls, Warren County, New York (Figure 1-1). The site is comprised of approximately 65.6 acres, based on geographic information system (GIS) mapping, and includes eight parcels: the Main Plant Site (~44.1 acres); North Lot (~3.1 acres); the Pretreatment Plant (~5.6 acres, PTP); PTP-East Lot (0.4 acres); East Area (~7.6 acres); Far-East Lot (~2.2 acres), Sliver Quarry (~2.4 acres); and the former Storm-Water Impoundment Basin (~1.0 acre, SWIB) (Figure 1-2).

Industrial activity began at the site in the late 1800s. All manufacturing operations occurred on the Main Plant Site. The original company was American Wallpaper, but the name was soon changed to Imperial Wallpaper. Wallpaper was manufactured, at that time, from purchased paper stock and pigments. In 1907, the company began developing inorganic pigments and formed Imperial Color Works, Inc. to expand manufacture and sale of a wide range of colored pigments. By the early 1920s, manufacture of organic pigments began. During World War II, the plant expanded to produce zinc chromate, chromium oxide and magnesium powders. Chromate ore was also processed on-site to extract the metals needed for the manufacturing operations. Ore tailings were deposited on-site as fill material.

Hercules, Inc. purchased Imperial Color Works, Inc. in 1960 and operated the Site until 1979 when they sold the pigment business, including the Main Plant Site, to Ciba-Geigy Corporation. Ciba-Geigy operated the site until February 1989, at which time production was stopped. The facility was decommissioned and demolished as an interim corrective measure between 1989 and 1991. Most of the contaminated building debris was disposed of in an off-site secure landfill. Uncontaminated organic materials were disposed of in an off-site solid waste landfill. Crushed building rubble was spread around the Main Plant Site with the building foundations remaining.

Environmental work at the site has been performed under the Resource Conservation and Recovery Act (RCRA) Program. However, the New York State Department of Environmental Conservation (NYSDEC) is the lead oversight agency. RCRA post-closure permits were issued by both NYSDEC (Hazardous Waste Management [HWM] Permit) and the U.S. Environmental Protection Agency (USEPA) (Hazardous and Solid Waste Amendments [HSWA] Permit). USEPA's HSWA Permit expired and was not required to be renewed. The RCRA HWM Permit was reissued in March 2015.

### **1.2 Scope of Recent Work**

AMO Environmental Decisions, Inc. (AMO) was retained by BASF in early 2012 to assess parcels generally north of Lower Warren Street and the Main Plant Site. For descriptive purposes, BASF/AMO refer to the North Lot and PTP Parcel, among other lots, as "upland parcels". Based on location, history, and recent work, the upland parcels appear to offer better possibility (than the remaining parcels) for near-term beneficial reuse.

The scope of BASF's recent work included assessment of background data, investigation of select parcels, and targeted removals of soil from the North Lot and PTP Parcel. These tasks are summarized below. Details pertaining to the North Lot and PTP Parcel are provided in the following sections.

**Parcels Investigation:** Statistically-based, systematic-random soil investigation plans were implemented in the Sliver Quarry, North Lot, PTP Parcel, and East Area during March and April 2013. The investigations considered historical knowledge regarding site history and chemicals/constituents of concern (COCs). The work was performed to support unbiased, parcel-wide assessment of each parcel.

Further details regarding this task as it pertained to the North Lot and PTP Parcel are given in Section 2.0.

**Target Removals:** Statistically-based sample results for North Lot and PTP Parcel soil identified isolated locations where target cleanup standards were exceeded. Excavation and removal of soil from these target locations enabled conclusions with respect to remaining soil quality and options regarding reuse of the parcels.

Further details regarding this task are given in Section 3.0.

### **1.3 Purpose of Recent Work**

AMO's investigative work was conducted for purposes of assessing soil conditions relative to potential redeployment options BASF might consider for certain parcels of the site in the future. Investigative results were compared to NYSDEC *Industrial and Commercial Soil Cleanup Objectives* (SCOs) to meet this request. As such, the work scope was not designed to meet requirements of, or fall under the purview of, NYSDEC's HWM Permit. However, related findings might be of value if/when conditions might favor divestiture of some parcels from the HWM Permit.

## **2.0 PARCELS INVESTIGATION**

The HWM Permit (reissued/effective March 6, 2015) details completion of corrective measures and continuing post-remedial obligations. No further action (NFA) is required by the permit regarding soil in the North Lot, PTP Parcel, and East Area. Groundwater monitoring remains a requirement in the PTP Parcel.

Interest in the potential for beneficial reuse of the upland parcels has grown over recent months. Private parties as well as the Town of Queensbury have expressed such interest. As outlined below, BASF assessed the North Lot and PTP Parcel through review of previous investigations and implementation of its own statistically-based investigation.

Focused soil sampling/assessment programs were performed in the North Lot and PTP Parcel, between the late 1990s and early 2000s. Soil was removed from isolated areas of the North Lot and PTP Parcel and placed beneath the RCRA cap in the northwest portion of the Main Plant Site as part of NYSDEC-directed corrective measures. Related investigation/corrective action documents, and the HWM Permit, indicate these tracts of land meet NYSDEC *Industrial Soil Cleanup Objectives* (SCOs, 6 NYCRR Part 375, Subpart 375-6).

BASF directed a statistically-based soil sampling program in the upland parcels in March and April 2013. The upland parcels assessment was completed to evaluate site conditions relative to potential exposure risks as determined by comparison to numerical risk-based standards and statistical analysis. The findings were compared with NYSDEC *Industrial* and *Commercial* SCOs.

The statistically-based program was designed based upon review of readily available background information, data pulled from pre-design investigation activities at the Main Plant Site, and consultation with Ashland. These data were used to develop a targeted analyte list for the 2013 investigation (Table 2-1), which included targeted volatile organic compounds (VOCs), targeted semi-volatile organic compounds (SVOCs), targeted metals, polychlorinated biphenyls (PCBs), and cyanide.

### **2.1 Scope of Work**

A total of 27 random soil samples were collected from the North Lot and PTP Parcel. These soil samples included ten soil samples collected from the North Lot and seventeen soil samples collected from the PTP Parcel. The sample locations were determined, without bias, through sampling grids having random origins and random orientations.

Each 2013 sample location was investigated to a depth of approximately three feet below ground surface (bgs) using direct-push drilling methods. Sample selection was biased based on: indications of potential contamination; the 6-inch interval above the zone judged to be least permeable; or the 1.5 to 2.0-foot bgs default interval. The default interval was sampled in each instance due to no indications of potential contamination and limiting zones not being found.

The investigation was designed to utilize compositing and reduced laboratory reporting limits (RLs). The methodology optimized analytical work by requiring the laboratory to maintain RLs that were one half the corresponding most stringent NYSDEC Commercial or Industrial SCOs for each analyte. The procedure involved collection of individual grab samples, which were preserved, handled, and submitted to the laboratory using standard chain of custody procedures. Each sample (or aliquot) was extracted by the laboratory, which then composited the extractions of two aliquots according to AMO's instructions (given on accompanying chains of custody). One composite sample was therefore created from two aliquots.

The compositing program was applied to all analytical fractions except VOCs. Each soil sample was analyzed directly for VOCs because: a) due to use of Encore devices, volatilization (contaminant loss) could occur during the extraction/compositing procedure; and b) it was unlikely the laboratory could achieve RLs equal to one half the most stringent Commercial/Industrial SCOs.

Analytical results for a composite sample that met or were less than reduced RLs also met applicable SCOs for individual aliquots associated with that composite. Conversely, if a composite sample result failed to meet the one-half-SCO criterion, the two correlating aliquot samples were taken off hold and run for individual analyses.

The three highest reported chromium aliquot results were analyzed for hexavalent chromium. Hexavalent chromium was not detected in the three soil samples. Therefore, chromium soil results were compared to trivalent NYSDEC SCOs.

## **2.2 Summary of Results**

Table 2-2 and Figure 2-1 summarize the scope and results of the statistically-based sampling program for the two parcels. Laboratory data is provided in Appendix A. The following assesses known soil conditions beneath the North Lot and PTP Parcel relative to NYSDEC Industrial and Commercial (or non-residential) SCOs. NYSDEC SCOs consider dermal contact, inhalation, and ingestion pathways. The SCOs are based on NYDEC's assessment of risk relative to a  $10^{-6}$  *Risk Factor* for carcinogens and a *Hazard Index* of 1 for non-carcinogens. Primary constituents of concern (COCs) in soil were found to be metals (cadmium and mercury).

Potential exposure risks associated with soil COCs and future users of the site are currently controlled through institutional and engineering controls. A *Deed Notice* has been established to address these concerns. Fencing is the engineering control for the upland parcels.

### ***North Lot***

The statistically-based sampling grid for the North Lot was constructed with approximate 117-foot centered node spacing. A total of 10 systematic random soil samples were collected from the parcel. Only cadmium exceeded its Commercial SCO (9.3 mg/kg) at one North Lot location (N002, Figure 2-1). Targeted removal, with confirmatory sampling/analysis, was chosen as the remedial action for this parcel.

### ***Pre-Treatment Plant Parcel***

The statistically-based sampling grid for the PTP Parcel was constructed with approximate 117-foot centered node spacing. A total of 17 random soil samples were collected from the parcel. Cadmium (76 mg/kg) and mercury (7.2 mg/kg) exceeded their respective Industrial SCOs (60 and 5.7 mg/kg) at one PTP Parcel location (P005, Figure 2-1). Barium (1,200 mg/kg), cadmium (13 and 76 mg/kg), lead (1,600 mg/kg), and/or mercury (7.2 mg/kg) exceeded their respective *Commercial* SCOs (400, 9.3, 1,000, and 2.8 mg/kg) at two PTP Parcel locations (P004 and P005, Figure 2-1). Targeted removal, with confirmatory sampling/analysis, was chosen as the remedial action for this parcel.

### **3.0 TARGETED REMOVALS**

#### **3.1 Pre-Removal Delineation Sampling & Analysis**

Investigative results presented in Section 2.0 identified cadmium as the COC targeted for removal in the North Lot (N002). Cadmium, barium, lead, and/or mercury were the targeted COCs in the PTP Parcel (P004 and P005). To minimize the number of mobilizations and optimize remedial efforts, these target removal areas were predefined through remediation-confirmation soil sampling/analysis tasks in November 2013. The pre-removal, remediation-confirmation tasks consisted of collecting samples to define horizontal and vertical limits of non-residential (Commercial/Industrial) SCO exceedances at the respective locations.

A series of step-out soil samples were collected for laboratory analyses from locations north, south, east, west, and below each soil exceedance location driving the target removals. Figure 3-1 and Table 3-1 summarize analytical results that confirm completion of this pre-removal delineation effort. Pre-removal confirmation of remediation within each area was based on four horizontal sample results (excavation sidewalls) one vertical sample result (excavation bottom) meeting NYSDEC Commercial/Industrial SCOs. Appendix B provides the laboratory data package for this work.

The pre-removal soil delineation program resulted in defining limits of excavation in each parcel. The North Lot target removal area (N002) covered an approximate 10 x 10-foot (100-foot<sup>2</sup>) area to a depth of 3-feet below ground surface (bgs). The P004 PTP Parcel removal area covered an approximate 15 x 25-foot (375-foot<sup>2</sup>) area to a depth of 4-feet bgs. The P005 PTP Parcel removal area covered an approximate 10 x 15-foot (150-foot<sup>2</sup>) area to a depth of 3-feet bgs.

#### **3.2 Community Air Monitoring**

North Lot and PTP Parcel soil removal tasks considered applicable portions of *6NYCRR Part 375* and New York State Department of Environmental Conservation's (NYSDEC's) *Technical Guidance for Site Investigation and Remediation* (DER-10). The *Community Air Monitoring Plan* (CAMP) was prepared based on Section 1.9 of DER-10, and designed to protect the public, living and working near the work area(s), from exposure to site contaminants prior to and during intrusive activities.

Investigations used to define the target removal areas considered site related constituents of concern (COCs) identified through several phases of earlier investigation. Metals were the only COCs detected at levels above NYSDEC Commercial SCOs in the target areas. The CAMP therefore included appropriate measures for fugitive dust and particulate monitoring as described in Appendix 1B of DER-10. Cadmium had the lowest *Permissible Exposure Limit* (PEL) of the metal detections above the NYSDEC SCOs (5 micrograms/m<sup>3</sup>).

During excavation and soil load out activities, particulate level was continuously monitored using real-time monitoring equipment capable of measuring particulate matter less than 10 micrometers in size (PM-10) and capable of integrating over a period of 15 minutes. The monitor was equipped with an audible alarm set to indicate an exceedance of the 5 micrograms/m<sup>3</sup> action limit.

Monitoring occurred in each work zone to evaluate potential worker exposure. Due to the small aerial extent of disturbance and short time frame each location would be exposed, one particulate monitor was used within

the work area at a height of approximately five feet above the ground surface (average height of a worker's nose and mouth) and immediately downwind of the excavation operation.

Results of CAMP station monitoring are provided in Appendix C. The 15-minute average work-zone exposure/action limit (5 micrograms/m<sup>3</sup> above upwind/background readings) was never reached during the work.

### **3.3 Excavation & Off-Site Disposal**

Remedial excavation activities the North Lot and PTP Parcel were performed by Land Remediation, Inc. of Averill Park, New York between July 15 and 17, 2014. As presented above and in Figure 3-1, target removal in the North Lot (N002) encompassed an approximate 100-foot<sup>2</sup> by 3-foot deep area; and target removal in the PTP Parcel encompassed an approximate 375-foot<sup>2</sup> by 4-foot deep area at location P004, and 150-foot<sup>2</sup> by 3-foot deep area at location P005.

A total of approximately 83 yards<sup>3</sup> of soil were removed from locations N002, P004, and P005 between July 15 and 16, 2014. Excavated soil was direct-loaded into an off-road Marooka dump truck, which transported the soil to a secure staging area. The staging area was a paved surface, covered by 6-mil poly, within the grounds of the PTP Parcel. The soil was covered by plastic during the nights of July 15 and 16.

All soil was direct-loaded for shipment from the PTP Parcel staging area to Casella's Clinton County Landfill (Permit #5-0946-00049/00005 – 286 Sand Road, Morrisonville, New York) on July 17, 2014. The soil was pre-approved by Casella based on analytical results for waste characterization sampling conducted within the target locations in December 2013. The samples were biased to vertical and horizontal locations that exhibited the highest concentrations of targeted parameters during previous investigations in each area. Three samples (one from each area) were composited and submitted for analysis of waste characterization parameters required by Casella's operating permit. Appendix D provides a copy of the waste characterization laboratory report and BASF's disposal application. Copies of the bills of lading are provided in Appendix E.

### **3.4 Site Restoration**

Following removal of soil from the targeted removal areas, virgin quarry-derived material\* was placed in each excavation and mechanically compacted in 1-foot lifts using the bucket of excavation equipment. Final restoration was accomplished by tracking over the backfilled areas until the backfilled surface visually met the elevation of the surrounding land. A copy of the clean fill certification is provided in Appendix F.

*\*Note: Material used as fill in the subject areas meets the requirements established in 6NYCRR Part 375-6.7(d) and Section 5.4 of DER-10. It consisted of virgin sand from Constantine Construction & Farm Incorporated's Halfmoon Pit (Mine Permit ID 50383; NYSDEC ID 5-4154-00034; NYSDOT Source Number 1-149F). As of September 24, 2013, this location was listed on the New York State Department of Transportation's Approved List Sources of Fine & Course Aggregates. A web search of NYSDEC's Mine Inspection Records found the Halfmoon Pit was last inspected on July 11, 2013 by Katherine Smith of the Mined Land staff; No violations were noted.*

#### **4.0 SUMMARY & CONCLUSIONS**

BASF directed a statistically-based soil investigation of the North Lot and PTP Parcel in 2013. The investigation included collection of 10 soil samples from the North Lot and 17 soil samples from the PTP Parcel. Investigative results identified one location (N002) at the North Lot where a cadmium level exceeded its NYSDEC Commercial SCO; and two locations at the PTP Parcel where cadmium (P004), and barium, cadmium, lead, and mercury (P005) levels exceeded their respective Commercial SCOs. Cadmium and mercury levels also exceeded their respective Industrial SCOs at location P005.

The above exceedance locations were delineated horizontally and vertically to the most stringent NYSDEC Commercial/Industrial SCOs prior to excavation and removal of soil. AMO oversaw removal of the isolated exceedances in July 2014. Approximately 83 yards<sup>3</sup> of soil was excavated and properly disposed off-site at Casella's Clinton County Landfill. Quarry-derived, virgin fill material was placed in each excavation in 1-foot lifts and mechanically compacted using the bucket of excavation equipment. Final restoration was accomplished by tracking over the backfilled areas until the backfilled surface visually met the elevation of the surrounding land.

A community air monitoring program was implemented to protect workers and potential downwind receptors from unnecessary exposure associated with dust that might have occurred during the target removals. Related action limits were never reached and no unacceptable risks were identified during this work.

**TABLE 2-1  
Targeted Analyte List**

Fraction	Parameter	Applicable Parcel
VOC	1,2-Dichlorobenzene	All Parcels

Explanation:

- TOS - Top of sample depth
- S\_Date - Sample Date
- U - Parameter not detected at a concentration greater than the laboratory detection limit.
- J - Estimated value
- NE - NYSDEC Soil Cleanup Objective Not Established
- Bold** - Exceedance of SCO/Target
- Concentrations are in milligrams per kilogram

COMM SCO/Target - NYSDEC Commercial Soil Cleanup Objective or Target Soil Cleanup Objective. Target Soil Cleanup Objectives were used for composite sample evaluation and are the COMM SCO divided by the number of aliquots used for the composite sample. All composite samples were comprised of two aliquots. Therefore, the COMM Target for composite sample results was the COMM SCO divided in half. If the composite result exceeded its COMM Target, each of the correlating aliquots was analyzed.

IND SCO/Target - NYSDEC Industrial Soil Cleanup Objective or Target Soil Cleanup Objective. Target Soil Cleanup Objectives were used for composite sample evaluation and are the IND SCO divided by the number of aliquots used for the composite sample. All composite samples were comprised of two aliquots. Therefore, the IND Target for composite sample results was the IND SCO divided in half. If the composite result exceeded its IND Target, each of the correlating aliquots was analyzed.

- Chromium composite samples were compared to hexavalent chromium Target COMM and IND SCOs as a conservative evaluation of the data.
- If chromium composite results exceeded one half hexavalent chromium COMM of IND SCOs, aliquotes were analyzed. The three highest chromium aliquote analytical results were analyzed for hexavalent chromium. Hexavalent chromium was not detected in the three samples. Therefore, the aliquote chromium results were compared to trivalent chromium COMM and IND SCOs.

Explanation:

TOS - Top of sample (feet below ground surface)

**Bold** - Exceedance of SCO

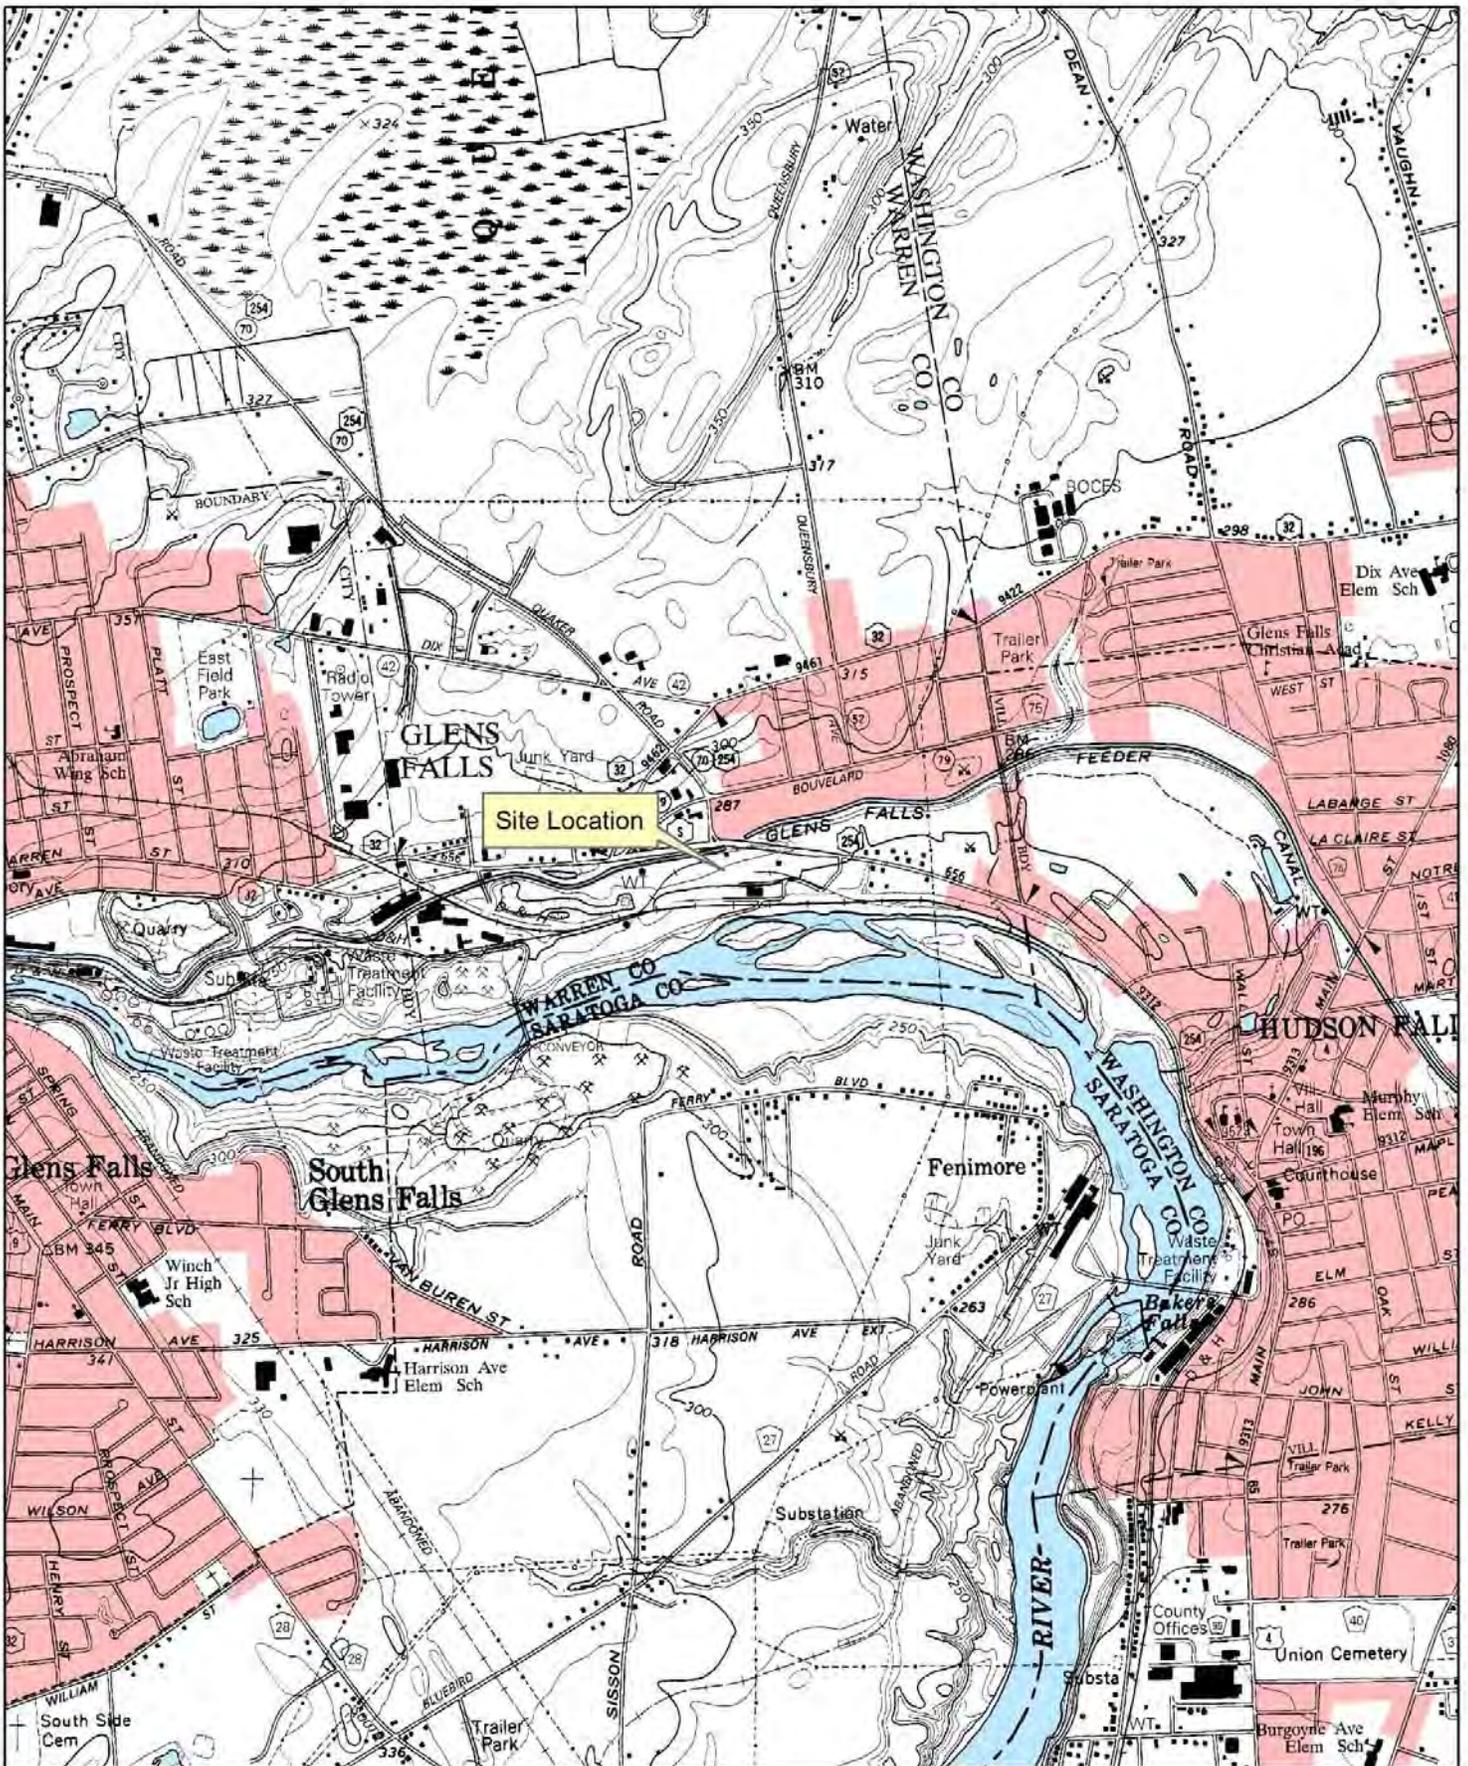

U - Parameter not detected at a concentration greater than the laboratory detection limit.

J - Estimated value

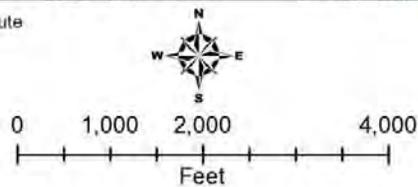

COMM - NYSDEC Commercial Soil Cleanup Objective

IND - NYSDEC Industrial Soil Cleanup Objective

- Concentrations are in milligrams per kilogram
