## 2015 Annual Basewide Monitoring Report

Installation Restoration Program  
Fort Drum, New York

### 1. Introduction

The PIKA - MP JV, LLC<sup>1</sup> (hereinafter referred to as the JV) has prepared this Basewide Monitoring Report on behalf of the Baltimore District of the US Army Corps of Engineers (USACE) for the Installation Restoration Program (IRP) Basewide Monitoring Program at the Fort Drum Military Installation (Fort Drum), New York. Long-term monitoring is being conducted under a New York State Department of Environmental Conservation (NYSDEC) Order on Consent and Administrative Settlement (Index No. A6-0797-12-10). In accordance with the Basewide Monitoring Plan, submitted as Appendix C of the NYSDEC-approved Work Plan, Installation Restoration Program, Fort Drum, New York (PIKA-MP JV, 2015a) (IRP Work Plan), the purpose of this report is to summarize the data collected during the 2015 monitoring and sampling events in support of ongoing remedial actions.

Field and laboratory activities were conducted in accordance with the Quality Assurance Project Plan (QAPP) and Data Management Plan (DMP) submitted as Appendix A and Appendix B to the IRP Work Plan. Field work followed the health and safety procedures described in the Accident Prevention Plan, Installation Restoration Program, Fort Drum, New York (PIKA-MP JV, 2015b). This work is funded under the USACE Baltimore District Multiple Award Environmental Services (MAES) contract, Award No. W912DR-12-D-0007, Delivery Order 0003.

#### 1.1 Site Description

Fort Drum encompasses approximately 168 square miles and is located approximately 10 miles northeast of Watertown, 80 miles north of Syracuse, and 25 miles southeast of the United States and Canadian border (Figure 1-1). Fort Drum occupies a large portion of northeastern Jefferson County, a portion of western Lewis County, and abuts the southern edge of St. Lawrence County. The Basewide Monitoring Program includes groundwater and surface water sampling and well gauging activities for the Gasoline Alley Areas (Areas 1295, 1595, 1795, 1995, and 3805), the Army and Air Force Exchange Service (AAFES) Station Site (Building P-2140), the Old Sanitary Landfill (OSL), and the Airfield Sanitary Landfill (ASL) (Figure 1-2).

---

<sup>1</sup> The PIKA-MP JV LLC Joint Venture is comprised of PIKA International, Inc. and its mentor ARCADIS-U.S. Inc.

## **2. Background**

### **2.1 Gasoline Alley**

Gasoline Alley is located in the old Cantonment area in the southwest corner of Fort Drum. This area is approximately 2 miles long, consisting of two parallel one-way streets, Oneida Avenue and Ontario Avenue (currently under construction to create a single two-way street). Previously, fuel dispensing areas were located in or near the median that separated these roads. The former dispensing areas are referred to as Areas 1295, 1595, 1795, 1995, and 3805. Diesel fuel, gasoline, jet fuel, and kerosene were stored and dispensed from multiple underground storage tanks (USTs) located along the north side of Oneida Avenue. The USTs and their associated piping were removed between 1994 and 1995. The general locations of these sites are shown on Figure 2.

#### **2.1.1 Area 1295 (FTD-030A)**

Gasoline and diesel fuel were released to the subsurface from USTs formerly located at the site, resulting in LNAPL and dissolved phase contamination in the underlying aquifer (primarily benzene, toluene, ethylbenzene, and xylenes [BTEX]). Previous remedial efforts, including the injection of Oxygen Release Compound (ORC®), in-situ chemical oxidation (ISCO) injection using Fenton's Reaction chemistry, and in-situ bioremediation utilizing ozone-enhanced air sparging have been unsuccessful at treating the entire BTEX groundwater plume (the majority of which is beneath railroad tracks) to achieve site closure. Based on these data, and the results of a membrane interface probe (MIP) investigation conducted in May 2009, there is source mass remaining in the subsurface that is a continuing source of dissolved-phase BTEX contamination. In 2015 the JV installed additional remedial wells and began operating an air sparge (AS) system to perform the physical removal and enhanced aerobic degradation of remaining hydrocarbon mass to achieve site closure.

#### **2.1.2 Area 1595 (FTD-030D)**

Contaminants (primarily VOCs, including BTEX) were released to the subsurface from gasoline and diesel USTs formerly located at the site. Previous remedial efforts include an LNAPL recovery system, AS/soil vapor extraction (SVE), an ozone injection system, and a more recent monthly nutrient application program. The recovery well system was decommissioned in 2005 after removing nearly 8,000 gallons of LNAPL from the subsurface. To address persistent contamination in the soil and groundwater

## 2015 Annual Basewide Monitoring Report

Installation Restoration Program  
Fort Drum, New York

at Area 1595, SVE and AS systems were installed. The SVE and AS systems began operation in December 2005. In 2009, an ozone AS technology was evaluated at this site and was implemented for two months from December 2009 through February 2010. The ozone treatment was determined not to be successful, so a three-month pilot-test application of a N: P: K solution was applied starting in January 2011. The AS/SVE system operation continued throughout the three-month pilot test of nutrient application, but was discontinued due to observed asymptotic vapor recovery. Following the pilot test, a monthly application for an N: P: K solution was completed from December 2011 through April 2012. In 2015 the JV reconfigured the existing remedial infrastructure and began operating a biosparging/bioventing (BV) system to enhance the biodegradation of remaining hydrocarbon mass to achieve site closure.

### 2.1.3 Area 1795 (FTD-030E)

Unleaded gasoline was released to the subsurface from USTs and dispenser piping formerly located at the site, resulting in LNAPL and dissolved phase contamination in the underlying aquifer (primarily VOCs, including BTEX). Measureable LNAPL is not currently present at the site and BTEX concentration trends are generally stable. Previous remedial efforts at the site have included a bioslurping treatment system, an AS/SVE/MPE system, an ozone injection system, and a more recent monthly nutrient application program. The bioslurping system operated between approximately 1998 and 2000. The AS/SVE/MPE system began operation in 2007. Ozone AAS technology and nutrient injection approaches were evaluated in 2010, but determined not to be effective. In 2015 the JV installed additional remedial wells, reconfigured the existing remedial infrastructure, and began operating an AS/BV system to perform the enhanced biodegradation of remaining dissolved phase mass to achieve site closure.

### 2.1.4 Area 3805/1995 (FTD-030F)

Jet fuel (JP-4), gasoline, and diesel fuels were stored in former USTs at this area from the 1940s through the early 1990s. Several remedial pilot studies have been conducted at Areas 1995 and 3805, including SVE, groundwater depression/ LNAPL recovery, mobile skimmer/LNAPL recovery, bioslurping, and MPE/AS. In addition to pilot studies, interim corrective measures were implemented. An interim corrective action involving a LNAPL recovery system was installed in 1996 and was decommissioned in April 2003. An MPE/AS system was subsequently installed in the source areas (extent of LNAPL) and started in November 2003 (Systems A and B) and October 2003 (System C). The Area 1995 MPE/AS system (System D) was started in May 2004 and was discontinued by 2008. The AS system was expanded and modified

in 2007 to enhance remediation of the dissolved plume in the down-gradient area of the site and improve the performance of System C. The vertical extraction wells were modified to horizontal extraction wells in March 2012 to treat the shallower impacted soil. Additionally, on December 13, 2011, a five month nutrient injection application trial was completed in conjunction with AS system operations. Beginning in March 2013, AS systems were shut down to conduct a six month bioremediation with bioaugmentation pilot study at Area 3805 with the majority of other remedial systems either not being operated or operated in a reduced capacity. In 2015 the JV installed additional remedial wells, reconfigured the existing remedial infrastructure, and began operating an AS/SVE/BV system to perform the physical removal and enhanced biodegradation of remaining hydrocarbon mass to achieve site closure.

## **2.2 AAFES Station Site, Building P-2140 (FTD-091)**

Building P-2140 is located in the old Cantonment area of Fort Drum. It is bounded on the north by Nash Boulevard, on the west by First Street, and on the south by a wetland associated with the Black River. Building P-2140 is an active gasoline retail service station. Contaminants (primarily VOCs, including BTEX) were released to the subsurface from gasoline USTs formerly located at the site and removed in 1993. Previous remedial efforts, including MPE, AS, and in-situ bioremediation utilizing ozone-enhanced air sparging beginning in 2002, 2006, and 2009, respectively, have been unsuccessful at reducing the size and magnitude of the BTEX groundwater plume near the source area, although down-gradient BTEX concentrations have been significantly reduced. Additionally, in December 2011, a five month nutrient injection application trial was completed in conjunction with AS system operations. Use of the ozone treatment system was discontinued in 2014 to facilitate a six month bioaugmentation pilot study. In 2015 the JV installed additional remedial wells, reconfigured the existing remedial infrastructure, and began operating an AS/SVE system to perform the physical removal and enhanced biodegradation of remaining hydrocarbon mass to achieve site closure.

## **2.3 Old Sanitary Landfill (FTD-007)**

The OSL is located in the southern portion of Fort Drum, north of the intersection of Route 26 (Great Bend Road) and Oneida Avenue. The OSL occupies approximately 40 to 50 acres and is comprised of two major cells identified as OSL Cell 1 and OSL Cell 2. There is an unnamed stream that is located immediately between OSL Cell 1 and OSL Cell 2 which originates as a seep, groundwater discharge, or a combination

of the two. Subsequently, the unnamed stream flows into the OSL Creek, which is approximately 2.5 miles long.

Operation of the OSL began in 1940 and continued through 1973. During the period of operation, most of the waste generated on the installation was disposed in the landfill (including, but not limited to materials such as, general refuse, containers with residual pesticides and herbicides, unused ammunition, chlorinated solvents, and industrial wastes). The OSL was formally closed in 1981 following placement of a 20-mil polyvinyl chloride (PVC) membrane cap and soil cover over approximately 38 acres to reduce infiltration and minimize leachate generation. The cap was covered with topsoil and grass and approximately 16 gas vents were installed. Cap improvement work has been conducted periodically since then as needed. Annual landfill inspections, surface water, groundwater, and seep sampling are conducted in accordance with the OSL Plan, submitted as Appendix D of the IRP Work Plan. Details of the inspections and sampling are provided in the *2015 Annual Post-Closure Operations and Maintenance Report for the OSL and ASL*, provided in Appendix A.

In November and December 2015, the JV repaired a failed pipe slope drain (PSD #4) and associated erosional damage to the north slope of Cell 2 of the OSL. Details of the repair will be provided under separate cover in an addendum to the *2015 Annual Post-Closure Operations and Maintenance Report for the OSL and ASL*.

#### **2.4 Airfield Sanitary Landfill (FTD-008)**

The ASL is located adjacent to Wheeler Sack Airfield's northeast boundary and approximately 1,000 feet northwest of the Black River. The landfill occupies approximately 37 acres and is covered with vegetation. The topography of the landfill and the surrounding area is nearly flat.

The ASL began operating in 1973 after closure of the OSL. Solid wastes generated from various locations were placed into trenches in the sandy soil until the landfill was closed in 1987. The types of wastes placed in the ASL included municipal solid waste, paint wastes, solvent containers, triple-rinsed pesticide containers, and petroleum, oil, and lubricant (POL) saturated wastes. The trenches were oriented northwest to southwest approximately 300 feet wide with a maximum length of 1,900 feet. The trenches were approximately 20 feet deep and were unlined. They were covered with native sandy soil and some areas were grassed. The northeast 14 acres of the site (referred to as "Phase I") were covered with an impermeable 20-millimeter PVC liner, 6 inches of soil cover, and re-vegetated. The Phase I area contains thirteen gravel gas

## 2015 Annual Basewide Monitoring Report

Installation Restoration Program  
Fort Drum, New York

vents; however the gas vents have silted in and are no longer visible from the surface. Solid waste was also disposed of on the 23 acres southwest of, and adjacent to, the Phase I area until October 1987 (referred to as "Phase II"). In 1990, Phase II was closed by installing a 40-millimeter PVC cover, 18 PVC gas vents, 12 inches of soil cover, and vegetation. Annual landfill inspections and groundwater sampling every five years (last conducted in 2011) is conducted in accordance with the ASL Plan, submitted as Appendix E of the IRP Work Plan. Details of the inspections are provided in the *2015 Annual Post-Closure Operations and Maintenance Report for the OSL and ASL*, provided in Appendix A.

### **3. Field Sampling**

#### **3.1 Sampling Dates and Methods**

Monitoring and sampling was conducted during the spring (April 13 through May 1, 2015) and fall (August 31 through October 7, 2015) of 2015. Well gauging locations, groundwater, surface water, and seep sampling locations, sample analyses, sampling frequency, and sampling methodology for the Basewide Monitoring Plan are listed in Table 3-1. Locations sampled annually are sampled during the fall sampling event and locations sampled semi-annually are sampled during both the spring and fall sampling events. Prior to sampling, water levels and light non-aqueous phase liquid (LNAPL), if present, were measured in each well. Groundwater sampling was conducted according to the USEPA protocol for Low Stress (Low Flow) Purging and Sampling (USEPA, 1998) using peristaltic and bladder pumps. As shown in Table 3-1, each year 68 samples from 55 monitoring wells are collected for analysis of only VOCs. Since these wells could potentially be sampled in the future using passive diffusion bag (PDB) samplers, 16 of these wells were sampled using both traditional low-flow methods and PDB samplers to allow for comparison of the sampling methods.

In accordance with the Basewide Monitoring Plan, samples were analyzed by ALS Environmental, a New York State Department of Health (NYSDOH) and Department of Defense (DoD) Environmental Laboratory Accreditation Program (ELAP)-certified laboratory. Field parameters, consisting of temperature, pH, specific conductivity, dissolved oxygen, oxidation-reduction potential, and turbidity were measured during purging using a water quality meter equipped with a flow-through cell. Groundwater, surface water, seep, and biomass sampling conducted as part of the long-term maintenance and monitoring for the OSL and ASL are presented in the *2015 Annual Post-Closure Operations and Maintenance Report for the OSL and ASL*, provided in Appendix A. Sampling methods, specific analytical methods, and sampling locations are discussed in detail in the Basewide Monitoring Plan, OSL Plan, and ASL Plan. Purge logs for the 2015 monitoring event are presented in Appendix B. Analytical laboratory reporting forms for 2015 monitoring event are presented in Appendix C.

#### **3.2 Sampling Summary**

In accordance with the Basewide Monitoring Plan, there are a total of 91 groundwater monitoring wells, seven surface water sampling locations, 10 seep sampling locations, and three biomass sampling locations that were scheduled for sampling in 2015. However, some locations either were not sampled or were sampled for limited

## 2015 Annual Basewide Monitoring Report

Installation Restoration Program  
Fort Drum, New York

analytical parameters during the monitoring events. Table 3-2 summarizes the monitoring wells that were not sampled for all or some parameters during the 2015 monitoring events. As shown in Table 3-2, three monitoring wells at Gasoline Alley sites and five OSL seep locations were not sampled during the 2015 fall monitoring event.

#### **4. 2015 Results**

The spring and fall 2015 groundwater elevation data are presented in Table 4-1. Groundwater, surface water, seep, and biomass analytical results for 2015 are summarized in Tables 4-2 and 4-3.

In accordance with the Basewide Monitoring Plan, data validation was performed for the samples collected during the spring and fall events to ensure that the data generated provide sufficient information to achieve the project objectives. The Data Usability Summary Reports are included in Appendix D. Sample processing was generally conducted in compliance with the analytical protocol requirements and quality criteria. All data were classified as usable with some minor qualification, with the exception of some ferrous iron samples which were analyzed outside of holding time. Additional discussion is provided in the DUSR narratives in Appendix D.

##### **4.1 Area 1295**

The average groundwater elevation at Area 1295 was 626.21 feet above mean sea level (amsl) and 625.24 feet amsl during the spring and fall 2015 events, respectively. As illustrated on Figures 4-1 and 4-2, groundwater flow in the vicinity of Area 1295 was generally to the north-northwest. LNAPL was not observed during well gauging or groundwater sampling at Area 1295 in 2015.

There are five groundwater monitoring wells in Area 1295 that are sampled under the Basewide Monitoring Program. Tables 4-2 and 4-3 and Figure 4-3 summarize exceedances of NYSDEC Class GA Groundwater Standards for samples collected during 2015. Analytes that exceeded NYSDEC Class GA Groundwater Standards generally included petroleum-related VOCs. As shown on Figure 4-3, samples from monitoring wells 1295-MW30 and 1295-MWS27 contained VOCs at concentrations greater than the corresponding NYSDEC Class GA Groundwater Standards. Samples from 1295-MW30 contained the highest concentrations of BTEX in both the spring and fall sampling events (3,842 micrograms per liter [ $\mu\text{g}/\text{L}$ ] and 398  $\mu\text{g}/\text{L}$ , respectively).

##### **4.2 Area 1595**

The average groundwater elevation at Area 1595 was 623.70 feet amsl and 622.69 feet amsl during the spring and fall 2015 events, respectively. As illustrated on Figures 4-4 and 4-5, groundwater flow in the vicinity of Area 1595 was generally to the

northwest. LNAPL was not observed during well gauging or groundwater sampling at Area 1595 in 2015.

There are 10 groundwater monitoring wells and two surface water sampling locations in Area 1595 that are sampled under the Basewide Monitoring Program. Tables 4-2 and 4-3 and Figure 4-6 summarize exceedances of NYSDEC Class GA Groundwater Standards for samples collected during 2015. Analytes that exceeded NYSDEC Class GA Groundwater Standards generally included petroleum-related VOCs. As shown on Figure 4-6, samples from monitoring wells 1595-MW33, 1595-MWS7, 1595-OBG2, and 1595-PZ12 contained VOCs at concentrations greater than the corresponding NYSDEC Class GA Groundwater Standards. Samples from 1595-MWS7 contained the highest concentrations of BTEX in both the spring and fall sampling events (3,800 µg/L and 1,504 µg/L, respectively).

As shown on Figure 4-6, none of the surface water samples from Area 1595 contained petroleum-related contaminants of concern at concentrations greater than applicable NYSDEC surface water standards/guidance values.

#### **4.3 Area 1795**

The average groundwater elevation at Area 1795 was 633.24 feet above amsl and 631.28 feet amsl during the spring and fall 2015 events, respectively. As illustrated on Figures 4-7 and 4-8, groundwater flow in the vicinity of Area 1795 was generally to the west-northwest. LNAPL was not observed during well gauging or groundwater sampling at Area 1795 in 2015.

There are 16 groundwater monitoring wells and two surface water sampling locations in Area 1795 that are sampled under the Basewide Monitoring Program. Tables 4-2 and 4-3 and Figure 4-9 summarize exceedances of NYSDEC Class GA Groundwater Standards for samples collected during 2015. Analytes that exceeded NYSDEC Class GA Groundwater Standards included petroleum-related VOCs, iron, and manganese. As shown on Figure 4-9, samples from monitoring wells 1795-MWD13, 1795-MW-S2, 1795-MWS3, 1795-MWS7, 1795-MWS9, 1795-PZ4, 1795-PZ5, 1795-PZ14, and 1795-PZ15 contained VOCs at concentrations greater than the corresponding NYSDEC Class GA Groundwater Standards. Samples from 1795-MWS7 contained the highest concentrations of BTEX in both the spring and fall sampling events (2,690 µg/L and 5,790 µg/L, respectively).

As shown on Figure 4-9, none of the surface water samples from Area 1795 contained petroleum-related contaminants at concentrations greater than applicable NYSDEC surface water standards/guidance values.

#### **4.4 Area 3805/1995**

The average groundwater elevation at Area 3805/1995 was 633.10 feet amsl and 632.30 feet amsl during the spring and fall 2015 events, respectively. As illustrated on Figures 4-10 and 4-11, groundwater flow in the vicinity of Area 3805/1995 was generally to the north. LNAPL was not observed during well gauging or groundwater sampling at Area 3805/1995 during the spring and fall 2015 monitoring events.

There are 43 groundwater monitoring wells in Area 3805/1995 that are sampled under the Basewide Monitoring Program and the overlapping OSL Environmental Monitoring Program. Tables 4-2 and 4-3 and Figures 4-12 and 4-13 summarize exceedances of NYSDEC Class GA Groundwater Standards for samples collected during 2015.

Analytes that exceeded NYSDEC Class GA Groundwater Standards included petroleum-related VOCs, chlorinated VOCs (associated with 3800 PCE Site plume), iron, manganese, and sodium. As shown on Figures 4-12 and 4-13, samples from all monitoring wells except 3805-MWD10, 3805-MWD16, 3805-MWS2, 3805-MWS19, 3805-PZ7, 3805-PZ-12D, 3805-PZ-13I, 3805-PZ-13D, 1995-MW43 contained VOCs at concentrations greater than the corresponding NYSDEC Class GA Groundwater Standards. The sample from 3805-PZ14 contained the highest concentrations of BTEX in the spring sampling event (23,130 µg/L) while the sample from 3805-PZ12S contained the highest concentrations of BTEX in the fall sampling event (15,632 µg/L).

#### **4.5 P-2140**

The average groundwater elevation at Area P-2140 was 610.29 feet amsl and 608.54 feet amsl during the spring and fall 2015 events, respectively. As illustrated on Figures 4-14 and 4-15, groundwater flow in the vicinity of Area P-2140 was generally to the southeast. LNAPL was not observed during well gauging or groundwater sampling at Area P-2140 in 2015.

There are 13 groundwater monitoring wells in Area P-2140 that are sampled under the Basewide Monitoring Program. Tables 4-2 and 4-3 and Figure 4-16 summarize exceedances of NYSDEC Class GA Groundwater Standards for samples collected during 2015. Analytes that exceeded NYSDEC Class GA Groundwater Standards included petroleum-related VOCs, iron, manganese, and chloride. As shown on Figure

4-16, samples from monitoring wells 2140-MW02, 2140-MW04, 2140-MW06, 2140-MW07, 2140-MW12, 2140-MW19, 2140-MW-27, 2140-MW37 contained VOCs at concentrations greater than the corresponding NYSDEC Class GA Groundwater Standards. Samples from 2140-MW06 contained the highest concentrations of BTEX in both the spring and fall sampling events (8,550 µg/L and 1,192 µg/L, respectively).

#### **4.6 PDB vs. Low-Flow Sampling**

During the fall 2015 sampling event 16 wells that are sampled for only VOCs were selected for sampling using both PDBs and traditional low-flow methods to evaluate data comparability. These wells are listed below and shown on Figures 4-6, 4-9, 4-12, 4-13, and 4-16.

- 1595-MWS8
- 1595-MW33
- 1595-PZ11
- 1595-PZ13
- 1795-MWS3
- 1795-MWS7
- 1795-PZ4
- 1795-PZ15
- 3805-002
- 3805-MW39
- 3805-MWI6
- 3805-MWS24
- 2140-MW02
- 2140-MW04
- 2140-MW06
- 2140-MW37

Table 4-4 summarizes the results obtained from these wells using PDBs and low-flow sampling. As shown on Table 4-4, with the exception of samples from 1795-PZ15 and 2140-MW06 (PDB data showed non-detect results) and 3805-MW39 (low-flow data showed non-detect results), results from PDBs are correlative with results from low-flow sampling. These three discrepancies are most likely attributable to:

- 1795-PZ15 showed a drop in average water level by over two feet between late summer and fall, which could have resulted in exposure of the PDB to the atmosphere during deployment.
- 2140 remedial systems were off during low-flow sampling but were on during PDB deployment and may have volatilized constituents during PDB sampling.
- Aggressive bubbling from the AS system at 3805-MW39 may have volatilized constituents during low-flow sampling.

## 5. Summary and Conclusions

A summary of the 2015 Basewide Monitoring Program field observations, measurements, and analytical data are provided below, as they relate to ongoing remedial efforts, conceptual models, and remedial optimization. Site remediation activities during the 2015 reporting period have been summarized in Construction Completion Reports for Areas 1295, 1595, 1795, 3805/1995, and P-2140 (PIKA-MP JV, 2015c-g) and Semi-Annual Reports. Remediation activities during the reporting period generally included the expansion, optimization, operation, and maintenance of the remedial systems. Total VOC concentration trends for each area are provided on Figures 5-1 through 5-6. These figures use 2014 as a baseline because remedial systems/approaches were reconfigured in 2015 by the JV.

### 5.1 Area 1295

The average groundwater elevation at Area 1295 was 0.97 feet higher during the spring 2015 event than during the fall 2015 event. The average groundwater elevations during the spring and fall 2015 events were 1.65 and 1.04 feet lower than the spring and fall 2014 events, respectively.

Groundwater BTEX concentrations decreased by an order of magnitude between the spring and fall 2015 sampling events and may reflect the impacts of the AS system that was installed and brought online during the summer of 2015. Monitored natural attenuation (MNA) parameter concentrations in 2015 were generally consistent with 2014 concentrations with the exception of sulfate and methane, which were generally lower than 2014 concentrations.

### 5.2 Area 1595

The average groundwater elevation at Area 1595 was 1.01 feet higher during the spring 2015 event than during the fall 2015 event. The average groundwater elevations during the spring and fall 2015 events were 0.32 feet lower and 0.41 feet higher than the spring and fall 2014 events, respectively.

With the exception of 1595-MWS7 and 1595-PZ12, groundwater BTEX concentrations increased in most Area 1595 wells between the spring and fall 2015 sampling events and may reflect the impacts of the AS/BV system that was brought online during the spring/summer of 2015. It is likely that these increases were associated with the activation of the sparging wells, which may have mobilized areas of residual

contaminant mass. While these increases are expected to be temporary, the system has been optimized by focusing flow to problem areas (and reducing flows in other areas). Coupled with ongoing performance monitoring, the impact of these system changes will be evaluated and the need for additional remedial infrastructure will be considered in the spring of 2016. BTEX concentrations in surface water at 1595-SW01 have also decreased between 2014 and 2015. MNA parameter concentrations in 2015 were generally consistent with 2014 concentrations with the exception of ferrous iron concentrations, which were generally greater than 2014 concentrations.

### **5.3 Area 1795**

The average groundwater elevation at Area 1795 was 1.96 feet higher during the spring 2015 event than during the fall 2015 event. The average groundwater elevations during the spring and fall 2015 events were 1.11 and 2.90 feet lower than the spring and fall 2014 events, respectively.

Groundwater BTEX concentrations generally increased by a factor of two between the spring and fall 2015 sampling events, which prompted the JV to add additional remedial wells and bring AS systems online in the fall/winter of 2015 (in addition to BV systems which were brought online during the spring/summer of 2015). BTEX was not detected in surface water at Area 1795, consistent with 2014 results. MNA parameter concentrations in 2015 were generally consistent with 2014 concentrations with the exception of methane which was generally greater than 2014 concentrations.

### **5.4 Area 3805/1995**

The average groundwater elevation at Area 3805/1995 was 0.80 feet higher during the spring 2015 event than during the fall 2015 event. The average groundwater elevations during the spring and fall 2015 events were 1.53 and 1.98 feet lower than the spring and fall 2014 events, respectively.

Groundwater BTEX concentrations were variable between the spring and fall 2015 sampling events and may reflect the impacts of the AS/SVE/BV system that was brought online during the spring/summer of 2015, expanded in the fall/winter of 2015. Additional optimization to target remedial efforts is ongoing. MNA parameter concentrations in 2015 were generally consistent with 2014 concentrations.

### **5.5 AAFES Station Site, Building P-2140**

The average groundwater elevation at Area P-2140 was 1.75 feet higher during the spring 2015 event than during the fall 2015 event. The average groundwater elevations during the spring and fall 2015 events were 1.29 and 0.95 feet lower than the spring and fall 2014 events, respectively.

Groundwater BTEX concentrations in the source treatment area decreased by one to two orders of magnitude between the spring and fall 2015 sampling events and may reflect the impacts of the AS/SVE system that was augmented and brought online during the summer of 2015. MNA parameter concentrations in 2015 were generally consistent with 2014 concentrations.

### **5.6 Sanitary Landfills**

Details of Sanitary Landfill groundwater, surface water, seep, and biomass sampling, along with annual inspections, maintenance, and repairs conducted during 2015 are provided in the *2015 Annual Post-Closure Operations and Maintenance Report for the OSL and ASL*, provided in Appendix A.

## **6. Recommendations**

The following modifications to the Basewide Monitoring Program are recommended.

1. Based on consistent water levels and groundwater flow patterns during at least the last 10 years of monitoring, it is recommended that, beginning with the spring 2016 monitoring event, water level measurements be reduced to include only monitoring wells that are sampled under the Basewide Monitoring Program during the respective monitoring events.
2. Based on the comparability of low-flow and PDB VOC results during the fall 2015 monitoring event, it is recommended that, beginning with the spring 2016 monitoring event, PDB samplers be used for all wells that only require analysis of VOCs. Results from on-going remedial performance monitoring sampling, which is conducted separately from the Basewide Monitoring Program using low-flow methods, would be used to regularly evaluate potentially anomalous PDB results.
3. Based on the fact that delineation work is complete, remedial measures are in place, and that sufficient historical data are available to evaluate potentially anomalous data, it is recommended that data validation no longer be required under the Basewide Monitoring Program since anomalous data could be easily identified based on previous results.
4. The current remedial strategies implemented by the JV at the Gasoline Alley and P-2140 sites utilize physical removal and enhanced aerobic degradation of remaining hydrocarbon mass, as opposed to previous efforts to bring the sites to anaerobic conditions. Therefore, it is recommended that MNA parameters for these sites be reduced to only include nitrate, sulfate, and iron(II). MNA parameters for the ASL would remain unchanged.

### NOTES:

- RESULTS ARE SHOWN IN MICROGRAMS PER LITER ( $\mu\text{g}/\text{L}$ )
- BRACKETED VALUES ARE RESULTS OF DUPLICATE SAMPLES.
- U: THE COMPOUND WAS ANALYZED FOR BUT NOT DETECTED. THE ASSOCIATED VALUE IS THE COMPOUND QUANTITATION LIMIT.
- J: THE COMPOUND WAS POSITIVELY IDENTIFIED; HOWEVER, THE ASSOCIATED NUMERICAL VALUE IS AN ESTIMATED CONCENTRATION ONLY.
- J: THE COMPOUND WAS POSITIVELY IDENTIFIED; HOWEVER THE ASSOCIATED NUMERICAL VALUE IS AN ESTIMATED CONCENTRATION THAT MAY BE BIASED LOW.
- D: CONCENTRATION IS A RESULT OF A DILUTION.
- E: CONCENTRATION EXCEEDS CALIBRATION RANGE.

Notes:

MNA - Monitored Natural Attenuation Parameters:  
 TOC, Nitrate, Sulfate, Iron(II), Iron, Manganese, Ammonia,  
 Dissolved Gases, & Chloride.

ASL - Airfield Sanitary LF Parameters include:  
 Alkalinity, Bromide, Nitrate, Nitrite,  
 Total Kjeldahl Nitrogen, Phenols, TDS, BOD, & COD.

(a) Could potentially be sampled using passive diffusion bags.

**Footnotes:**

U - The compound was analyzed for but not detected. The associated value is the compound quantitation limit.

B - The compound has been found in the sample as well as its associated blank, its presence in the sample may be suspect.

J - The compound was positively identified; however, the associated numerical value is an estimated concentration only.

UJ - The compound was not detected above the reported sample quantitation limit. However, the reported limit is approximate and may or may not represent the actual limit of quantitation.

UB - Compound considered non-detect at the listed value due to associated blank contamination.

ug/mL = micrograms per Liter

mg/mL = milligrams per Liter

**Footnotes:**

U - The compound was analyzed for but not detected. The associated value is the compound quantitation limit.

B - The compound has been found in the sample as well as its associated blank, its presence in the sample may be suspect.

J - The compound was positively identified; however, the associated numerical value is an estimated concentration only.

UJ - The compound was not detected above the reported sample quantitation limit. However, the reported limit is approximate and may or may not represent the actual limit of quantitation.

UB - Compound considered non-detect at the listed value due to associated blank contamination.

ug/mL = micrograms per Liter

mg/mL = milligrams per Liter

**Footnotes:**

- U - The compound was analyzed for but not detected. The associated value is the compound quantitation limit.
  - B - The compound has been found in the sample as well as its associated blank; its presence in the sample may be suspect.
  - J - The compound was positively identified; however, the associated numerical value is an estimated concentration only.
  - UJ - The compound was not detected above the reported sample quantitation limit. However, the reported limit is approximate and may or may not represent the actual limit of quantitation.
  - UB - Compound considered non-detect at the listed value due to associated blank contamination.
- ug/mL = micrograms per Liter  
mg/mL = milligrams per Liter

**Footnotes:**

- U - The compound was analyzed for but not detected. The associated value is the compound quantitation limit.
  - B - The compound has been found in the sample as well as its associated blank; its presence in the sample may be suspect.
  - J - The compound was positively identified; however, the associated numerical value is an estimated concentration only.
  - UJ - The compound was not detected above the reported sample quantitation limit. However, the reported limit is approximate and may or may not represent the actual limit of quantitation.
  - UB - Compound considered non-detect at the listed value due to associated blank contamination.
- ug/mL = micrograms per Liter  
mg/mL = milligrams per Liter

**Footnotes:**

- U - The compound was analyzed for but not detected. The associated value is the compound quantitation limit.
  - B - The compound has been found in the sample as well as its associated blank; its presence in the sample may be suspect.
  - J - The compound was positively identified; however, the associated numerical value is an estimated concentration only.
  - UJ - The compound was not detected above the reported sample quantitation limit. However, the reported limit is approximate and may or may not represent the actual limit of quantitation.
  - UB - Compound considered non-detect at the listed value due to associated blank contamination.
- ug/mL = micrograms per Liter  
mg/mL = milligrams per Liter

**Footnotes:**

- U - The compound was analyzed for but not detected. The associated value is the compound quantitation limit.
  - B - The compound has been found in the sample as well as its associated blank; its presence in the sample may be suspect.
  - J - The compound was positively identified; however, the associated numerical value is an estimated concentration only.
  - UJ - The compound was not detected above the reported sample quantitation limit. However, the reported limit is approximate and may or may not represent the actual limit of quantitation.
  - UB - Compound considered non-detect at the listed value due to associated blank contamination.
- ug/mL = micrograms per Liter  
mg/mL = milligrams per Liter

**Footnotes:**

- U - The compound was analyzed for but not detected. The associated value is the compound quantitation limit.
  - B - The compound has been found in the sample as well as its associated blank; its presence in the sample may be suspect.
  - J - The compound was positively identified; however, the associated numerical value is an estimated concentration only.
  - UJ - The compound was not detected above the reported sample quantitation limit. However, the reported limit is approximate and may or may not represent the actual limit of quantitation.
  - UB - Compound considered non-detect at the listed value due to associated blank contamination.
- ug/mL = micrograms per Liter  
mg/mL = milligrams per Liter

**Footnotes:**

- U - The compound was analyzed for but not detected. The associated value is the compound quantitation limit.
  - B - The compound has been found in the sample as well as its associated blank; its presence in the sample may be suspect.
  - J - The compound was positively identified; however, the associated numerical value is an estimated concentration only.
  - UJ - The compound was not detected above the reported sample quantitation limit. However, the reported limit is approximate and may or may not represent the actual limit of quantitation.
  - UB - Compound considered non-detect at the listed value due to associated blank contamination.
- ug/mL = micrograms per Liter  
mg/mL = milligrams per Liter

**Footnotes:**

- U - The compound was analyzed for but not detected. The associated value is the compound quantitation limit.
  - B - The compound has been found in the sample as well as its associated blank; its presence in the sample may be suspect.
  - J - The compound was positively identified; however, the associated numerical value is an estimated concentration only.
  - UJ - The compound was not detected above the reported sample quantitation limit. However, the reported limit is approximate and may or may not represent the actual limit of quantitation.
  - UB - Compound considered non-detect at the listed value due to associated blank contamination.
- ug/mL = micrograms per Liter  
mg/mL = milligrams per Liter

Footnotes:

U - The compound was analyzed for but not detected. The associated value is the compound quantitation limit.

B - The compound has been found in the sample as well as its associated blank, its presence in the sample may be suspect.

J - The compound was positively identified; however, the associated numerical value is an estimated concentration only.

UJ - The compound was not detected above the reported sample quantitation limit. However, the reported limit is approximate and may or may not represent the actual limit of quantitation.

UB - Compound considered non-detect at the listed value due to associated blank contamination.

## 2015 Annual Post-Closure Operations and Maintenance Report for the OSL and ASL

Installation Restoration Program  
Fort Drum, New York

### 1. Introduction

The PIKA - MP JV, LLC<sup>1</sup> (hereinafter referred to as the JV) has prepared this Post-Closure Operations and Maintenance Report on behalf of the Baltimore District of the US Army Corps of Engineers (USACE) for the annual inspections and maintenance activities at the Old Sanitary Landfill (OSL) (FTD-007) and Airfield Sanitary Landfill (ASL) (FTD-008) at the Fort Drum Military Installation (Fort Drum), New York. Long-term maintenance and monitoring is being conducted in accordance with a New York State Department of Environmental Conservation (NYSDEC) Order on Consent and Administrative Settlement (Index No. A6-0797-12-10).

In accordance with the OSL Monitoring and Maintenance Operations Manual and ASL Monitoring and Maintenance Operations Manual, submitted as Appendices D and E respectively, of the NYSDEC-approved Work Plan, Installation Restoration Program, Fort Drum, New York (PIKA-MP JV, 2015a) (IRP Work Plan), the purpose of this report is to summarize the data collected during the 2015 inspection, maintenance, and groundwater and surface water monitoring activities.

Field and laboratory activities were conducted in accordance with the Quality Assurance Project Plan (QAPP) and Data Management Plan (DMP) submitted as Appendix A and Appendix B to the IRP Work Plan. Field work followed the health and safety procedures described in the Accident Prevention Plan, Installation Restoration Program, Fort Drum, New York (PIKA-MP JV, 2015b). This work is funded under the USACE Baltimore District Multiple Award Environmental Services (MAES) contract, Award No. W912DR-12-D-0007, Delivery Order 0003.

#### 1.1 Site Description

Fort Drum encompasses approximately 168 square miles and is located approximately 10 miles northeast of Watertown, 80 miles north of Syracuse, and 25 miles southeast of the United States and Canadian border. Fort Drum occupies a large portion of northeastern Jefferson County, a portion of western Lewis County, and abuts the southern edge of St. Lawrence County. The OSL encompasses approximately 50 acres and is located northeast of the 3805 and 1995 Areas near the intersection of

**2015 Annual Post-Closure Operations and Maintenance Report for the OSL and ASL**

Installation Restoration Program  
Fort Drum, New York

New York State Route 26 and Oneida Avenue. The OSL consists of two landfill cells separated by ravine with an unnamed creek which joins with the OSL Creek to the northeast (Figure 1-1). The ASL encompasses approximately 37 acres and is located adjacent to Wheeler Sack Airfield's northeast boundary and approximately 1,000 feet northwest of the Black River (Figure 1-1).

## 2015 Annual Post-Closure Operations and Maintenance Report for the OSL and ASL

Installation Restoration Program  
Fort Drum, New York

## 2. Background

### 2.1 Old Sanitary Landfill

The OSL is located in the southern portion of Fort Drum, north of the intersection of Route 26 (Great Bend Road) and Oneida Avenue. The OSL occupies approximately 40 to 50 acres and is comprised of two major cells identified as OSL Cell 1 and OSL Cell 2. There is an unnamed stream that is located immediately between OSL Cell 1 and OSL Cell 2 which originates as a seep, groundwater discharge, or a combination of the two. Subsequently, the unnamed stream flows into the OSL Creek, which is approximately 2.5 miles long.

Operation of the OSL began in 1940 and continued through 1973. During the period of operation, most of the waste generated on the installation was disposed in the landfill (including, but not limited to materials such as, general refuse, containers with residual pesticides and herbicides, unused ammunition, chlorinated solvents, and industrial wastes). The OSL was closed in 1981 following placement of a 20-mil polyvinyl chloride (PVC) membrane cap and soil cover over approximately 38 acres to reduce infiltration and minimize leachate generation. The cap was covered with topsoil and grass and approximately 16 gas vents were installed. Cap improvement work has been conducted periodically since then as needed. Annual landfill inspections, surface water, groundwater, and seep sampling are conducted in accordance with the OSL Plan (PIKA-MP JV, 2015a), concurrently with the fall Basewide Monitoring sampling event.

### 2.2 Airfield Sanitary Landfill

The ASL is located adjacent to Wheeler Sack Airfield's northeast boundary and approximately 1,000 feet northwest of the Black River. The landfill occupies approximately 37 acres and is covered with vegetation. The topography of the landfill and the surrounding area is nearly flat.

The ASL began operating in 1973 after closure of the OSL. Solid wastes generated from various locations were placed into trenches in the sandy soil until the landfill was closed in 1987. The types of wastes placed in the ASL included municipal solid waste, paint wastes, solvent containers, triple-rinsed pesticide containers, and petroleum, oil, and lubricant (POL) saturated wastes. The trenches were oriented northwest to southwest approximately 300 feet wide with a maximum length of 1,900 feet. The trenches were approximately 20 feet deep and were unlined. They were covered with

**2015 Annual Post-Closure Operations and Maintenance Report for the OSL and ASL**

Installation Restoration Program  
Fort Drum, New York

native sandy soil and some areas were grassed. The northeast 14 acres of the site (referred to as "Phase I") were covered with an impermeable 20-millimeter PVC liner, 6 inches of soil cover, and re-vegetated. The Phase I area contains thirteen gravel gas vents; however the gas vents have silted in and are no longer visible from the surface. Solid waste was disposed of on the 23 acres southwest of, and adjacent to, the Phase I area until October 1987 (referred to as "Phase II"). In 1990, Phase II was closed by installing a 40-millimeter PVC cover, 18 PVC gas vents, 12 inches of soil cover, and vegetation. Annual landfill inspections and groundwater sampling every five years (last conducted in 2011) is conducted in accordance with the ASL Plan (PIKA-MP JV, 2015a), concurrently with the fall Basewide Monitoring sampling event.

### **3. Old Sanitary Landfill**

#### **3.1 OSL Inspection**

The annual inspection at the OSL is designed to ensure the integrity of the landfill's erosion control measures, drainage control structures, vegetative cover, gas vents, roads, and monitoring points and wells in accordance with the OSL Plan (PIKA-MP JV, 2015a). The JV conducted the annual inspection on September 3, 2015.

##### **3.1.1 OSL Inspection Summary**

At the time of the inspection both cells of the OSL were found to be in good condition, with the exception of soil erosion that was observed to be occurring at pipe slope drain #4 of Cell 2 (first noted during site walk in late July 2015), which is discussed in more detail in Section 3.1.2. The gas vents appeared to be in good condition. Drainage features and structures appeared to be unobstructed and functional, with the exception of pipe slope drain #4. Perimeter fences and signage were intact and in good condition. The OSL was mowed on August 13, 2015. Landfill inspection forms are provided in Attachment 1. Landfill inspection photographs are provided in Attachment 2. Landfill inspection results are summarized on Figure 3-1.

##### **3.1.2 OSL Cell 2 Pipe Slope Drain #4 Damage**

In July 2015, it was observed that surface drainage flowing to the inlet of pipe slope drain (PSD) #4 of Cell 2 was partially bypassing the outfall pipe and was instead flowing into a void in the ground surface adjacent to the flared-end section at the pipe inlet. This flow created an eroded zone outside of and directly beneath the buried pipe, which in turn caused dislodgement and migration of the soil surrounding and supporting the pipe. The eroded zone beneath the pipe continues to the north slope of the OSL (to the northwest of the pipe). Surface water flow along the eroded zone led to the formation of a washout ravine and the deposition of slope sediments at the bottom of the slope adjacent to the OSL creek. Temporary mitigation measures to divert surface water away from the inlet were put in place until a permanent repair could be implemented. Preliminary signs of failure were also noted at PSDs #2 and #3.

In November and December 2015 the JV repaired the inlet and initial downchute segment of PSD #4 and refilled and stabilized the washout area. Details of the repair will be provided under separate cover in an addendum to this report.

## 2015 Annual Post-Closure Operations and Maintenance Report for the OSL and ASL

Installation Restoration Program  
Fort Drum, New York

### 3.1.3 OSL Inspection Recommendations

The annual landfill inspections should be continued in accordance with the OSL Plan (PIKA-MP JV, 2015a). In addition, it is recommended that inspections of the pipe slope drains be conducted on a monthly basis and following large rain and/or snow melt events. This additional monitoring is already being conducted on an interim basis as part of the PSD #4 mitigation measures.

## 3.2 OSL Environmental Monitoring

Groundwater, surface water, and seep samples are collected annually from 10 monitoring wells around Cells 1 and 2 of the OSL, three surface water sample locations along the creek that bounds the cells to the north, and two seep locations. Figure 3-1 shows the sampling locations and Table 3-1 summarizes the analyses and sampling frequency. Purge logs for the 2015 monitoring event are presented in Appendix B of the 2015 Annual Basewide Monitoring Report. Analytical laboratory reporting forms for 2015 monitoring event are presented in Appendix C of the 2015 Annual Basewide Monitoring Report. Data Usability Summary Reports (DUSRs) for the 2015 monitoring event are presented in Appendix D of the 2015 Annual Basewide Monitoring Report.

### 3.2.1 OSL Analytical Results

Groundwater, surface water, and seep, analytical results for 2015 are summarized in Table 3-2 and depicted on Figure 3-2. Groundwater analytes that exceeded applicable NYSDEC standards generally included petroleum-related VOCs, iron, manganese, and sodium, consistent with previous results. Surface water analytes that exceeded applicable NYSDEC standards/guidance values included sodium and iron, consistent with previous results. As discussed in the 2015 Annual Basewide Monitoring Report, samples from seeps SP01, SP01-EFF, and SP03 were not collected in 2015 due to dry conditions in these areas. The sample from SP03-EFF contained only iron at a concentration greater than applicable NYSDEC standards, consistent with previous results.

### 3.2.2 OSL Environmental Monitoring Recommendations

The environmental monitoring program at the OSL should continue in accordance with the OSL Plan (PIKA-MP JV, 2015a) and remain unchanged for 2016.

### **3.3 Phytoremediation Plantation Inspection**

The annual inspection at the phytoremediation plantation is designed to assess survivability of the planted willow trees, weed control, and mitigation of insect, animal, and disease problems in accordance with the OSL Plan (PIKA-MP JV, 2015a). The JV conducted the annual inspection on September 3, 2015.

#### **3.3.1 Phytoremediation Plantation Inspection Summary**

At the time of the inspection the plantation areas revealed no significant signs of abnormal tree die-off. Some willow tree stands had fallen over, but were left as found after consultation with the Fort Drum environmental program manager as it was determined that these stands had fallen over (and were left in place) previous to 2015. Neither weeds, insect, animal activity, nor disease were not found to have impacted willow tree survivability. Phytoremediation plantation inspection photographs are provided in Attachment 2.

#### **3.3.2 Phytoremediation Plantation Inspection Recommendations**

The annual phytoremediation plantation inspections should be continued in accordance with the OSL Plan (PIKA-MP JV, 2015a) and remain unchanged for 2016.

### **3.4 Phytoremediation Environmental Monitoring**

Five landfill seeps and their down-gradient counterparts are sampled annually to monitor the impact of the plantation on water quality as seep waters flow through the plantation. Three willow tree sapwood biomass samples are collected every three years from within plantation zone A2, and were collected in 2015. Figure 3-3 shows the sampling locations and Table 3-1 summarizes the analyses and sampling frequency. Analytical laboratory reporting forms for 2015 monitoring event are presented in Appendix C of the 2015 Annual Basewide Monitoring Report. Data Usability Summary Reports (DUSRs) for the 2015 monitoring event are presented in Appendix D of the 2015 Annual Basewide Monitoring Report.

#### **3.4.1 Phytoremediation Analytical Results**

Seep and biomass analytical results for 2015 are summarized in Table 3-2 and depicted on Figure 3-3. As discussed in the 2015 Annual Basewide Monitoring Report, samples from seeps SP01, SP01-EFF, and SP03 were not collected in 2015 due to dry

conditions in these areas. Additionally, samples from seeps LS31 and LS31-EFF were not collected in 2015 due to previously-existing damage of the willow boxes in this vicinity. Influent seeps to the phytoremediation plantation, LS34 and LC009, generally contained petroleum-related organics and metals (iron and lead) at concentrations that exceeded applicable NYSDEC standards, consistent with previous results. Effluent seeps from the phytoremediation plantation, LS34-EFF, LC009-EFF, and SP03-EFF, contained only iron at concentrations that exceeded applicable NYSDEC standards, demonstrating significant reductions in petroleum-related organic constituents through the phytoremediation plantation. All three biomass samples collected in 2015 contained VOCs, lead, and iron, demonstrating contaminant uptake by the phytoremediation plantation. The number of detections and concentrations of VOCs in the 2015 biomass samples were generally lower than the 2012 sampling event. The concentrations of iron in the 2015 biomass samples was generally lower than the 2012 sampling event, while lead was not detected in the 2012 samples.

### 3.4.2 Phytoremediation Environmental Monitoring Recommendations

Seep and biomass sample results indicate that the phytoremediation plot is continuing to serve its purpose in reducing contaminant flux from the landfill to the OSL Creek. Therefore, the environmental monitoring program at the phytoremediation plantation should continue in accordance with the OSL Plan (PIKA-MP JV, 2015a) and remain unchanged for 2016. Biomass samples will be collected again in 2018.

## 2015 Annual Post-Closure Operations and Maintenance Report for the OSL and ASL

Installation Restoration Program  
Fort Drum, New York

### 4. Airfield Sanitary Landfill

#### 4.1 ASL Inspection

The annual inspection at the ASL is designed to ensure the integrity of the landfill's erosion control measures, drainage control structures, vegetative cover, gas vents, roads, and monitoring points and wells in accordance with the ASL Plan (PIKA-MP JV, 2015a). The JV conducted the annual inspection on September 3, 2015.

##### 4.1.1 ASL Inspection Summary

At the time of the inspection the ASL cap was found to be in good condition. The gas vents also appeared to be in good condition. Drainage features and structures appeared to be unobstructed. Perimeter fences and signage were intact and in good condition. Several minor animal burrows were discovered during the September 3, 2015 inspection which were subsequently filled in on September 22, 2015. The ASL was mowed on August 13 and 14, 2015. Landfill inspection forms are provided in Attachment 1. Landfill inspection photographs are provided in Attachment 2. Landfill inspection results are summarized on Figure 4-1.

##### 4.1.2 ASL Inspection Recommendations

The annual landfill inspections should be continued in accordance with the ASL Plan (PIKA-MP JV, 2015a).

#### 4.2 ASL Environmental Monitoring

Groundwater samples are collected every five years from eight monitoring wells at the ASL. Samples were last collected in 2011 and will be collected again in 2016 in accordance with the ASL Plan (PIKA-MP JV, 2015a).

**Footnotes:**

U - The compound was analyzed for but not detected. The associated value is the compound quantitation limit.  
B - The compound has been found in the sample as well as its associated blank; its presence in the sample may be suspect.

J - The compound was positively identified; however, the associated numerical value is an estimated concentration only.

UJ - The compound was not detected above the reported sample quantitation limit. However, the reported limit is approximate and may or may not represent the actual limit of quantitation.

UB - Compound considered non-detect at the listed value due to associated blank contamination.

ug/mL = micrograms per Liter

mg/mL = milligrams per Liter

RE: Fort Drum Installation Restoration Program (IRP), Basewide Monitoring Program  
Data Usability Summary Report (DUSR) Validation of Analytical Data Packages  
ALS SDG Nos. R1502843 and R1503071

Dear Mr. Bagnato:

Review has been completed for the data packages generated by ALS Environmental (ALS) that pertain to samples collected between 04/20/15 and 04/29/15 at the Fort Drum IRP, Basewide Monitoring Program site. Twenty aqueous samples and a field duplicate were processed for project-specific volatile analytes, methane, ethane, ethane, total iron, total manganese, ammonia, chloride, sulfate, nitrate, ferrous iron, and TOC. Fourteen additional aqueous samples, two field duplicates, and five trip blanks were processed for project-specific volatile analytes.

Validation of the analytical data was performed in accordance with the project Quality Assurance Project Plan (QAPP) dated January 2015, which utilizes the following documents and professional judgment:

- DoD Quality Systems Manual for Environmental Laboratories V. 4.2 dated June 5, 2003 (QSM)
- USEPA Contract Laboratory Program National Functional Guidelines for Organic Data Review (October 1999)
- USEPA Contract Laboratory Program National Functional Guidelines for Inorganic Data Review (October 2004)
- USEPA Region 2 Data Validation Standard Operating Procedures (SOPs) HW-2a, HW-2c, HW-33, HW-34, HW-35, HW-36, and HW-37

The following items were reviewed:

- \* Data Completeness
- \* Case Narrative
- \* Custody Documentation
- \* Holding Times
- \* Surrogate and Internal Standard Recoveries
- \* Trip/Method Blanks
- \* Laboratory Control Sample (LCS)
- \* Field Duplicate Correlations
- \* Matrix Spike Recoveries and Duplicate Correlations
- \* Field Duplicate Correlations

- \* Instrumental Tunes
- \* Calibration Standards
- \* ICP Serial Dilution Evaluations
- \* ICP Interference Check Samples
- \* Method Compliance
- \* Sample Result Verification

The data review includes evaluation of the specific items noted in The NYS DER-10 Appendix B section 2.0 (c) DUSR description. The items listed above that show deficiencies are discussed within the text of this narrative. The laboratory QC forms illustrating the excursions can be found within the laboratory data package.

**In summary**, results are usable either as reported or with minor qualification/edit, with the exception of the following:

- The ferrous iron result in 1595-PZ12-042915 is rejected due to extended holding time, but can be considered not to exceed the total iron value of 991 ug/L. The detected values for four other samples processed with the same timeframe are qualified as estimated, and may have a significant low bias.
- Nitrate, sulfate, chloride, and ferrous iron are reported with laboratory Limits of Quantitation (LOQ) that are above those noted in the project QAPP
- Detected results for nitrate in five samples are qualified as estimated, and may have a significant bias due to outlying holding time.
- Numerous volatile low level detections are edited to be non-detection due to failure to meet identification criteria.

More specifics of these issues are discussed in the text below.

Accuracy, precision, comparability, representativeness, and data sensitivity are acceptable. With the exception of the reporting limits of the four wet chemistry analytes noted above, sensitivity is also acceptable.

Sample identifications and validation qualifier definitions are attached to this narrative. Also included in this submission are the client results tables, with recommended qualifiers/edits applied in red.

#### **Chain-of-Custody/Sample Receipt**

The individual relinquishing the samples in the interim transfer is different than the individual who initially received the samples. They are both laboratory employees and the samples were in a secure location.

#### **Field Duplicate Correlations**

Blind field duplicates were collected at locations 3805-MWS24-042015, 2140-MW37-042715, and 1595-PZ11-042915. All correlations are within validation action limits.

#### **Volatile Analyses by EPA8260C**

The following detections are edited to nondetection due to very poor mass spectral quality, indicating poor or uncertain identification:

- p-isopropyltoluene (cymene) in 3805-MWS24-042015, 3805-PZ12S-042015, OSL-MW3-042215, 3805-MWS11-042215, 3805-MWS8-042215, 2140-MW07-042315, and 1595-PZ12-042915
- 2-hexanone in 1795-MWS3-042215 and 1795-MWS7-042215
- chloromethane in 1795-MWS21-042215
- n-butylbenzene in 1995-MWS9-042215
- n-butylbenzene, 4-chlorotoluene, 2-hexanone, and p-isopropyltoluene in 2140-MW37-042715
- n-butylbenzene and p-isopropyltoluene in DUP-02-042715
- t-butylbenzene in 1595-OBG2-042915

Due to presence in the associated trip and/or method blanks, the following detections are within the validation action levels to be considered external contamination, and are edited to reflect non-detection:

- acetone in 3805-MWS24-42015, 3805-PZ12S-042015, 3805-PZ3-42015, DUP-01-042015, 2140-MW14-042815
- naphthalene in 1295-MW26-042815, and 2140-MW27-042815

Results for analytes initially reported with the laboratory “E” flag are derived from dilution analyses, thus reflecting responses within the established linear range of the instruments. They are the following:

- o-xylene in 1795-MWS7-042215
- o-xylene and 1,2,4-trimethylbenzene in 1795-PZ15-042215

The matrix spikes of 3805-PZ14-042015, 1295-MWS27-042715, and 1295-MW30-042715 show recoveries and correlations that are within the QAPP referenced QSM limits, with the exception of one slightly low recovery. The acceptance ranges/limits in the data package for LCS and matrix spikes are laboratory in-house limits, and are stricter than those of the QSM. Therefore the laboratory cites three other recovery outliers that are actually within project limits.

Holding times were met. LCS recoveries are compliant. Blanks show no detections that are above one half of the LOQ or that affect sample reported results.

Calibration standards show acceptable responses, with the following exceptions, results for which are qualified as estimated in the indicated samples:

- bromomethane (21%D to 33%D) in all samples except 1595-MWS7-042915, 1595-OBG2-042915, and 1595-PZ12-042915
- 1,2-dibromo-3-chloropropane in 1795-MWS3-042215

Some of the samples were processed at initial dilution due to high target analyte concentrations, thereby producing elevated reporting limits.

### **Methane, Ethane, and Ethene Analyses by RSK-175**

Results for methane initially reported with the laboratory “E” flag are derived from dilution analyses, thus reflecting responses within the established linear range of the instruments. They are the following: 1995-MWS10-042215, 1995-MWS9-042215, 3805-MWS24-042215, DUP-01-042015, 1595-MW33-042915, 1595-MWS7-042815, 1595-OBG2-042915, and 1595-P12-042915

Matrix spikes of 3805-PZ14-042015 and 1295-MWS27-042715 show acceptable recoveries and duplicate correlations.

Holding times were met. LCS recoveries for those analytes are compliant. Blanks show no detections that are above one half of the LOQ or that affect sample reported results. Calibration standards show acceptable responses.

### **Total Iron and Manganese Analyses by EPA 6010C**

Matrix spikes and laboratory duplicate evaluations were performed on 3805-PZ14-042015 and 1295-MWS27-042715, and show acceptable reocveries and correlations.

Calibration standard responses are compliant. Blanks show no detections that are above one half of the LOQ or that affect sample reported results.

The ICP serial dilution evaluations were performed on 3805-PZ14-042015 and 1295-MWS27-042715X. Correlations are within validation guidelines.

### **Wet Chemistry—Chloride, Sulfate, Nitrate, Ammonia, Ferrous iron, and Total Organic Carbon**

The following samples were processed for ferrous iron beyond the allowable QAPP holding time of 48 hours, at six days from collection: 1595-PZ12-042915, 1595-MWS7-042915, 1595-OBG2-042915, 1595-PZ11-042915, and 1595-MW33-042915. 1595-PZ12-042915 shows no detection, and that result is therefore rejected, and not usable. The results for the other four samples are qualified as estimated, with a possible significant bias. The direction of bias would be low unless the samples were a reducing medium.

The following samples were processed for nitrate beyond the allowable QAPP holding time of 48 hours, at seven and eight days from collection: 1295-MWS27-042715, 1295-MW25-042715, 1295-MWS28-042715, 1295-MW30-042715, and 1295-MWS26-042815. These samples show detection, and the results qualified as estimated, with a possible significant bias. The direction of bias would be low unless the samples were an oxidizing medium.

The following laboratory reporting limits are above those of the QAPP. The number of samples showing no detection at the laboratory limits is also indicated:

Analyte	QAPP LOQ	Reported LOQ	Number of Nondetects
Ammonia	0.01	0.1	0
Chloride	1	2	0
Nitrate	0.1	0.5	7
Sulfate	1	2	4

Calibration standard responses are compliant. Blanks show no detections that are above one half of the reported LOQs.

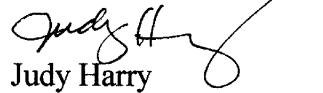

Matrix spikes/duplicates of 3805-PZ14-042015 and 1295-MWS27-042715 show acceptable recoveries/correlations, with the exception of one elevated recovery each for chloride and sulfate in the

former. No qualification to the data is made. An additional set of matrix spikes was evaluated for ferrous iron in 1795-MWS3-042215, with acceptable accuracy and precision.

The laboratory acceptance ranges/limits used for TOC LCS and matrix spike are 85% to 115%, whereas the project (SQM) limits are 90% to 110%. Actual recoveries are within both ranges, and data are unaffected.

Please do not hesitate to contact me if questions or comments arise during your review of this report.

Very truly yours,

Judy Harry

Att: Validation Qualifier Definitions  
Sample Identifications and Analytical Requirements  
Qualified Client Results EDDs

## **VALIDATION DATA QUALIFIER DEFINITIONS**

- J** Estimated: The analyte was positively identified, the quantitation is an estimation due to discrepancies in meeting certain analyte-specific quality control criteria.
- U** The analyte was analyzed for, but was not detected above the level of the associated reported quantitation limit.
- UB** Blank contamination: The analyte was found in an associated blank above one half the LOQ, as well as in the sample.
- UJ** The analyte was not detected; however, the result is estimated due to discrepancies in meeting certain analyte-specific quality control criteria.
- R** The data are rejected due to deficiencies in meeting QC criteria and may not be used for decision making.

RE: Fort Drum Installation Restoration Program (IRP) 3800 PCE Site  
Data Usability Summary Report (DUSR) Validation of Analytical Data Packages  
ALS SDG Nos. R1507407, R1507446, R1507461, R1507527, R1507588, R1507736, R1507738,  
R1507860, R1507965, R1507970, R1508476, and R1508557

Dear Mr. Bagnato:

Review has been completed for the data packages generated by ALS Environmental (ALS) that pertain to samples collected between 09/03/15 and 10/07/15 at the Fort Drum IRP 3800 PCE site. Eighty six aqueous samples and six field duplicates were processed for project-specific volatile analytes; ten of those samples and one of the field duplicates were also processed for TAL metals, and five others for total iron and lead. Twenty one aqueous samples and a field duplicate were processed for project-specific volatile analytes, methane, ethane, ethane, chloride, sulfate, nitrate as N, ammonia, TOC, ferrous iron, and total iron and manganese; one of these was also processed for TCL semivolatiles. Seven aqueous samples and one field duplicate were processed for project-specific volatile analytes, TCL semivolatiles, TCL pesticides, TCL PCBs, TAL metals, and total cyanide. Nine aqueous samples were processed for project-specific volatile analytes, TCL semivolatiles, and TAL metals; three are also processed for total hardness. Four aqueous samples were processed for project-specific volatile analytes, TCL semivolatiles, total iron and lead, and total hardness. Three soil samples were processed for project-specific volatile analytes and total iron and lead. The analytical methodologies that were utilized are those of the USEPA SW846 methods 8260C, 8270D, 8081B, 8082A, 6010C, 7470A, and 9012, and Standard Methods.

Validation of the analytical data was performed in accordance with the project Quality Assurance Project Plan (QAPP) dated January 2015, which utilizes the following documents and professional judgment:

- DoD Quality Systems Manual for Environmental Laboratories V. 4.2 dated June 5, 2003 (QSM)
- USEPA Contract Laboratory Program National Functional Guidelines for Organic Data Review (October 1999)
- USEPA Contract Laboratory Program National Functional Guidelines for Inorganic Data Review (October 2004)
- USEPA Region 2 Data Validation Standard Operating Procedures (SOPs) HW-2a, HW-2c, HW-33, HW-35, HW-36, and HW-37

The following items were reviewed:

- \* Data Completeness
- \* Case Narrative
- \* Custody Documentation
- \* Holding Times
- \* Surrogate and Internal Standard Recoveries
- \* Trip/Method Blanks
- \* Laboratory Control Sample (LCS)
- \* Field Duplicate Correlations
- \* Matrix Spike Recoveries and Duplicate Correlations
- \* Field Duplicate Correlations
- \* Instrumental Tunes
- \* Calibration Standards
- \* ICP Serial Dilution Evaluations
- \* ICP Interference Check Samples
- \* Method Compliance
- \* Sample Result Verification

The data review includes evaluation of the specific items noted in The NYS DER-10 Appendix B section 2.0 (c) DUSR description. The items listed above that show deficiencies are discussed within the text of this narrative. The laboratory QC forms illustrating the excursions can be found within the laboratory data package.

**In summary**, most samples were processed primarily in compliance with project requirements, and are usable either as reported or with minor qualification/edit. The exception is that the results for ferrous iron in three samples are not usable due to outlying holding time to analysis.

Accuracy, precision, comparability, representativeness, sensitivity, and data completeness are acceptable.

Sample identifications and validation qualifier definitions are attached to this narrative. Also included in this submission are the client results tables, with recommended qualifiers/edits applied in red.

#### **Chain-of-Custody/Sample Receipt**

Some of the sample identifications that include the “MWS” designation were reported by one or both of the laboratory locations as being “MW5”.

1995-MW52-091715, OSL-MW9A-091715, 3805-MWI12-091715, and OSL-MW8-091715 were received at elevated temperature. Therefore results for all analytes except the metals have been qualified as estimated in these four samples. Although qualified, the bias in the PCB results is expected to be minimal. Other of the coolers received at elevated temperature contain samples collected the same day as laboratory receipt that were in the processing of cooling, and no qualification is made.

Although the login form associated with SDG L1507965 states that the trip blank was not received, but it was logged in and reported.

The analytical requirements for DUP-100715-01 were not specified on the custody form.

The Trip Blank associated with the samples reported in R1508476 was not entered onto the custody form, but was received.

The custody for samples reported in SDG R1507407 does not include laboratory receipt entries.

### **Field Duplicate Correlations**

Blind field duplicates were collected at locations 1995-MWS10-090915, 1995-MW43-090815, 3805-PZ7-091015, 3805-MWD10-091415, 1595-PZ12-091715, 3805-PZ2D-092115, 2140-MW02-092215, and PCERI-IMW-25I-100715. All correlations are within validation action limits, with the following exceptions, results for which have been qualified as estimated in the indicated parent sample and its duplicate:

- 1,2,4-trimethylbenzene, 1,3,5-trimethylbenzene, o-xylene, m,p-xylene, and naphthalene in 1995-MWS10-090915
- aluminum in PCERI-IMW-25I-100715

### **Volatile Analyses by EPA8260C**

The results for SP03-EFF-090415 are qualified as estimated, with a low bias, due to low surrogate standard d8-toluene recoveries, indicating a matrix effect.

LC009-090415 and LS34-090415 were received at elevated pH above 2, indicating inadequate preservation. The samples were processed beyond the allowable holding time for unpreserved samples, and the results are therefore qualified as estimated in value, with a possible low bias. As the vials are certified for preservative, there may be a buffering effect from the matrix.

Many of the laboratory blanks and some of the trip blanks show low level contamination of 1,2,4-trichlorobenzene, naphthalene, and hexachlorobutadiene. Detections of these compounds in the associated samples that are within the level for consideration as contamination have been edited to reflect non-detection at either the reporting limit, or original reported concentration, whichever is greater. The laboratory applied the "B" flag (indicating co-presence in the associated method blank) only sporadically).

The following detections are edited to non-detection due to very poor mass spectral quality:

- acetone in 1795-SW00-090315, 1795-SW04-090315, and SP03-EFF-090415
- 2-butanone in 1595-SW01-090315, 3805-PZ2S-091115, and 1595-MWS8-091715
- chloroform in LC009-090415
- chloromethane in 1795-MWS9-090915
- 2-butanone in DUP-02-090915
- n-butylbenzene in 1995-MWS10-090915, 3805-PZ2S-091115, WWII-002-090915, 1795-PZ5-091015, 3805-PZ12S-091615, 3805-MWI9-091415, DUP05-091515, 3805-PZ13S-091515, 3805-MWI17-091615, 3805-PZ14-092315, 1595-MWS7-091815, 1595-PZ9-091615, and 1595-PZ12-091715
- p-isopropyltoluene in 3805-014-090815 and 3805-PZ13S-091515

The matrix spikes of 1795-MWS3-090915, 1795-PZ04-090815, 3805-014-090815, 3805-MWS8-0910415, 1795-MWS21-091015, 3805-MWD16-091515, DUP07-092115, 2140-MW12-092115, 1995-PZ13-091715, 2140-MW07-092315, 3805-MWD18-092215, PCERI-IMW-05, and 3805-002-100715 show recoveries and correlations that are within the QAPP referenced QSM limits, with the following exceptions, results for which are qualified as estimated in the indicated parent sample:

- 1,2,4-trimethylbenzene and m,p-xylene (153% to 238%) in 1795-MWS3-090915
- 1,2,4-trimethylbenzene, 1,3,5-trimethylbenzene, and styrene (11% to 71%) in 3805-MWS8-0910415 and 2140-MW07-092315
- 1,3,5-trimethylbenzene and styrene (43% to 61%) in 1795-MWS21-091015
- dibromochloromethane, dichlorobromomethane, and bromoform (21% to 58%) in PCERI-IMW-05
- styrene (34% and 46%) in 3805-MWD18-092215

Results for analytes initially reported by the laboratory with the "E" flag are therefore derived from the dilution analyses of the samples, thus reflecting responses within the established linear range of the instrument.

Holding times were met. LCS recoveries are compliant. Internal standards are compliant.

Calibration standards show acceptable responses, with the exception of those for bromomethane (26%D to 37%D) in the samples reported in SDGs R1507461, R1507527, R1507965, and R1508476, in all samples reported in SDG R1507738 except 3805-MWI17-091615, 3805-MWS4-091615, 3805-MWS2-091615, 3805-MW9A-091615, OSL-MW8-091715, and the trip blanks, and in DUP-100-715-01, PCERI-IMW-04, and Trip Blank 2, results for which are qualified as estimated in those associated samples.

Some of the samples were processed at dilution due to target analyte concentrations. This results in elevated reporting limits proportional to the level of dilution. The three soil samples reported in SDG R1507446 were processed at dilution due to foaming.

### **Semivolatile Analyses by EPA8270D**

The detection of 4-chloroaniline in 1295-MW-3D0-091515 is edited to non-detection due to very poor quality, non-definitive, mass spectral quality.

The matrix spikes of 3805-MWD16-091515 show acceptable recoveries and correlations. LCS recoveries are compliant.

Holding times were met. Blanks show no contamination. Calibration standards show acceptable responses. Surrogate and internal standards are compliant.

### **Methane, Ethane, Analyses by RSK175**

Results for analytes initially reported by the laboratory with the "E" flag are therefore derived from the dilution analyses of the samples, thus reflecting responses within the established linear range of the instrument.

The matrix spikes of 1795-MWS3-090915 show acceptable recoveries and correlations. LCS recoveries are compliant.

Holding times were met. Blanks show no contamination. Calibration standards show acceptable responses.

#### **Pesticide and PCB Analyses by EPA8081A and 8082**

Due to a low surrogate DCB recovery, the results for pesticides and PCBs in 3805-MWS14-091515 are qualified as estimated in value, with a possible low bias. The sample was re-extracted successfully, but just beyond the allowable holding time. Although those results are qualified, the field duplicate taken at this location did not require qualification, and can be used to indicate characterization at that location.

The pesticide and Aroclor 1016 and 1260 matrix spikes of 3805-MWD16-091515 show outlying recoveries for endrin aldehyde (28% and 37%). The associated LCSs also show one low recovery and an elevated correlation for that compound. Therefore, results for that analyte have been qualified as estimated in the samples reported in SDG L1507738.

Blanks show no contamination. Calibration standards show acceptable responses.

#### **TAL Metals by EPA 6010C and 7470C**

Matrix spikes and laboratory duplicate evaluations were performed on 1595-SW04-090315, 1795- MWS3-090415, 1295-MWS27-091115, PCERI-IMW-05, and 3805-MWD16-091515, and show acceptable recoveries and correlations.

Calibration and low level standard responses are compliant. Blanks show no detections that are above one half of the LOQ or that affect sample reported results.

The ICP serial dilution evaluations were performed on 1595-SW04-090315, 1595-SW01-090315, BM-03-090415, 1795-MWS3-090415, LC009-EFF-090415, 1295-MWS27-091115, 1295-MWS25-091615, PCERI-IMW-25I, PCERI-IMW-05, 3805-MW18-092215, 3805-MWD16-091515, 1595-MWS7-091815, and 3805-MWS5-092315. Correlations are within validation guidelines.

#### **Wet Chemistry Analyses—Total Cyanide, Total Hardness, Chloride, Nitrate as N, Sulfate, TOC, Ammonia, and Ferrous Iron**

Review was conducted for method compliance, transcription, calculations, standard and blank acceptability, accuracy and precision, etc., as applicable to each procedure. All were found acceptable unless noted specifically within this text.

1795-MWS3-090915, 1295-MW26-091115, 1295-MW27-091115, and 3805-PZ-2S-091115 were analyzed at between six and eight days from collection, so far beyond the 48 hour required holding time as to warrant non-detected results rejected, and detected results as qualified as estimated with a likely significant low bias.

The samples reported in R1507527 were also analyzed for ferrous iron beyond the holding time, and have been qualified as estimated in value, with a low bias.

Total cyanide results for the samples reported in SDG R1507738 are qualified as estimated, with a low bias, due to outlying holding time for analysis. The samples were originally processed within the required time, but were reprocessed due to initial QC failure.

Matrix spike recovery/duplicate correlation evaluations were performed as follows, with acceptable accuracy and precision:

- chloride, nitrate, sulfate, ammonia, ferrous iron, and TOC in 1795-MWS3-090915
- total cyanide (single matrix spike) on 3805-MWD16-091515
- ferrous iron, nitrate, and sulfate in 2140-MW27-09315
- ferrous iron (laboratory duplicate) on 2140-MW27-092314
- total hardness (laboratory duplicate) on OSL-SW09-090315
- chloride, nitrate, and sulfate in 1295-MW26-091115

Please do not hesitate to contact me if questions or comments arise during your review of this report.

Very truly yours,

  
Judy Harry

Att: Validation Qualifier Definitions  
Sample Identifications and Analytical Requirements  
Qualified Client Results EDDs

## **VALIDATION DATA QUALIFIER DEFINITIONS**

- U** The analyte was analyzed for, but was not detected above the level of the associated reported quantitation limit.
- J** The analyte was positively identified; the associated numerical value is an approximate concentration of the analyte in the sample.
- J-** The analyte was positively identified; the associated numerical value is an estimated quantity that may be biased low.
- J+** The analyte was positively identified; the associated numerical value is an estimated quantity that may be biased high.
- UJ** The analyte was analyzed for, but was not detected. The associated reported quantitation limit is approximate and may be inaccurate or imprecise.
- NJ** The detection is tentative in identification and estimated in value. Although there is presumptive evidence of the analyte, the result should be used with caution as a potential false positive and/or elevated quantitative value.
- R** The data are unusable. The sample results are rejected due to serious deficiencies in meeting Quality Control limits. The analyte may or may not be present.
- EMPC** The results do not meet all criteria for a confirmed identification. The quantitative value represents the Estimated Maximum Possible Concentration of the analyte in the sample.

## **SAMPLE IDENTIFICATIONS AND ANALYTICAL REQUIREMENTS**
