1.0 Project Description

The United States Army Corps of Engineers (USACE) has been tasked by Ft. Drum to complete a Base-wide assessment of areas potentially impacted by Perfluorinated Compounds (PFCs) and areas of potential exposure risk to end users of water systems. Impact assessment was carried out by conducting interviews of Ft. Drum employees, research of records, and site investigation. Due to the nature of the assessment some sites would be actively investigated and tested once they have been identified during these reporting activities. As such, some results have been provided within this document while others areas will require further investigation.

1.1 Purpose

Perfluorooctanoic acid (PFOA) and perfluorooctyl sulfonate (PFOS) are manmade chemicals in a large family of chemicals called perfluoroalkyl substances (PFASs) (Buck et al. 2011). PFOA has been used in a variety of consumer products and in the production of fluoropolymers, and is generated as a degradation product of other perfluorinated compounds. PFOA and PFOS are very persistent in the environment and the human body; it has been detected in water, wildlife, and humans worldwide.

In May of 2016 the United States Environmental Protection Agency (EPA) issued Health Advisory Levels (HA) for PFOA & PFOS in drinking water. For each of these two compounds a 0.07 µg/L lifetime HA has been set by the EPA. The reference dose for both PFOA and PFOS are based on similar developmental effects and are numerically identical; when these two chemicals co-occur at the same time and location in a drinking water source, a conservative and health-protective approach that EPA recommends would be to compare the sum of the concentrations ([PFOA] + [PFOS]) to the HA (0.07 µg/L) (EPA).

New York Department of Environmental Conservation as part of its commitment to safe drinking water in the state filed a Notice of Adoption for amendments to 6 NYCRR Part 597, Hazardous Substances Identification, Release Prohibition, and Release Reporting on March 3, 2017 to include PFOA and PFOS.

With these new regulations Ft. Drum and the Army have taken an active approach in identifying potential contaminations in soil and groundwater around the installation and accessing the level of contamination. In response to these new advisories Ft. Drum was also ordered by the U.S. Army Installation Management Command under Fragmentary Order 01 to Operations Order 16-088: PFC Contaminations Assessment (U) dated August 29, 2016 to: (1) assess PFOS and PFOA concentrations in drinking water systems serving Army Soldiers, Families, and Civilians and (2) evaluate current or former restoration sites as well as new sites where past or current use of PFOS/PFOA-containing products may have resulted in a Comprehensive Environmental Response, Compensation & Liability Act (CERCLA) release to the environment. This document outlines the results of this task.

1.2 Site Description

Fort Drum encompasses approximately 168 square miles and is located approximately 10 miles northeast of Watertown, 80 miles north of Syracuse, and 25 miles southeast of the United States and Canadian border. Fort Drum occupies a large portion of northeastern Jefferson County, a portion of western Lewis County, and abuts the southern edge of St. Lawrence County. Identified sites around Ft. Drum to screen for PFCs includes the Fire

Training Area (FTA), the Old Sanitary Landfill (OSL), the Airfield Sanitary Landfill (ASL), the Former Fire House, the Laundry Pad Sites, the Non-Regulated/Non-Public Water Systems, and Drinking Water Wells (Figures 1-1, 1-2, 1-3, & 1-4).

1.2.1 Physiography and Geology

Fort Drum lies within two physiographic areas; the Adirondack Highlands to the northeast, and the Erie-Ontario Lowlands to the southwest. Precambrian high-grade metamorphic rocks are the prominent rock type within the Adirondack Highland area. These consist of gneisses, granites, and marbles. Paleozoic sandstones, dolomitic sandstones, and limestone are the prominent rock types in the Erie-Ontario Lowland area. A thin coverage of glacial deposits is found throughout the area.

1.2.2 Sites of interest

1.2.2.1 Fire Training Area

The Training Pit within the Fire Training Area consisted of an 80 foot diameter concrete basin with a drainage system and underground storage tank. Historically fuel was poured into the pit and ignited, fire fighters would practice extinguishing the fires. One such practice for extinguishing the fires was to employ the use of Aqueous Film-Forming Foams (AFFF) which contained PFCs as a principle compound. Fuels used included waste Petroleum, Oil, & Lubricants (POL) products, POL contaminated materials, JP-4, gasoline and diesel fuels. An investigation conducted in 1990 as part of the Resource Conservation and Recovery Act (RCRA), the Facility Assessment (RFA) did not indicate impacts to the environment from operations POLs or related constituents. PFCs that may have been present in the fire-fighting foam were not identified (and not known) as potential constituents of concern during the 1990 investigation.

"The Fire Training Pit is located along the southern margin of Fort Drum south of Wheeler Sack Army Airfield. This area is underlain by approximately 50 feet of silty sand. These sands are deltaic deposits from the Black River delta, and consist of fine to medium grained sand that is variably silty. Thin veneers of lacustrine clay and silt or till deposits underlie these sands.

The uppermost bedrock units in this area are the limestone formations (from top to bottom, Chaumont, Lowville, and Pamela Formations) of the Black River Group. The Chaumont Formation consists of massive gray, finely textured cherty limestone. The middle unit, Lowville Formation, consists of medium gray fossiliferous, thick to thinly bedded limestone with shale partings. The lower unit, Pamela Formation, consists of dolomite limestone with limestone beds, and grades to dolomitic sandstone near the installation.

Near the Fire Training Pit, the land surface is drained by the Black River, which empties into Lake Ontario. Both surface water and groundwater in the vicinity of the Fire Training Pit discharge into the Black River.

The surficial sand aquifer in the vicinity of the Fire Training Pit is recharged by precipitation. Studies by Reynolds indicate that the underlying bedrock aquifer is hydraulically connected to and recharged by the surficial aquifer in the vicinity of the contaminant area, north-west of the Fire Training Pit, as indicated by similarities in groundwater flow direction and

location of groundwater divides in these two aquifers. Water levels in the surficial water-table aquifer and confined limestone units show that the water table is approximately 50 feet above the potentiometric surface in the fire training pit area." (Radian Corp, 1991)

According to Reynolds, regional groundwater flow in the vicinity of the Fire Training Pit is predominantly east-southeast, toward the Black River, and groundwater occurs approximately 30 feet below ground surface in silty sand deposits (Radian Corp, 1991).

1.2.2.2 Old Sanitary Landfill

"The OSL is located in the southern portion of Fort Drum, north of the intersection of Route 26 (Great Bend Road) and Oneida Avenue. The OSL occupies approximately 40 to 50 acres and is comprised of two major cells identified as OSL Cell 1 and OSL Cell 2. There is an unnamed stream that is located immediately between OSL Cell 1 and OSL Cell 2 which originates as a seep, groundwater discharge, or a combination of the two. Subsequently, the unnamed tributary of Pleasant Creek stream flows into the OSL Creek, which is approximately 2.5 miles long.

Operation of the OSL began in 1940 and continued through 1973. During the period of operation, most of the waste generated on the installation was disposed in the landfill (including, but not limited to materials such as, general refuse, containers with residual pesticides and herbicides, unused ammunition, chlorinated solvents, and industrial wastes). The OSL was formally closed in 1981 following placement of a 20-mil polyvinyl chloride (PVC) membrane cap and soil cover over approximately 38 acres to reduce infiltration and minimize leachate generation." (2016 Basewide Monitoring Report)

1.2.2.3 Airfield Sanitary Landfill

"The ASL is located adjacent to Wheeler Sack Airfield's northeast boundary and approximately 1,000 feet northwest of the Black River. The landfill occupies approximately 37 acres and is covered with vegetation. The topography of the landfill and the surrounding area is nearly flat.

The ASL began operating in 1973 after closure of the OSL. Solid wastes generated from various locations were placed into trenches in the sandy soil until the landfill was closed in 1987. The types of wastes placed in the ASL included municipal solid waste, paint wastes, solvent containers, triple-rinsed pesticide containers, and petroleum, oil, and lubricant (POL) saturated wastes. The trenches were oriented northwest to southeast approximately 300 feet wide with a maximum length of 1,900 feet. The trenches were approximately 20 feet deep and were unlined. They were covered with native sandy soil and some areas were grassed. The northeast 14 acres of the site (referred to as "Phase I") were covered with an impermeable 20-millimeter PVC liner, 6 inches of soil cover, and re-vegetated. Solid waste was also disposed of on the 23 acres southwest of, and adjacent to, the Phase I area until October 1987 (referred to as "Phase II"). In 1990, Phase II was closed by installing a 40-millimeter PVC cover, 18 PVC gas vents, 12 inches of soil cover, and vegetation." (2016 Basewide Monitoring Report)

1.2.2.4 Laundry Pads

The Shower/Laundry Pads are located in the training area north-northeast of the Airfield and south-southwest of the Main Impact Area. The downrange area is heavily wooded and has remote access from the rest of the installation.

A Laundry Pad is a simple structure that is nothing more than a rimmed square concrete slab with one or two sumps for waste water to drain out into a small leachate field. These pads were temporary working areas for the LADS. A single LADS can launder 500 sets of laundry a day. To support a Brigade Combat Team during 14-day training exercise two LADS could be utilized, allowing soldiers to receive clean laundry every four days. The LADS is a highly efficient system, recycling more than 98% of its 1,300 gallon tank with every cycle, but by the end of the exercise the LADS will produce nearly 1,500 gallons of wastewater, assuming no clothing would be laundered the first three or last three days of the exercise. This wastewater contained detergents, dirt, and oils, as well as a Teflon-based additive to restore water repellency to Gore-Tex material.

1.2.2.5 Former Fire House

Former building 2061, once located on the grounds at Wheeler Sacks Army Airfield just inside the main airfield gate off of now Munns Corner Road, the Former Fire House was where the Ft. Drum Fire Department was stationed by Wheeler Sack Airfield prior to moving its current location at FOB Road by the Airfield Base Operations building. The Fire House was part of the emergency response system at the airfield. The fire department may have used and stored AFFF for firefighting purposes at this location.

1.2.2.6 Non-Regulated/Non-Public Water Systems

The Non-Regulated/Non-Public Water Systems consist of a group of non-potable water supply wells used for field showers, sinks, and sanitary systems than service fewer than 25 people at any well location. All wells with the exception of one are located in the Training Area which lies to the north-northeast of the airfield.

1.2.2.7 Water Supply Wells

The Water Supply Wells are a group of wells installed for potable water consumption and are all located near the airfield side on Ft. Drum. The well field consists of a number of older wells (Wells 2 through 12) and newer wells, termed New Well Field (Wells 13 through 18, though 13 is non-productive). Currently none of the older wells are actively used because of operational issues or the presence of contamination. In some instances, the source of the contamination may not be well understood and is being evaluated under a separate scope titled, Fort Drum Well Field Evaluation Scope of Work, dated February 2017. Wells 7, 11, and 12 are impacted by PFCs presumably from the nearby FTA. Of the older wells only 2,3,7,9, 10, 11, and 12 have operating pumps to allow for sampling or operation. As of this report the New Well Field is in a phased start-up plan and not all wells are currently active.

1.2.2.8 Fire Suppression Systems

Fire suppression systems in this assessment included any devices which have or had the means of employing the use of AFFF, including stationary suppression systems located in Hangers at Wheeler Sack Airfield (2072, 2049,

2050, 2060, 2070, 2074, 19710, 20470, & 20471), Building 19855 and non-stationary systems including five crash trucks and one DES Trailer.

2.0 Methods

As part of the Screening Level Investigation a base-wide assessment was conducted in order to better ascertain a clear image of areas that could have been impacted by PFC contamination and to what level of concern. Data collection for the assessment was completed by conducting research into sites with higher known potential risk to exposure, targeting known groundwater supply resources, and by completing interviews with personnel who would have knowledge of the use of chemical uses around the installation such as AFFF. Sites that could be rapidly accessed for field investigation and sampling were completed during this assessment in order to gain a clear picture of total overall actual risk sooner and to meet Army requirements. Sampling for PFCs followed USACE-Baltimore District Standard Operating Procedure for Sampling of PFCs.

3.0 Site Assessments

The base wide site assessment was conducted by the following methods in order to determine the risk and need to investigate for PFCs; review of current and former IRP sites, internal interviews, research into the use of AFFF, and following authority under Fragmentary Order 01 to Operations Order 16-088.

A review of existing Installation Restoration Program (IRP) sites was conducted to determine potential for PFC contamination based off of historical knowledge of the sites and current reporting data. Of these sites, three were selected for investigation; the OSL, ASL, and FTA. The OSL and ASL were selected for investigation because of the potential for refuse containing PFCs. These sites were also a reasonable targets to get data quickly as they are currently part of a Long Term Monitoring Program (LTM) under the IRP and have monitoring points already in place. The FTA is a closed IRP site, but at the time of closure PFCs were not a chemical of concern (CoC). Due to the known use of AFFF in the area for training purposes and PFCs being detected from nearby production wells (Well 7, 11, and 12) it was determined that additional sampling for PFCs was needed. It was decided that both soil and groundwater samples would be collected around the FTA pit area. A preliminary site assessment was conducted at the FTA documented in Field Summary Report - Old Fire Training Pit to determine the existence of PFC contamination in groundwater around the Fire Training Pit Area due to the use of AFFF as a result of fire training purposes.

At the request of the New York State Department of Environmental Conservation (NYSDEC), a Class B Fire Suppression Foam Usage Survey was completed. The purpose of this survey and associated interviews was to determine the period of use, storage practices and locations, brands, and instances of use to best determine areas subjected to PFCs through the use of AFFF. Interviews were conducted and determined that there were no onsite spills or discharge of AFFF other than the FTA that would warrant further investigation. However, AFFF was utilized in fire suppression systems around the base where there were no hazardous discharges.

Through a "White Paper" written by a soldier requesting for the use of the laundry pads for use in training purposes, the laundry pads were identified as an area of interest for this investigation. Further collected data through interviews and research indicated for the potential use of laundry

detergents at LADSS that contained a Teflon based additive to restore water repellency to Gore-Tex materials which contain Perfluoroacrylate. Laundry Pad Sites 1, 2 and 3 in the Down Range area of the installation were identified as areas of potential areas of concern. These areas were sampled for PFCs, as well as, VOCs and Metals.

Another area identified during the interview process was the former fire station. The possibility that AFFF may have been discharged around the area due to historical cleaning and disposal practices. As a result the former fire house area has been identified for further investigation.

Under direction of Fragmentary Order 01 to Operations Order 16-088 Ft. Drum and the USACE also conducted PFOS and PFOA sampling for all Army-owned and operated water systems that have not previously sampled for PFOS and PFOA. These sites included potable and non-potable water supply systems that are both active and inactive which had a method of delivering water supplies. This means that all wells which had running electricity and functioning pumps were sampled. Wells that were identified as meeting these criteria were Water Wells 002, 003, 007, 009, 010, 011, 012, 014, 015, 016, 017, & 018. Additionally, the non-regulated/non-public water systems that were identified for investigation were located at locations; Hillside Lodge, Ammo Supply Point Admin, Ammo Supply Point Turn-In, Ammo Supply Point Inspection, Shower Points 14G, 13A & 17D, and Ranges 13A, 23, 35, 39, 44 & 48.

4.0 Field Activities

After the initial site assessment, investigations of the potentially impacted sites were ordered immediately after identification if time, accessibility, and resources aloud. In some cases areas that could not be investigated at the time of this report are in the planning process for investigation. Additionally, sites like the FTA it was determined that a more aggressively proactive approach was warranted due to the impact of nearby water supply wells and the Black River.

4.1 Fire Training Area

Ft. Drum Directorate of Public Works conducted a soil sampling event on 9-June-2016 at the project site as part of a spill response in which a petroleum odor was detected during a site walk-through. Field samples that were collected for analysis during this effort were from various locations around and immediately under the eastern concrete rim of the Fire Training Pit, all matrices were soil. Samples of the sludge and water perched in the pit were also collected for analysis. Based off of the returned results the facility took action to reduce the risk of further exposure to ground by demolishing and disposal of the Fire Training Pit materials and removal of soil to five feet below grade.

During the Month of August 2016 the USACE Field Exploration Unit (FEU) completed the installation of four groundwater monitoring wells in the area immediately up gradient and downgradient of former fire pit for characterization of PFCs in groundwater. Details of this event are outlined in Appendix A.

During the Month of October 2016 the Ft. Drum Directorate of Public Works conducted the removal of the Fire Pit Drainage System. The systems piping was plumbed from a floor drain in the fire pit to about four feet below top of ground and extended about one hundred feet to the west ending at an

underground storage tank and oil water separator. The tanks were placed at a bottom depth of around 12 feet. During the excavation it was noted that the piping from the pit to the tanks was braking during removal efforts, as such the remaining piping fragments were abandoned in place. A series of grab samples were taken at the base of the piping at different intervals along its length. Grab samples were also taken at the base of each of the tanks.

4.1.1 Results

The results for the June-2016 soil sampling event showed high levels of PFOS in the range of 150 ng/g to 11000 ng/g and low to high levels of PFOA in the range of 1.3 ng/g to 200 ng/g. The results from this sampling event show that concentrations are highest immediately at and to the northeast edge of the fire pit with concentrations decreasing rotating around the pit to the east southeastern edge and outward to Pit #1. The surface water that was perched within the pit had detections of PFOS at 280,000 and PFOA at 30,000.

The PFC results from the August-2016 groundwater sampling event showed that nearly all concentrations are very high. The dilution factor for many of the samples were extremely high due to the high concentrations, particularly for PFOS and PFOA. With dilution factors of 90 to 100 the data is reported in table 1 below as greater than the result, as the actual result exceeds the instrument range even with the dilutions. The range of results for PFOS is >1500 ng/L to >4800 ng/L. The range of results for PFOA is 150 ng/L (MW-4) to >2100 ng/L.

The October-2016 soil samples that were collected during the removal of the fire training pit drainage system in generally showed low levels of PFC contamination. Only two samples showed somewhat elevated concentrations of PFOS and PFOA, the ground immediately under the oil water separator with PFOS at 100 ng/L and PFOA at 0.74 ng/L and Line Pit 2 (center of the drainage pipe) had levels of PFOS at 68 ng/L and PFOA at 5.6 ng/L.

4.2 Old Sanitary Landfill

Three groundwater monitoring wells at the OSL were sampled for PFCs; OSL-MW10, OSL-MW9A, and OSL-MW08. These three wells were chosen for sampling because of their positions to the edge of the landfills and the local groundwater flow directions at this site. Groundwater flows generally to the North and Northwest. OSL-MW-10 and OSL-MW9A were sampled due to their downgradient position to each cell of the OSL and OSL-MW08 was chosen because of the upgradient relationship to both OSL Cells. It was decided that if contamination were to occur it would be likely that it would be detected at these locations.

During the sampling event there was high level of construction activities located at OSL-MW08. Due to the construction activities a field blank was taken at this location to check for any background interference.

4.2.1 Results

All levels of PFCs were either non-detect or detected in very low concentrations, < 7.6 ng/L (PFOA+PFOS) in any one well. Construction activities showed no signs of negatively impacting the results.

Based on test results indicating no or very low level PFC detections, no additional investigations for PFCs at the Old Sanitary Landfill are recommended at this time.

4.3 Airfield Sanitary Landfill

Three groundwater monitoring wells at the ASL were sampled for PFCs; ASL-MW12A, ASL-MW14, and ASL-MW961. These three wells were chosen for sampling because of their positions to the edge of the landfills and the local groundwater flow directions at this site. Groundwater flows generally to the south-southeast over the majority of the ASL. Towards the North end of the ASL groundwater flows more towards the east. MW12A and ASL-MW14 were sampled because of their downgradient position relative to the ASL and ASL-MW961 was chosen because of the upgradient relationship. It was decided that if contamination were to occur it would be likely that it would be detected at these locations.

It was observed during sampling that these monitoring wells had dedicated Teflon lined sample tubing installed in each well. This was noted during sampling as Teflon lined tubing is not recommended for PFC sampling. Prior to sampling the tubing was removed and each well was purged according to low flow sampling guidelines.

4.3.1 Results

All levels of PFCs were either non-detect or detected in very low concentrations, < 4.3 ng/L (PFOA+PFOS) in any one well.

Based on test results indicating no or very low level PFC detections, no additional investigations for PFCs at the Airfield Sanitary Landfill are recommended at this time.

4.4 Laundry Pads

The laundry pads consist of three separate sites with nearly identical infrastructure and were believed to have been operated similarly. At each pad a sump drain and a leachate field sample were taken. Laundry Pad 3 had two sump drains so there was a sample taken from each in this case. In addition to PFC analysis, metals and sVOCs were analyzed as well.

The sump samples were taken by driving a decontaminated standard split spoon sampler through the bottom of each sump to a depth of two feet. A composite soil sample was collected for analysis.

While exact construction of the leachate field was not known prior to investigation, it was surmised that the four inch corrugated pipe that drained each sump lead directly out from the laundry pads to a below grade gravel bed leachate field. During field investigation this was found to be true. In order to identify the location for sampling a Schonstedt metal detector was used to define the linear extent of the drainage pipe from the sump that it drained. Once the end of the pipe was determined a CME750 drill rig was used to auger near the end of the pipe to a depth just below the piping as determined from the sump drainage measurement from top of ground. A split spoon sampler was driven through the augers until through the gravel bed. Once through the gravel bed a second split spoon sampler was driven for a length of two feet. The resulting soil sample was composited and jarred for analysis.

4.4.1 Results

All levels of PFCs were non-detect with the exception of a low level detect of < 1.6 ng/g PFOS at SB-3 Sump A.

There were no significant level of metals or sVOCs detected during this investigation. Based on test results indicating no or very low level detections of PFC, metals, or sVOCs, no additional investigations at the laundry pads are recommended at this time.

4.5 Former Firehouse

The Former Firehouse is no longer standing and has been replaced by new infrastructure. Future investigation to be conducted at this site has been identified and is expected to occur in calendar year(s) 2017/2018. Research will be conducted into what the exact footprint of the building and lot boundaries were. Once further research has been conducted a small series of soil and groundwater samples will be collected through temporary borings and an addendum in the form of a memo to this Preliminary Assessment will be issued.

4.6 Non-Regulated/Non-Public Water Systems

All water supply wells outside of the normal potable water distribution network which had operational pumps were sampled for PFCs by Ft. Drum Directorate of Public Works during July-2016. As these wells are operational no purge time was required and samples were collected directly from the supply lines.

4.6.1 Results

All levels of PFCs at each tested well were non-detect.

4.7 Water Supply Wells

All water supply wells that are part of the installation's potable water supply distribution network which had operational pumps were sampled for PFCs in joint effort by Ft. Drum Directorate of Public Works and the COE Baltimore District. At the time of the wells being sampled none of the wells were actively producing water.

Wells 2, 3, 9, 10, 14, 15, 16, 17, & 18 were sampled in April of 2017 exclusively by Fort Drum Directorate of Public Works. It is unclear the specific sampling methodology used at the time of sample collection for this event. What is known is that, no wells were operational at the time of sampling. Each well had to be turned on prior to sampling and samples were collected directly from the supply lines for that well prior to entering the main water supply network.

Wells 7 and 11 were sampled for PFCs during June-2016, along with the resampling of wells 14, 15, 16, 17, and 18. This sampling event was conducted jointly by the Fort Drum Directorate of Public Works and the USACE Baltimore District, where the USACE was the task lead. Sampling protocols followed the USACE Baltimore District standard operating procedures for sampling of PFCs. At the time of sampling none of the wells were in operation. Each well was turned on and three calculated well volumes were purged into an onsite vacuum

truck from either a hydrant or a valved bypass. Once purging was completed standard water quality parameters were collected and the purged water was discharged to the Ft. Drum sanitary sewer system for treatment. All samples were collected from either the hydrants or the bypasses.

In July-2016 Well 12 was sampled for PFCs. This well is situated between wells 7 and 11 and was not initially tested during the June event due to not having power to the system for operation. Once power was connected the same personnel and protocols were used for sampling of this well as was during the June event.

4.7.1 Results

Of the wells not associated with the New Well Field (Wells 14, 15, 16, 17, & 18) there were no detects of any PFCs in wells 9 and 10. Wells 2 and 3 had no detections of PFOS or PFOA but did have low levels of both PFHpA and PFHxS which there is no Health Advisory (HA) values associated. Wells 7, 11, and 12 did have detections of PFOS as well as detections of PFHpA and PFHxS, but did not exceed the HA levels of 70 ng/L. Well 7 was the only well with detections of PFOA and was the only well tested that exceeded HA levels for both PFOA and PFAS at a combined total of 101 ng/L, with PFOA being the largest constituent at 90 ng/L.

Of the wells associated with the New Well Field there were no detections of any PFCs that were tested.

4.8 Fire Suppression Systems

A total of ten fire suppression systems (9 hangers and 1 building), five DES crash trucks, and one DES trailer were investigated under this assessment for the use of AFFF and compliance with NYDEC's emergency and chemical bulk storage rules. Storage locations for fire suppressing foams exist at hanger locations 2072, 2060, 2074, 20470, and 20471 where the foaming agents are contained in 55 gallon drums. Under the chemical bulk storage rule registration is required only if the concentrations of PFOA and PFOS exceeds 1% or more by volume of one or more of the PFOA/S hazardous substances and the stationary device stores more than 185 gallons or 2200 lbs. in non-stationary devices. Additionally, all of the fixed fire suppression systems utilize entirely indoor and above ground infrastructure such as above ground storage tanks (AST) and above ground piping. The emergency rule sets in place guidelines for the prohibition and phase-out of PFOA and PFOS containing AFFF that would release more than one pound of the chemicals when used.

The Class B Fire Suppression Foam Usage Survey (*Appendix E*) as stated previously was completed at the request of NYSDEC. In completing this survey the NYSDEC requested further details on the use of specific manufacture products of AFFF being used by the suppression systems, specifically in response to questions 7a and 7e of this form. *Appendix G* contains volumes and manufacturer information for each type of foam used at each one of these systems. To ensure manufacture provided data was accurate, collection and testing of foam from the suppression systems to confirm. Data for this testing can be found in *Appendix C*. It has been noted that historical data of types of foams used 5 years or greater in the past has not been located after exhaustively searching of facility records, as provided to the Division of Environmental Remediation - NYSDEC.

4.8.1 Results

None of the investigated locations require chemical bulk storage registration as no foam used contains 1% or more by volume of PFOA and PFOS.

Of the stationary systems checked only Hanger 2072 and Building 19855 employ the use of AFFF containing PFOA and PFOS all other buildings fire suppression systems have been replaced. Likewise, all newer buildings constructed have no known history of deployment of AFFF for fire suppression uses. In one case there was an accidental discharges of AFFF from a fire suppression systems in a newer building which was not released to the environment, waste from this particular deployment was drained into the sanitary sewer system via floor drains in the building. To this point, the fixed suppression systems being indoors and above ground would protect the environment as equally to this case since any release would be contained to building and the sanitary sewer drainage system. Otherwise, the discharge of AFFF in aircraft hangers is inherently rare due to the infrequency of aircraft fires, and fiscal loss incurred by the need to recharge the foam in the event of an accidental discharge. Because of the use of ASTs and above ground piping over underground systems there inherently is a lower risk to the environment from any potential leaks.

All non-stationary systems, five of the crash trucks and the trailer employ the use of AFFF which contains PFOA and PFOS. In each case there would be less than 0.5 lbs. of PFOA + PFOS discharged in any single event from any one of these systems which is well under the 1.0 lb. limit, meaning that a one-time release in the case of an emergency would not require an investigation. It may be the case however if there were to be multiple releases in one specific area over time, such as the FTA. The <0.5 lb. value was derived from the data of the confirmatory testing that was completed by Ft. Drum as described in section 4.8 using:

Equation

$$\frac{(\text{Vol. liquid}) * (\text{specific gravity}) * (8.3\text{lb/gal}) * (\text{concentration in PPM PFOA/S})}{1,000,000.}$$

This value is up dated from the previously reported value of 0.003 lbs. maximum release as depicted in **Appendix G**. Using the calculation above, crash truck #2 with a volume of 1.7042 mg/L (PFOA+PFOS) came in at the highest tested concentration by volume stored at 0.45 lbs. and crash truck #4 came in <0.003 lbs. per volume stored. These system's foams also should be expected to contain other PFCs aside from PFOA and PFOS.

Fort Drum takes maintenance to ensure the safest operation possible of the fire systems seriously and as such are some of the best maintained systems in its inventory. This is especially true in the high profile areas as the aircraft hangers.

5.0 Discussion

In general there were no exceedances of PFOA + PFAS at any of the tested locations with the exception of the FTA and the water wells nearby the FTA. All other locations sampled were below the HA values and do not pose a risk

to any users. This lends to the point that PFCs should not be expected in any exceedances except for those areas where there was repetitive and definitive use or exposure to chemicals such as those found in AFFF.

Based off of the results taken from this assessment there are no anticipated impacts of PFCs to the new well field and Ft. Drums water supply distribution system.

The FTA has shown that the usage of AFFF largely contributes to the known contamination of PFCs in soil and groundwater, even in the case when using perceived appropriate precautionary measures. The level of detections at the FTA warrant further investigation at the FTA, which is currently under way at the time of this report. The contamination at the FTA stands to impact nearby water wells 7, 11, & 12 which has been seen from this assessment and could potentially lead to downgradient impacts to surface water bodies and future groundwater usage. It is believed at this time that the PFC contamination has been held largely in place locally to the FTA and slightly upgradient towards wells 7, 11, & 12 as wells 7 and 11 were operational up until the end of March-2016.

Due to the operation of Wells 7 and 11 until March-2016, the detection of PFCs at both the wells and the FTA, and analysis of hydrogeological models it is believed that the source of contamination at these wells can be attributed to the contamination at the FTA. As well 7 is the closest well to the FTA it stands to reason that its influence of the groundwater table would be largest thusly show higher detections of PFCs, which it does. There is also a noticeable decrease in concentrations moving further away towards well 12 and then well 11.

Under directive by the Department of Defense, the base has discontinued the use of any Class B firefighting foams for training purposes.

Description

3M® Light Water FC-203CF 3% Aqueous Film Forming Foam (AFFF) is a synthetic firefighting foam concentrate designed for use on non-polar, hydrocarbon hazards. When proportioned with water and applied with conventional foam or water/fog equipment, Light Water 3% AFFF provides excellent control and extinguishment of Class B fires by spreading a vapor-sealing film over the liquid fuel. This vapor seal inhibits reflash even when the foam blanket is ruptured and also allows the product to be used to secure non-ignited spills. Light Water 3% AFFF provides excellent penetrating and wetting qualities when used on Class A fires. This is important when extinguishing deep-seated fires in wood, paper, rubber tires and other ordinary combustibles.

Typical Properties

(Not for Specification Purposes)

Nominal use concentration	3%
Specific gravity	@ 77°F (25°C): 1.027
Density	8.56 lbs./gal.
Viscosity	@ 77°F (25°C): 3.5 centistokes @ 40°F (4.4°C): 5.3 centistokes
Minimum use temperature	35°F (1.7°C)
Storage temperature	35° - 120°F (1.7° - 49°C)
Freeze point	25°F (-4°C)
pH	@ 77°F (25°C): 8
Appearance	Amber liquid

Applications

Light Water FC-203CF 3% AFFF can be used with conventional foam equipment with fresh, sea or brackish water. Self-educing foam nozzles and foam nozzles with in-line educators are among the most common types of hardware for application.

In addition to its use in aspirating foam equipment, Light Water 3% AFFF can be dispensed effectively through non-aspirating equipment including fog nozzles, water spray devices and standard sprinklers. Light Water 3% AFFF exceeds U.S. Military specification MIL F24385F, supersedes E(SII) and is listed on the U.S. Military Q.P.L. (Qualified Product List). Light Water FC-203CF 3% AFFF is listed by UL and approved by Factory Mutual Research Corporation (FM).

Light Water 3% AFFF may be applied to fires simultaneously with dry chemical firefighting agents because the two are compatible.

Features

Effective: Rapid extinguishment reduces the chances of dangerous incidents and reduces the risk to property and equipment. Light Water 3% AFFF also prevents reflash and bumback, which are major causes of injuries. The securing action of Light Water 3% AFFF minimizes the fire hazard during clean up of flammable liquid spills.

Reliable: Light Water 3% AFFF can be stored for virtually an indefinite period of time in approved equipment and systems. NFPA 11 recommends annual inspection of all foam systems.

Features (cont.)

Economical: Light Water™ FC-203CF 3% AFFF offers faster extinguishment than protein based foams, so less agent is required in training and actual fire emergencies. Its wide range of applications reduces or eliminates the need to inventory other special type agents.

**Environmental/
Toxicological
Properties**

Light Water FC-203CF 3% AFFF concentrates undergo a program of ongoing testing to assess the impact of 3M firefighting foam on the natural environment. Data indicate that:

3M™ AFFF products are low in toxicity to tested aquatic organisms. (Toxicity information is available from Product Environmental Data Sheets, Material Safety Data Sheets and Toxicity Summary Sheets for individual products.)

Aquatic life is not adversely affected when 3M AFFF products are used and disposed of properly.

3M AFFF products can be successfully treated in biological waste water treatment systems. (Request Product Environmental Data Sheets and Disposal Recommendations from your 3M representative.)

Storage

Light Water FC-203CF 3% AFFF may be stored in its shipping container without change in its original physical or chemical characteristics. It does not show significant sedimentation or precipitation in storage or after temperature cycling. Freezing and thawing have no effect on performance and the concentrate proportions satisfactorily in ordinary equipment at temperatures above 32°F. Freeze-thaw cycling may cause slight stratification which may be overcome with moderate agitation. Premix solutions in fresh water may be stored long-term for ready use at temperatures above freezing.

Packaging

Light Water 3% AFFF is available in 5 gallon pails or 55 gallon drums.

FLASH POINT:..... None (Setaflash CC)
FLAMMABLE LIMITS - LEL:..... N/A
FLAMMABLE LIMITS - UEL:..... N/A
AUTOIGNITION TEMPERATURE:..... N/A

EXTINGUISHING MEDIA:

Product is a fire-extinguishing agent.

SPECIAL FIRE FIGHTING PROCEDURES:

Not applicable

UNUSUAL FIRE AND EXPLOSION HAZARDS:

See Hazardous Decomposition section for products of combustion.

4. REACTIVITY DATA

STABILITY: Stable

INCOMPATIBILITY - MATERIALS/CONDITIONS TO AVOID:

Not applicable.

HAZARDOUS POLYMERIZATION: Hazardous polymerization will not occur.

MSDS: FC-203CF LIGHT WATER(TM) Brand Aqueous Film Forming Foam

PAGE 3

4. REACTIVITY DATA (continued)

HAZARDOUS DECOMPOSITION PRODUCTS:

Carbon Monoxide and Carbon Dioxide, Oxides of Nitrogen, Oxides of Sulfur, Hydrogen Fluoride

Thermal decomposition of usage concentrations does not present a hazard.

5. ENVIRONMENTAL INFORMATION

SPILL RESPONSE:

Observe precautions from other sections. Ventilate area. Contain spill. Cover with absorbent material. Collect spilled material. Clean up residue with water. Place in an approved metal container. Seal the container.

RECOMMENDED DISPOSAL:

Discharge spent solutions to a wastewater treatment system. Reduce discharge rate if foaming occurs. Large quantities may adversely affect biological wastewater treatment systems. Incinerate in an industrial or commercial facility in the presence of a combustible material. Combustion products will include HF.

ENVIRONMENTAL DATA:

A Product Environmental Data Sheet (PED) is available.

5-Day Biochemical Oxygen Demand (BOD5): 0.35 g/g; 20-Day Biochemical Oxygen Demand (BOD20): 0.75 g/g; 20-Day BOD/COD: 0.96; Chemical Oxygen Demand (COD): 0.75 g/g; 96-Hr LC50, Fathead minnow (*Pimephales promelas*): >1,000 mg/L; 48-Hr EC50, Water flea, (*Daphnia magna*): >1,000 mg/L; 96-Hr EC50, Algae (*Selenastrum capricornutum*): 143 mg/L (130-156); 30-Min EC50, *Photobacterium phosphoreum* (Microtox System): 280 mg/L (260-300); 3-Hr, 20C EC50, Activated Sludge Respiration (OECD Method #209): >1,000 mg/L.

REGULATORY INFORMATION:

Volatile Organic Compounds: 200 gms/liter South Coast Air Quality Mgmt Dist Method Calo. @ 20 C..
VOC Less H2O & Exempt Solvents: N/A.

Since regulations vary, consult applicable regulations or authorities before disposal. In the event of an uncontrolled release of this material, the user should determine if the release qualifies as a reportable quantity. U.S. EPA Hazardous Waste Number = None (Not U.S. EPA Hazardous).

The components of this product are in compliance with the chemical registration requirements of: TSCA, EINECS, CDSL, AICS, MITI.

6. SUGGESTED FIRST AID
.....

EYE CONTACT:

Immediately flush eyes with large amounts of water for at least 15 minutes. Get immediate medical attention.

SKIN CONTACT:

Flush skin with large amounts of water. If irritation persists, get medical attention.

INHALATION:

If signs/symptoms occur, remove person to fresh air. If signs/symptoms continue, call a physician.

IF SWALLOWED:

Drink two glasses of water. Call a physician.
.....

.....
7. PRECAUTIONARY INFORMATION
.....

EYE PROTECTION:

Avoid eye contact with vapor, spray, or mist. Wear vented goggles.

SKIN PROTECTION:

Avoid skin contact. Wear appropriate gloves when handling this material. A pair of gloves made from the following material(s) are recommended: butyl rubber.

RECOMMENDED VENTILATION:

Use with adequate dilution ventilation.

RESPIRATORY PROTECTION:

Avoid breathing of vapors, mists or spray. Select one of the following NIOSH approved respirators based on airborne concentration of contaminants and in accordance with OSHA regulations: Half-mask organic vapor respirator with dust/mist prefilter.

PREVENTION OF ACCIDENTAL INGESTION:

Do not eat, drink or smoke when using this product. Wash exposed areas thoroughly with soap and water. Wash hands after handling and before eating.

* SKIN NOTATION: Listed substances indicated with 'Y' under SKIN refer to the potential contribution to the overall exposure by the cutaneous route including mucous membrane and eye, either by airborne or, more particularly, by direct contact with the substance. Vehicles can alter skin absorption.

SOURCE OF EXPOSURE LIMIT DATA:

- ACGIH: American Conference of Governmental Industrial Hygienists
- 3M: 3M Recommended Exposure Guidelines
- CMRG: Chemical Manufacturer Recommended Exposure Guidelines
- NONE: None Established

8. HEALTH HAZARD DATA

EYE CONTACT:

Moderate Eye Irritation: signs/symptoms can include redness, swelling, pain, tearing, and hazy vision.

SKIN CONTACT:

Moderate Skin Irritation (after prolonged or repeated contact): signs/symptoms can include redness, swelling, itching, and dryness.

Prolonged or repeated exposure may cause:

May be absorbed through the skin in harmful amounts.

MSDS: FC-203CF LIGHT WATER(TM) Brand Aqueous Film Forming Foam
November 05, 1997

PAGE 6

8. HEALTH HAZARD DATA (continued)

INHALATION:

Single overexposure, above recommended guidelines, may cause:

Central Nervous System Depression: signs/symptoms can include headache, dizziness, drowsiness, incoordination, slowed reaction time, slurred speech, giddiness and unconsciousness.

Irritation (upper respiratory): signs/symptoms can include soreness of the nose and throat, coughing and sneezing.

Prolonged or repeated overexposure, above recommended guidelines, may cause:

Blood disorders: signs/symptoms can include prolonged weakness and fatigue.

Bone Marrow Depression: signs/symptoms can include prolonged weakness and fatigue.

Kidney Effects: signs/symptoms can include reduced urine volume, blood in urine and back pain.

Liver Effects: signs/symptoms can include yellow skin(jaundice) and tenderness of upper abdomen.

Pulmonary Edema: signs/symptoms can include coughing, congestion, difficulty breathing, which can result in respiratory failure and death.

IF SWALLOWED:

Ingestion is not a likely route of exposure to this product.

OTHER HEALTH HAZARD INFORMATION:

This product is not known to contain any substances regulated under California Proposition 65.

A 3M Product Toxicity Summary Sheet is available.

MATERIAL SAFETY **DATA SHEET**

CHEMGUARD 3% AFFF C-303

Revision Date: 1/25/2006

1. PRODUCT IDENTIFICATION

Chemical Family: Surfactant mixture; fire fighting foam concentrate
Aqueous Film Forming Foam

Product name: Chemguard 3% AFFF C-303

Manufacturer: Chemguard, Inc.
204 South 6th Ave.
Mansfield, TX 76063
emergency phone: 817-473-9964

2. COMPOSITION / INFORMATION ON INGREDIENTS

<u>CAS NO.</u>	<u>Common Name</u>	<u>ACGIH/PPM</u>		<u>OSHA/PPM</u>		<u>% by wt</u>
		<u>TWA</u>	<u>STEL</u>	<u>PEL</u>		
7732-18-5	water					85% - 90%
57018-52-7	propylene glycol t-butyl ether	not established				2% - 4%
7487-88-9	magnesium sulfate	N/A	N/A	N/A		1% - 2%
proprietary mixture	proprietary hydrocarbon surfactant	N/A	N/A	N/A		proprietary
proprietary mixture	proprietary fluorosurfactant	N/A	N/A	N/A		proprietary

3. HAZARDS IDENTIFICATION

Routes of entry: Dermal, inhalation and ingestion

Potential Health Effects: May cause skin and eye irritation.

Carcinogenicity: Not a carcinogen.

4. FIRST AID MEASURES

Ingestion: Do not induce vomiting. Call a physician.

Inhalation: Remove to fresh air.

Skin: Rinse with water. Wash with soap and water. Contaminated clothing should be washed before re-use.

Eyes: Rinse with water. Call a physician.

5. FIRE FIGHTING MEASURES

Flash Point:	>150°F
Flammable Limits in air (lower % by volume):	not evaluated
Flammable Limits in air (upper % by volume):	not evaluated
Auto-ignition Temperature:	not evaluated

General Hazards: None known.

Fire Fighting Equipment: Self contained breathing apparatus

Fire Extinguishing Media: Water, Foam, Carbon Dioxide, Dry Chemical, Halon

Fire and Explosion Hazards: Decomposition products may be toxic.

Hazardous Combustion Products: oxides of nitrogen, sulfur and carbon

6. ACCIDENTAL RELEASE

Contain spills. Vacuum or pump into storage containers, absorb smaller quantities with absorbent materials, and dispose of properly. Washing area with water will create large amounts of foam.

Dispose of released and contained material in accordance with local, state, and federal regulations. Release to local waste treatment plant only with permission.

7. HANDLING AND STORAGE

Store in original container, or appropriate end-use device. Store at temperatures of 35 - 120 degrees F. If the material freezes, it may be thawed without loss of performance.

8. EXPOSURE CONTROLS, PERSONAL PROTECTION

Eye Protection: Wear side-shield safety glasses.

Skin Protection: Wear latex gloves.

Respiratory Protection: Use organic vapor respirator if needed.

9. PHYSICAL AND CHEMICAL PROPERTIES

Boiling Point:	205° - 212°F
Melting Point:	30° F
Specific Gravity:	1.012 g/ml
Vapor Pressure (mm Hg):	N/A
pH	7.0 - 8.5
Flash Point (PMCC):	>150°F
Vapor Density (air = 1)	N/A
Solubility in water:	100%
Appearance:	clear amber liquid
Odor:	slight solvent odor

10. STABILITY AND REACTIVITY

Stability: Stable

Incompatibility: Strong oxidizers

Hazardous Polymerization: Will not occur.

Decomposition Products: Oxides of nitrogen, sulfur, carbon.

11. TOXICOLOGICAL INFORMATION

Eye Irritation: (Rabbits) mild irritant

Skin Irritation: (Rabbits) minimal irritant

Inhalation Toxicity: not evaluated

Sensitization: not evaluated

Teratology: not evaluated

Mutagenicity: not evaluated

Reproduction: not evaluated

Acute Oral Effects (Rats): not evaluated

12. ECOLOGICAL INFORMATION

	<u>CONCENTRATE</u>	<u>SOLUTION (AS USED)</u>
Chemical Oxygen Demand:	210,000 mg/l	6,300 mg/l
Biological Oxygen Demand (20 day):	79,800 mg/l	2,394 mg/l
Biodegradability (B.O.D./C.O.D.)	38%	38%
Total Organic Carbon:	33,600 mg/l	1008 mg/l
LC50 (96 hour pimephales promelas)	233 ppm	7767 ppm
LC50 (48 hour, daphnia magna)	1110 ppm	37,000 ppm

13. DISPOSAL CONSIDERATIONS

Dispose in accordance with local, state, and federal regulations. Discharge to waste treatment plants only with permission. Anti-foam agents may be used to reduce foaming in waste streams.

14. TRANSPORTATION INFORMATION

Department of Transportation proper shipping name: not regulated

15. REGULATORY INFORMATION

All ingredients are on the TSCA inventory.

No components are reportable under SARA Title III, sec. 313

No components are priority pollutants listed under the U.S. Clean Water Act Section 307 (2)(1)
Priority Pollutant List (40 CFR 401.15).

No components are reportable under **CERCLA**.

Revision 2 - Revision date changed.

1. IDENTIFICATION OF THE SUBSTANCE/PREPARATION AND OF THE COMPANY/UNDERTAKING

1.1. Identification of the preparation

Product Name: "SILV-EX Foam Concentrate"
Chemical Name: N/A – This is a mixture/preparation.
CAS No.: N/A – This is a mixture/preparation.
Chemical Formula: N/A – This is a mixture/preparation.
EINECS Number: N/A – This is a mixture/preparation.

1.2. Use of the preparation

The intended or recommended use of this preparation is as a FIRE EXTINGUISHING AGENT.

1.3. Company identification

Manufacturer/Supplier: ANSUL INCORPORATED
Address: One Stanton Street, Marinette, WI 54143-2542
Prepared by: Safety and Health Department
Phone: 715-735-7411
Internet/Home Page: <http://www.ansul.com>
Date of Issue: September, 2003

1.4. Emergency telephone

CHEMTREC 800-424-9300 or 703-527-3887

2. COMPOSITION/INFORMATION ON INGREDIENTS

- 2.1. Ingredient Name: Proprietary mixture consisting of sodium and ammonium salts of fatty alcohol ether sulfates (C8-C18), higher alcohols, and water.

Not otherwise specified.

Chemical Formula: N/A – This is a mixture/preparation.
CAS No.: N/A – This is a mixture/preparation.
EINECS Number: N/A – This is a mixture/preparation.
Concentration, Wt %: >70 %.
Hazard Identification: See Heading 3.

Ingredient Name: Diethylene Glycol Monobutyl Ether (a).

Chemical Formula: $C_4H_9O(CH_2CH_2O)_2H$.
CAS No.: 112-34-5.
EINECS Number: 203-961-6.
Concentration, Wt %: 18 %.
Hazard Identification: See Heading 3.

Ingredient Name: Ethanol (Ethyl Alcohol).

Chemical Formula: CH_3CH_2OH .
CAS No.: 64-17-5.
EINECS Number: 200-578-6.
Concentration, Wt %: 8 %.
Hazard Identification: See Heading 3.

(a) This chemical is subject to reporting requirements of SARA Title III Section 313 and 40 CFR Section 372.

3. HAZARDS IDENTIFICATION

FOR HUMANS:

Product:

EU Classification:		Irritant – Xi; Flammable – F.
R Phrases:	11	Highly flammable.
	36	Irritating to eyes.
S Phrases	2	Keep out of the reach of children.
	7	Keep container tightly closed.
	16	Keep away from sources of ignition – No smoking.
	24	Avoid contact with skin.
	26	In case of contact with eyes, rinse immediately with plenty of water and seek medical advice.

Components:

Diethylene Glycol Monobutyl Ether:

EU Classification:		Irritant – Xi.
R Phrases:	36	Irritating to eyes.
S Phrases:	2	Keep out of the reach of children.
	24	Avoid contact with skin.
	26	In case of contact with eyes, rinse immediately with plenty of water and seek medical advice.

Ethanol (Ethyl Alcohol):

EU Classification:		Flammable – F.
R Phrases:	11	Highly flammable.
S Phrases:	2	Keep out of the reach of children.
	7	Keep container tightly closed.
	16	Keep away from sources of ignition – No smoking.

Limit Values for Exposure:

Diethylene Glycol Monobutyl Ether:

OSHA PEL (General Industry) 8 hour TWA:	None established.
MAK (DE) Limit value:	100 mg/m ³ .
Short term exposure limit value (8 times, 5 minutes):	200 mg/m ³ .

Ethanol (Ethyl Alcohol):

ACGIH TLV-TWA:	1000 ppm.
OSHA PEL (General Industry) 8 hour TWA:	1000 ppm (1900 mg/m ³).

Neither this preparation nor the substances contained in it have been listed as carcinogenic by National Toxicology Program, I.A.R.C., or OSHA.

AS PART OF GOOD INDUSTRIAL AND PERSONAL HYGIENE AND SAFETY PROCEDURE, avoid all unnecessary exposure to the chemical substance and ensure prompt removal from skin, eyes, and clothing.

SIGNS AND SYMPTOMS:

Acute Exposure:

Eye Contact:	May cause mild to moderate transient irritation.
Skin Contact:	May cause mild transient irritation and/or dermatitis.
Inhalation:	Not an expected route of entry.
Ingestion:	Irritating to mucous membranes. Large oral doses could produce narcosis.
Chronic Overexposure:	Possible problems with kidneys, lungs, gastrointestinal, spleen, behavioral (sleep, motor, headache), lungs, gastrointestinal, liver, endocrine, blood, developmental.

Diethylene Glycol Monobutyl Ether did not interfere with reproduction. However, body weights of newborn animals were decreased.

MEDICAL CONDITIONS GENERALLY AGGRAVATED BY EXPOSURE: Diseases of the kidney and liver.

FOR ENVIRONMENT:

As much as possible, keep from being washed into surface waters.

4. FIRST AID MEASURES

Eye Contact:	Wash with water for a minimum of 15 minutes. If irritation persists, seek medical attention.
Skin Contact:	Wash affected area with soap and water. If irritation persists, seek medical attention.
Inhalation:	Remove from exposure. If irritation persists, seek medical attention.
Ingestion:	Dilute by drinking large quantities of water.

5. FIRE-FIGHTING MEASURES

This preparation is an extinguishing media.
There are NO extinguishing media which must not be used for safety reasons.
NO special protective equipment is needed for fire-fighters.

6. ACCIDENTAL RELEASE MEASURES

For personal protection: Prevent skin and eye contact, see Heading 8.
Clean up: Use an absorbent material such as diatomaceous earth, sawdust, etc., and sweep up, see Heading 13.
As much as possible, keep from being washed into surface waters.

7. HANDLING AND STORAGE

7.1. Handling

Care should be taken in handling all chemical substances and preparations.
See incompatibility information in Heading 10.

7.2. Storage

NO special conditions are needed for safe storage.
See incompatibility information in Heading 10.
Store in original container. Keep tightly closed until used.
As much as possible, keep from being washed into surface waters.

7.3. Specific use

The intended or recommended use of this preparation is as a FIRE EXTINGUISHING AGENT.

8. EXPOSURE CONTROLS/PERSONAL PROTECTION

8.1. Exposure limit values

Limit Values for Exposure:

Diethylene Glycol Monobutyl Ether:

OSHA PEL (General Industry) 8 hour TWA: None established.

MAK (DE) Limit value: 100 mg/m³.

Short term exposure limit value

(8 times, 5 minutes): 200 mg/m³.

Ethanol (Ethyl Alcohol):

ACGIH TLV-TWA: 1000 ppm.

OSHA PEL (General Industry) 8 hour TWA: 1000 ppm (1900 mg/m³).

8.2. Exposure controls**8.2.1. Occupational exposure controls****8.2.1.1. Respiratory protection**

None expected to be needed. Mechanical ventilation is recommended.

8.2.1.2. Hand protection

Use chemical resistant gloves when handling the preparation.

8.2.1.3. Eye protection

Chemical goggles are recommended.

8.2.1.4. Skin protection

Standard fire fighting safety equipment should provide all protection which is necessary.

8.2.2. Environmental exposure controls

As much as possible, keep from being washed into surface waters.

9. PHYSICAL AND CHEMICAL PROPERTIES

9.1. General information

Appearance: Pale straw yellow, clear liquid.
Odor: Mild, sweet odor.

9.2. Important health, safety, and environmental information

pH: 7.0-8.5.
Boiling point/boiling range: 65-70 °C (initial boiling).
Flash point: 40 °C PMCC.
Flammability (solid/gas): Flammable.
Explosive properties: Not explosive.
Oxidizing properties: Not an oxidizer.
Vapor Pressure: Not determined.
Relative Density (Water = 1): About 1.
Solubility:
– Water solubility: Completely soluble.
– Fat solubility: Not soluble.
Partition coefficient, n-octanol/water: Not determined.
Viscosity: 2-10 Cs.
Vapor density (Air = 1): Not determined, but <1.
Evaporation rate
(Butyl acetate = 1): Approx. 0.005.

9.3. Other information

Auto-ignition temperature: Does not ignite.

10. STABILITY AND REACTIVITY

10.1. Conditions to avoid

There are NO known conditions such as temperature, pressure, light, shock, etc., which may cause a dangerous reaction.

10.2. Materials to avoid

Reactive metals, electrically energized equipment, any material reactive with water, or strong oxidizers.

10.3. Hazardous decomposition products

Normally stable.

Hazardous polymerization will NOT occur.

Not known, however, carbon monoxide and oxides of nitrogen and sulfur may be produced during fire conditions.

Hydrogen sulfide may be produced during bacterial decomposition under anaerobic conditions.

11. TOXICOLOGICAL INFORMATION

Product: The toxicity of the product mixture has not been determined.

Components:

Diethylene glycol monobutyl ether:

Toxicity Data:	Oral (rat) LD ₅₀	5,660 mg/kg.	[Dow Chemical Co.].
	Oral (rat) LD ₅₀	9,623 mg/kg.	[EINICS ESIS].
	Dermal (rabbit) LD ₅₀	4,000 mg/kg.	[Dow Chemical Co.].
	Dermal (rabbit) LD ₅₀	2,764 mg/kg.	[EINICS ESIS].
Irritation Data:	Eye (rabbit)	20 mg/24 hrs.	Moderate. [EINICS ESIS].
	Eye (rabbit) Draize test	Highly irritating.	[EINICS ESIS].
	Skin (rabbit)	1000 mg/kg/day	Moderate with edema, fissuring, and leathery appearance. [EINICS ESIS].

Target organs: Kidney, blood, liver, lungs, gastrointestinal, spleen.

Ethanol:

Toxicity Data:	Oral (rat) LD ₅₀	7,060 mg/kg
	Inhalation (rat) LC ₅₀	20,000 ppm/10 hrs
Irritation Data:	Skin (rabbit)	400 mg open Mild
	Eye (rabbit)	500 mg/24 hrs Moderate
Target organs:	Behavioral (sleep, motor, headache), lungs, gastrointestinal, liver, endocrine, blood, developmental.	

12. ECOLOGICAL INFORMATION

12.1. Ecotoxicity

Components:

Diethylene glycol monobutyl ether:

Fish, <i>Lepomis macrochirus</i> :	LC ₅₀ (96 hrs)	1,300 mg/L.
Carrassius auratus:	LC ₅₀ (24 hrs)	2,700 mg/L.
Daphnids, <i>Daphnia magna</i> :	EC ₅₀ (24 hrs)	3,184 mg/L.
Algae, <i>Scenedesmus subspicatus</i> :	EC ₅₀ (96 hrs)	>100 mg/L.

Ethanol:

Fish, <i>Oncorhynchus mykiss</i> :	LC ₅₀ (24 hrs)	11,200 mg/L.
<i>Alburnus alburnus</i> :	LC ₅₀ (96 hrs)	11,000 mg/L.
Daphnids, <i>Daphnia magna</i> :	EC ₅₀ (24 hrs)	10,800 mg/L.

12.2. Mobility

Diethylene glycol monobutyl ether:

Should not partition from a water column to organic matter contained in sediments and suspended solids.

Ethanol:

Its low octanol/water partition coefficient indicates that its absorption to soil will be low.

12.3. Persistence and degradability

Diethylene glycol monobutyl ether:

Indirect photodegradation is about 50% in 3.5 hours.

Aerobic degradation with adapted activated sludge is 60% after 28 days.

COD = 2080 mg/g substance.

BOD5 = 250 mg O₂/g substance.

Theoretical oxygen demand = 2.17 mg/mg.

Ethanol:

Indirect photodegradation is about 50 % in 6 hours.

Aerobic degradation with adapted activated sludge is 74% after 5 days.

COD = 1700 mg/g substance.

BOD5 = 0.8 kg/L.

12.4. Bioaccumulative potential

Diethylene glycol monobutyl ether:

Should not bioaccumulate. Estimated bioaccumulation factor (log BCF) = 0.46.

Ethanol:

Will not bioaccumulate.

12.5. Other adverse effects

Ozone depletion potential: None.

Photochemical ozone creation potential: None.

Global warming potential: None.

13. DISPOSAL CONSIDERATIONS

As much as possible, keep from being washed into surface waters.

Dispose of in compliance with national, regional, and local provisions that may be in force.

14. TRANSPORT INFORMATION

Hazard Class or Division: Not hazardous.

For additional transport information, contact Ansul Incorporated.

As much as possible, keep from being washed into surface waters.

15. REGULATORY INFORMATION

EU Classification:	Irritant – Xi; Flammable – F.
R Phrases:	11 Highly flammable.
	36 Irritating to eyes.
S Phrases:	2 Keep out of the reach of children.
	7 Keep container tightly closed.
	16 Keep away from sources of ignition – No smoking.
	24 Avoid contact with skin.
	26 In case of contact with eyes, rinse immediately with plenty of water and seek medical advice.

Limit Values for Exposure:

Diethylene Glycol Monobutyl Ether:

OSHA PEL (General Industry) 8 hour TWA: None established.

MAK (DE) Limit value: 100 mg/m³.

Short term exposure limit value

(8 times, 5 minutes): 200 mg/m³.

Ethanol (Ethyl Alcohol):

ACGIH TLV-TWA: 1000 ppm.

OSHA PEL (General Industry) 8 hour TWA: 1000 ppm (1900 mg/m³).

EINECS Status: All components are included in EINECS inventories or are exempt from listing.

EPA TSCA Status: All components are included in TSCA inventories or are exempt from listing.

Canadian DSL (Domestic Substances List): All components are included in the DSL or are exempt from listing.

Environmental restrictions: None are known.

Restrictions on Marketing and Use: None are known.

Refer to any other national measures that may be relevant.

16. OTHER INFORMATION**(HMIS) HAZARDOUS MATERIAL IDENTIFICATION SYSTEM RATINGS:**

HEALTH:	<u>1</u>	4. Severe Hazard
FLAMMABILITY:	<u>2</u>	3. Serious Hazard
REACTIVITY:	<u>0</u>	2. Moderate Hazard
		1. Slight Hazard
		0. Minimal Hazard

(WHMIS) CANADIAN WORKPLACE HAZARDOUS MATERIAL IDENTIFICATION SYSTEM RATINGS:This product is rated **D2B – Product may irritate eyes, skin or mucous membranes.**

Format is from directive 2001/58/EC.

EINECS data is from <http://exb.jrc.it/existing-chemicals/>

Data used to compile the data sheet is from Ansul Material Safety Data Sheet, February, 2002.

The EU Classification has been changed in accordance with Directive 1999/45/EC and information in the EINECS ESIS files (Existing Substances Information System).

Toxicological information added from the EINECS ESIS (Existing Substances Information System) and from Dow Chemical Company.

A rating under WHMIS has been added, following the Canadian guidelines.

Limit values for exposure for diethylene glycol monobutyl ether were changed, based on EINECS ESIS data.

17. DISCLAIMER

THE ABOVE INFORMATION IS BELIEVED TO BE CORRECT, BUT DOES NOT PURPORT TO BE ALL INCLUSIVE AND SHALL BE USED ONLY AS A GUIDE. ANSUL SHALL NOT BE HELD LIABLE FOR ANY DAMAGE RESULTING FROM HANDLING OR FROM CONTACT WITH THE ABOVE PRODUCT.

NELAC NARRATIVE PAGE

Client: United States Army Corp of Engineers

Report #: 372298NP

Eurofins Eaton Analytical, Inc. is a NELAP accredited laboratory. All reported results meet the requirements of the NELAC standards, unless otherwise noted.

EEA contact person: Jessie Brasch

NELAP requires complete reporting of deviations from method requirements, regardless of the suspected impact on the data. Quality control failures not reported within the report summary are noted here.

Note: There were quality control issues with this report for Method 537. See Report Summary.

There were no additional quality control failures.

Note: This report may not be reproduced, except in full, without written approval from EEA. EEA is accredited by the National Environmental Laboratory Accreditation Program (NELAP).

Lab Definitions

Continuing Calibration Check Standard (CCC) / Continuing Calibration Verification (CCV) / Initial Calibration Verification Standard (ICV) / Initial Performance Check (IPC) - is a standard containing one or more of the target analytes that is prepared from the same standards used to calibrate the instrument. This standard is used to verify the calibration curve at the beginning of each analytical sequence, and may also be analyzed throughout and at the end of the sequence. The concentration of continuing standards may be varied, when prescribed by the reference method, so that the range of the calibration curve is verified on a regular basis. CCL, CCM, and CCH are the CCC standards at low, mid, and high concentration levels, respectively.

Internal Standards (IS) - are pure compounds with properties similar to the analytes of interest, which are added to field samples or extracts, calibration standards, and quality control standards at a known concentration. They are used to measure the relative responses of the analytes of interest and surrogates in the sample, calibration standard or quality control standard.

Laboratory Duplicate (LD) - is a field sample aliquot taken from the same sample container in the laboratory and analyzed separately using identical procedures. Analysis of laboratory duplicates provides a measure of the precision of the laboratory procedures.

Laboratory Fortified Blank (LFB) / Laboratory Control Sample (LCS) - is an aliquot of reagent water to which known concentrations of the analytes of interest are added. The LFB is analyzed exactly the same as the field samples. LFBs are used to determine whether the method is in control. FBL, FBM, and FBH are the LFB samples at low, mid, and high concentration levels, respectively.

Laboratory Method Blank (LMB) / Laboratory Reagent Blank (LRB) - is a sample of reagent water included in the sample batch analyzed in the same way as the associated field samples. The LMB is used to determine if method analytes or other background contamination have been introduced during the preparation or analytical procedure. The LMB is analyzed exactly the same as the field samples.

Laboratory Trip Blank (LTB) / Field Reagent Blank (FRB) - is a sample of laboratory reagent water placed in a sample container in the laboratory and treated as a field sample, including storage, preservation, and all analytical procedures. The FRB/LTB container follows the collection bottles to and from the collection site, but the FRB/LTB is not opened at any time during the trip. The FRB/LTB is primarily a travel blank used to verify that the samples were not contaminated during shipment.

Matrix Spike Duplicate Sample (MSD) / Laboratory Fortified Sample Matrix Duplicate (LFSMD) - is a sample aliquot taken from the same field sample source as the Matrix Spike Sample to which known quantities of the analytes of interest are added in the laboratory. The MSD is analyzed exactly the same as the field samples. Analysis of the MSD provides a measure of the precision of the laboratory procedures in a specific matrix. SDL, SDM, and SDH / LFSMDL, LFSMDM, and LFSMDH are the MSD or LFSMD at low, mid, and high concentration levels, respectively.

Matrix Spike Sample (MS) / Laboratory Fortified Sample Matrix (LFSM) - is a sample aliquot taken from field sample source to which known quantities of the analytes of interest are added in the laboratory. The MS is analyzed exactly the same as the field samples. The purpose is to demonstrate recovery of the analytes from a sample matrix to determine if the specific matrix contributes bias to the analytical results. MSL, MSM, and MSH / LFSML, LFSMM, and LFSMH are the MS or LFSM at low, mid, and high concentration levels, respectively.

Quality Control Standard (QCS) / Second Source Calibration Verification (SSCV) - is a solution containing known concentrations of the analytes of interest prepared from a source different from the source of the calibration standards. The solution is obtained from a second manufacturer or lot if the lot can be demonstrated by the manufacturer as prepared independently from other lots. The QCS sample is analyzed using the same procedures as field samples. The QCS is used as a check on the calibration standards used in the method on a routine basis.

Reporting Limit Check (RLC) / Initial Calibration Check Standard (ICCS) - is a procedural standard that is analyzed each day to evaluate instrument performance at or below the minimum reporting limit (MRL).

Surrogate Standard (SS) / Surrogate Analyte (SUR) - is a pure compound with properties similar to the analytes of interest, which is highly unlikely to be found in any field sample, that is added to the field samples, calibration standards, blanks and quality control standards before sample preparation. The SS is used to evaluate the efficiency of the sample preparation process.

Quality Control Summary

Client Name: Converse Laboratories, Inc.
Reported: 12/08/2016 10:36

Group Number: 1726839

Matrix QC may not be reported if insufficient sample or site-specific QC samples were not submitted. In these situations, to demonstrate precision and accuracy at a batch level, a LCS/LCSD was performed, unless otherwise specified in the method.

All Inorganic Initial Calibration and Continuing Calibration Blanks met acceptable method criteria unless otherwise noted on the Analysis Report.

Method Blank

Analysis Name	Result ng/g	MDL** ng/g	LOQ ng/g

*- Outside of specification

** This limit was used in the evaluation of the final result for the blank

(1) The result for one or both determinations was less than five times the LOQ.

(2) The unspiked result was more than four times the spike added.

P##### is indicative of a Background or Unspiked sample that is batch matrix QC and was not performed using a sample from this submission group.

Explanation of Symbols and Abbreviations

The following defines common symbols and abbreviations used in reporting technical data:

BMQL	Below Minimum Quantitation Level	mg	milligram(s)
C	degrees Celsius	mL	milliliter(s)
cfu	colony forming units	MPN	Most Probable Number
CP Units	cobalt-chloroplatinate units	N.D.	none detected
F	degrees Fahrenheit	ng	nanogram(s)
g	gram(s)	NTU	nephelometric turbidity units
IU	International Units	pg/L	picogram/liter
kg	kilogram(s)	RL	Reporting Limit
L	liter(s)	TNTC	Too Numerous To Count
lb.	pound(s)	µg	microgram(s)
m3	cubic meter(s)	µL	microliter(s)
meq	milliequivalents	umhos/cm	micromhos/cm
<	less than		
>	greater than		
ppm	parts per million - One ppm is equivalent to one milligram per kilogram (mg/kg) or one gram per million grams. For aqueous liquids, ppm is usually taken to be equivalent to milligrams per liter (mg/l), because one liter of water has a weight very close to a kilogram. For gases or vapors, one ppm is equivalent to one microliter per liter of gas.		
ppb	parts per billion		
Dry weight basis	Results printed under this heading have been adjusted for moisture content. This increases the analyte weight concentration to approximate the value present in a similar sample without moisture. All other results are reported on an as-received basis.		

Laboratory Data Qualifiers:

- B - Analyte detected in the blank
- C - Result confirmed by reanalysis
- E - Concentration exceeds the calibration range
- J (or G, I, X) - estimated value $\geq$ the Method Detection Limit (MDL or DL) and $<$ the Limit of Quantitation (LOQ or RL)
- P - Concentration difference between the primary and confirmation column $>40\%$. The lower result is reported.
- U - Analyte was not detected at the value indicated
- V - Concentration difference between the primary and confirmation column $>100\%$. The reporting limit is raised due to this disparity and evident interference...
- W - The dissolved oxygen uptake for the unseeded blank is greater than 0.20 mg/L.

Additional Organic and Inorganic CLP qualifiers may be used with Form 1 reports as defined by the CLP methods. Qualifiers specific to Dioxin/Furans and PCB Congeners are detailed on the individual Analysis Report.

Analytical test results meet all requirements of the associated regulatory program (i.e., NELAC (TNI), DoD, and ISO 17025) unless otherwise noted under the individual analysis.

Measurement uncertainty values, as applicable, are available upon request.

Tests results relate only to the sample tested. Clients should be aware that a critical step in a chemical or microbiological analysis is the collection of the sample. Unless the sample analyzed is truly representative of the bulk of material involved, the test results will be meaningless. If you have questions regarding the proper techniques of collecting samples, please contact us. We cannot be held responsible for sample integrity, however, unless sampling has been performed by a member of our staff.

This report shall not be reproduced except in full, without the written approval of the laboratory.

Times are local to the area of activity. Parameters listed in the 40 CFR Part 136 Table II as "analyze immediately" are not performed within 15 minutes.

WARRANTY AND LIMITS OF LIABILITY - In accepting analytical work, we warrant the accuracy of test results for the sample as submitted. THE FOREGOING EXPRESS WARRANTY IS EXCLUSIVE AND IS GIVEN IN LIEU OF ALL OTHER WARRANTIES, EXPRESSED OR IMPLIED. WE DISCLAIM ANY OTHER WARRANTIES, EXPRESSED OR IMPLIED, INCLUDING A WARRANTY OF FITNESS FOR PARTICULAR PURPOSE AND WARRANTY OF MERCHANTABILITY. Quality Control Summary

Client Name: Converse Laboratories, Inc.

Group Number: 1670726

Reported: 08/08/2016 10:47

Matrix QC may not be reported if insufficient sample or site-specific QC samples were not submitted. In these situations, to demonstrate precision and accuracy at a batch level, a LCS/LCSD was performed, unless otherwise specified in the method.

All Inorganic Initial Calibration and Continuing Calibration Blanks met acceptable method criteria unless otherwise noted on the Analysis Report.

Method Blank

Explanation of Symbols and Abbreviations

The following defines common symbols and abbreviations used in reporting technical data:

RL	Reporting Limit	BMQL	Below Minimum Quantitation Level
N.D.	none detected	MPN	Most Probable Number
TNTC	Too Numerous To Count	CP Units	cobalt-chloroplatinate units
IU	International Units	NTU	nephelometric turbidity units
umhos/cm	micromhos/cm	ng	nanogram(s)
C	degrees Celsius	F	degrees Fahrenheit
meq	milliequivalents	lb.	pound(s)
g	gram(s)	kg	kilogram(s)
µg	microgram(s)	mg	milligram(s)
mL	milliliter(s)	L	liter(s)
m3	cubic meter(s)	µL	microliter(s)
		pg/L	picogram/liter
<	less than		
>	greater than		
ppm	parts per million - One ppm is equivalent to one milligram per kilogram (mg/kg) or one gram per million grams. For aqueous liquids, ppm is usually taken to be equivalent to milligrams per liter (mg/l), because one liter of water has a weight very close to a kilogram. For gases or vapors, one ppm is equivalent to one microliter per liter of gas.		
ppb	parts per billion		
Dry weight basis	Results printed under this heading have been adjusted for moisture content. This increases the analyte weight concentration to approximate the value present in a similar sample without moisture. All other results are reported on an as-received basis.		

Laboratory Data Qualifiers:

- B - Analyte detected in the blank
- C - Result confirmed by reanalysis
- E - Concentration exceeds the calibration range
- J (or G, I, X) - estimated value $\geq$ the Method Detection Limit (MDL or DL) and $<$ the Limit of Quantitation (LOQ or RL)
- P - Concentration difference between the primary and confirmation column $>40\%$. The lower result is reported.
- U - Analyte was not detected at the value indicated
- V - Concentration difference between the primary and confirmation column $>100\%$. The reporting limit is raised due to this disparity and evident interference...

Additional Organic and Inorganic CLP qualifiers may be used with Form 1 reports as defined by the CLP methods. Qualifiers specific to Dioxin/Furans and PCB Congeners are detailed on the individual Analysis Report.

Analytical test results meet all requirements of the associated regulatory program (i.e., NELAC (TNI), DoD, and ISO 17025) unless otherwise noted under the individual analysis.

Measurement uncertainty values, as applicable, are available upon request.

Tests results relate only to the sample tested. Clients should be aware that a critical step in a chemical or microbiological analysis is the collection of the sample. Unless the sample analyzed is truly representative of the bulk of material involved, the test results will be meaningless. If you have questions regarding the proper techniques of collecting samples, please contact us. We cannot be held responsible for sample integrity, however, unless sampling has been performed by a member of our staff.

This report shall not be reproduced except in full, without the written approval of the laboratory.

Times are local to the area of activity. Parameters listed in the 40 CFR Part 136 Table II as "analyze immediately" are not performed within 15 minutes.

WARRANTY AND LIMITS OF LIABILITY - In accepting analytical work, we warrant the accuracy of test results for the sample as submitted. THE FOREGOING EXPRESS WARRANTY IS EXCLUSIVE AND IS GIVEN IN LIEU OF ALL OTHER WARRANTIES, EXPRESSED OR IMPLIED. WE DISCLAIM ANY OTHER WARRANTIES, EXPRESSED OR IMPLIED, INCLUDING A WARRANTY OF FITNESS FOR PARTICULAR PURPOSE AND WARRANTY OF MERCHANTABILITY. IN NO EVENT SHALL EUROFINS LANCASTER LABORATORIES ENVIRONMENTAL, LLC BE LIABLE FOR INDIRECT, SPECIAL, CONSEQUENTIAL, OR INCIDENTAL DAMAGES INCLUDING, BUT NOT LIMITED TO, DAMAGES FOR LOSS OF PROFIT OR GOODWILL REGARDLESS OF (A) THE NEGLIGENCE (EITHER SOLE OR CONCURRENT) OF EUROFINS LANCASTER LABORATORIES ENVIRONMENTAL AND (B) WHETHER EUROFINS LANCASTER LABORATORIES ENVIRONMENTAL HAS BEEN INFORMED OF THE POSSIBILITY OF SUCH DAMAGES. We accept no legal responsibility for the purposes for which the client uses the test results. No purchase order or other order for work shall be accepted by Eurofins Lancaster Laboratories Environmental which includes any conditions that vary from the Standard Terms and Conditions, and Eurofins Lancaster Laboratories Environmental hereby objects to any conflicting terms contained in any acceptance or order submitted by client.

Report Summary

Detailed quantitative results are presented on the following pages. The results presented relate only to the samples provided for analysis.

We appreciate the opportunity to provide you with this analysis. If you have any questions concerning this report, please do not hesitate to call Jessie Brasch at (574) 233-4777.

Lab Definitions

Continuing Calibration Check Standard (CCC) / Continuing Calibration Verification (CCV) / Initial Calibration Verification Standard (ICV) / Initial Performance Check (IPC) - is a standard containing one or more of the target analytes that is prepared from the same standards used to calibrate the instrument. This standard is used to verify the calibration curve at the beginning of each analytical sequence, and may also be analyzed throughout and at the end of the sequence. The concentration of continuing standards may be varied, when prescribed by the reference method, so that the range of the calibration curve is verified on a regular basis. CCL, CCM, and CCH are the CCC standards at low, mid, and high concentration levels, respectively.

Internal Standards (IS) - are pure compounds with properties similar to the analytes of interest, which are added to field samples or extracts, calibration standards, and quality control standards at a known concentration. They are used to measure the relative responses of the analytes of interest and surrogates in the sample, calibration standard or quality control standard.

Laboratory Duplicate (LD) - is a field sample aliquot taken from the same sample container in the laboratory and analyzed separately using identical procedures. Analysis of laboratory duplicates provides a measure of the precision of the laboratory procedures.

Laboratory Fortified Blank (LFB) / Laboratory Control Sample (LCS) - is an aliquot of reagent water to which known concentrations of the analytes of interest are added. The LFB is analyzed exactly the same as the field samples. LFBs are used to determine whether the method is in control. FBL, FBM, and FBH are the LFB samples at low, mid, and high concentration levels, respectively.

Laboratory Method Blank (LMB) / Laboratory Reagent Blank (LRB) - is a sample of reagent water included in the sample batch analyzed in the same way as the associated field samples. The LMB is used to determine if method analytes or other background contamination have been introduced during the preparation or analytical procedure. The LMB is analyzed exactly the same as the field samples.

Laboratory Trip Blank (LTB) / Field Reagent Blank (FRB) - is a sample of laboratory reagent water placed in a sample container in the laboratory and treated as a field sample, including storage, preservation, and all analytical procedures. The FRB/LTB container follows the collection bottles to and from the collection site, but the FRB/LTB is not opened at any time during the trip. The FRB/LTB is primarily a travel blank used to verify that the samples were not contaminated during shipment.

Matrix Spike Duplicate Sample (MSD) / Laboratory Fortified Sample Matrix Duplicate (LFSMD) - is a sample aliquot taken from the same field sample source as the Matrix Spike Sample to which known quantities of the analytes of interest are added in the laboratory. The MSD is analyzed exactly the same as the field samples. Analysis of the MSD provides a measure of the precision of the laboratory procedures in a specific matrix. SDL, SDM, and SDH / LFSMDL, LFSMDM, and LFSMDH are the MSD or LFSMD at low, mid, and high concentration levels, respectively.

Matrix Spike Sample (MS) / Laboratory Fortified Sample Matrix (LFSM) - is a sample aliquot taken from field sample source to which known quantities of the analytes of interest are added in the laboratory. The MS is analyzed exactly the same as the field samples. The purpose is to demonstrate recovery of the analytes from a sample matrix to determine if the specific matrix contributes bias to the analytical results. MSL, MSM, and MSH / LFSML, LFSMM, and LFSMH are the MS or LFSM at low, mid, and high concentration levels, respectively.

Quality Control Standard (QCS) / Second Source Calibration Verification (SSCV) - is a solution containing known concentrations of the analytes of interest prepared from a source different from the source of the calibration standards. The solution is obtained from a second manufacturer or lot if the lot can be demonstrated by the manufacturer as prepared independently from other lots. The QCS sample is analyzed using the same procedures as field samples. The QCS is used as a check on the calibration standards used in the method on a routine basis.

Reporting Limit Check (RLC) / Initial Calibration Check Standard (ICCS) - is a procedural standard that is analyzed each day to evaluate instrument performance at or below the minimum reporting limit (MRL).

Surrogate Standard (SS) / Surrogate Analyte (SUR) - is a pure compound with properties similar to the analytes of interest, which is highly unlikely to be found in any field sample, that is added to the field samples, calibration standards, blanks and quality control standards before sample preparation. The SS is used to evaluate the efficiency of the sample preparation process.

Subject: RE: Order 300219

Ok, miscommunication when Ron Quoted the project... pricing was only provided for a FD and a MS, not the MSD. I spoke to Scott Forbes and he ok'd the addition of the MSD.

The sample site labeled Duplicate will be the sample type Field Duplicate with NO parent sample association; it will just be treated as a regular sample.

Please note my new email address is now JessieBrasch@EurofinsUS.com, please update your address book as JessieVarab@EurofinsUS.com will only be active for a short period of time.

8-18-16 Per the laboratory Technical Manager, in order for a sample to be a true Field Duplicate within the EEA LIMS, there must be a parent sample associated and linked in our system. Since the addition of an MSD for this report group was approved by Scott Forbes the batch QC was met therefore the sample labeled Duplicate was changed to a sample type of Field Sample (FS) and was treated as a field sample. Lab Definitions

Continuing Calibration Check Standard (CCC) / Continuing Calibration Verification (CCV) / Initial Calibration Verification Standard (ICV) / Initial Performance Check (IPC) - is a standard containing one or more of the target analytes that is prepared from the same standards used to calibrate the instrument. This standard is used to verify the calibration curve at the beginning of each analytical sequence, and may also be analyzed throughout and at the end of the sequence. The concentration of continuing standards may be varied, when prescribed by the reference method, so that the range of the calibration curve is verified on a regular basis. CCL, CCM, and CCH are the CCC standards at low, mid, and high concentration levels, respectively.

Internal Standards (IS) - are pure compounds with properties similar to the analytes of interest, which are added to field samples or extracts, calibration standards, and quality control standards at a known concentration. They are used to measure the relative responses of the analytes of interest and surrogates in the sample, calibration standard or quality control standard.

Laboratory Duplicate (LD) - is a field sample aliquot taken from the same sample container in the laboratory and analyzed separately using identical procedures. Analysis of laboratory duplicates provides a measure of the precision of the laboratory procedures.

Laboratory Fortified Blank (LFB) / Laboratory Control Sample (LCS) - is an aliquot of reagent water to which known concentrations of the analytes of interest are added. The LFB is analyzed exactly the same as the field samples. LFBs are used to determine whether the method is in control. FBL, FBM, and FBH are the LFB samples at low, mid, and high concentration levels, respectively.

Laboratory Method Blank (LMB) / Laboratory Reagent Blank (LRB) - is a sample of reagent water included in the sample batch analyzed in the same way as the associated field samples. The LMB is used to determine if method analytes or other background contamination have been introduced during the preparation or analytical procedure. The LMB is analyzed exactly the same as the field samples.

Laboratory Trip Blank (LTB) / Field Reagent Blank (FRB) - is a sample of laboratory reagent water placed in a sample container in the laboratory and treated as a field sample, including storage, preservation, and all analytical procedures. The FRB/LTB container follows the collection bottles to and from the collection site, but the FRB/LTB is not opened at any time during the trip. The FRB/LTB is primarily a travel blank used to verify that the samples were not contaminated during shipment.

Matrix Spike Duplicate Sample (MSD) / Laboratory Fortified Sample Matrix Duplicate (LFSMD) - is a sample aliquot taken from the same field sample source as the Matrix Spike Sample to which known quantities of the analytes of interest are added in the laboratory. The MSD is analyzed exactly the same as the field samples. Analysis of the MSD provides a measure of the precision of the laboratory procedures in a specific matrix. SDL, SDM, and SDH / LFSMDL, LFSMDM, and LFSMDH are the MSD or LFSMD at low, mid, and high concentration levels, respectively.

Matrix Spike Sample (MS) / Laboratory Fortified Sample Matrix (LFSM) - is a sample aliquot taken from field sample source to which known quantities of the analytes of interest are added in the laboratory. The MS is analyzed exactly the same as the field samples. The purpose is to demonstrate recovery of the analytes from a sample matrix to determine if the specific matrix contributes bias to the analytical results. MSL, MSM, and MSH / LFSML, LFSMM, and LFSMH are the MS or LFSM at low, mid, and high concentration levels, respectively.

Quality Control Standard (QCS) / Second Source Calibration Verification (SSCV) - is a solution containing known concentrations of the analytes of interest prepared from a source different from the source of the calibration standards. The solution is obtained from a second manufacturer or lot if the lot can be demonstrated by the manufacturer as prepared independently from other lots. The QCS sample is analyzed using the same procedures as field samples. The QCS is used as a check on the calibration standards used in the method on a routine basis.

Reporting Limit Check (RLC) / Initial Calibration Check Standard (ICCS) - is a procedural standard that is analyzed each day to evaluate instrument performance at or below the minimum reporting limit (MRL).

Surrogate Standard (SS) / Surrogate Analyte (SUR) - is a pure compound with properties similar to the analytes of interest, which is highly unlikely to be found in any field sample, that is added to the field samples, calibration standards, blanks and quality control standards before sample preparation. The SS is used to evaluate the efficiency of the sample preparation process.

Lab Definitions

Continuing Calibration Check Standard (CCC) / Continuing Calibration Verification (CCV) / Initial Calibration Verification Standard (ICV) / Initial Performance Check (IPC) - is a standard containing one or more of the target analytes that is prepared from the same standards used to calibrate the instrument. This standard is used to verify the calibration curve at the beginning of each analytical sequence, and may also be analyzed throughout and at the end of the sequence. The concentration of continuing standards may be varied, when prescribed by the reference method, so that the range of the calibration curve is verified on a regular basis. CCL, CCM, and CCH are the CCC standards at low, mid, and high concentration levels, respectively.

Internal Standards (IS) - are pure compounds with properties similar to the analytes of interest, which are added to field samples or extracts, calibration standards, and quality control standards at a known concentration. They are used to measure the relative responses of the analytes of interest and surrogates in the sample, calibration standard or quality control standard.

Laboratory Duplicate (LD) - is a field sample aliquot taken from the same sample container in the laboratory and analyzed separately using identical procedures. Analysis of laboratory duplicates provides a measure of the precision of the laboratory procedures.

Laboratory Fortified Blank (LFB) / Laboratory Control Sample (LCS) - is an aliquot of reagent water to which known concentrations of the analytes of interest are added. The LFB is analyzed exactly the same as the field samples. LFBs are used to determine whether the method is in control. FBL, FBM, and FBH are the LFB samples at low, mid, and high concentration levels, respectively.

Laboratory Method Blank (LMB) / Laboratory Reagent Blank (LRB) - is a sample of reagent water included in the sample batch analyzed in the same way as the associated field samples. The LMB is used to determine if method analytes or other background contamination have been introduced during the preparation or analytical procedure. The LMB is analyzed exactly the same as the field samples.

Laboratory Trip Blank (LTB) / Field Reagent Blank (FRB) - is a sample of laboratory reagent water placed in a sample container in the laboratory and treated as a field sample, including storage, preservation, and all analytical procedures. The FRB/LTB container follows the collection bottles to and from the collection site, but the FRB/LTB is not opened at any time during the trip. The FRB/LTB is primarily a travel blank used to verify that the samples were not contaminated during shipment.

Matrix Spike Duplicate Sample (MSD) / Laboratory Fortified Sample Matrix Duplicate (LFSMD) - is a sample aliquot taken from the same field sample source as the Matrix Spike Sample to which known quantities of the analytes of interest are added in the laboratory. The MSD is analyzed exactly the same as the field samples. Analysis of the MSD provides a measure of the precision of the laboratory procedures in a specific matrix. SDL, SDM, and SDH / LFSMDL, LFSMDM, and LFSMDH are the MSD or LFSMD at low, mid, and high concentration levels, respectively.

Matrix Spike Sample (MS) / Laboratory Fortified Sample Matrix (LFSM) - is a sample aliquot taken from field sample source to which known quantities of the analytes of interest are added in the laboratory. The MS is analyzed exactly the same as the field samples. The purpose is to demonstrate recovery of the analytes from a sample matrix to determine if the specific matrix contributes bias to the analytical results. MSL, MSM, and MSH / LFSML, LFSMM, and LFSMH are the MS or LFSM at low, mid, and high concentration levels, respectively.

Quality Control Standard (QCS) / Second Source Calibration Verification (SSCV) - is a solution containing known concentrations of the analytes of interest prepared from a source different from the source of the calibration standards. The solution is obtained from a second manufacturer or lot if the lot can be demonstrated by the manufacturer as prepared independently from other lots. The QCS sample is analyzed using the same procedures as field samples. The QCS is used as a check on the calibration standards used in the method on a routine basis.

Reporting Limit Check (RLC) / Initial Calibration Check Standard (ICCS) - is a procedural standard that is analyzed each day to evaluate instrument performance at or below the minimum reporting limit (MRL).

Surrogate Standard (SS) / Surrogate Analyte (SUR) - is a pure compound with properties similar to the analytes of interest, which is highly unlikely to be found in any field sample, that is added to the field samples, calibration standards, blanks and quality control standards before sample preparation. The SS is used to evaluate the efficiency of the sample preparation process.

Report Summary

Detailed quantitative results are presented on the following pages. The results presented relate only to the samples provided for analysis.

We appreciate the opportunity to provide you with this analysis. If you have any questions concerning this report, please do not hesitate to call Kelly Trott at (574) 233-4777.

Note: This report may not be reproduced, except in full, without written approval from EEA.

Lab Definitions

Continuing Calibration Check Standard (CCC) / Continuing Calibration Verification (CCV) / Initial Calibration Verification Standard (ICV) / Initial Performance Check (IPC) - is a standard containing one or more of the target analytes that is prepared from the same standards used to calibrate the instrument. This standard is used to verify the calibration curve at the beginning of each analytical sequence, and may also be analyzed throughout and at the end of the sequence. The concentration of continuing standards may be varied, when prescribed by the reference method, so that the range of the calibration curve is verified on a regular basis. CCL, CCM, and CCH are the CCC standards at low, mid, and high concentration levels, respectively.

Internal Standards (IS) - are pure compounds with properties similar to the analytes of interest, which are added to field samples or extracts, calibration standards, and quality control standards at a known concentration. They are used to measure the relative responses of the analytes of interest and surrogates in the sample, calibration standard or quality control standard.

Laboratory Duplicate (LD) - is a field sample aliquot taken from the same sample container in the laboratory and analyzed separately using identical procedures. Analysis of laboratory duplicates provides a measure of the precision of the laboratory procedures.

Laboratory Fortified Blank (LFB) / Laboratory Control Sample (LCS) - is an aliquot of reagent water to which known concentrations of the analytes of interest are added. The LFB is analyzed exactly the same as the field samples. LFBs are used to determine whether the method is in control. FBL, FBM, and FBH are the LFB samples at low, mid, and high concentration levels, respectively.

Laboratory Method Blank (LMB) / Laboratory Reagent Blank (LRB) - is a sample of reagent water included in the sample batch analyzed in the same way as the associated field samples. The LMB is used to determine if method analytes or other background contamination have been introduced during the preparation or analytical procedure. The LMB is analyzed exactly the same as the field samples.

Laboratory Trip Blank (LTB) / Field Reagent Blank (FRB) - is a sample of laboratory reagent water placed in a sample container in the laboratory and treated as a field sample, including storage, preservation, and all analytical procedures. The FRB/LTB container follows the collection bottles to and from the collection site, but the FRB/LTB is not opened at any time during the trip. The FRB/LTB is primarily a travel blank used to verify that the samples were not contaminated during shipment.

Matrix Spike Duplicate Sample (MSD) / Laboratory Fortified Sample Matrix Duplicate (LFSMD) - is a sample aliquot taken from the same field sample source as the Matrix Spike Sample to which known quantities of the analytes of interest are added in the laboratory. The MSD is analyzed exactly the same as the field samples. Analysis of the MSD provides a measure of the precision of the laboratory procedures in a specific matrix. SDL, SDM, and SDH / LFSMDL, LFSMDM, and LFSMDH are the MSD or LFSMD at low, mid, and high concentration levels, respectively.

Matrix Spike Sample (MS) / Laboratory Fortified Sample Matrix (LFSM) - is a sample aliquot taken from field sample source to which known quantities of the analytes of interest are added in the laboratory. The MS is analyzed exactly the same as the field samples. The purpose is to demonstrate recovery of the analytes from a sample matrix to determine if the specific matrix contributes bias to the analytical results. MSL, MSM, and MSH / LFSML, LFSMM, and LFSMH are the MS or LFSM at low, mid, and high concentration levels, respectively.

Quality Control Standard (QCS) / Second Source Calibration Verification (SSCV) - is a solution containing known concentrations of the analytes of interest prepared from a source different from the source of the calibration standards. The solution is obtained from a second manufacturer or lot if the lot can be demonstrated by the manufacturer as prepared independently from other lots. The QCS sample is analyzed using the same procedures as field samples. The QCS is used as a check on the calibration standards used in the method on a routine basis.

Reporting Limit Check (RLC) / Initial Calibration Check Standard (ICCS) - is a procedural standard that is analyzed each day to evaluate instrument performance at or below the minimum reporting limit (MRL).

Surrogate Standard (SS) / Surrogate Analyte (SUR) - is a pure compound with properties similar to the analytes of interest, which is highly unlikely to be found in any field sample, that is added to the field samples, calibration standards, blanks and quality control standards before sample preparation. The SS is used to evaluate the efficiency of the sample preparation process.

Report Summary

Detailed quantitative results are presented on the following pages. The results presented relate only to the samples provided for analysis.

We appreciate the opportunity to provide you with this analysis. If you have any questions concerning this report, please do not hesitate to call Kelly Trott at (574) 233-4777.

Note: This report may not be reproduced, except in full, without written approval from EEA.

Lab Definitions

Continuing Calibration Check Standard (CCC) / Continuing Calibration Verification (CCV) / Initial Calibration Verification Standard (ICV) / Initial Performance Check (IPC) - is a standard containing one or more of the target analytes that is prepared from the same standards used to calibrate the instrument. This standard is used to verify the calibration curve at the beginning of each analytical sequence, and may also be analyzed throughout and at the end of the sequence. The concentration of continuing standards may be varied, when prescribed by the reference method, so that the range of the calibration curve is verified on a regular basis. CCL, CCM, and CCH are the CCC standards at low, mid, and high concentration levels, respectively.

Internal Standards (IS) - are pure compounds with properties similar to the analytes of interest, which are added to field samples or extracts, calibration standards, and quality control standards at a known concentration. They are used to measure the relative responses of the analytes of interest and surrogates in the sample, calibration standard or quality control standard.

Laboratory Duplicate (LD) - is a field sample aliquot taken from the same sample container in the laboratory and analyzed separately using identical procedures. Analysis of laboratory duplicates provides a measure of the precision of the laboratory procedures.

Laboratory Fortified Blank (LFB) / Laboratory Control Sample (LCS) - is an aliquot of reagent water to which known concentrations of the analytes of interest are added. The LFB is analyzed exactly the same as the field samples. LFBs are used to determine whether the method is in control. FBL, FBM, and FBH are the LFB samples at low, mid, and high concentration levels, respectively.

Laboratory Method Blank (LMB) / Laboratory Reagent Blank (LRB) - is a sample of reagent water included in the sample batch analyzed in the same way as the associated field samples. The LMB is used to determine if method analytes or other background contamination have been introduced during the preparation or analytical procedure. The LMB is analyzed exactly the same as the field samples.

Laboratory Trip Blank (LTB) / Field Reagent Blank (FRB) - is a sample of laboratory reagent water placed in a sample container in the laboratory and treated as a field sample, including storage, preservation, and all analytical procedures. The FRB/LTB container follows the collection bottles to and from the collection site, but the FRB/LTB is not opened at any time during the trip. The FRB/LTB is primarily a travel blank used to verify that the samples were not contaminated during shipment.

Matrix Spike Duplicate Sample (MSD) / Laboratory Fortified Sample Matrix Duplicate (LFSMD) - is a sample aliquot taken from the same field sample source as the Matrix Spike Sample to which known quantities of the analytes of interest are added in the laboratory. The MSD is analyzed exactly the same as the field samples. Analysis of the MSD provides a measure of the precision of the laboratory procedures in a specific matrix. SDL, SDM, and SDH / LFSMDL, LFSMDM, and LFSMDH are the MSD or LFSMD at low, mid, and high concentration levels, respectively.

Matrix Spike Sample (MS) / Laboratory Fortified Sample Matrix (LFSM) - is a sample aliquot taken from field sample source to which known quantities of the analytes of interest are added in the laboratory. The MS is analyzed exactly the same as the field samples. The purpose is to demonstrate recovery of the analytes from a sample matrix to determine if the specific matrix contributes bias to the analytical results. MSL, MSM, and MSH / LFSML, LFSMM, and LFSMH are the MS or LFSM at low, mid, and high concentration levels, respectively.

Quality Control Standard (QCS) / Second Source Calibration Verification (SSCV) - is a solution containing known concentrations of the analytes of interest prepared from a source different from the source of the calibration standards. The solution is obtained from a second manufacturer or lot if the lot can be demonstrated by the manufacturer as prepared independently from other lots. The QCS sample is analyzed using the same procedures as field samples. The QCS is used as a check on the calibration standards used in the method on a routine basis.

Reporting Limit Check (RLC) / Initial Calibration Check Standard (ICCS) - is a procedural standard that is analyzed each day to evaluate instrument performance at or below the minimum reporting limit (MRL).

Surrogate Standard (SS) / Surrogate Analyte (SUR) - is a pure compound with properties similar to the analytes of interest, which is highly unlikely to be found in any field sample, that is added to the field samples, calibration standards, blanks and quality control standards before sample preparation. The SS is used to evaluate the efficiency of the sample preparation process.

Quality Control Summary

Client Name: Converse Laboratories, Inc.

Group Number: 1729266

Reported: 12/08/2016 10:36

Matrix QC may not be reported if insufficient sample or site-specific QC samples were not submitted. In these situations, to demonstrate precision and accuracy at a batch level, a LCS/LCSD was performed, unless otherwise specified in the method.

All Inorganic Initial Calibration and Continuing Calibration Blanks met acceptable method criteria unless otherwise noted on the Analysis Report.

Method Blank

Analysis Name	Result	MDL**	LOQ
	ng/g	ng/g	ng/g

*- Outside of specification

**-This limit was used in the evaluation of the final result for the blank

(1) The result for one or both determinations was less than five times the LOQ.

(2) The unspiked result was more than four times the spike added.

P##### is indicative of a Background or Unspiked sample that is batch matrix QC and was not performed using a sample from this submission group.

Explanation of Symbols and Abbreviations

The following defines common symbols and abbreviations used in reporting technical data:

BMQL	Below Minimum Quantitation Level	mg	milligram(s)
C	degrees Celsius	mL	milliliter(s)
cfu	colony forming units	MPN	Most Probable Number
CP Units	cobalt-chloroplatinate units	N.D.	none detected
F	degrees Fahrenheit	ng	nanogram(s)
g	gram(s)	NTU	nephelometric turbidity units
IU	International Units	pg/L	picogram/liter
kg	kilogram(s)	RL	Reporting Limit
L	liter(s)	TNTC	Too Numerous To Count
lb.	pound(s)	µg	microgram(s)
m3	cubic meter(s)	µL	microliter(s)
meq	milliequivalents	umhos/cm	micromhos/cm
<	less than		
>	greater than		
ppm	parts per million - One ppm is equivalent to one milligram per kilogram (mg/kg) or one gram per million grams. For aqueous liquids, ppm is usually taken to be equivalent to milligrams per liter (mg/l), because one liter of water has a weight very close to a kilogram. For gases or vapors, one ppm is equivalent to one microliter per liter of gas.		
ppb	parts per billion		
Dry weight basis	Results printed under this heading have been adjusted for moisture content. This increases the analyte weight concentration to approximate the value present in a similar sample without moisture. All other results are reported on an as-received basis.		

Laboratory Data Qualifiers:

- B - Analyte detected in the blank
- C - Result confirmed by reanalysis
- E - Concentration exceeds the calibration range
- J (or G, I, X) - estimated value $\geq$ the Method Detection Limit (MDL or DL) and $<$ the Limit of Quantitation (LOQ or RL)
- P - Concentration difference between the primary and confirmation column $>40\%$. The lower result is reported.
- U - Analyte was not detected at the value indicated
- V - Concentration difference between the primary and confirmation column $>100\%$. The reporting limit is raised due to this disparity and evident interference...
- W - The dissolved oxygen uptake for the unseeded blank is greater than 0.20 mg/L.

Additional Organic and Inorganic CLP qualifiers may be used with Form 1 reports as defined by the CLP methods. Qualifiers specific to Dioxin/Furans and PCB Congeners are detailed on the individual Analysis Report.

Analytical test results meet all requirements of the associated regulatory program (i.e., NELAC (TNI), DoD, and ISO 17025) unless otherwise noted under the individual analysis.

Measurement uncertainty values, as applicable, are available upon request.

Tests results relate only to the sample tested. Clients should be aware that a critical step in a chemical or microbiological analysis is the collection of the sample. Unless the sample analyzed is truly representative of the bulk of material involved, the test results will be meaningless. If you have questions regarding the proper techniques of collecting samples, please contact us. We cannot be held responsible for sample integrity, however, unless sampling has been performed by a member of our staff.

This report shall not be reproduced except in full, without the written approval of the laboratory.

Times are local to the area of activity. Parameters listed in the 40 CFR Part 136 Table II as "analyze immediately" are not performed within 15 minutes.

WARRANTY AND LIMITS OF LIABILITY - In accepting analytical work, we warrant the accuracy of test results for the sample as submitted. THE FOREGOING EXPRESS WARRANTY IS EXCLUSIVE AND IS GIVEN IN LIEU OF ALL OTHER WARRANTIES, EXPRESSED OR IMPLIED. WE DISCLAIM ANY OTHER WARRANTIES, EXPRESSED OR IMPLIED, INCLUDING A WARRANTY OF FITNESS FOR PARTICULAR PURPOSE AND WARRANTY OF MERCHANTABILITY. IN NO EVENT SHALL EUROFINS LANCASTER LABORATORIES ENVIRONMENTAL, LLC BE LIABLE FOR INDIRECT, SPECIAL, CONSEQUENTIAL, OR INCIDENTAL DAMAGES INCLUDING, BUT NOT LIMITED TO, DAMAGES FOR LOSS OF PROFIT OR GOODWILL REGARDLESS OF (A) THE NEGLIGENCE (EITHER SOLE OR CONCURRENT) OF EUROFINS LANCASTER LABORATORIES ENVIRONMENTAL AND (B) WHETHER EUROFINS LANCASTER LABORATORIES ENVIRONMENTAL HAS BEEN INFORMED OF THE POSSIBILITY OF SUCH DAMAGES. We accept no legal responsibility for the purposes for which the client uses the test results. No purchase order or other order for work shall be accepted by Eurofins Lancaster Laboratories Environmental which includes any conditions that vary from the Standard Terms and Conditions, and Eurofins Lancaster Laboratories Environmental hereby objects to any conflicting terms contained in any acceptance or order submitted by client.

Quality Control Summary

Client Name: Converse Laboratories, Inc.
Reported: 08/16/2016 10:23

Group Number: 1671282

Matrix QC may not be reported if insufficient sample or site-specific QC samples were not submitted. In these situations, to demonstrate precision and accuracy at a batch level, a LCS/LCSD was performed, unless otherwise specified in the method.

All Inorganic Initial Calibration and Continuing Calibration Blanks met acceptable method criteria unless otherwise noted on the Analysis Report.

Method Blank

Analysis Name	Result ng/l	MDL** ng/l	LOQ ng/l
Batch number: 16166005	Sample number(s): 8422678

*- Outside of specification

** This limit was used in the evaluation of the final result for the blank

(1) The result for one or both determinations was less than five times the LOQ.

(2) The unspiked result was more than four times the spike added.

is indicative of a Background or Unspiked sample that is batch matrix QC and was not performed using a sample from this submission group.

CHEMICAL TEST REPORT

Ref. C262640

Date October 25, 2016

Page 1 of 1

Attention: Diane Covell

Materials Specification: N/A

Customer: Converse Laboratories
800 Starbuck Ave, Suite B101
Watertown, NY 13601

Test Methods: EPA Method 3545A *Pressurized Fluid Extraction (PFE)* and EPA Method 8321B *Solvent Extractable Nonvolatile Compounds by High Performance Liquid Chromatography/Thermospray/Mass Spectrometry (HPLC/TS/MS) or Ultraviolet (UV) Detection*

P.O.# 16207

Samples: See Below

Test Results

Sample	Results			
	PFOA		PFOS	
	ppb (µg/L)	ppm (mg/L)	ppb (µg/L)	ppm (mg/L)
2072 PFOA + PFOS	25.790	0.026	156.0	0.156
Crash Truck #1	N.D. < 100 ppt	N/A	1361.2	1.36
Crash Truck #2	42.440	0.042	137160	137
Crash Truck #3	N.D. < 100 ppt	N/A	4035.6	4.04
Crash Truck #4	N.D. < 100 ppt	N/A	873.0	0.873
Crash Truck #5	N.D. < 100 ppt	N/A	3286.4	3.29

The sample was analyzed for PFOA and PFOS with a detection limit of 100 parts per trillion (ppt) ng/L.

N. D. < 100 – None Detected, less than 100 parts per trillion.

ISO 9001

APPENDIX E

Class B Fire Suppression Foam Usage Survey Questions

If possible, please complete the fillable PDF survey available at:

http://www.dec.ny.gov/docs/remediation_hudson_pdf/survey2.pdf

Instructions: Please answer all questions with respect to the period of current ownership/operation. In the event information is available regarding prior owners or operators, include it in the responses.

Please return the completed survey (PDF file) via email to derweb@dec.ny.gov by **July 15, 2016**. Non-electronic responses must be mailed to the following address: Ted Bennett, NYSDEC, Division of Environmental Remediation, 625 Broadway (12th Floor), Albany, NY 12233-7012.

If you have any questions, contact Ted Bennett at (518) 402-9764 or by email at theodore.bennett@dec.ny.gov

1. Facility Name: Fort Drum - Environmental Compliance Branch
2. Facility Address: 4896 Nininger St
City/Town: Fort Drum
State: New York
Zip Code: 13602-5097
3. Period of Facility Ownership: 1940s to present
4. Period of Facility Operation or Control: 1940s to present
5. Identities of Prior Facility Owners and Operators (to the extent available to current Owner/Operator): NA
6. Is any Class B fire suppression foam currently stored and/or used at the Facility? ☒ Yes ☐ No

If yes, please provide all known information about the type of Class B fire suppression foam currently stored and/or used, including:

- a. Date of purchase: 2005/2006/2011/2016
- b. Manufacturer and type of Class B fire suppression foam stored: 1. National Foam Aqueous Water 3% AFFF-2
- c. Quantity of Class B fire suppression foam stored: 10,316 gallons or 87,857 lbs
- d. % PFOS/A concentrate: Varies by product. See attached spreadsheet.
- e. Method of storage: 55 gallon drums, tanks, fire crash trucks
- f. Other relevant information: See attached spreadsheet of Class B foam inventory

7. Has any Class B fire suppression foam ever been stored and/or used at the Facility? ☒ Yes ☐ No ☐ Unknown

If yes, please note:

- a. Dates of storage: Last several decades
- b. Manufacturer and type of Class B fire suppression foam stored: Multiple types and formulations of AFFF were
- c. Quantity of Class B fire suppression foam stored: Storage quantity's were less histo
- d. % PFOS/A concentrate: unknown/various
- e. Method of storage: Tanks, 55-gallon drums, emergency response vehicles
- f. Other relevant information: Since 2011, six (6) aircraft hangers were converted from AFFF to high

8. Has Class B fire suppression foam ever been used for training purposes at the Facility?

☒ Yes ☐ No ☐ Unknown

If yes, please note:

- a. Dates and frequency of training: Monthly functional tests at fire training pit plus periodic training
 - i. If exact information is not available, please provide an estimate:
 - 1. 1-10 times over 10 years ☐
 - 2. 11-50 times over 10 years ☐
 - 3. 50 or more times over 10 years ☒
- b. Manufacturer and type of Class B fire suppression foam used in training: National Foam Aer-O-Water/Lite 3% and others
- c. Quantity of Class B fire suppression foam used in training: Approximately 100 gallons or 835ll
- d. Other relevant information: Used for fire fighting training certification

9. Has Class B fire suppression foam ever been used for firefighting or other emergency response purposes at the Facility? ☒ Yes ☐ No ☐ Unknown

If yes, please note:

- a. Date of emergency response: 2002
 - i. If exact information is not available, please provide an estimate:
 - 1. 1-10 times over 10 years ☒
 - 2. 11-50 times over 10 years ☐
 - 3. 50 or more times over 10 years ☐
- b. Manufacturer and type of Class B fire suppression foam used in firefighting or emergency response: National Foam or Ansul AFFF 3%
- c. Quantity of Class B fire suppression foam used in firefighting and emergency response: 400 gallons or 3340 lbs
- d. Other relevant information: Used to extinguish rubber backdrop on firing Range 8

10. Has the Facility ever experienced a spill or leak of Class B fire suppression foam? ☒ Yes ☐ No ☐ Unknown

If yes, please note:

a. Date of spill/leak: 1987-present; exact dates unknown

i. If exact information is not available, please provide an estimate:

1. 1-10 times over 10 years ☒
2. 11-50 times over 10 years ☐
3. 50 or more times over 10 years ☐

b. Manufacturer and type of Class B fire suppression foam spilled/leaked: SEE 10.d.

c. Quantity of Class B fire suppression foam spilled/leaked: SEE 10.d.

d. Other relevant information: National Foam Aer-O-Water/Lite 3% unknown quantity of drips in piping inside buildings repaired over several years

11. Has your Facility ever been responsible for the use of Class B fire suppression foam at a location other than the Facility (i.e. offsite training, emergency response, or spill)?

☒ Yes ☐ No ☐ Unknown

If yes, please note:

a. Date of each offsite use: 5/11/2001 and 7/30/2012

i. If exact information is not available, please provide an estimate:

1. 1-10 times over 10 years ☒
2. 11-50 times over 10 years ☐
3. 50 or more times over 10 years ☐

b. Manufacturer and type of Class B fire suppression foam used: National Foam or Ansul AFFF 3%

c. Quantity of Class B fire suppression foam: 2001-800 gals, 2012-10 gals

d. Other relevant information: 2001 - tractor trailer rollover (Rt 342/Rt11)
2012 - brake fire on Rt. 81 in Watertown

☐ Upon completing the survey you must place an "✓" in this box to certify the following:

Certification. I certify that this document was prepared under my direction or supervision in accordance with a system designed to assure that qualified personnel properly gather and evaluate the information submitted. Based on my inquiry of the person or persons who manage the system, or those persons directly responsible for gathering the information, the information submitted is, to the best of my knowledge and belief, true, accurate, and complete.

Name of person who completed and submitted responses to Survey (the legal owner, operator, or their representative authorized to complete and submit Survey)

BRYAN J. LASKEY, Garrison Commander

Name and Official Title

For use of this form, see 10th Mtn Div & Fort Drum Pam 5-1. The proponent is the SGS.				
SUBJECT: Class B Foam Survey for NYSDEC		DATE: 11 July 2016	OFFICE: IMDR-PWE	POC / POC #: James Miller 772-5269
		EMAIL: james.m.miller352.civ@mail.mil		
TO:	ACTION / INFO	INITIAL / DATE	COMMENTS	REMARKS:
aSC				1. PURPOSE. To obtain the Garrison Commander's signature on the attached firefighting foam usage survey from the New York State Department of Environmental Conservation (NYSDEC). The survey was due to the NYSDEC by 15 July 2016 with a 30 day extension request granted on 7/13/2016. 2. BACKGROUND a. In January 2016, New York State passed emergency regulations adding perfluorooctanoic acid (PFOA) and perfluorooctane sulfonic acid (PFOS) to the state's hazardous substance list. PFOA/PFOS (PFOA/S) are ingredients in certain firefighting foams. b. The five key aspects of the emergency regulation are: (i) registration of certain PFOA/S containing tanks; (ii) reporting of certain PFOA/S releases; (iii) replacement of certain PFOA/S systems by April, 2017; (iv) the state-wide ban on the discharge of all Class B foams for training regardless of PFOS concentration; and (v) soil and groundwater clean-up obligations where PFOA/S releases have occurred. c. Firefighting foams at Fort Drum are present in emergency response vehicles, in fixed fire suppression systems, and drum storage areas. The Directorate of Public Works (DPW) evaluated each storage area (enclosure 1) for compliance with the emergency regulation. Based on the low PFOA/S concentrations present at all locations, the registration, reporting, and system replacement mandates of the regulation are not triggered. d. The NYSDEC prohibition on the use of class B foams for training purposes (as opposed to an actual emergency) will adversely impact the Directorate of Emergency Services (DES). Additionally, the ACSIM issued a policy directive prohibiting all non-emergency discharges of Aqueous Film Forming Foam (AFFF) effective 29 June 2016. The NYSDEC/ACSIM directives are applicable to the AFFF foam currently used in DES Fire Fighting Vehicles. While it is not expected that one time release of the AFFF type currently used by DES is likely to cause contamination, repeated application during training or equipment testing (on or off post) could. e. Legacy AFFF formulations used on FD are suspected to have contained PFOA/S. The cost of studies and clean-up obligations due to PFOA/S contamination could reach several 100's of thousands of dollars or more. Ground water contamination exceeding health advisory (HA) levels continues to be detected in the aquifer near the fire training pit. 3. RECOMMENDATION: Recommend that the Garrison Commander sign the attached (enclosure 2) survey.

Appendix G

Fire Fighting Foam Compliance Storyboard												
Foam Storage as of 7/12/2016	Chemical Bulk Storage (CBS) Registration Determination *					Hazardous Substance Reporting Determination		Release Prohibition and Phase-Out Determination		Training & Testing Release Prohibitions		General PFC Considerations
	Gallons of Liquid Concentrate	Container Type	Foam Manufacturer & Name	Percent (by volume) of the four regulated PFOA/S Hazardous Substances in the Liquid Concentrate	Does the container require CBC Registration by April 2016 due to PFOA/S? (Yes/No)	Pounds of PFOA/S Released in the event of 100% discharge from the container	Would a full container discharge exceed the 1 lb Reportable Quantity (RQ) for PFOA/S? (Y/N)	Will more than one pound of PFOA/S be discharged when the fire suppression system or emergency response vehicle is used? ***	Is the fixed or mobile fire suppression system required to be replaced by DEC's April 25, 2017 deadline? (Y/N) ***	Is the foam subject to NYSDEC request to discontinue use of ANY Class B fire fighting foam for training purposes due to potential environmental and human health effects? (Yes/No)	Is the foam subject to ACSIM request to discontinue use of AFFF for training purposes ? (Yes/No)	Other than PFOA/S, should the foam be expected to have any other Perfluorinated Chemicals (PFCs), Fluroalkyl surfactants, etc. including the short chain less toxic PFC compounds with C6 telomer chemisty? (Yes/No)

* CBS registration is required only if the concentration of PFOA/S exceeds 1% or more by volume of one or more of the PFOA/S hazardous substances AND the stationary device stores more than 185 gallons (or 2,200 lbs in a non-stationary device).

** The Hanger 2074 stationary tank is currently empty.

*** In accordance with NYSDEC's emergency rule, replacement foam may not contain a hazardous substance at a concentration that would release more than one pound when used. The foams currently in place are therefore considered regulatory compliant since there "use" would not exceed 1 pound.
