GC/MS-Whole Air Calculations

Relative Response Factor (RRF)

$$RRF = \frac{Ax * Cis}{Ais * Cx}$$

where: Ax = area of the characteristic ion for the compound being measured
Ais = area of the characteristic ion for the specific internal standard of the compound being measured
Cx = concentration of the compound being measured (ppbv)
Cis = concentration of the internal standard (ppbv)

Percent Relative Standard Deviation (%RSD)

$$\% RSD = \frac{\text{Standard deviation of RRF values} * 100}{\text{mean RRF}}$$

Percent Difference (%D)

$$\% D = \frac{(RRFc - \text{mean RRFi}) * 100}{\text{mean RRFi}}$$

where: RRFc = relative response factor from the continuing calibration
mean RRFi = mean relative response factor from the initial calibration

Sample Calculations

$$ppbv = \frac{Ax * Is * Df}{Ais * RRF}$$

where: Ax = area of the characteristic ion for the compound being measured
Ais = area of the characteristic ion for the specific internal standard of the compound being measured
Is = Concentration of the internal standard injected (ppbv)
RRF= relative response factor for the compound being measured
Df = Dilution factor

ANALYTICAL QC SUMMARY REPORT

CLIENT: FPM
Work Order: C1110054
Project: 1000-08-17

TestCode: 1ugM3_TO15

Sample ID ALCS1UG-103111 SampType: LCS TestCode: 1ugM3_TO15 Units: ppbV Prep Date: RunNo: 5117
Client ID: ZZZZZ Batch ID: R5117 TestNo: TO-15 Analysis Date: 10/31/2011 SeqNo: 60279

Analyte	Result	PQL	SPK value	SPK Ref Val	%REC	LowLimit	HighLimit	RPD Ref Val	%RPD	RPDLimit	Qual
1,1,1-Trichloroethane	1.050	0.15	1	0	105	70	130				
1,1,2,2-Tetrachloroethane	0.9700	0.15	1	0	97.0	70	130				
1,1,2-Trichloroethane	1.020	0.15	1	0	102	70	130				
1,1-Dichloroethane	1.010	0.15	1	0	101	70	130				
1,1-Dichloroethene	1.110	0.15	1	0	111	70	130				
1,2,4-Trichlorobenzene	0.8500	0.15	1	0	85.0	70	130				
1,2,4-Trimethylbenzene	0.8900	0.15	1	0	89.0	70	130				
1,2-Dibromoethane	1.020	0.15	1	0	102	70	130				
1,2-Dichlorobenzene	0.9400	0.15	1	0	94.0	70	130				
1,2-Dichloroethane	0.9800	0.15	1	0	98.0	70	130				
1,2-Dichloropropane	1.020	0.15	1	0	102	70	130				
1,3,5-Trimethylbenzene	0.9900	0.15	1	0	99.0	70	130				
1,3-butadiene	0.8700	0.15	1	0	87.0	70	130				
1,3-Dichlorobenzene	0.9900	0.15	1	0	99.0	70	130				
1,4-Dichlorobenzene	0.9500	0.15	1	0	95.0	70	130				
1,4-Dioxane	0.9700	0.30	1	0	97.0	70	130				
2,2,4-trimethylpentane	0.9900	0.15	1	0	99.0	70	130				
4-ethyltoluene	0.9300	0.15	1	0	93.0	70	130				
Acetone	1.180	0.30	1	0	118	70	130				
Allyl chloride	0.9400	0.15	1	0	94.0	70	130				
Benzene	1.020	0.15	1	0	102	70	130				
Benzyl chloride	0.9000	0.15	1	0	90.0	70	130				
Bromodichloromethane	1.030	0.15	1	0	103	70	130				
Bromoform	1.070	0.15	1	0	107	70	130				
Bromomethane	0.8600	0.15	1	0	86.0	70	130				

Qualifiers:
. Results reported are not blank corrected
E Value above quantitation range
H Holding times for preparation or analysis exceeded
J Analyte detected at or below quantitation limits
ND Not Detected at the Reporting Limit
R RPD outside accepted recovery limits
S Spike Recovery outside accepted recovery limits

Laboratory:	Centek Laboratories, LLC
Sample Matrix:	Soil gas
Number of Samples:	6
Analytical Protocol:	AFCEE QAPP, Version 4.0, with AFCEE-approved lab variances
Data Reviewer:	Connie van Hoesel
Sample Date:	January 18, 2011

LIST OF DATA VERIFICATION SAMPLES

This verification report pertains to the following environmental samples and corresponding QC samples:

Sample ID	Date	Sample ID	Date
786VMP0102AA	1/18/11	TRIP BLANK	1/18/11
786VMP0202AA	1/18/11		
786VMP0302AA	1/18/11		
786CA0100AA	1/18/11		
786CA0200AA	1/18/11		

Notes:

Refer to attached chain-of-custody for detailed sampling information and sample specific analyses requested.
AA, AD – Primary environmental samples

DELIVERABLES

The data deliverable report was per requirements of the AFCEE QAPP 4.0 and approved variances. The report consisted of the following major sections: lab attachment letter, case narrative, chain-of-custody, lab qualifier definitions, analytical results (sheet 2) based on analytical batch, calibration summaries, method blank summaries, laboratory control sample summaries, matrix spike/matrix spike duplicate summaries, holding time forms, performance checks, surrogate and internal standard recoveries, as applicable.

ANALYTICAL METHODS

The analytical test methods and QA/QC requirements used for the water sample analysis were per methods as specified in the AFCEE Quality Assurance Project Plan, Version 4.0 and AFCEE approved laboratory variances. The analytical methods employed included the EPA Compendium Methods for toxic organics: Volatile Organic Compounds (VOC) by EPA method TO-15.

VERIFICATION GUIDANCE

The analytical work was performed by Severn Trent Laboratory in accordance with the Air Force Center for Environmental Excellence (AFCEE), Quality Assurance Project Plan (QAPP), Version 4.0, with AFCEE-approved laboratory variances. The data was verified according to the protocols and QC requirements of the respective analytical methods and of the QAPP Version 4.0. For data usability purposes all values were further evaluated, including positive and non-detect results that were qualified "Q" according to the QAPP. The data usability analysis was based on the reviewer's professional judgment and on an assessment of how this data would fare with respect to the method performance criteria for acceptance of data established by U.S. Environmental Protection Agency (USEPA) in Compendium Method TO-15, and the AFCEE QAPP, Version 4.0.

QA/QC CRITERIA

The following QA/QC criteria were reviewed, as applicable and available:

- Method detection limits and reporting limits (MDL, RL)
- Holding times, sample preservation and storage
- MS tune performance
- Initial and Continuing calibration summaries
- Second source calibration verification summary
- Method blanks
- Ambient, equipment, and trip blanks (as applicable)
- Field duplicate results

- Surrogate spike recoveries
- Internal standard areas counts and retention times
- Laboratory control samples (LCS)
- Results reported between MDL and RL (F-flag)
- Sample storage and preservation
- Data system printouts
- Qualitative and quantitative compound identification
- Chain-of-custody (COC)
- Case narrative and deliverables compliance

The items listed above were in compliance with AFCEE QAPP and USEPA criteria and protocols with exceptions discussed in the text below. The data have been verified according to the procedures outlined above and qualified accordingly.

GENERAL NOTES:

BLANKS

Whenever blanks, including method, ambient, equipment, and trip, contained low levels of contaminants (between MDL and RL), the laboratory and/or data validator qualified the subject results with an "F" flag. Since no qualification of associated field samples are required for blanks less than half the RL, no further action was taken in such instances.

REPORTING LIMIT

It should be noted that the "U" qualifier has been defined by the laboratory as the "compound was not detected above the *reporting limit*." AFCEE defines this qualifier as the compound was not detected above the *method detection limit*. The "U" qualifier as defined by the laboratory shall be retained for the purpose of consistency with previous soil vapor results.

In general, results less than the reporting limit were flagged "J" by the laboratory. However, these results were identified as detected but the quantitated amount was below the limit of quantitation (i.e., the reporting limit). An "F" flag, as defined by the AFCEE QAPP, was thus deemed the more appropriate qualifier for these results.

VOLATILE ORGANIC COMPOUNDS (VOC)

- Laboratory performance on individual samples is established by means of spiking all samples prior to analysis with surrogate compounds and assessing the percent recoveries. The following table summarizes QC exceedances for samples which exhibited surrogate compound recovery deficiencies. The Sample ID, surrogate compound, percent recoveries, and QC limits are listed. Note that the AFCEE QC limits of 60-140% for Bromofluorobenzene are listed in the table, whereas the laboratory's internal control limits are 70-130%.

Sample ID	Surrogate	%Rec	AFCEE QC Limits (%)	Flag Applied	Rationale
785VMP0202AD (1:5 dilution)	Bromofluorobenzene	69	60-140	None	%Rec less than laboratory lower QC limit but within AFCEE limits

If the surrogate recovery is not within AFCEE limits, corrective action shall be implemented: the sample shall be reextracted and reanalyzed. If the corrective action is ineffective in resolving the exceedance, then all analytes associated with the surrogate in that sample are qualified. As per the QAPP, for samples with recoveries greater than the upper control limit, positive sample results are considered estimated (flagged "J"). For samples with surrogate recoveries greater than 10% but less than the lower control limit, positive results are considered estimated (flagged "J") and non-detect results are considered estimated (flagged "UJ"). For samples with surrogate recoveries less than 10%, the results are rejected for the analytes. However, using professional judgment, no corrective action and/or flagging is required for minimal exceedances (i.e., within 1% of the control limits).

Corrective Action: Sample 785VMP0202AD (1:5 dilution) exhibited a surrogate recovery exceedance of the laboratory's internal control limits of 70-130 for bromofluorobenzene. However, the recoveries were within AFCEE's QC limits of 60-140. No flagging was considered necessary.

- According to the case narrative, in the following continuing calibration verification (CCV), analytes exhibited the following exceedances:

Type of Calibration Exceedance Affected Analytes	%D/ %RSD	AFCEE QC Limit	Flag Applied	Rationale
CCV 3/25/11, 2:46				
Hexachloro-1,3-butadiene	***-58.4***	±30	None	%D > upper control limit, all results ND
CCV 3/30/11, 12:13				
Tetrahydrofuran	***49.9***	±30	J	%D < lower control limit
Cyclohexane	***41.0***	±30	None	Compound not reported from associated analyses
2,2,4-Trimethylpentane	***46.8***	±30	None	Compound not reported from associated analyses
Heptane	***46.5***	±30	None	Compound not reported from associated

Type of Calibration Exceedance Affected Analytes	%D/ %RSD	AFCEE QC Limit	Flag Applied	Rationale
				analyses
Methyl Isobutyl Ketone	***40.3***	±30	None	Compound not reported from associated analyses
Methyl Butyl Ketone	***48.2***	±30	None	Compound not reported from associated analyses
Ethylbenzene	***41.9***	±30	None	Compound not reported from associated analyses
m,p-Xylenes	***33.0***	±30	J	%D < lower control limit
Hexachloro-1,3-butadiene	***-78.0***	±30	None	Compound not reported from associated analyses

Corrective Action: For hexachloro-1,3-butadiene, the standard response was above the acceptance limit, and the associated results may be biased high. All associated results were non-detect, so flagging was not deemed necessary or appropriate. For the remaining compounds in the CCV (3/30/11), the standard response was below the acceptance limit; associated detected results for tetrahydrofuran and/or m,p-xylenes were flagged "J" (only applicable to samples 785VMP0202AD, 785CA0100AB, and 785CA0200AA).

- Laboratory control samples (LCS) are samples spiked with all analytes of interest at known concentrations. The following table summarizes QC exceedances (**bold**) of the LCS analyses. The LCS ID, percent recovery, and QC limits are listed. For each LCS sample, the associated samples are also listed in the table.

Spike Analytes	LCS %Rec	QC Limits	ME Limits	Flag Applied	Rationale
LCS ID BLCS1UG-033011					
(No associated samples)					
LCS: Hexachloro-1,3-butadiene*	***140***	70-130	60-140	None	Compound not reported from associated analyses
LCSD: Hexachloro-1,3-butadiene*	***149***	70-130	60-140	None	Compound not reported from associated analyses
LCSD: Ethyl acetate*	***49***	70-130	60-140	None	Compound not reported from associated analyses
LCSD: Hexane*	***62***	70-130	60-140	None	Compound not reported from associated analyses
LCSD: Methyl Butyl Ketone*	***43***	70-130	60-140	None	Compound not reported from associated analyses
LCSD: Methyl Ethyl Ketone*	***30***	70-130	60-140	None	Compound not reported from associated analyses
LCSD: Methyl Isobutyl Ketone*	***63***	70-130	60-140	None	Compound not reported from associated analyses
LCSD: MTBE*	***51***	70-130	60-140	None	Compound not reported from associated analyses
LCSD: Tetrahydrofuran*	***55***	70-130	60-140	None	Compound not reported from associated analyses
LCSD: Vinyl acetate*	***51***	70-130	60-140	None	Compound not reported from associated analyses
LCS ID BLCS1UG-032511					

(associated samples 785VMP0202AD, 785VMP0401AA, 785CA0100AB, 785CA0200AA, TRIP BLANK)					
LCSD: 1,4-dioxane*	***46***	70-130	60-140	None	Primary LCS within AFCEE control limits
LCSD: Methyl butyl ketone*	***31***	70-130	60-140	None	Primary LCS within AFCEE control limits
LCSD: Methyl isobutyl ketone*	***47***	70-130	60-140	None	Primary LCS within AFCEE control limits

Note 1: The compounds listed with asterisks above are not listed in the AFCEE QAPP for Method TO-15. In all such cases, using professional judgment and consistent with the lab's methodology, the LCS QC acceptance range was assumed to be 70-130.

The LCS analyses are used to assess the overall laboratory performance pertaining to the analytical method. The QAPP includes method-specific QC acceptance criteria for the percent recovery of the spike compounds. However, the QAPP includes criteria for only a sub-set of the TO-15 analyte list; in the case of all other analytes, using professional judgment and consistent with the lab's methodology, the LCS QC acceptance range for percent recovery was assumed to be 70-130. The LCS results are used to evaluate each AFCEE analytical batch and to determine if the method is within control limits. When an LCS analyte is outside the acceptance limit, the laboratory shall perform corrective action. If the corrective action is ineffective in resolving the exceedance, then that analyte's results in all the associated samples are qualified. According to the QAPP, when the percent recovery (%Rec) is greater than the upper control limit, positive results are considered estimated (flagged "J"); and when the %Rec is less than the lower control limit, positive values are estimated (flagged "J") and non-detects are rejected (flagged "R"). Using professional judgment, the non-detect results may be considered usable, albeit estimated, and shall be flagged "UJ."

Corrective Action: For LCS (033011), the recovery for hexachloro-1,3-butadiene was above the upper control limit. This compound is not included in the AFCEE QAPP Method TO-14A/TO-15 list, so it was not considered necessary for the laboratory to perform additional corrective action. Since the recovery was within marginal exceedance limits, the LCS canister was independent of the continuing calibration canister, and all other QC met criteria for the associated samples, no flagging was considered necessary.

There were several recovery exceedances in the LCSD (032511), but since all recoveries of these compounds in the associated primary LCS sample were within QC limits, no further corrective action was considered necessary.

It should also be noted that several of the associated results were not used since they were associated with dilutions performed for other compounds.

There were some exceedances of the RPD (30%) between the LCS and LCSD samples BLCSD1UG-033011, for the following compounds: 1,1,2-trichloroethane (38.5%), acetone (38.6%), ethyl acetate (39.3%), methyl butyl ketone (47.8%), methyl ethyl ketone (85.7%), MTBE (38.1%), Trichloroethene (30.9%), and vinyl acetate (38.1%); also in LCS and LCSD samples BLCS1UGD-032511, for the following compounds: 1,4-dioxane (42.7%), hexachloro-1,3-butadiene (31.1%), methyl butyl ketone (78.4%), methyl ethyl ketone (34.6%), and methyl isobutyl ketone (42.0%). No corrective action was deemed necessary for RPD exceedances alone. The laboratory was consulted regarding these exceedances: sample humidity and/or carbon dioxide content in recently analyzed samples can greatly affect the integrity of the LCSD analysis.

- Second source calibration verification analysis, which is basically a calibration standard obtained from a source (vendor) other than the one for the Initial calibration standard, is required to be run once per five-point Initial calibration. It is used to verify that the analytes' relative response factors (RRF) calculated from the Initial calibration runs is accurate. According to the lab, the second source calibration is the same as the laboratory control sample (LCS; it should be noted that LCSD samples were not used for this purpose). As discussed above, there were several laboratory control samples with exceedances, but only two LCS's with exceedances of compounds on the AFCEE QAPP TO-14A/TO-15 list with a percent difference (%D) value between the RRF of the Initial and Second source exceeding the AFCEE QAPP QC criteria of ±30% (see table below). The AFCEE QAPP requires that the second source calibration verification be within control limits. Since these compounds were within marginal exceedance limits as applicable to LCS samples, using professional judgment, no further corrective action was deemed necessary. As stated in the case narrative, if results continue to be outside established limits, then the system would be recalibrated. For data usability purposes, using professional judgment, the analyte concentrations are considered usable data, albeit estimated, with positive results flagged "J" and non-detects flagged "UJ".

Type of Calibration Exceedance Affected Analytes	%D/ %RSD	AFCEE QC Limit	Flag Applied	Rationale
ALCS1UG-101210				
Styrene	***54***	±30	None	%D > upper control limit, all results ND
ALCS1UG-101310				
Tetrachloroethene	***-34***	±30	UJ	%D < lower control limit; associated result ND

Corrective Action: Since the %D value was less than 30% for the analyte tetrachloroethene, the associated result (in TRIP BLANK 10/6/10 sample), which was non-detect, was flagged "UJ." No flags were found necessary for styrene, since all associated results were non-detect and the exceedance indicated a high bias.

- Internal Standard (IS) performance criteria ensure that the GC/MS sensitivity and response are stable during every experimental run. Per the AFCEE QAPP, for Method TO-15 the internal standard area count must not vary by more than -40% to +40% from the associated continuing calibration standard. Also, per the QAPP, for Method TO-15 the retention time of the internal standard must not vary more than ±20 seconds from the associated continuing calibration standard. If these criteria are exceeded, the QAPP requires a mandatory re-analysis of samples analyzed while the system was malfunctioning, and all results for analytes associated with the deficient IS are qualified ("Q"), unless a matrix effect can be verified, in which case an "M" qualifier is applied. In such circumstances, the EPA National Functional Guidelines for Organic Data Review provide the following guidance: If the area count is outside the (-50% to +100%) range of the associated standard, all of the positive results for compounds quantitated using that IS are qualified as estimated ("J"); no action is taken for non-detects if IS area is > 100%, and all non-detects are qualified as estimated ("UJ") if IS area is < 50%. Non-detects are qualified as "R" if there is a severe loss of

sensitivity (< 25% of associated IS area counts). Also, if an internal standard retention time varies by more than 30 seconds, the reviewer will use professional judgment to determine either partial or total rejection of the data for that sample fraction. **Proposed approach**: In this data verification, for data usability purposes, the data qualifiers will be applied following the EPA National Functional Guidance [estimate ("J") for positives if area count is outside of allowed ±40% range, no action for non-detects if IS area > + 40%, estimate ("UJ") for non-detects if IS area < - 40%, reject ("R") for non-detects if IS area is < -75%, and use professional judgment if retention time varies by more than 20 seconds].

The following are the assessment results for the "internal standards performance" criterion (the Sample ID and IS area counts are listed) for samples exhibiting exceedance (***bold italic***) [no retention time exceedances were encountered during this sampling round and NOTE: Samples with no exceedances are not listed below]:

	IS1 (BCM)	IS2 (DFB)	IS3 (CBZ)
12 Hour Std. (3/30/11)	23589	85556	75269
Upper Limit (+40%)	33025	119778	105377
Lower Limit (-40%)	14153	51334	45161
Severe loss of sensitivity (< -75%)*	5897	21389	18817
SAMPLE ID			
785VMP0401AA (1:80)	20028	***50415***	46707
785CA0100AB (1:16)	21043	55900	***43889***
785CA0100AB (1:40)	19186	***48468***	***44036***
785CA0100AB (1:320)	19840	***46663***	***40250***
785CA0200AA (1:10)	20163	62761	***44689***
785CA0200AA (1:40)	18792	***48797***	46245
LCSD-033011	21293	***49442***	53098

IS1 (BCM) =Bromochloromethane; IS2 (DFB) =1,4-Difluorobenzene; IS3 (CBZ) = Chlorobenzene-d5
Area count: Upper Limit = +40% and Lower Limit = -40% of internal standard

Corrective Action: For exceedances above the upper limit, analytes associated with the exceeding internal standard(s) are qualified as estimated ("J") for positive results; for non-detects, no qualification was necessary. For exceedances below the lower limit, analytes associated with the exceeding internal standard(s) are qualified estimated ("J") for positive results, and estimated ("UJ") for non-detect results. If matrix effects were verified (i.e., analyses at 1x met performance criteria, or interfering peaks were observed), then "M" flags are applicable. In accordance with the case narrative, based on the results of the 1x concentration with criteria being met, the internal standard results for samples 786VMP0401AA (1:80) and 785CA0100AB (1:16 and 1:320 dilutions) do appear to be the result of a matrix effect. "M" flags were applied to the associated results as required:

Sample ID	Analyte	Associated IS outside of AFCEE QAPP criteria	Flag Applied	Rationale

Sample ID	Analyte	Associated IS outside of AFCEE QAPP criteria	Flag Applied	Rationale
786VMP0401AA (1:80)	Trichloroethene	DFB	M	Matrix effect due to interfering peaks
785CA0100AB (1:16)	m,p-Xylenes	CBZ	M	Matrix effect due to interfering peaks
785CA0100AB (1:320)	Trichloroethene	DFB	M	Matrix effect due to interfering peaks

DATA USABILITY RESULTS

VOCs

Based on the evaluation of all information in the analytical data groups, the results of all the samples for VOCs are highly usable with the data validation qualifiers as noted. Using the validation approach as presented above, the results for all samples in this analytical batch are 100% usable [i.e., all results are usable when the results from dilution samples are transferred to the original sample results]. The AFCEE QAPP minimum requirement for completeness (for aqueous samples, but will be applied here for vapor samples) is 95%, which is exceeded in this analytical batch.

AFCEE SUMMARY

All data in Job # C1101031 are usable, which can be used with qualifications as noted in the data review.

FPM GROUP, LTD.
Data Verification and Usability Report
GRIFFISS AIR FORCE BASE
GRIFFISS SUBSLAB VAPOR MITIGATION SYSTEM
Site Griffiss AFB Building 785
Contract No. FA8903-04-D-8687

FPM Project No. 1000-08-17

Centek Job # C1103055

Laboratory:	Centek Laboratories, LLC
Sample Matrix:	Soil gas
Number of Samples:	5
Analytical Protocol:	AFCEE QAPP, Version 4.0, with AFCEE-approved lab variances
Data Reviewer:	Connie van Hoesel
Sample Date:	March 18 and 22, 2011

LIST OF DATA VERIFICATION SAMPLES

This verification report pertains to the following environmental samples and corresponding QC samples:

Sample ID	Date	Sample ID	Date
785VMP0202AD	3/18/11		
785VMP0401AA	3/18/11		
785CA0100AA	3/22/11	TRIP BLANK	3/22/11
786CA0200AA	3/22/11		

Notes:

Refer to attached chain-of-custody for detailed sampling information and sample specific analyses requested.

AA, AD – Primary environmental samples

DELIVERABLES

The data deliverable report was per requirements of the AFCEE QAPP 4.0 and approved variances. The report consisted of the following major sections: lab attachment letter, case narrative, chain-of-custody, lab qualifier definitions, analytical results (sheet 2) based on analytical batch, calibration summaries, method blank summaries, laboratory control sample summaries, matrix spike/matrix spike duplicate summaries, holding time forms, performance checks, surrogate and internal standard recoveries, as applicable.

ANALYTICAL METHODS

The analytical test methods and QA/QC requirements used for the water sample analysis were per methods as specified in the AFCEE Quality Assurance Project Plan, Version 4.0 and AFCEE approved laboratory variances. The analytical methods employed included the EPA Compendium Methods for toxic organics: Volatile Organic Compounds (VOC) by EPA method TO-15.

VERIFICATION GUIDANCE

The analytical work was performed by Severn Trent Laboratory in accordance with the Air Force Center for Environmental Excellence (AFCEE), Quality Assurance Project Plan (QAPP), Version 4.0, with AFCEE-approved laboratory variances. The data was verified according to the protocols and QC requirements of the respective analytical methods and of the QAPP Version 4.0. For data usability purposes all values were further evaluated, including positive and non-detect results that were qualified "Q" according to the QAPP. The data usability analysis was based on the reviewer's professional judgment and on an assessment of how this data would fare with respect to the method performance criteria for acceptance of data established by U.S. Environmental Protection Agency (USEPA) in Compendium Method TO-15, and the AFCEE QAPP, Version 4.0.

QA/QC CRITERIA

The following QA/QC criteria were reviewed, as applicable and available:

- Method detection limits and reporting limits (MDL, RL)
- Holding times, sample preservation and storage
- MS tune performance
- Initial and Continuing calibration summaries
- Second source calibration verification summary
- Method blanks
- Ambient, equipment, and trip blanks (as applicable)

- Field duplicate results
- Surrogate spike recoveries
- Internal standard areas counts and retention times
- Laboratory control samples (LCS)
- Results reported between MDL and RL (F-flag)
- Sample storage and preservation
- Data system printouts
- Qualitative and quantitative compound identification
- Chain-of-custody (COC)
- Case narrative and deliverables compliance

The items listed above were in compliance with AFCEE QAPP and USEPA criteria and protocols with exceptions discussed in the text below. The data have been verified according to the procedures outlined above and qualified accordingly.

GENERAL NOTES:

BLANKS

Whenever blanks, including method, ambient, equipment, and trip, contained low levels of contaminants (between MDL and RL), the laboratory and/or data validator qualified the subject results with an "F" flag. Since no qualification of associated field samples are required for blanks less than half the RL, no further action was taken in such instances.

REPORTING LIMIT

It should be noted that the "U" qualifier has been defined by the laboratory as the "compound was not detected above the *reporting limit*." AFCEE defines this qualifier as the compound was not detected above the *method detection limit*. The "U" qualifier as defined by the laboratory shall be retained for the purpose of consistency with previous soil vapor results.

In general, results less than the reporting limit were flagged "J" by the laboratory. However, these results were identified as detected but the quantitated amount was below the limit of quantitation (i.e., the reporting limit). An "F" flag, as defined by the AFCEE QAPP, was thus deemed the more appropriate qualifier for these results.

VOLATILE ORGANIC COMPOUNDS (VOC)

- Laboratory performance on individual samples is established by means of spiking all samples prior to analysis with surrogate compounds and assessing the percent recoveries. The following table summarizes QC exceedances for samples which exhibited surrogate compound recovery deficiencies. The Sample ID, surrogate compound, percent recoveries, and QC limits are listed. Note that the AFCEE QC limits of 60-140% for Bromofluorobenzene are listed in the table, whereas the laboratory's internal control limits are 70-130%.

Sample ID	Surrogate	%Rec	AFCEE QC Limits (%)	Flag Applied	Rationale
785VMP0202AD (1:5 dilution)	Bromofluorobenzene	69	60-140	None	%Rec less than laboratory lower QC limit but within AFCEE limits

If the surrogate recovery is not within AFCEE limits, corrective action shall be implemented: the sample shall be reextracted and reanalyzed. If the corrective action is ineffective in resolving the exceedance, then all analytes associated with the surrogate in that sample are qualified. As per the QAPP, for samples with recoveries greater than the upper control limit, positive sample results are considered estimated (flagged "J"). For samples with surrogate recoveries greater than 10% but less than the lower control limit, positive results are considered estimated (flagged "J") and non-detect results are considered estimated (flagged "UJ"). For samples with surrogate recoveries less than 10%, the results are rejected for the analytes. However, using professional judgment, no corrective action and/or flagging is required for minimal exceedances (i.e., within 1% of the control limits).

Corrective Action: Sample 785VMP0202AD (1:5 dilution) exhibited a surrogate recovery exceedance of the laboratory's internal control limits of 70-130 for bromofluorobenzene. However, the recoveries were within AFCEE's QC limits of 60-140. No flagging was considered necessary.

- According to the case narrative, in the following continuing calibration verification (CCV), analytes exhibited the following exceedances:

Type of Calibration Exceedance Affected Analytes	%D/ %RSD	AFCEE QC Limit	Flag Applied	Rationale
CCV 3/25/11, 2:46				
Hexachloro-1,3-butadiene	***-58.4***	±30	None	%D > upper control limit, all results ND
CCV 3/30/11, 12:13				
Tetrahydrofuran	***49.9***	±30	J	%D < lower control limit
Cyclohexane	***41.0***	±30	None	Compound not reported from associated analyses
2,2,4-Trimethylpentane	***46.8***	±30	None	Compound not reported from associated analyses
Heptane	***46.5***	±30	None	Compound not reported from associated

Type of Calibration Exceedance Affected Analytes	%D/ %RSD	AFCEE QC Limit	Flag Applied	Rationale
				analyses
Methyl Isobutyl Ketone	***40.3***	±30	None	Compound not reported from associated analyses
Methyl Butyl Ketone	***48.2***	±30	None	Compound not reported from associated analyses
Ethylbenzene	***41.9***	±30	None	Compound not reported from associated analyses
m,p-Xylenes	***33.0***	±30	J	%D < lower control limit
Hexachloro-1,3-butadiene	***-78.0***	±30	None	Compound not reported from associated analyses

Corrective Action: For hexachloro-1,3-butadiene, the standard response was above the acceptance limit, and the associated results may be biased high. All associated results were non-detect, so flagging was not deemed necessary or appropriate. For the remaining compounds in the CCV (3/30/11), the standard response was below the acceptance limit; associated detected results for tetrahydrofuran and/or m,p-xylenes were flagged "J" (only applicable to samples 785VMP0202AD, 785CA0100AB, and 785CA0200AA).

- Laboratory control samples (LCS) are samples spiked with all analytes of interest at known concentrations. The following table summarizes QC exceedances (**bold**) of the LCS analyses. The LCS ID, percent recovery, and QC limits are listed. For each LCS sample, the associated samples are also listed in the table.

Spike Analytes	LCS %Rec	QC Limits	ME Limits	Flag Applied	Rationale
LCS ID BLCS1UG-033011					
(No associated samples)					
LCS: Hexachloro-1,3-butadiene*	***140***	70-130	60-140	None	Compound not reported from associated analyses
LCSD: Hexachloro-1,3-butadiene*	***149***	70-130	60-140	None	Compound not reported from associated analyses
LCSD: Ethyl acetate*	***49***	70-130	60-140	None	Compound not reported from associated analyses
LCSD: Hexane*	***62***	70-130	60-140	None	Compound not reported from associated analyses
LCSD: Methyl Butyl Ketone*	***43***	70-130	60-140	None	Compound not reported from associated analyses
LCSD: Methyl Ethyl Ketone*	***30***	70-130	60-140	None	Compound not reported from associated analyses
LCSD: Methyl Isobutyl Ketone*	***63***	70-130	60-140	None	Compound not reported from associated analyses
LCSD: MTBE*	***51***	70-130	60-140	None	Compound not reported from associated analyses
LCSD: Tetrahydrofuran*	***55***	70-130	60-140	None	Compound not reported from associated analyses
LCSD: Vinyl acetate*	***51***	70-130	60-140	None	Compound not reported from associated analyses

LCS ID BLCS1UG-032511					
(associated samples 785VMP0202AD, 785VMP0401AA, 785CA0100AB, 785CA0200AA, TRIP BLANK)					
LCSD: 1,4-dioxane*	***46***	70-130	60-140	None	Primary LCS within AFCEE control limits
LCSD: Methyl butyl ketone*	***31***	70-130	60-140	None	Primary LCS within AFCEE control limits
LCSD: Methyl isobutyl ketone*	***47***	70-130	60-140	None	Primary LCS within AFCEE control limits

Note 1: The compounds listed with asterisks above are not listed in the AFCEE QAPP for Method TO-15. In all such cases, using professional judgment and consistent with the lab's methodology, the LCS QC acceptance range was assumed to be 70-130.

The LCS analyses are used to assess the overall laboratory performance pertaining to the analytical method. The QAPP includes method-specific QC acceptance criteria for the percent recovery of the spike compounds. However, the QAPP includes criteria for only a sub-set of the TO-15 analyte list; in the case of all other analytes, using professional judgment and consistent with the lab's methodology, the LCS QC acceptance range for percent recovery was assumed to be 70-130. The LCS results are used to evaluate each AFCEE analytical batch and to determine if the method is within control limits. When an LCS analyte is outside the acceptance limit, the laboratory shall perform corrective action. If the corrective action is ineffective in resolving the exceedance, then that analyte's results in all the associated samples are qualified. According to the QAPP, when the percent recovery (%Rec) is greater than the upper control limit, positive results are considered estimated (flagged "J"); and when the %Rec is less than the lower control limit, positive values are estimated (flagged "J") and non-detects are rejected (flagged "R"). Using professional judgment, the non-detect results may be considered usable, albeit estimated, and shall be flagged "UJ."

Corrective Action: For LCS (033011), the recovery for hexachloro-1,3-butadiene was above the upper control limit. This compound is not included in the AFCEE QAPP Method TO-14A/TO-15 list, so it was not considered necessary for the laboratory to perform additional corrective action. Since the recovery was within marginal exceedance limits, the LCS canister was independent of the continuing calibration canister, and all other QC met criteria for the associated samples, no flagging was considered necessary.

There were several recovery exceedances in the LCSD (032511), but since all recoveries of these compounds in the associated primary LCS sample were within QC limits, no further corrective action was considered necessary.

It should also be noted that several of the associated results were not used since they were associated with dilutions performed for other compounds.

There were some exceedances of the RPD (30%) between the LCS and LCSD samples BLCSD1UG-033011, for the following compounds: 1,1,2-trichloroethane (38.5%), acetone (38.6%), ethyl acetate (39.3%), methyl butyl ketone (47.8%), methyl ethyl ketone (85.7%), MTBE (38.1%), Trichloroethene (30.9%), and vinyl acetate (38.1%); also in LCS and LCSD samples BLCS1UGD-032511, for the following compounds: 1,4-dioxane (42.7%), hexachloro-1,3-butadiene (31.1%), methyl butyl ketone (78.4%), methyl ethyl ketone (34.6%), and methyl isobutyl ketone (42.0%). No corrective action was deemed necessary for RPD exceedances alone. The laboratory was consulted regarding these exceedances:

sample humidity and/or carbon dioxide content in recently analyzed samples can greatly affect the integrity of the LCSD analysis.

- Second source calibration verification analysis, which is basically a calibration standard obtained from a source (vendor) other than the one for the Initial calibration standard, is required to be run once per five-point Initial calibration. It is used to verify that the analytes' relative response factors (RRF) calculated from the Initial calibration runs is accurate. According to the lab, the second source calibration is the same as the laboratory control sample (LCS; it should be noted that LCSD samples were not used for this purpose). As discussed above, there were several laboratory control samples with exceedances, but only two LCS's with exceedances of compounds on the AFCEE QAPP TO-14A/TO-15 list with a percent difference (%D) value between the RRF of the Initial and Second source exceeding the AFCEE QAPP QC criteria of ±30% (see table below). The AFCEE QAPP requires that the second source calibration verification be within control limits. Since these compounds were within marginal exceedance limits as applicable to LCS samples, using professional judgment, no further corrective action was deemed necessary. As stated in the case narrative, if results continue to be outside established limits, then the system would be recalibrated. For data usability purposes, using professional judgment, the analyte concentrations are considered usable data, albeit estimated, with positive results flagged "J" and non-detects flagged "UJ".

Type of Calibration Exceedance Affected Analytes	**%D/ %RSD**	**AFCEE QC Limit**	**Flag Applied**	**Rationale**
ALCS1UG-101210				
Styrene	***54***	±30	None	%D > upper control limit, all results ND
ALCS1UG-101310				
Tetrachloroethene	***-34***	±30	UJ	%D < lower control limit; associated result ND

<u>Corrective Action</u>: Since the %D value was less than 30% for the analyte tetrachloroethene, the associated result (in TRIP BLANK 10/6/10 sample), which was non-detect, was flagged "UJ." No flags were found necessary for styrene, since all associated results were non-detect and the exceedance indicated a high bias.

- Internal Standard (IS) performance criteria ensure that the GC/MS sensitivity and response are stable during every experimental run. Per the AFCEE QAPP, for Method TO-15 the internal standard area count must not vary by more than -40% to +40% from the associated continuing calibration standard. Also, per the QAPP, for Method TO-15 the retention time of the internal standard must not vary more than ±20 seconds from the associated continuing calibration standard. If these criteria are exceeded, the QAPP requires a mandatory re-analysis of samples analyzed while the system was malfunctioning, and all results for analytes associated with the deficient IS are qualified ("Q"), unless a matrix effect can be verified, in which case an "M" qualifier is applied. In such circumstances, the EPA National Functional Guidelines for Organic Data Review provide the following guidance: If the area count is outside the (-50% to +100%) range of the associated standard, all of the positive results for compounds quantitated using that IS are qualified as estimated ("J"); no action is

taken for non-detects if IS area is > 100%, and all non-detects are qualified as estimated ("UJ") if IS area is < 50%. Non-detects are qualified as "R" if there is a severe loss of sensitivity (< 25% of associated IS area counts). Also, if an internal standard retention time varies by more than 30 seconds, the reviewer will use professional judgment to determine either partial or total rejection of the data for that sample fraction. **Proposed approach**: In this data verification, for data usability purposes, the data qualifiers will be applied following the EPA National Functional Guidance [estimate ("J") for positives if area count is outside of allowed ±40% range, no action for non-detects if IS area > + 40%, estimate ("UJ") for non-detects if IS area < - 40%, reject ("R") for non-detects if IS area is < -75%, and use professional judgment if retention time varies by more than 20 seconds].

The following are the assessment results for the "internal standards performance" criterion (the Sample ID and IS area counts are listed) for samples exhibiting exceedance (***bold italic***) [no retention time exceedances were encountered during this sampling round and NOTE: Samples with no exceedances are not listed below]:

	IS1 (BCM)	IS2 (DFB)	IS3 (CBZ)
12 Hour Std. (3/30/11)	23589	85556	75269
Upper Limit (+40%)	33025	119778	105377
Lower Limit (-40%)	14153	51334	45161
Severe loss of sensitivity (< -75%)*	5897	21389	18817
SAMPLE ID			
785VMP0401AA (1:80)	20028	***50415***	46707
785CA0100AB (1:16)	21043	55900	***43889***
785CA0100AB (1:40)	19186	***48468***	***44036***
785CA0100AB (1:320)	19840	***46663***	***40250***
785CA0200AA (1:10)	20163	62761	***44689***
785CA0200AA (1:40)	18792	***48797***	46245
LCSD-033011	21293	***49442***	53098

IS1 (BCM) =Bromochloromethane; IS2 (DFB) =1,4-Difluorobenzene; IS3 (CBZ) = Chlorobenzene-d5
Area count: Upper Limit = +40% and Lower Limit = -40% of internal standard

Corrective Action: For exceedances above the upper limit, analytes associated with the exceeding internal standard(s) are qualified as estimated ("J") for positive results; for non-detects, no qualification was necessary. For exceedances below the lower limit, analytes associated with the exceeding internal standard(s) are qualified estimated ("J") for positive results, and estimated ("UJ") for non-detect results. If matrix effects were verified (i.e., analyses at 1x met performance criteria, or interfering peaks were observed), then "M" flags are applicable. In accordance with the case narrative, based on the results of the 1x concentration with criteria being met, the internal standard results for samples 786VMP0401AA (1:80) and 785CA0100AB (1:16 and 1:320 dilutions) do appear to be the result of a matrix effect. "M" flags were applied to the associated results as required:

Sample ID	Analyte	Associated IS outside of AFCEE QAPP criteria	Flag Applied	Rationale
786VMP0401AA (1:80)	Trichloroethene	DFB	M	Matrix effect due to interfering peaks
785CA0100AB (1:16)	m,p-Xylenes	CBZ	M	Matrix effect due to interfering peaks
785CA0100AB (1:320)	Trichloroethene	DFB	M	Matrix effect due to interfering peaks

DATA USABILITY RESULTS

VOCs

Based on the evaluation of all information in the analytical data groups, the results of all the samples for VOCs are highly usable with the data validation qualifiers as noted. Using the validation approach as presented above, the results for all samples in this analytical batch are 100% usable [i.e., all results are usable when the results from dilution samples are transferred to the original sample results]. The AFCEE QAPP minimum requirement for completeness (for aqueous samples, but will be applied here for vapor samples) is 95%, which is exceeded in this analytical batch.

AFCEE SUMMARY

All data in Job # C1103055 are usable, which can be used with qualifications as noted in the data review.

FPM Project No. 1000-08-17

Centek Job # C1105011

Laboratory:	Centek Laboratories, LLC
Sample Matrix:	Soil gas
Number of Samples:	10
Analytical Protocol:	AFCEE QAPP, Version 4.0, with AFCEE-approved lab variances
Data Reviewer:	Connie van Hoesel
Sample Date:	May 4 and 5, 2011

LIST OF DATA VERIFICATION SAMPLES

This verification report pertains to the following environmental samples and corresponding QC samples:

Sample ID	Date	Sample ID	Date
774VMP0101AA	5/4/11		
774VMP0201AA	5/4/11		
774VMP0301AA	5/4/11		
774IA1AD	5/5/11		
776VMP0101AA	5/4/11		
776VMP0201AA	5/4/11	TRIP BLANK	5/4/11
776VMP0301AA	5/4/11		
776IA1CA	5/4/11		
776OA1DA	5/4/11		

Notes:

Refer to attached chain-of-custody for detailed sampling information and sample specific analyses requested.
AA, CA, DA – Primary environmental samples

DELIVERABLES

The data deliverable report was per requirements of the AFCEE QAPP 4.0 and approved variances. The report consisted of the following major sections: lab attachment letter, case narrative, chain-of-custody, lab qualifier definitions, analytical results (sheet 2) based on analytical batch, calibration summaries, method blank summaries, laboratory control sample summaries, matrix spike/matrix spike duplicate summaries, holding time forms, performance checks, surrogate and internal standard recoveries, as applicable.

ANALYTICAL METHODS

The analytical test methods and QA/QC requirements used for the water sample analysis were per methods as specified in the AFCEE Quality Assurance Project Plan, Version 4.0 and AFCEE approved laboratory variances. The analytical methods employed included the EPA Compendium Methods for toxic organics: Volatile Organic Compounds (VOC) by EPA method TO-15.

VERIFICATION GUIDANCE

The analytical work was performed by Severn Trent Laboratory in accordance with the Air Force Center for Environmental Excellence (AFCEE), Quality Assurance Project Plan (QAPP), Version 4.0, with AFCEE-approved laboratory variances. The data was verified according to the protocols and QC requirements of the respective analytical methods and of the QAPP Version 4.0. For data usability purposes all values were further evaluated, including positive and non-detect results that were qualified "Q" according to the QAPP. The data usability analysis was based on the reviewer's professional judgment and on an assessment of how this data would fare with respect to the method performance criteria for acceptance of data established by U.S. Environmental Protection Agency (USEPA) in Compendium Method TO-15, and the AFCEE QAPP, Version 4.0.

QA/QC CRITERIA

The following QA/QC criteria were reviewed, as applicable and available:

- Method detection limits and reporting limits (MDL, RL)
- Holding times, sample preservation and storage
- MS tune performance
- Initial and Continuing calibration summaries
- Second source calibration verification summary
- Method blanks
- Ambient, equipment, and trip blanks (as applicable)
- Field duplicate results
- Surrogate spike recoveries
- Internal standard areas counts and retention times

- Laboratory control samples (LCS)
- Results reported between MDL and RL (F-flag)
- Sample storage and preservation
- Data system printouts
- Qualitative and quantitative compound identification
- Chain-of-custody (COC)
- Case narrative and deliverables compliance

The items listed above were in compliance with AFCEE QAPP and USEPA criteria and protocols with exceptions discussed in the text below. The data have been verified according to the procedures outlined above and qualified accordingly.

GENERAL NOTES:

BLANKS

Whenever blanks, including method, ambient, equipment, and trip, contained low levels of contaminants (between MDL and RL), the laboratory and/or data validator qualified the subject results with an "F" flag. Since no qualification of associated field samples are required for blanks less than half the RL, no further action was taken in such instances.

REPORTING LIMIT

It should be noted that the "U" qualifier has been defined by the laboratory as the "compound was not detected above the *reporting limit*." AFCEE defines this qualifier as the compound was not detected above the *method detection limit*. The "U" qualifier as defined by the laboratory shall be retained for the purpose of consistency with previous soil vapor results.

In general, results less than the reporting limit were flagged "J" by the laboratory. However, these results were identified as detected but the quantitated amount was below the limit of quantitation (i.e., the reporting limit). An "F" flag, as defined by the AFCEE QAPP, was thus deemed the more appropriate qualifier for these results.

VOLATILE ORGANIC COMPOUNDS (VOC)

- According to the case narrative, in the following continuing calibration verification (CCV), analytes exhibited the following exceedances:

Type of Calibration Exceedance Affected Analytes	%D/ %RSD	AFCEE QC Limit	Flag Applied	Rationale
CCV 5/10/11, 1:14				
MTBE	***-50.8***	±30	None	%D > upper control limit; results ND
1,2,4-Trichlorobenzene	***-78.9***	±30	None	%D > upper control limit; results ND
Naphthalene	***-120.0***	±30	None	%D > upper control limit; results ND
CCV 5/12/11, 12:52				
1,2,4-Trichlorobenzene	***-67.9***	±30	None	%D > upper control limit; results ND
Naphthalene	***-73.8***	±30	None	Compound not included on target analyte list
Hexachloro-1,3-butadiene	***-56.2***	±30	None	%D > upper control limit; results ND

Corrective Action: As stated in the case narrative, the standard response in the CCV for all compounds was above the acceptance limit, and the associated results may be biased high. All associated results were non-detect, so flagging was not deemed necessary or appropriate.

- Laboratory control samples (LCS) are samples spiked with all analytes of interest at known concentrations. The following table summarizes QC exceedances (**bold**) of the LCS analyses. The LCS ID, percent recovery, and QC limits are listed. For each LCS sample, the associated samples are also listed in the table.

Spike Analytes	LCS %Rec	QC Limits	ME Limits	Flag Applied	Rationale
LCS ID ALCS1UG-051011					
(all samples associated)					
LCS: 1,2,4-Trichlorobenzene*	***163***	70-130	60-140	None	%Rec greater than upper control limit and all associated results ND
LCSD: 1,2,4-Trichlorobenzene*	***170***				
LCS: Hexachloro-1,3-butadiene*	***136***	70-130	60-140	None	%Rec within AFCEE control limits
LCSD: Hexachloro-1,3-butadiene*	***168***				
LCS: MTBE*	***142***	70-130	60-140	None	Compound not reported from associated analyses
LCSD: 1,1,1-Trichloroethane	***139***	70-130	60-140	None	%Rec within AFCEE control limits
LCSD: Bromodichloromethane*	***132***	70-130	60-140	None	%Rec within AFCEE control limits
LCSD: Carbon tetrachloride	***137***	70-130	60-140	None	%Rec within AFCEE control limits
LCSD: Vinyl bromide*	***132***	70-130	60-140	None	%Rec within AFCEE control limits
LCS ID ALCS1UG-051211					

(associated samples 774VMP0101AA 1:90, 774VMP0201AA 1:270, 774VMP0301AA 1:90, 776VMP0201AA 1:90, and 776VMP0301AA 1:270)					
LCS: 1,2,4-Trichlorobenzene*	***145***	70-130	60-140	None	%Rec greater than upper control limit and all associated results ND
LCS: Hexachloro-1,3-butadiene*	***152***	70-130	60-140	None	%Rec greater than upper control limit and all associated results ND

Note 1: The compounds listed with asterisks above are not listed in the AFCEE QAPP for Method TO-15. In all such cases, using professional judgment and consistent with the lab's methodology, the LCS QC acceptance range was assumed to be 70-130.

The LCS analyses are used to assess the overall laboratory performance pertaining to the analytical method. The QAPP includes method-specific QC acceptance criteria for the percent recovery of the spike compounds. However, the QAPP includes criteria for only a sub-set of the TO-15 analyte list; in the case of all other analytes, using professional judgment and consistent with the lab's methodology, the LCS QC acceptance range for percent recovery was assumed to be 70-130. The LCS results are used to evaluate each AFCEE analytical batch and to determine if the method is within control limits. When an LCS analyte is outside the acceptance limit, the laboratory shall perform corrective action. If the corrective action is ineffective in resolving the exceedance, then that analyte's results in all the associated samples are qualified. According to the QAPP, when the percent recovery (%Rec) is greater than the upper control limit, positive results are considered estimated (flagged "J"); and when the %Rec is less than the lower control limit, positive values are estimated (flagged "J") and non-detects are rejected (flagged "R"). Using professional judgment, the non-detect results may be considered usable, albeit estimated, and shall be flagged "UJ."

Corrective Action: For all compounds listed above, the recoveries were above the upper control limit, indicating a high bias for associated results. Since all associated results were non-detect, no flagging and/or further corrective action is considered necessary.

- Second source calibration verification analysis, which is basically a calibration standard obtained from a source (vendor) other than the one for the Initial calibration standard, is required to be run once per five-point Initial calibration. It is used to verify that the analytes' relative response factors (RRF) calculated from the Initial calibration runs is accurate. According to the lab, the second source calibration is the same as the laboratory control sample (LCS; it should be noted that LCSD samples were not used for this purpose). As discussed above, there were several laboratory control samples with exceedances, but no compounds on the AFCEE QAPP TO-14A/TO-15 list with a percent difference (%D) value between the RRF of the Initial and Second source exceeding the AFCEE QAPP QC criteria of ±30%.

DATA USABILITY RESULTS

VOCs

Based on the evaluation of all information in the analytical data groups, the results of all the samples for VOCs are highly usable with the data validation qualifiers as noted. Using the validation approach as presented above, the results for all samples in this analytical batch are 100% usable [i.e., all results are usable when the results from dilution samples are transferred to the original sample results]. The AFCEE QAPP minimum requirement for completeness (for aqueous samples, but will be applied here for vapor samples) is 95%, which is exceeded in this analytical batch.

AFCEE SUMMARY

All data in Job # C1105011 are usable, which can be used with qualifications as noted in the data review.

Centek Job # C1106007

Laboratory:	Centek Laboratories, LLC
Sample Matrix:	Soil gas
Number of Samples:	3
Analytical Protocol:	AFCEE QAPP, Version 4.0, with AFCEE-approved lab variances
Data Reviewer:	Connie van Hoesel
Sample Date:	May 19, 2011

LIST OF DATA VERIFICATION SAMPLES

This verification report pertains to the following environmental samples and corresponding QC samples:

Sample ID	Date	Sample ID	Date
785786CA0100AA	5/19/11		
785786CA0200AA	5/19/11	TRIP BLANK	5/19/11

Notes:

Refer to attached chain-of-custody for detailed sampling information and sample specific analyses requested.
AA – Primary environmental samples

DELIVERABLES

The data deliverable report was per requirements of the AFCEE QAPP 4.0 and approved variances. The report consisted of the following major sections: lab attachment letter, case narrative, chain-of-custody, lab qualifier definitions, analytical results (sheet 2) based on analytical batch, calibration summaries, method blank summaries, laboratory control sample summaries, matrix spike/matrix spike duplicate summaries, holding time forms, performance checks, surrogate and internal standard recoveries, as applicable.

ANALYTICAL METHODS

The analytical test methods and QA/QC requirements used for the water sample analysis were per methods as specified in the AFCEE Quality Assurance Project Plan, Version 4.0 and AFCEE approved laboratory variances. The analytical methods employed included the EPA Compendium Methods for toxic organics: Volatile Organic Compounds (VOC) by EPA method TO-15.

VERIFICATION GUIDANCE

The analytical work was performed by Severn Trent Laboratory in accordance with the Air Force Center for Environmental Excellence (AFCEE), Quality Assurance Project Plan (QAPP), Version 4.0, with AFCEE-approved laboratory variances. The data was verified according to the protocols and QC requirements of the respective analytical methods and of the QAPP Version 4.0. For data usability purposes all values were further evaluated, including positive and non-detect results that were qualified "Q" according to the QAPP. The data usability analysis was based on the reviewer's professional judgment and on an assessment of how this data would fare with respect to the method performance criteria for acceptance of data established by U.S. Environmental Protection Agency (USEPA) in Compendium Method TO-15, and the AFCEE QAPP, Version 4.0.

QA/QC CRITERIA

The following QA/QC criteria were reviewed, as applicable and available:

- Method detection limits and reporting limits (MDL, RL)
- Holding times, sample preservation and storage
- MS tune performance
- Initial and Continuing calibration summaries
- Second source calibration verification summary
- Method blanks
- Ambient, equipment, and trip blanks (as applicable)

- Field duplicate results
- Surrogate spike recoveries
- Internal standard areas counts and retention times
- Laboratory control samples (LCS)
- Results reported between MDL and RL (F-flag)
- Sample storage and preservation
- Data system printouts
- Qualitative and quantitative compound identification
- Chain-of-custody (COC)
- Case narrative and deliverables compliance

The items listed above were in compliance with AFCEE QAPP and USEPA criteria and protocols with exceptions discussed in the text below. The data have been verified according to the procedures outlined above and qualified accordingly.

GENERAL NOTES:

BLANKS

Whenever blanks, including method, ambient, equipment, and trip, contained low levels of contaminants (between MDL and RL), the laboratory and/or data validator qualified the subject results with an "F" flag. Since no qualification of associated field samples are required for blanks less than half the RL, no further action was taken in such instances.

REPORTING LIMIT

It should be noted that the "U" qualifier has been defined by the laboratory as the "compound was not detected above the *reporting limit*." AFCEE defines this qualifier as the compound was not detected above the *method detection limit*. The "U" qualifier as defined by the laboratory shall be retained for the purpose of consistency with previous soil vapor results.

In general, results less than the reporting limit were flagged "J" by the laboratory. However, these results were identified as detected but the quantitated amount was below the limit of quantitation (i.e., the reporting limit). An "F" flag, as defined by the AFCEE QAPP, was thus deemed the more appropriate qualifier for these results.

VOLATILE ORGANIC COMPOUNDS (VOC)

- Internal Standard (IS) performance criteria ensure that the GC/MS sensitivity and response are stable during every experimental run. Per the AFCEE QAPP, for Method TO-15 the internal standard area count must not vary by more than -40% to +40% from the associated continuing calibration standard. Also, per the QAPP, for Method TO-15 the retention time of the internal standard must not vary more than ±20 seconds from the associated continuing calibration standard. If these criteria are exceeded, the QAPP requires a mandatory re-analysis of samples analyzed while the system was malfunctioning, and all results for analytes associated with the deficient IS are qualified ("Q"), unless a matrix effect can be verified, in which case an "M" qualifier is applied. In such circumstances, the EPA National Functional Guidelines for Organic Data Review provide the following guidance: If the area count is outside the (-50% to +100%) range of the associated standard, all of the positive results for compounds quantitated using that IS are qualified as estimated ("J"); no action is taken for non-detects if IS area is > 100%, and all non-detects are qualified as estimated ("UJ") if IS area is < 50%. Non-detects are qualified as "R" if there is a severe loss of sensitivity (< 25% of associated IS area counts). Also, if an internal standard retention time varies by more than 30 seconds, the reviewer will use professional judgment to determine either partial or total rejection of the data for that sample fraction. **Proposed approach**: In this data verification, for data usability purposes, the data qualifiers will be applied following the EPA National Functional Guidance [estimate ("J") for positives if area count is outside of allowed ±40% range, no action for non-detects if IS area > + 40%, estimate ("UJ") for non-detects if IS area < - 40%, reject ("R") for non-detects if IS area is < -75%, and use professional judgment if retention time varies by more than 20 seconds].

  The following are the assessment results for the "internal standards performance" criterion (the Sample ID and IS area counts are listed) for samples exhibiting exceedance (***bold italic***) [no retention time exceedances were encountered during this sampling round and NOTE: Samples with no exceedances are not listed below]:

	IS1 (BCM)	IS2 (DFB)	IS3 (CBZ)
12 Hour Std. (6/9/11)	36570	100404	97689
Upper Limit (+40%)	51198	140566	136765
Lower Limit (-40%)	21942	60242	58613
Severe loss of sensitivity (< -75%)*	9143	25101	24422
SAMPLE ID			
785VMP0401AA (1:80)	36141	119692	***138487***

IS1 (BCM) =Bromochloromethane; IS2 (DFB) =1,4-Difluorobenzene; IS3 (CBZ) = Chlorobenzene-d5
Area count: Upper Limit = +40% and Lower Limit = -40% of internal standard

  <u>Corrective Action</u>: For exceedances above the upper limit, analytes associated with the exceeding internal standard(s) are qualified as estimated ("J") for positive results; for non-detects, no qualification was necessary. For exceedances below the lower limit, analytes associated with the exceeding internal standard(s) are qualified estimated ("J") for positive results, and estimated ("UJ") for non-detect results. If matrix effects were verified (i.e.,

analyses at 1x met performance criteria, or interfering peaks were observed), then "M" flags are applicable. In accordance with the case narrative, based on the results of the the sample's dilution analysis with criteria being met, the internal standard results for sample 785786CA0100AA (1:1) do appear to be the result of a matrix effect. "M" flags were applied to the associated results as required:

Sample ID	Analyte	Associated IS outside of AFCEE QAPP criteria	Flag Applied	Rationale
785786CA0100AA	1,2,4-Trimethylbenzene	CBZ	M	Matrix effect due to interfering peaks
	1,3,5-Trimethylbenzene	CBZ	M	Matrix effect due to interfering peaks
	Ethylbenzene	CBZ	M	Matrix effect due to interfering peaks
	M,p-Xylenes	CBZ	M	Matrix effect due to interfering peaks
	o-Xylene	CBZ	M	Matrix effect due to interfering peaks
	Toluene	CBZ	M	Matrix effect due to interfering peaks

DATA USABILITY RESULTS

VOCs

Based on the evaluation of all information in the analytical data groups, the results of all the samples for VOCs are highly usable with the data validation qualifiers as noted. Using the validation approach as presented above, the results for all samples in this analytical batch are 100% usable [i.e., all results are usable when the results from dilution samples are transferred to the original sample results]. The AFCEE QAPP minimum requirement for completeness (for aqueous samples, but will be applied here for vapor samples) is 95%, which is exceeded in this analytical batch.

AFCEE SUMMARY

All data in Job # C1106007 are usable, which can be used with qualifications as noted in the data review.

FPM Project No. 1000-08-17

Centek Job # C1106012

Laboratory:	Centek Laboratories, LLC
Sample Matrix:	Soil gas
Number of Samples:	3
Analytical Protocol:	AFCEE QAPP, Version 4.0, with AFCEE-approved lab variances
Data Reviewer:	Connie van Hoesel
Sample Date:	June 6, 2011

LIST OF DATA VERIFICATION SAMPLES

This verification report pertains to the following environmental samples and corresponding QC samples:

Sample ID	Date	Sample ID	Date
774776CA01AA	6/6/11		
774776CA02AA	6/6/11	TRIP BLANK	6/6/11

Notes:

Refer to attached chain-of-custody for detailed sampling information and sample specific analyses requested.

AA – Primary environmental samples

DELIVERABLES

The data deliverable report was per requirements of the AFCEE QAPP 4.0 and approved variances. The report consisted of the following major sections: lab attachment letter, case narrative, chain-of-custody, lab qualifier definitions, analytical results (sheet 2) based on analytical batch, calibration summaries, method blank summaries, laboratory control sample summaries, matrix spike/matrix spike duplicate summaries, holding time forms, performance checks, surrogate and internal standard recoveries, as applicable.

ANALYTICAL METHODS

The analytical test methods and QA/QC requirements used for the water sample analysis were per methods as specified in the AFCEE Quality Assurance Project Plan, Version 4.0 and AFCEE approved laboratory variances. The analytical methods employed included the EPA Compendium Methods for toxic organics: Volatile Organic Compounds (VOC) by EPA method TO-15.

VERIFICATION GUIDANCE

The analytical work was performed by Severn Trent Laboratory in accordance with the Air Force Center for Environmental Excellence (AFCEE), Quality Assurance Project Plan (QAPP), Version 4.0, with AFCEE-approved laboratory variances. The data was verified according to the protocols and QC requirements of the respective analytical methods and of the QAPP Version 4.0. For data usability purposes all values were further evaluated, including positive and non-detect results that were qualified "Q" according to the QAPP. The data usability analysis was based on the reviewer's professional judgment and on an assessment of how this data would fare with respect to the method performance criteria for acceptance of data established by U.S. Environmental Protection Agency (USEPA) in Compendium Method TO-15, and the AFCEE QAPP, Version 4.0.

QA/QC CRITERIA

The following QA/QC criteria were reviewed, as applicable and available:

- Method detection limits and reporting limits (MDL, RL)
- Holding times, sample preservation and storage
- MS tune performance
- Initial and Continuing calibration summaries
- Second source calibration verification summary
- Method blanks
- Ambient, equipment, and trip blanks (as applicable)

- Field duplicate results
- Surrogate spike recoveries
- Internal standard areas counts and retention times
- Laboratory control samples (LCS)
- Results reported between MDL and RL (F-flag)
- Sample storage and preservation
- Data system printouts
- Qualitative and quantitative compound identification
- Chain-of-custody (COC)
- Case narrative and deliverables compliance

The items listed above were in compliance with AFCEE QAPP and USEPA criteria and protocols with exceptions discussed in the text below. The data have been verified according to the procedures outlined above and qualified accordingly.

GENERAL NOTES:

BLANKS

Whenever blanks, including method, ambient, equipment, and trip, contained low levels of contaminants (between MDL and RL), the laboratory and/or data validator qualified the subject results with an "F" flag. Since no qualification of associated field samples are required for blanks less than half the RL, no further action was taken in such instances.

REPORTING LIMIT

It should be noted that the "U" qualifier has been defined by the laboratory as the "compound was not detected above the *reporting limit*." AFCEE defines this qualifier as the compound was not detected above the *method detection limit*. The "U" qualifier as defined by the laboratory shall be retained for the purpose of consistency with previous soil vapor results.

In general, results less than the reporting limit were flagged "J" by the laboratory. However, these results were identified as detected but the quantitated amount was below the limit of quantitation (i.e., the reporting limit). An "F" flag, as defined by the AFCEE QAPP, was thus deemed the more appropriate qualifier for these results.

VOLATILE ORGANIC COMPOUNDS (VOC)

- Laboratory control samples (LCS) are samples spiked with all analytes of interest at known concentrations. There were some exceedances of the RPD (30%) between the LCS and LCSD samples ALCS1UGD-060911, for the following compounds: 1,2,4-trimethylbenzene (42.4%), 1,2-dichlorobenzene (30.5%), 1,3,5-trimethylbenzene (38.8%), 1,3-butadiene (37.9%), 4-ethyltoluene (38.8%), benzyl chloride (38.5%), isopropyl alcohol (31.4%), and methyl ethyl ketone (36.4%). Since all recoveries were within AFCEE control limits, no corrective action was deemed necessary for RPD exceedances alone. The laboratory was consulted regarding these exceedances: sample humidity and/or carbon dioxide content in recently analyzed samples can greatly affect the integrity of the LCSD analysis.

- The following blank sample analyses indicated blank contaminants present at concentrations equal to or greater than half the reporting limit (RL). The Blank ID, detected contaminant, and concentration are listed.

Blank ID	Analyte	Concentration ($\mu g/m^3$)	Reporting Limit ($\mu g/m^3$)	Samples Affected
TRIP BLANK	Carbon disulfide	0.32 F	0.47	774776CA01AA , 774776CA02AA

The purpose of laboratory, equipment or trip blank analysis is to determine the existence and magnitude of contamination resulting from lab or field activities. If contamination is found in blanks the associated sample results for these analytes may be considered suspect. As per the QAPP, based on the blank contaminants present above half the RL, results for the specific analytes in the associated environmental samples are qualified with a "B" flag. However, in accordance with the EPA National Functional Guidelines and consistent with AFCEE QAPP Version 4.0, the "B" flag is **not** applied for sample results that are greater than five times (5x) the blank concentration. Thus the "B" flag is only applied to those samples for which the sample result is positive and less than five times (5x) the blank concentration.

Corrective Action: "B" flags were applied to the carbon disulfide results for the field samples as shown in the table above.

DATA USABILITY RESULTS

VOCs

Based on the evaluation of all information in the analytical data groups, the results of all the samples for VOCs are highly usable with the data validation qualifiers as noted. Using the validation approach as presented above, the results for all samples in this analytical batch are 100% usable [i.e., all results are usable when the results from dilution samples are transferred to the original sample results]. The AFCEE QAPP minimum requirement for completeness (for aqueous samples, but will be applied here for vapor samples) is 95%, which is exceeded in this analytical batch.

AFCEE SUMMARY

All data in Job # C1106012 are usable, which can be used with qualifications as noted in the data review.

Notes:

Refer to attached chain-of-custody for detailed sampling information and sample specific analyses requested.
AB, AE, IA, OA – Primary environmental samples

DELIVERABLES

The data deliverable report was per requirements of the AFCEE QAPP 4.0 and approved variances. The report consisted of the following major sections: lab attachment letter, case narrative, chain-of-custody, lab qualifier definitions, analytical results (sheet 2) based on analytical batch, calibration summaries, method blank summaries, laboratory control sample summaries, matrix spike/matrix spike duplicate summaries, holding time forms, performance checks, surrogate and internal standard recoveries, as applicable.

ANALYTICAL METHODS

The analytical test methods and QA/QC requirements used for the water sample analysis were per methods as specified in the AFCEE Quality Assurance Project Plan, Version 4.0 and AFCEE approved laboratory variances. The analytical methods employed included the EPA Compendium Methods for toxic organics: Volatile Organic Compounds (VOC) by EPA method TO-15.

VERIFICATION GUIDANCE

The analytical work was performed by Severn Trent Laboratory in accordance with the Air Force Center for Environmental Excellence (AFCEE), Quality Assurance Project Plan (QAPP), Version 4.0, with AFCEE-approved laboratory variances. The data was verified according to the protocols and QC requirements of the respective analytical methods and of the QAPP Version 4.0. For data usability purposes all values were further evaluated, including positive and non-detect results that were qualified "Q" according to the QAPP. The data usability analysis was based on the reviewer's professional judgment and on an assessment of how this data would fare with respect to the method performance criteria for acceptance of data established by U.S. Environmental Protection Agency (USEPA) in Compendium Method TO-15, and the AFCEE QAPP, Version 4.0.

QA/QC CRITERIA

The following QA/QC criteria were reviewed, as applicable and available:

- Method detection limits and reporting limits (MDL, RL)
- Holding times, sample preservation and storage
- MS tune performance
- Initial and Continuing calibration summaries
- Second source calibration verification summary
- Method blanks
- Ambient, equipment, and trip blanks (as applicable)

- Field duplicate results
- Surrogate spike recoveries
- Internal standard areas counts and retention times
- Laboratory control samples (LCS)
- Results reported between MDL and RL (F-flag)
- Sample storage and preservation
- Data system printouts
- Qualitative and quantitative compound identification
- Chain-of-custody (COC)
- Case narrative and deliverables compliance

The items listed above were in compliance with AFCEE QAPP and USEPA criteria and protocols with exceptions discussed in the text below. The data have been verified according to the procedures outlined above and qualified accordingly.

GENERAL NOTES:

BLANKS

Whenever blanks, including method, ambient, equipment, and trip, contained low levels of contaminants (between MDL and RL), the laboratory and/or data validator qualified the subject results with an "F" flag. Since no qualification of associated field samples are required for blanks less than half the RL, no further action was taken in such instances.

REPORTING LIMIT

It should be noted that the "U" qualifier has been defined by the laboratory as the "compound was not detected above the *reporting limit*." AFCEE defines this qualifier as the compound was not detected above the *method detection limit*. The "U" qualifier as defined by the laboratory shall be retained for the purpose of consistency with previous soil vapor results.

In general, results less than the reporting limit were flagged "J" by the laboratory. However, these results were identified as detected but the quantitated amount was below the limit of quantitation (i.e., the reporting limit). An "F" flag, as defined by the AFCEE QAPP, was thus deemed the more appropriate qualifier for these results.

VOLATILE ORGANIC COMPOUNDS (VOC)

- Laboratory control samples (LCS) are samples spiked with all analytes of interest at known concentrations. The following table summarizes QC exceedances (**bold**) of the LCS analyses. The LCS ID, percent recovery, and QC limits are listed. For each LCS sample, the associated samples are also listed in the table.

Spike Analytes	LCS %Rec	QC Limits	ME Limits	Flag Applied	Rationale
LCS ID ALCS1UG-090711					
(all samples associated)					
LCS: 1,4-dioxane*	***65***	70-130	60-140	None	%Rec within AFCEE control limits in primary LCS
LCSD: 1,4-dioxane*	***51***				
LCSD: 1,2,4-Trichlorobenzene*	***65***	70-130	60-140	None	%Rec within AFCEE control limits
LCSD: Hexachloro-1,3-butadiene*	***53***	70-130	60-140	None	%Rec within AFCEE control limits in primary LCS
LCSD: Methyl Butyl Ketone*	***54***	70-130	60-140	None	%Rec within AFCEE control limits in primary LCS

Note 1: The compounds listed with asterisks above are not listed in the AFCEE QAPP for Method TO-15. In all such cases, using professional judgment and consistent with the lab's methodology, the LCS QC acceptance range was assumed to be 70-130.

The LCS analyses are used to assess the overall laboratory performance pertaining to the analytical method. The QAPP includes method-specific QC acceptance criteria for the percent recovery of the spike compounds. However, the QAPP includes criteria for only a sub-set of the TO-15 analyte list; in the case of all other analytes, using professional judgment and consistent with the lab's methodology, the LCS QC acceptance range for percent recovery was assumed to be 70-130. The LCS results are used to evaluate each AFCEE analytical batch and to determine if the method is within control limits. When an LCS analyte is outside the acceptance limit, the laboratory shall perform corrective action. If the corrective action is ineffective in resolving the exceedance, then that analyte's results in all the associated samples are qualified. According to the QAPP, when the percent recovery (%Rec) is greater than the upper control limit, positive results are considered estimated (flagged "J"); and when the %Rec is less than the lower control limit, positive values are estimated (flagged "J") and non-detects are rejected (flagged "R"). Using professional judgment, the non-detect results may be considered usable, albeit estimated, and shall be flagged "UJ."

Corrective Action: In the LCS sample listed above, all compounds yielded recoveries within AFCEE control limits, so no flagging and/or further corrective action is considered necessary. There were several recovery exceedances in the LCSD (090711), but since all recoveries of these compounds in the associated primary LCS sample were within QC limits, no further corrective action was considered necessary.

There were some exceedances of the RPD (30%) between the LCS and LCSD samples, for the following compound: hexachloro-1,3-butadiene (40.6%). No corrective action was deemed necessary for RPD exceedances alone. The laboratory was consulted regarding these

exceedances: sample humidity and/or carbon dioxide content in recently analyzed samples can greatly affect the integrity of the LCSD analysis.

- Second source calibration verification analysis, which is basically a calibration standard obtained from a source (vendor) other than the one for the Initial calibration standard, is required to be run once per five-point Initial calibration. It is used to verify that the analytes' relative response factors (RRF) calculated from the Initial calibration runs is accurate. According to the lab, the second source calibration is the same as the laboratory control sample (LCS; it should be noted that LCSD samples were not used for this purpose). As discussed above, there were several laboratory control samples with exceedances, but no compounds on the AFCEE QAPP TO-14A/TO-15 list with a percent difference (%D) value between the RRF of the Initial and Second source exceeding the AFCEE QAPP QC criteria of ±30%.

- The following blank sample analyses indicated blank contaminants present at concentrations equal to or greater than half the reporting limit (RL). The Blank ID, detected contaminant, and concentration are listed.

Blank ID	Analyte	Concentration ($\mu g/m^3$)	Reporting Limit ($\mu g/m^3$)	Samples Affected
TRIP BLANK	Acetone	4.9	0.72	774VMP0301AB, 785VMP0202AE, 785VMP0401AB, 785VMP0501AA, 786VMP0102AB, 786VMP0302AB, 774776CA02AB, 785786CA01AB, 785786CA02AB

The purpose of laboratory, equipment or trip blank analysis is to determine the existence and magnitude of contamination resulting from lab or field activities. If contamination is found in blanks the associated sample results for these analytes may be considered suspect. As per the QAPP, based on the blank contaminants present above half the RL, results for the specific analytes in the associated environmental samples are qualified with a "B" flag. However, in accordance with the EPA National Functional Guidelines and consistent with AFCEE QAPP Version 4.0, the "B" flag is **not** applied for sample results that are greater than five times (5x) the blank concentration. Thus the "B" flag is only applied to those samples for which the sample result is positive and less than five times (5x) the blank concentration.

Corrective Action: "B" flags were applied to the acetone results for the field samples as shown in the table above.

DATA USABILITY RESULTS

VOCs

Based on the evaluation of all information in the analytical data groups, the results of all the samples for VOCs are highly usable with the data validation qualifiers as noted. Using the validation approach as presented above, the results for all samples in this analytical batch are 100% usable [i.e., all results are usable when the results from dilution samples are transferred to the original sample results]. The AFCEE QAPP minimum requirement for completeness (for aqueous samples, but will be applied here for vapor samples) is 95%, which is exceeded in this analytical batch.

AFCEE SUMMARY

All data in Job # C1108077 are usable, which can be used with qualifications as noted in the data review.

Signed: _Concordia van Hoesel___ Date: ___12/12/2011_____

Centek Job # C1109015

Laboratory:	Centek Laboratories, LLC
Sample Matrix:	Soil gas
Number of Samples:	6
Analytical Protocol:	AFCEE QAPP, Version 4.0, with AFCEE-approved lab variances
Data Reviewer:	Connie van Hoesel
Sample Date:	September 6, 2011

LIST OF DATA VERIFICATION SAMPLES

This verification report pertains to the following environmental samples and corresponding QC samples:

Sample ID	Date	Sample ID	Date
776VMP0101AB	8/24/11		
776VMP0201AB	8/24/11		
776VMP0301AB	8/24/11		
776IA1DA	8/24/11		
776OA1EA	8/24/11		
774IA1AE	8/24/11		

Notes:

Refer to attached chain-of-custody for detailed sampling information and sample specific analyses requested.
AB, AE, DA, EA – Primary environmental samples

DELIVERABLES

The data deliverable report was per requirements of the AFCEE QAPP 4.0 and approved variances. The report consisted of the following major sections: lab attachment letter, case narrative, chain-of-custody, lab qualifier definitions, analytical results (sheet 2) based on analytical batch, calibration summaries, method blank summaries, laboratory control sample summaries, matrix spike/matrix spike duplicate summaries, holding time forms, performance checks, surrogate and internal standard recoveries, as applicable.

ANALYTICAL METHODS

The analytical test methods and QA/QC requirements used for the water sample analysis were per methods as specified in the AFCEE Quality Assurance Project Plan, Version 4.0 and AFCEE approved laboratory variances. The analytical methods employed included the EPA Compendium Methods for toxic organics: Volatile Organic Compounds (VOC) by EPA method TO-15.

VERIFICATION GUIDANCE

The analytical work was performed by Severn Trent Laboratory in accordance with the Air Force Center for Environmental Excellence (AFCEE), Quality Assurance Project Plan (QAPP), Version 4.0, with AFCEE-approved laboratory variances. The data was verified according to the protocols and QC requirements of the respective analytical methods and of the QAPP Version 4.0. For data usability purposes all values were further evaluated, including positive and non-detect results that were qualified "Q" according to the QAPP. The data usability analysis was based on the reviewer's professional judgment and on an assessment of how this data would fare with respect to the method performance criteria for acceptance of data established by U.S. Environmental Protection Agency (USEPA) in Compendium Method TO-15, and the AFCEE QAPP, Version 4.0.

QA/QC CRITERIA

The following QA/QC criteria were reviewed, as applicable and available:

- Method detection limits and reporting limits (MDL, RL)
- Holding times, sample preservation and storage
- MS tune performance
- Initial and Continuing calibration summaries
- Second source calibration verification summary
- Method blanks
- Ambient, equipment, and trip blanks (as applicable)

- Field duplicate results
- Surrogate spike recoveries
- Internal standard areas counts and retention times
- Laboratory control samples (LCS)
- Results reported between MDL and RL (F-flag)
- Sample storage and preservation
- Data system printouts
- Qualitative and quantitative compound identification
- Chain-of-custody (COC)
- Case narrative and deliverables compliance

The items listed above were in compliance with AFCEE QAPP and USEPA criteria and protocols with exceptions discussed in the text below. The data have been verified according to the procedures outlined above and qualified accordingly.

GENERAL NOTES:

BLANKS

Whenever blanks, including method, ambient, equipment, and trip, contained low levels of contaminants (between MDL and RL), the laboratory and/or data validator qualified the subject results with an "F" flag. Since no qualification of associated field samples are required for blanks less than half the RL, no further action was taken in such instances.

REPORTING LIMIT

It should be noted that the "U" qualifier has been defined by the laboratory as the "compound was not detected above the *reporting limit*." AFCEE defines this qualifier as the compound was not detected above the *method detection limit*. The "U" qualifier as defined by the laboratory shall be retained for the purpose of consistency with previous soil vapor results.

In general, results less than the reporting limit were flagged "J" by the laboratory. However, these results were identified as detected but the quantitated amount was below the limit of quantitation (i.e., the reporting limit). An "F" flag, as defined by the AFCEE QAPP, was thus deemed the more appropriate qualifier for these results.

VOLATILE ORGANIC COMPOUNDS (VOC)

- Laboratory control samples (LCS) are samples spiked with all analytes of interest at known concentrations. The following table summarizes QC exceedances (**bold**) of the LCS analyses. The LCS ID, percent recovery, and QC limits are listed. For each LCS sample, the associated samples are also listed in the table.

Spike Analytes	LCS %Rec	QC Limits	ME Limits	Flag Applied	Rationale
LCS ID ALCS1UG-091011					
(all samples associated)					
LCSD: Carbon tetrachloride	***137***	70-130	60-140	None	%Rec within AFCEE control limits
LCSD: o-Xylene	***138***	70-130	60-140	None	%Rec within AFCEE control limits

The LCS analyses are used to assess the overall laboratory performance pertaining to the analytical method. The QAPP includes method-specific QC acceptance criteria for the percent recovery of the spike compounds. However, the QAPP includes criteria for only a sub-set of the TO-15 analyte list; in the case of all other analytes, using professional judgment and consistent with the lab's methodology, the LCS QC acceptance range for percent recovery was assumed to be 70-130. The LCS results are used to evaluate each AFCEE analytical batch and to determine if the method is within control limits. When an LCS analyte is outside the acceptance limit, the laboratory shall perform corrective action. If the corrective action is ineffective in resolving the exceedance, then that analyte's results in all the associated samples are qualified. According to the QAPP, when the percent recovery (%Rec) is greater than the upper control limit, positive results are considered estimated (flagged "J"); and when the %Rec is less than the lower control limit, positive values are estimated (flagged "J") and non-detects are rejected (flagged "R"). Using professional judgment, the non-detect results may be considered usable, albeit estimated, and shall be flagged "UJ."

Corrective Action: As shown above, there were two recovery exceedances in the LCSD (091011), but since all recoveries of these compounds in the associated primary LCS sample were within QC limits, no further corrective action was considered necessary.

There was one exceedance of the RPD (30%) between the LCS and LCSD samples, for the following compound: hexachloro-1,3-butadiene (40.6%). No corrective action was deemed necessary for RPD exceedances alone. The laboratory was consulted regarding these exceedances: sample humidity and/or carbon dioxide content in recently analyzed samples can greatly affect the integrity of the LCSD analysis.

- According to the case narrative, in the following continuing calibration verification (CCV), analytes exhibited the following exceedances:

Type of Calibration Exceedance Affected Analytes	%D/ %RSD	AFCEE QC Limit	Flag Applied	Rationale
CCV 9/10/11, 9:29				
Naphthalene	***48.3***	±30	UJ	Compound not included on target analyte list

Corrective Action: No corrective action was deemed necessary, since naphthalene is not included on the target analyte list.

DATA USABILITY RESULTS

VOCs

Based on the evaluation of all information in the analytical data groups, the results of all the samples for VOCs are highly usable with the data validation qualifiers as noted. Using the validation approach as presented above, the results for all samples in this analytical batch are 100% usable [i.e., all results are usable when the results from dilution samples are transferred to the original sample results]. The AFCEE QAPP minimum requirement for completeness (for aqueous samples, but will be applied here for vapor samples) is 95%, which is exceeded in this analytical batch.

AFCEE SUMMARY

All data in Job # C1109015 are usable, which can be used with qualifications as noted in the data review.

METHOD TO-15

QUALITY CONTROL SUMMARY

FPM GROUP, LTD.
Data Verification and Usability Report
GRIFFISS AIR FORCE BASE
GRIFFISS SUBSLAB VAPOR MITIGATION SYSTEM
Site Griffiss AFB Building 774, 776
Contract No. FA8903-04-D-8687

FPM Project No. 1000-08-17

Centek Job # C1110030

Laboratory:	Centek Laboratories, LLC
Sample Matrix:	Soil gas
Number of Samples:	3
Analytical Protocol:	AFCEE QAPP, Version 4.0, with AFCEE-approved lab variances
Data Reviewer:	Connie van Hoesel
Sample Date:	October 14, 2011

LIST OF DATA VERIFICATION SAMPLES

This verification report pertains to the following environmental samples and corresponding QC samples:

Sample ID	Date	Sample ID	Date
774776CA01AC	10/14/11		
774776CA01AD	10/14/11	TRIP BLANK	10/14/11

Notes:

Refer to attached chain-of-custody for detailed sampling information and sample specific analyses requested.
AC, AD – Primary environmental samples

DELIVERABLES

The data deliverable report was per requirements of the AFCEE QAPP 4.0 and approved variances. The report consisted of the following major sections: lab attachment letter, case narrative, chain-of-custody, lab qualifier definitions, analytical results (sheet 2) based on analytical batch, calibration summaries, method blank summaries, laboratory control sample summaries, matrix spike/matrix spike duplicate summaries, holding time forms, performance checks, surrogate and internal standard recoveries, as applicable.

ANALYTICAL METHODS

The analytical test methods and QA/QC requirements used for the water sample analysis were per methods as specified in the AFCEE Quality Assurance Project Plan, Version 4.0 and AFCEE approved laboratory variances. The analytical methods employed included the EPA Compendium Methods for toxic organics: Volatile Organic Compounds (VOC) by EPA method TO-15.

VERIFICATION GUIDANCE

The analytical work was performed by Severn Trent Laboratory in accordance with the Air Force Center for Environmental Excellence (AFCEE), Quality Assurance Project Plan (QAPP), Version 4.0, with AFCEE-approved laboratory variances. The data was verified according to the protocols and QC requirements of the respective analytical methods and of the QAPP Version 4.0. For data usability purposes all values were further evaluated, including positive and non-detect results that were qualified "Q" according to the QAPP. The data usability analysis was based on the reviewer's professional judgment and on an assessment of how this data would fare with respect to the method performance criteria for acceptance of data established by U.S. Environmental Protection Agency (USEPA) in Compendium Method TO-15, and the AFCEE QAPP, Version 4.0.

QA/QC CRITERIA

The following QA/QC criteria were reviewed, as applicable and available:

- Method detection limits and reporting limits (MDL, RL)
- Holding times, sample preservation and storage
- MS tune performance
- Initial and Continuing calibration summaries
- Second source calibration verification summary
- Method blanks
- Ambient, equipment, and trip blanks (as applicable)
- Field duplicate results
- Surrogate spike recoveries
- Internal standard areas counts and retention times

- Laboratory control samples (LCS)
- Results reported between MDL and RL (F-flag)
- Sample storage and preservation
- Data system printouts
- Qualitative and quantitative compound identification
- Chain-of-custody (COC)
- Case narrative and deliverables compliance

The items listed above were in compliance with AFCEE QAPP and USEPA criteria and protocols with exceptions discussed in the text below. The data have been verified according to the procedures outlined above and qualified accordingly.

GENERAL NOTES:

BLANKS

Whenever blanks, including method, ambient, equipment, and trip, contained low levels of contaminants (between MDL and RL), the laboratory and/or data validator qualified the subject results with an "F" flag. Since no qualification of associated field samples are required for blanks less than half the RL, no further action was taken in such instances.

REPORTING LIMIT

It should be noted that the "U" qualifier has been defined by the laboratory as the "compound was not detected above the *reporting limit*." AFCEE defines this qualifier as the compound was not detected above the *method detection limit*. The "U" qualifier as defined by the laboratory shall be retained for the purpose of consistency with previous soil vapor results.

In general, results less than the reporting limit were flagged "J" by the laboratory. However, these results were identified as detected but the quantitated amount was below the limit of quantitation (i.e., the reporting limit). An "F" flag, as defined by the AFCEE QAPP, was thus deemed the more appropriate qualifier for these results.

VOLATILE ORGANIC COMPOUNDS (VOC)

- According to the case narrative, in the following continuing calibration verification (CCV), analytes exhibited the following exceedances:

Type of Calibration Exceedance Affected Analytes	%D/ %RSD	AFCEE QC Limit	Flag Applied	Rationale
CCV 10/21/11, 7:32				
Bromodichloromethane	***-30.7***	±30	None	%D > upper control limit; results ND
CCV 10/22/11, 12:18				
1,1,1-Trichloroethane	***-44.7***	±30	None	Associated results not used; dilution analysis performed for other analytes
Carbon Tetrachloride	***-47.9***	±30	None	Associated results not used; dilution analysis performed for other analytes
Bromodichloromethane	***-51.3***	±30	None	Associated results not used; dilution analysis performed for other analytes
Dibromochloromethane	***-34.9***	±30	None	Associated results not used; dilution analysis performed for other analytes
CCV 10/24/11, 10:49				
1,1,1-Trichloroethane	***-41.1***	±30	None	Associated results not used; dilution analysis performed for other analytes
Bromodichloromethane	***-38.8***	±30	None	Associated results not used; dilution analysis performed for other analytes
Dibromochloromethane	***-43.6***	±30	None	Associated results not used; dilution analysis performed for other analytes
Bromoform	***-42.3***	±30	None	Associated results not used; dilution analysis performed for other analytes
Naphthalene	***34.9***	±30	None	Compound not included on target analyte list

Corrective Action: As stated in the case narrative, the standard response in the CCV for bromodichloromethane (10/21/11) was above the acceptance limit, and the associated results may be biased high. All associated results were non-detect, so flagging was not deemed necessary or appropriate. For the remaining exceedances, results were not reported from the affected compounds, as the associated analyses were dilutions performed for the quantification of other compounds.

- Laboratory control samples (LCS) are samples spiked with all analytes of interest at known concentrations. The following table summarizes QC exceedances (**bold**) of the LCS analyses. The LCS ID, percent recovery, and QC limits are listed. For each LCS sample, the associated samples are also listed in the table.

Spike Analytes	LCS %Rec	QC Limits	ME Limits	Flag Applied	Rationale
LCS ID ALCS1UG-102111					
(all samples associated)					

Spike Analytes	LCS %Rec	QC Limits	ME Limits	Flag Applied	Rationale
LCS: 1,4-dioxane*	***188***	70-130	60-140	None	%Rec greater than upper control limit and all associated results ND
LCS: Isopropyl alcohol*	***143***	70-130	60-140	None	%Rec greater than upper control limit and all associated results ND

LCS: Methyl Butyl Ketone*	***189***	70-130	60-140	None	Associated results not used; dilution analysis performed for other analytes

Note 1: The compounds listed with asterisks above are not listed in the AFCEE QAPP for Method TO-15. In all such cases, using professional judgment and consistent with the lab's methodology, the LCS QC acceptance range was assumed to be 70-130.

The LCS analyses are used to assess the overall laboratory performance pertaining to the analytical method. The QAPP includes method-specific QC acceptance criteria for the percent recovery of the spike compounds. However, the QAPP includes criteria for only a sub-set of the TO-15 analyte list; in the case of all other analytes, using professional judgment and consistent with the lab's methodology, the LCS QC acceptance range for percent recovery was assumed to be 70-130. The LCS results are used to evaluate each

AFCEE analytical batch and to determine if the method is within control limits. When an LCS analyte is outside the acceptance limit, the laboratory shall perform corrective action. If the corrective action is ineffective in resolving the exceedance, then that analyte's results in all the associated samples are qualified. According to the QAPP, when the percent recovery (%Rec) is greater than the upper control limit, positive results are considered estimated (flagged "J"); and when the %Rec is less than the lower control limit, positive values are estimated (flagged "J") and non-detects are rejected (flagged "R"). Using professional judgment, the non-detect results may be considered usable, albeit estimated, and shall be flagged "UJ."

Corrective Action: For all compounds listed above, results were not reported from the affected compounds, as the associated analyses were dilutions performed for the quantification of other compounds. No flagging and/or corrective action was deemed necessary.

- Second source calibration verification analysis, which is basically a calibration standard obtained from a source (vendor) other than the one for the Initial calibration standard, is required to be run once per five-point Initial calibration. It is used to verify that the analytes' relative response factors (RRF) calculated from the Initial calibration runs is accurate. According to the lab, the second source calibration is the same as the laboratory control sample (LCS; it should be noted that LCSD samples were not used for this purpose). As discussed above, there were several laboratory control samples with exceedances, but only two LCS's with exceedances of compounds on the AFCEE QAPP TO-14A/TO-15 list with a percent difference (%D) value between the RRF of the Initial and Second source exceeding the AFCEE QAPP QC criteria of ±30% (see table below). The AFCEE QAPP requires that the second source calibration verification be within control limits.

Type of Calibration Exceedance Affected Analytes	%D/ %RSD	AFCEE QC Limit	Flag Applied	Rationale
ALCS1UG-102211				
1,1,1-Trichloroethane	***39***	±30	None	%D > upper control limit, all results ND
1,2-Dichloropropane	***31***	±30	None	%D > upper control limit, all results ND
Carbon tetrachloride	***56***	±30	None	%D > upper control limit, all results ND
ALCS1UG-102411				
1,1,1-Trichloroethane	***61***	±30	None	%D > upper control limit, all results ND
1,1,2,2-Tetrachloroethane	***46***	±30	None	%D > upper control limit, all results ND
1,2-Dibromoethane	***39***	±30	None	Within AFCEE control limits
1,2-Dichloropropane	***51***	±30	None	%D > upper control limit, all results ND
Carbon tetrachloride	***53***	±30	None	%D > upper control limit, all results ND

Corrective Action: Since all associated results were non-detect and the exceedance indicated a high bias, using professional judgment, no further corrective action was deemed necessary. As stated in the case narrative, if results continue to be outside established limits, then the system would be recalibrated.

DATA USABILITY RESULTS

VOCs

Based on the evaluation of all information in the analytical data groups, the results of all the samples for VOCs are highly usable with the data validation qualifiers as noted. Using the validation approach as presented above, the results for all samples in this analytical batch are 100% usable [i.e., all results are usable when the results from dilution samples are transferred to the original sample results]. The AFCEE QAPP minimum requirement for completeness (for aqueous samples, but will be applied here for vapor samples) is 95%, which is exceeded in this analytical batch.

AFCEE SUMMARY

All data in Job # C1110030 are usable, which can be used with qualifications as noted in the data review.

Notes:

Refer to attached chain-of-custody for detailed sampling information and sample specific analyses requested.
AC, AF, FA, EA, AB, AE – Primary environmental samples

DELIVERABLES

The data deliverable report was per requirements of the AFCEE QAPP 4.0 and approved variances. The report consisted of the following major sections: lab attachment letter, case narrative, chain-of-custody, lab qualifier definitions, analytical results (sheet 2) based on analytical batch, calibration summaries, method blank summaries, laboratory control sample summaries, matrix spike/matrix spike duplicate summaries, holding time forms, performance checks, surrogate and internal standard recoveries, as applicable.

ANALYTICAL METHODS

The analytical test methods and QA/QC requirements used for the water sample analysis were per methods as specified in the AFCEE Quality Assurance Project Plan, Version 4.0 and AFCEE approved laboratory variances. The analytical methods employed included the EPA Compendium Methods for toxic organics: Volatile Organic Compounds (VOC) by EPA method TO-15.

VERIFICATION GUIDANCE

The analytical work was performed by Severn Trent Laboratory in accordance with the Air Force Center for Environmental Excellence (AFCEE), Quality Assurance Project Plan (QAPP), Version 4.0, with AFCEE-approved laboratory variances. The data was verified according to the protocols and QC requirements of the respective analytical methods and of the QAPP Version 4.0. For data usability purposes all values were further evaluated, including positive and non-detect results that were qualified "Q" according to the QAPP. The data usability analysis was based on the reviewer's professional judgment and on an assessment of how this data would fare with respect to the method performance criteria for acceptance of data established by U.S. Environmental Protection Agency (USEPA) in Compendium Method TO-15, and the AFCEE QAPP, Version 4.0.

QA/QC CRITERIA

The following QA/QC criteria were reviewed, as applicable and available:

- Method detection limits and reporting limits (MDL, RL)
- Holding times, sample preservation and storage
- MS tune performance
- Initial and Continuing calibration summaries
- Second source calibration verification summary
- Method blanks
- Ambient, equipment, and trip blanks (as applicable)
- Field duplicate results
- Surrogate spike recoveries
- Internal standard areas counts and retention times

- Laboratory control samples (LCS)
- Results reported between MDL and RL (F-flag)
- Sample storage and preservation
- Data system printouts
- Qualitative and quantitative compound identification
- Chain-of-custody (COC)
- Case narrative and deliverables compliance

The items listed above were in compliance with AFCEE QAPP and USEPA criteria and protocols with exceptions discussed in the text below. The data have been verified according to the procedures outlined above and qualified accordingly.

GENERAL NOTES:

BLANKS

Whenever blanks, including method, ambient, equipment, and trip, contained low levels of contaminants (between MDL and RL), the laboratory and/or data validator qualified the subject results with an "F" flag. Since no qualification of associated field samples are required for blanks less than half the RL, no further action was taken in such instances.

REPORTING LIMIT

It should be noted that the "U" qualifier has been defined by the laboratory as the "compound was not detected above the *reporting limit*." AFCEE defines this qualifier as the compound was not detected above the *method detection limit*. The "U" qualifier as defined by the laboratory shall be retained for the purpose of consistency with previous soil vapor results.

In general, results less than the reporting limit were flagged "J" by the laboratory. However, these results were identified as detected but the quantitated amount was below the limit of quantitation (i.e., the reporting limit). An "F" flag, as defined by the AFCEE QAPP, was thus deemed the more appropriate qualifier for these results.

VOLATILE ORGANIC COMPOUNDS (VOC)

- According to the case narrative, in the following continuing calibration verification (CCV), analytes exhibited the following exceedances:

Type of Calibration Exceedance Affected Analytes	%D/ %RSD	AFCEE QC Limit	Flag Applied	Rationale
CCV 11/1/11, 1:49				
Methyl Isobutyl Ketone	***-112.8***	±30	None	%D > upper control limit, all results ND
Methyl Butyl Ketone	***-291.1***	±30	None	%D > upper control limit, all results ND

Corrective Action: As stated in the case narrative, the standard response in the CCV for these compounds (11/1/11) was above the acceptance limit, and the associated results may be biased high. All associated results were non-detect, so flagging was not deemed necessary or appropriate.

- Laboratory control samples (LCS) are samples spiked with all analytes of interest at known concentrations. The following table summarizes QC exceedances (**bold**) of the LCS analyses. The LCS ID, percent recovery, and QC limits are listed. For each LCS sample, the associated samples are also listed in the table.

Spike Analytes	LCS %Rec	QC Limits	ME Limits	Flag Applied	Rationale
LCS ID ALCS1UG-110111					
(all sample dilutions associated)					
LCS: Bromoform*	***150***	70-130	60-140	None	Associated results not used; dilution analysis performed for other analytes
LCSD: Bromoform*	***137***	70-130	60-140	None	Associated results not used; dilution analysis performed for other analytes
LCSD: 1,2,4-Trichlorobenzene*	***46.0***	70-130	60-140	None	Associated results not used; dilution analysis performed for other analytes
LCSD: 1,3,5-Trimethylenzene	***69.0***	70-130	60-140	None	Associated results not used; dilution analysis performed for other analytes
LCSD: 1,4-dioxane*	***27.0***	70-130	60-140	None	Associated results not used; dilution analysis performed for other analytes
LCSD: 4-ethyltoluene*	***64.0***	70-130	60-140	None	Associated results not used; dilution analysis performed for other analytes
LCS: Carbon tetrachloride	***157***	70-130	60-140	None	Associated results not used; dilution analysis performed for other analytes
LCSD: Carbon tetrachloride	***160***	70-130	60-140	None	Associated results not used; dilution analysis performed for other analytes
LCS: Dibromochloromethane*	***140***	70-130	60-140	None	Associated results not used; dilution analysis performed for other analytes
LCSD: Dibromochloromethane*	***132***	70-130	60-140	None	Associated results not used; dilution analysis performed for other analytes
LCSD: Hexachloro-1,3-butadiene*	***49.0***	70-130	60-140	None	Associated results not used; dilution analysis performed for other analytes
LCS: Methyl Butyl Ketone*	***156***	70-130	60-140	None	Associated results not used; dilution analysis performed for other analytes

Spike Analytes	LCS %Rec	QC Limits	ME Limits	Flag Applied	Rationale
LCSD: Methyl Ethyl Ketone*	***37.0***	70-130	60-140	None	Associated results not used; dilution analysis performed for other analytes
LCS ID ALCS1UG-103111					
(associated samples 774776CA01AD 1:10, 1:40, and 1:90 only)					
LCSD: 1,2,4-Trichlorobenzene*	***48.0***	70-130	60-140	None	%Rec within AFCEE control limits in primary LCS
LCSD: 1,2,4-Trimethylenzene	***60.0***	70-130	60-140	None	%Rec within AFCEE control limits in primary LCS
LCSD: 1,3,5-Trimethylenzene	***59.0***	70-130	60-140	None	%Rec within AFCEE control limits in primary LCS
LCSD: 1,4-dioxane*	***60.0***	70-130	60-140	None	%Rec within AFCEE control limits in primary LCS
LCSD: 4-ethyltoluene*	***49.0***	70-130	60-140	None	%Rec within AFCEE control limits in primary LCS
LCSD: Hexachloro-1,3-butadiene*	***43.0***	70-130	60-140	None	%Rec within AFCEE control limits in primary LCS
LCSD: Methyl Butyl Ketone*	***49.0***	70-130	60-140	None	%Rec within AFCEE control limits in primary LCS
LCSD: Methyl Ethyl Ketone*	***56.0***	70-130	60-140	None	%Rec within AFCEE control limits in primary LCS

Note 1: The compounds listed with asterisks above are not listed in the AFCEE QAPP for Method TO-15. In all such cases, using professional judgment and consistent with the lab's methodology, the LCS QC acceptance range was assumed to be 70-130.

The LCS analyses are used to assess the overall laboratory performance pertaining to the analytical method. The QAPP includes method-specific QC acceptance criteria for the percent recovery of the spike compounds. However, the QAPP includes criteria for only a sub-set of the TO-15 analyte list; in the case of all other analytes, using professional judgment and consistent with the lab's methodology, the LCS QC acceptance range for percent recovery was assumed to be 70-130. The LCS results are used to evaluate each AFCEE analytical batch and to determine if the method is within control limits. When an LCS analyte is outside the acceptance limit, the laboratory shall perform corrective action. If the corrective action is ineffective in resolving the exceedance, then that analyte's results in all the associated samples are qualified. According to the QAPP, when the percent recovery (%Rec) is greater than the upper control limit, positive results are considered estimated (flagged "J"); and when the %Rec is less than the lower control limit, positive values are estimated (flagged "J") and non-detects are rejected (flagged "R"). Using professional judgment, the non-detect results may be considered usable, albeit estimated, and shall be flagged "UJ."

Corrective Action: There were several recovery exceedances in the LCSD (103111), but since all recoveries of these compounds in the associated primary LCS sample were within QC limits, no further corrective action was considered necessary.

It should also be noted that all of the results associated with exceedances in LCS/LCSD (110111) were not used since they were associated with dilutions performed for other compounds.

There were some exceedances of the RPD (30%) between the LCS and LCSD samples ALCS1UGD-103111, for the following compounds: 1,2,4-trichlorobenzene (55.6%), 1,2,4-

trimethylbenzene (38.9%), 1,3,5-trimethylbenzene (50.6%), 1,4-dioxane (47.1%), 4-ethyltoluene (62.0%), acetone (39.6%), hexachloro-1,3-butadiene (78.0%), isopropyl alcohol (33.3%), methyl butyl ketone (64.8%), and methyl ethyl ketone (49.7%); also in LCS and LCSD samples ALCS1UGD-110111, for the following compounds: 1,2,4-trichlorobenzene (52.8%), hexachloro-1,3-butadiene (62.0%), methyl butyl ketone (37.3%), methyl ethyl ketone (70.2%). No corrective action was deemed necessary for RPD exceedances alone. The laboratory was consulted regarding these exceedances: sample humidity and/or carbon dioxide content in recently analyzed samples can greatly affect the integrity of the LCSD analysis.

- Second source calibration verification analysis, which is basically a calibration standard obtained from a source (vendor) other than the one for the Initial calibration standard, is required to be run once per five-point Initial calibration. It is used to verify that the analytes' relative response factors (RRF) calculated from the Initial calibration runs is accurate. According to the lab, the second source calibration is the same as the laboratory control sample (LCS; it should be noted that LCSD samples were not used for this purpose). As discussed above, there were several laboratory control samples with exceedances, but only two LCS's with exceedances of compounds on the AFCEE QAPP TO-14A/TO-15 list with a percent difference (%D) value between the RRF of the Initial and Second source exceeding the AFCEE QAPP QC criteria of ±30% (see table below). The AFCEE QAPP requires that the second source calibration verification be within control limits.

Type of Calibration Exceedance Affected Analytes	%D/ %RSD	AFCEE QC Limit	Flag Applied	Rationale
ALCS1UG-110111				
Carbon tetrachloride	***57***	±30	None	%D > upper control limit, all results ND

Corrective Action: Since all associated results were non-detect and the exceedance indicated a high bias, using professional judgment, no further corrective action was deemed necessary. As stated in the case narrative, if results continue to be outside established limits, then the system would be recalibrated.

- Internal Standard (IS) performance criteria ensure that the GC/MS sensitivity and response are stable during every experimental run. Per the AFCEE QAPP, for Method TO-15 the internal standard area count must not vary by more than -40% to +40% from the associated continuing calibration standard. Also, per the QAPP, for Method TO-15 the retention time of the internal standard must not vary more than ±20 seconds from the associated continuing calibration standard. If these criteria are exceeded, the QAPP requires a mandatory re-analysis of samples analyzed while the system was malfunctioning, and all results for analytes associated with the deficient IS are qualified ("Q"), unless a matrix effect can be verified, in which case an "M" qualifier is applied. In such circumstances, the EPA National Functional Guidelines for Organic Data Review provide the following guidance: If the area count is outside the (-50% to +100%) range of the associated standard, all of the positive results for compounds quantitated using that IS are qualified as estimated ("J"); no action is taken for non-detects if IS area is > 100%, and all non-detects are qualified as estimated ("UJ") if IS area is < 50%. Non-detects are qualified as "R" if there is a severe loss of

sensitivity (< 25% of associated IS area counts). Also, if an internal standard retention time varies by more than 30 seconds, the reviewer will use professional judgment to determine either partial or total rejection of the data for that sample fraction. **Proposed approach**: In this data verification, for data usability purposes, the data qualifiers will be applied following the EPA National Functional Guidance [estimate ("J") for positives if area count is outside of allowed ±40% range, no action for non-detects if IS area > + 40%, estimate ("UJ") for non-detects if IS area < - 40%, reject ("R") for non-detects if IS area is < -75%, and use professional judgment if retention time varies by more than 20 seconds].

The following are the assessment results for the "internal standards performance" criterion (the Sample ID and IS area counts are listed) for samples exhibiting exceedance (***bold italic***) [no retention time exceedances were encountered during this sampling round and NOTE: Samples with no exceedances are not listed below]:

	IS1 (BCM)	IS2 (DFB)	IS3 (CBZ)
12 Hour Std. (10/31/11)	20531	57419	56959
Upper Limit (+40%)	28743	80387	79743
Lower Limit (-40%)	12319	34451	34175
Severe loss of sensitivity (< -75%)*	5133	14355	14240
SAMPLE ID			
776VMP0301AC (1:10)	18121	37405	***33832***
774776CA02AC (1:5)	17110	38155	***31802***

IS1 (BCM) =Bromochloromethane; IS2 (DFB) =1,4-Difluorobenzene; IS3 (CBZ) = Chlorobenzene-d5
Area count: Upper Limit = +40% and Lower Limit = -40% of internal standard

Corrective Action: The exceedances for internal standard chlorobenzene-d5 are not associated with the analytes for which the dilutions were performed; therefore, no flagging was deemed necessary.

DATA USABILITY RESULTS

VOCs

Based on the evaluation of all information in the analytical data groups, the results of all the samples for VOCs are highly usable with the data validation qualifiers as noted. Using the validation approach as presented above, the results for all samples in this analytical batch are 100% usable [i.e., all results are usable when the results from dilution samples are transferred to the original sample results]. The AFCEE QAPP minimum requirement for completeness (for aqueous samples, but will be applied here for vapor samples) is 95%, which is exceeded in this analytical batch.

AFCEE SUMMARY

All data in Job # C1110054 are usable, which can be used with qualifications as noted in the data review.

Buildings 774 and 776 Bill of Materials

System Component	Characteristics
Blower TEFC 15 HP electric motor (ROTRON® Model DR909BE72W)	Maximum flow: 600 SCFM, Maximum Vacuum: 106 inch w.g.
50 gallon Moisture Knockout Vessel High Level Alarm Switch (Flow Line® LC05)	Required to avoid moisture impact on blower. When moisture knockout vessel reaches maximum volume, high level alarm switch is initiated. Equipped with manual bottom drain.
Inline Particulate Filter (Solberg® Model CT-235P 4" NPT)	An inlet filter is required to avoid the negative impact of soil particles present in the extracted vapor.
Air Dilution Ball Valve (Dilution Filter 0.010 inch slotted PVC)	An air dilution valve is required to adjust the systems applied vacuum.
Vacuum Relief Valve (Kunkle® Model 215V)	A vacuum relief valve is required to avoid damage to the blower in the event the flow is obstructed.
Discharge Silencer (Universal® Silencer Model #U5-4)	A silencer is needed to mitigate the noise impact of the blower on the surroundings.
Horizontal Well Manifold (4 inch PVC)	Three point manifold with individual ball valves to control flow rate and vacuum per each horizontal well.
Gauges: Analog Dial Bimetal Thermometers, WIKA® Low Vacuum Gauges, Magnehelic® Differential Pressure Gauges, Pitot Tubes (Series DS-300 Flow Sensors)	Outlet temperature gauge before and after vapor treatment, inlet vacuum gauge before and after filter, and three flow meters, vacuum gauges and temperature gauges on each leg of manifold.
Control Panel	Fused disconnect, input voltage: 208V, 3 phase power, HOA switch, motor overload and starter, motor fault light, high fault light, high level shut down relay.
Vapor After Treatment	Two air purification canisters (G3-S) with 140-pounds granular activated carbon installed to treat vapor extracted from the soil.
Heat Exchanger (ACA® Model 6422-3)	Air cooled heat exchanger creates optimal influent temperatures for efficient absorption through granular activated carbon treatment.
Enclosure: wooden shed, 8ft X 8ft T-111 sided, wooden floor, asphalt shingle. Heater: 1,800 watt electric heater with thermostat. Exhaust Fan: manual inlet louver and exhaust fan with thermostat.	System will be located outside of office building, and needs to be enclosed with lights, heater, exhaust fan, insulation, and outlet.

Voltage - ROTRON motors are designed to handle a broad range of world voltages and power supply variations. Our dual voltage 3 phase motors are factory tested and certified to operate on both: **208-230/415-460 VAC-3 ph-60 Hz** and **190-208/380-415 VAC-3 ph-50 Hz**. Our dual voltage 1 phase motors are factory tested and certified to operate on both: **104-115/208-230 VAC-1 ph-60 Hz** and **100-110/200-220 VAC-1 ph-50 Hz**. All voltages above can handle a ±10% voltage fluctuation. Special wound motors can be ordered for voltages outside our certified range.

Operating Temperatures - Maximum operating temperature: Motor winding temperature (winding rise plus ambient) should not exceed 140°C for Class F rated motors or 120°C for Class B rated motors. Blower outlet air temperature should not exceed 140°C (air temperature rise plus inlet temperature). Performance curve maximum pressure and suction points are based on a 40°C inlet and ambient temperature. Consult factory for inlet or ambient temperatures above 40°C.

Maximum Blower Amps - Corresponds to the performance point at which the motor or blower temperature rise with a 40°C inlet and/or ambient temperature reaches the maximum operating temperature.

This document is for informational purposes only and should not be considered as a binding description of the products or their performance in all applications. The performance data on this page depicts typical performance under controlled laboratory conditions. AMETEK is not responsible for blowers driven beyond factory specified speed, temperature, pressure, flow or without proper alignment. Actual performance will vary depending on the operating environment and application. AMETEK products are not designed for and should not be used in medical life support applications. AMETEK reserves the right to revise its products without notification. The above characteristics represent standard products. For product designed to meet specific applications, contact AMETEK Technical & Industrial Products Sales department.

Industrial / Chemical Processing Blowers

DR 909 & CP 909

ROTRON®

10.0 / 15.0 HP Regenerative Blower

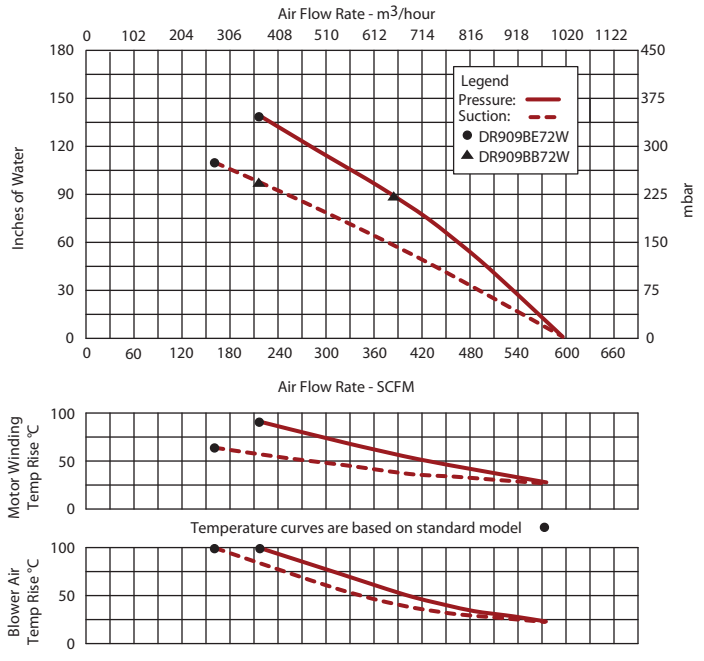
FEATURES

- Manufactured in the USA - ISO 9001 and NAFTA compliant
- CE compliant - Declaration of Conformity on file
- Maximum flow: 600 SCFM
- Maximum pressure: 137 IWG
- Maximum vacuum: 106 IWG
- Standard motor: 15 HP, TEFC
- Cast aluminum blower housing, impeller & cover; cast iron flanges (threaded)
- UL & CSA approved motor with permanently sealed ball bearings
- Inlet & outlet internal muffling
- Quiet operation within OSHA standards when properly piped and muffled

MOTOR OPTIONS

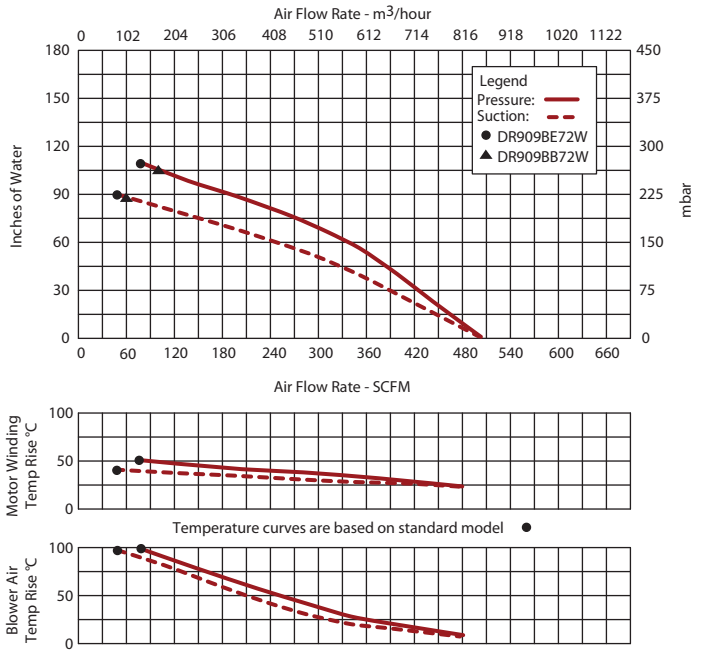
- International voltage & frequency (Hz)
- Chemical duty, high efficiency, inverter duty or industry-specific designs
- Various horsepowers for application-specific needs

BLOWER OPTIONS



- Corrosion resistant surface treatments & sealing options
- Remote drive (motorless) models
- Slip-on or face flanges for application-specific needs

ACCESSORIES



- Flowmeters reading in SCFM
- Filters & moisture separators
- Pressure gauges, vacuum gauges, & relief valves
- Switches - air flow, pressure, vacuum, or temperature
- External mufflers for additional silencing
- Air knives (used on blow-off applications)
- Variable frequency drive package

Blower Performance at Standard Conditions

60 Hz

50 Hz

1. AMETEK Rotron DR, EN and HiE regenerative direct drive blowers are guaranteed for one full year from the date of installation (limited to 18 months from the date of shipment) to the original purchaser only. Should the blower fail we will evaluate the failure If failure is determined to be workmanship or material defect related, we will at our option repair or replace the blower.

2. AMETEK Rotron Minispiral, Revaflow, Multiflow, Nautilair, remote drive blowers, moisture separators, packaged units, CP blowers, Nasty Gas™ models and special built (EO) products are guaranteed for one full year from date of shipment for workmanship and material defect to the original purchaser only. Should the blower fail, If failure is determined to be workmanship or material defect related, we will at our option repair or replace the blower.

3. **Parts Policy** - AMETEK Rotron spare parts and accessories are guaranteed for three months from date of shipment for workmanship and material defect to the original purchaser only. If failure is determined to be workmanship or material defect related we will at our option repair or replace the part.

Corrective Action - A written report will be provided indicating reason(s) for failure, with suggestions for corrective action. Subsequent customer failures due to abuse, misuse, misapplication or repeat offense will not be covered. AMETEK Rotron will then notify you of your options. Any failed unit that is tampered with by attempting repair or diagnosis will void the warranty, unless authorized by the factory.

Terms and Conditions - Our warranty covers repairs or replacement of regenerative blowers only, and will not cover labor for installation, outbound and inbound shipping costs, accessories or other items not considered integral blower parts. Charges may be incurred on products returned for reasons other than failures covered by their appropriate warranty. Out-of-warranty product and in warranty product returned for failures determined to be caused by abuse, misuse, or repeat offense will be subject to an evaluation charge. Maximum liability will in no case exceed the value of the product purchased. Damage resulting from mishandling during shipment is not covered by this warranty. It is the responsibility of the purchaser to file claims with the carrier. Other terms and conditions of sale are stated on the back of the order acknowledgement.

Installation Instructions for SL, DR, EN, CP, and HiE Series Blowers

1. **Bolt It Down** - Any blower must be secured against movement prior to starting or testing to prevent injury or damage. The blower does not vibrate much more than a standard electric motor.

2. **Filtration** - All blowers should be filtered prior to starting. Care must be taken so that no foreign material enters the blower. If foreign material does enter the blower, it could cause internal damage or may exit at extremely high velocity.

   Should excessive amounts of material pass through the blower, it is suggested that the cover(s) and impeller(s) be removed periodically and cleaned to avoid impeller imbalance. Impeller

imbalance greatly speeds bearing wear, thus reducing blower life. Disassembling the blower will void warranty, so contact the factory for cleaning authorization.

3. **Support the Piping** - The blower flanges and nozzles are designed as connection points only and are not designed to be support members.

   Caution: Plastic piping should not be used on blowers larger than 1 HP that are operating near their maximum pressure or suction point. Blower housing and nearby piping temperatures can exceed 200°F. Access by personnel to the blower or nearby piping should be limited, guarded, or marked, to prevent danger of burns.

4. **Wiring** - Blowers must be wired and protected/fused in accordance with local and national electrical codes. All blowers must be grounded to prevent electrical shock. Slo-Blo or time delay fuses should be used to bypass the first second of start-up amperage.

5. **Pressure/Suction Maximums** - The maximum pressure and/or suction listed on the model label should not be exceeded. This can be monitored by means of a pressure or suction gage (available from Rotron), installed in the piping at the blower outlet or inlet. Also, if problems do arise, the Rotron Field representative will need to know the operating pressure/suction to properly diagnose the problem.

6. **Excess Air** - Bleed excess air off. DO NOT throttle to reduce flow. When bleeding off excess air, the blower draws less power and runs cooler.

   Note: Remote Drive (Motorless) Blowers - Properly designed and installed guards should be used on all belts, pulleys, couplings, etc. Observe maximum remote drive speed allowable. Due to the range of uses, drive guards are the responsibility of the customer or user. Belts should be tensioned using belt gauge.

Maintenance Procedure

When properly piped, filtered, and applied, little or no routine maintenance is required. Keep the filter clean. Also, all standard models in the DR, EN, CP, and HiE series have sealed bearings that require no maintenance. Bearing should be changed after 15,000 to 20,000 hours, on average. Replacement bearing information is specified on the chart below.

Bearing Part Number	Size	Seal Material	Grease	Heat Stabilized
510217 510218 510219	205 206 207	Polyacrylic	Nye Rheotemp 500 30% +/- 5% Fill	Yes – 325 F
510449 516440 516648	203 202 307	Buna N	Exxon Polyrex Grease	NO
516840 516841 516842 516843 516844 516845 516846 516847	206 207 208 210 309 310 311 313	Buna N	Exxon Polyrex Grease	NO

Troubleshooting

		POSSIBLE CAUSE	OUT OF WARRANTY REMEDY ***
IMPELLER DOES NOT TURN	Humming Sound	1. * One phase of power line not connected 2. * One phase of stator winding open 3. Bearings defective 4. Impeller jammed by foreign material 5. Impeller jammed against housing or cover 6. ** Capacitor open	1. Connect 2. Rewind or buy new motor 3. Change bearings 4. Clean and add filter 5. Adjust 6. Change capacitor
	No Sound	1. * Two phases of power line not connected 2. * Two phases of stator winding open	1. Connect 2. Rewind or buy new motor
IMPELLER TURNS	Blown Fuse	1. Insufficient fuse capacity 2. Short circuit	1. Use time delay fuse of proper rating 2. Repair
	Motor Overheated Or Protector Trips	1. High or low voltage 2. * Operating in single phase condition 3. Bearings defective 4. Impeller rubbing against housing or cover 5. Impeller or air passage clogged by foreign material 6. Unit operating beyond performance range 7. Capacitor shorted 8. * One phase of stator winding short circuited	1. Check input voltage 2. Check connections 3. Check bearings 4. Adjust 5. Clean and add filter 6. Reduce system pressure/vacuum 7. Change capacitor 8. Rewind or buy new motor
	Abnormal Sound	1. Impeller rubbing against housing or cover 2. Impeller or air passages clogged by foreign material 3. Bearings defective	1. Adjust 2. Clean and add filter 3. Change bearings
	Performance Below Standard	1. Leak in piping 2. Piping and air passages clogged 3. Impeller rotation reversed 4. Leak in blower 5. Low voltage	1. Tighten 2. Clean 3. Check wiring 4. Tighten cover, flange 5. Check input voltage

* 3 phase units

** 1 phase units

*** Disassembly and repair of new blowers or motors will void the Rotron warranty. Factory should be contacted prior to any attempt to field repair an in-warranty unit.

Blower Disassembly:

WARNING: Attempting to repair or diagnose a blower may void Rotron's warranty. It may also be difficult to successfully disassemble and reassemble the unit.

1) Disconnect the power leads. **CAUTION:** Be sure the power is disconnected before doing any work whatsoever on the unit.

2) Remove or separate piping and/or mufflers and filters from the unit.

3) Remove the cover bolts and then the cover. **NOTE:** Some units are equipped with seals. It is mandatory that these seals be replaced once the unit has been opened.

4) Remove the impeller bolt and washers and then remove the impeller. **NOTE:** Never pry on the edges of the impeller. Use a puller as necessary.

5) Carefully note the number and location of the shims. Remove and set them aside. NOTE: If the disassembly was for inspection and cleaning the unit may now be reassembled by reversing the above steps. If motor servicing or replacement and/or impeller replacement is required the same shims may not be used. It will be necessary to re-shim the impeller according to the procedure explained under assembly.

6) Remove the housing bolts and remove the motor assembly (arbor/.housing on remote drive models).

7) Arbor disassembly (Applicable on remote drive models only):
   a) Slide the bearing retraining sleeve off the shaft at the blower end.
   b) Remove the four (4) screws and the bearing retaining plate from the blower end.
   c) Lift the shaft assembly far enough out of the arbor to allow removal of the blower end snap ring.
   d) Remove the shaft assembly from the arbor.
   e) If necessary, remove the shaft dust seal from the pulley end of the arbor.

Muffler Material Replacement:

1) Remove the manifold cover bolts and them manifold cover.

2) The muffler material can now be removed and replaced if necessary. On blowers with fiberglass acoustical wrap the tubular retaining screens with the fiberglass matting before sliding the muffler pads over the screens.

3) Reassemble by reversing the procedure.

NOTE: On DR068 models with tubular mufflers it is necessary to remove the cover and impeller accessing the muffler material from the housing cavity.

Blower Reassembly:

1) Place the assembled motor (assembled arbor assembly for remote drive models) against the rear of the housing and fasten with the bolts and washer.

2) To ensure the impeller is centered within the housing cavity re-shim the impeller according to the procedure outlined below.

3) If blower had a seal replace the seal with a new one.

4) Place the impeller onto the shaft making sure the shaft key is in place and fasten with the bolt, washer and spacer as applicable. Torque the impeller bolt per the table below. Once fastened carefully rotate the impeller to be sure it turns freely.

5) Replace the cover and fasten with bolts.

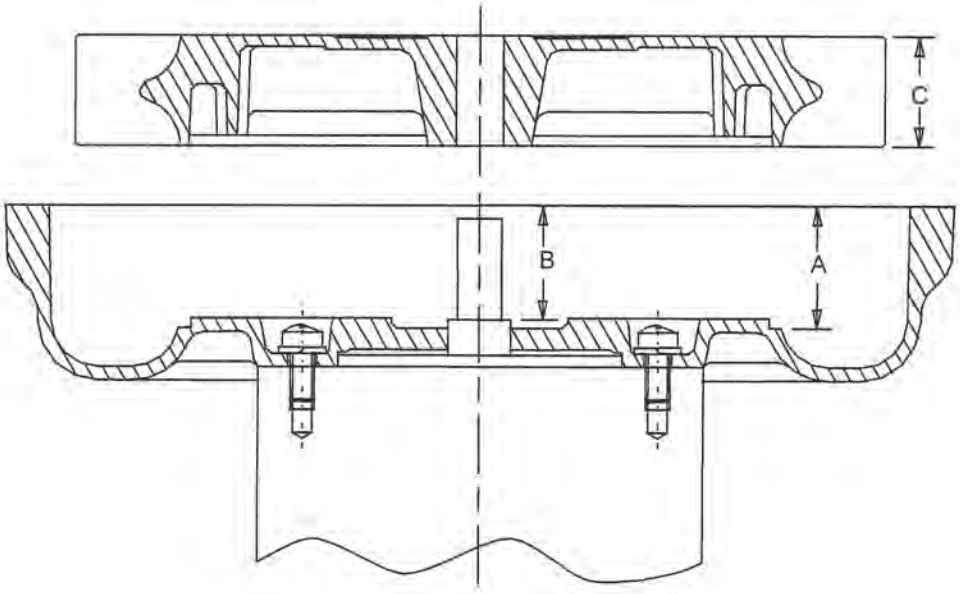
6) Reconnect the power leads to the motor per the motor nameplate.

Bolt Size	Torque Pound-Force-Foot
1/4-20	6.25 +/- 0.25
5/16-18	11.5 +/- 0.25
3/8-16	20.0 +/- 0.5
½-13	49.0 +/- 1
5/8 –11	90.0 +/- 2

Impeller Shimming Procedure:

WARNING: This unit may be difficult to shim. Extreme care may be exercised.

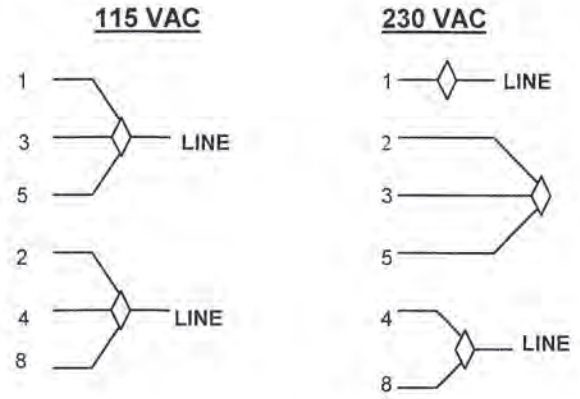
Tools Needed: Machinist's Parallel Bar
Vernier Caliper with depth measuring capability
Feeler gauges or depth gauge



Measure the Following:

Distance from the flange face to the housing (A)
Distance from the flange face to the motor shaft shoulder (B)
Impeller Thickness (C)

Measurements (A) and (B) are made by laying the parallel bar across the housing flange face and measuring to the proper points. Each measurement should be made at three points, and the average of the readings should be used.



Shim Thickness = B – (A+C)/2

After the impeller installation (step #4 above) the impeller/cover clearance can be checked with feeler gauges, laying the parallel bar across the housing flange face. This clearance should nominally be (A-C)/2.

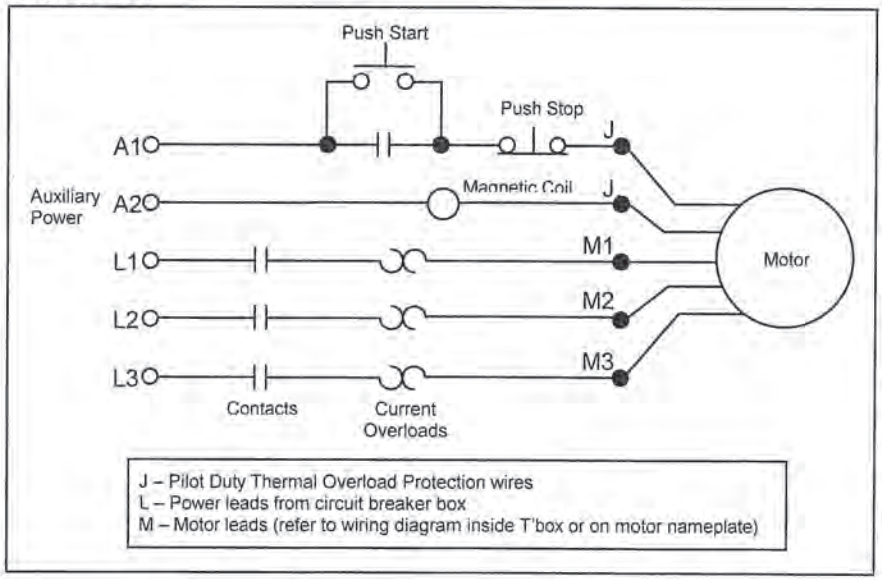
EXPLOSION-PROOF BLOWERS



IMPORTANT: Read before wiring this Explosion-proof Blower

This AMETEK Rotron Explosion-proof Regenerative Blower may be equipped with Pilot Duty Thermal Overload (PDTO) or Automatic Thermal Overload (ATO) protection. When properly wired to a motor starter, this protection limits the motor winding temperature rise per the National Electric Code (NEC) article 500. Failure to properly wire this blower is an NEC violation and could cause an explosion. AMETEK Rotron assumes no responsibilities for damages incurred by negligent use of this product, and will not warranty a blower on which the PDTO is not properly connected. Some blowers 1 HP and under do not require PDTO and have built in ATO. Consult the factory if verification of wiring connections is required.

In all cases, follow the motor controller manufacturer's instructions. The following schematic is for conceptual understanding only, and may not apply to all motor/controller combinations.

The manufacturer's wiring diagram found on the motor takes precedent over reference diagrams supplied by AMETEK Rotron Technical Motor Division.

Schematic

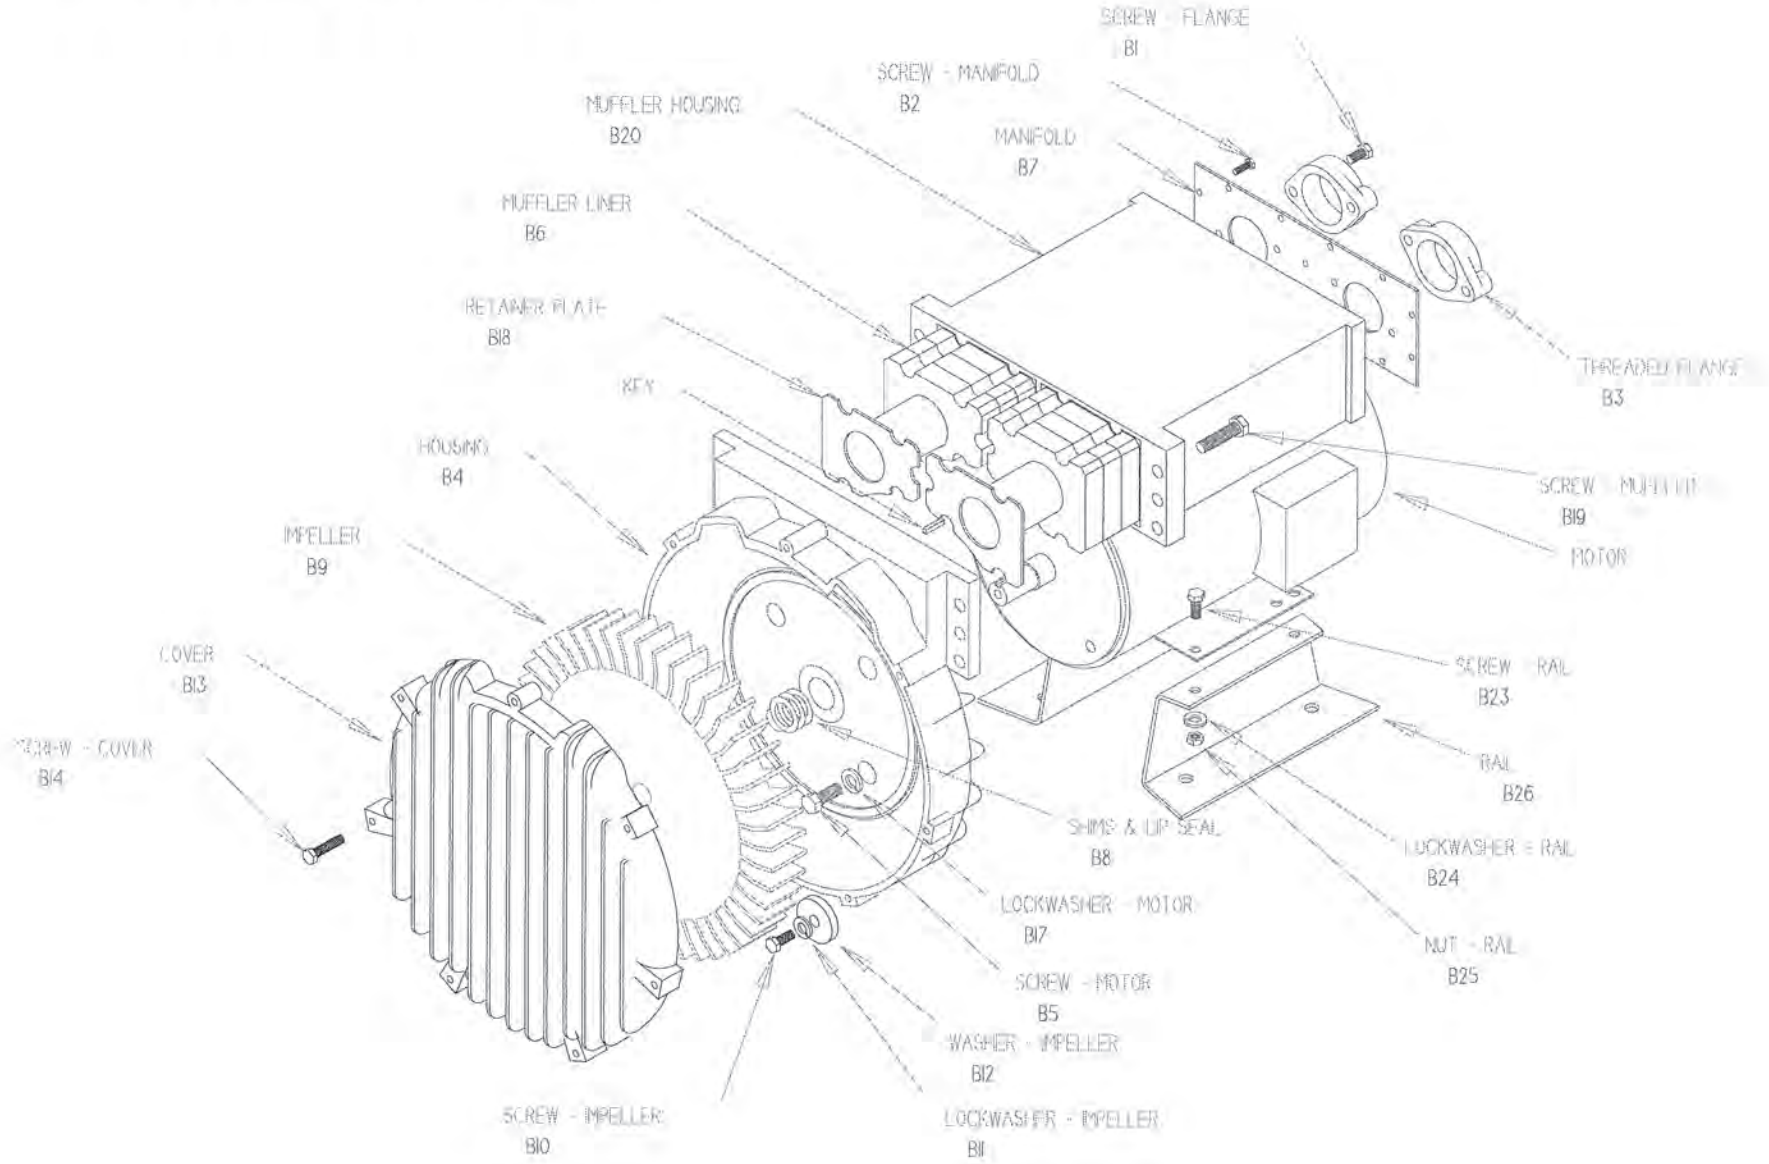
The schematic is shown for a three phase motor. For a single phase motor disregard L3 and M3. Pushing the START button completes the auxiliary control circuit, allowing current to flow through the magnetic coil. The contacts are magnetically closed, starting the motor and latching the auxiliary circuit. The motor will continue to run until the STOP push button is depressed, the motor reaches the overload temperature, or the current sensing overloads trip out.

If you have any questions, contact AMETEK Rotron at 914-246-3401 for the location of your area representative.

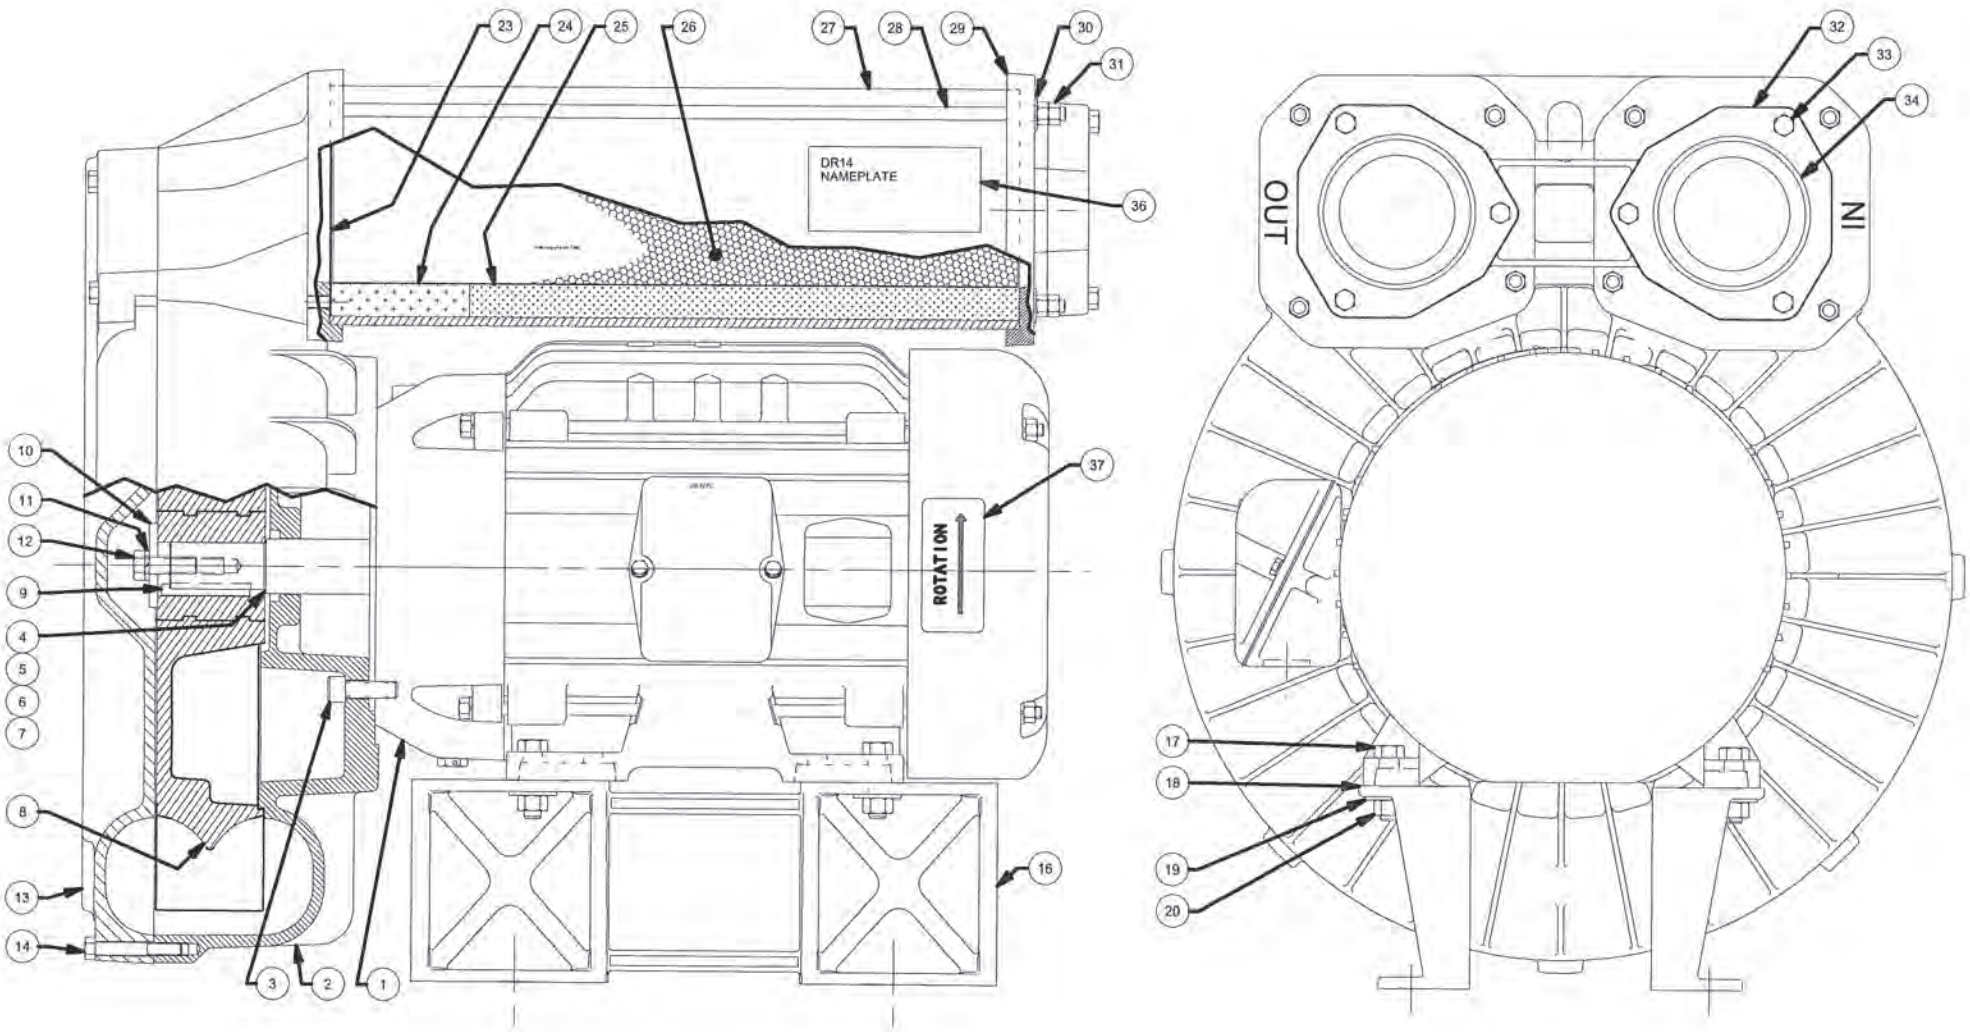
POLICY REGARDING INSTALLATION OF AMETEK ROTRON REGENERATIVE BLOWERS IN HAZARDOUS LOCATIONS

AMETEK Rotron will not knowingly specify, design or build any regenerative blower for installation in a hazardous, explosive location without the proper NEMA motor enclosure. AMETEK Rotron does not recognize sealed blowers as a substitute for explosion-proof motors. Sealed units with standard TEFC motors should never be utilized where local, state, and/or federal codes specify the use of explosion-proof equipment.

AMETEK Rotron has a complete line of regenerative blowers with explosion-proof motors. Division 1 & 2, Class I, Group D; Class II, Groups F & G requirements are met with these standard explosion-proof blowers.



AMETEK Rotron will not knowingly specify, design or build any regenerative blower for installation in a hazardous, corrosive environment without the proper surface treatment and sealing options.



AMETEK Rotron has a complete line of Chemical Processing and Nasty Gas™ regenerative blowers with Chem-Tough™, stainless steel parts, and seals.

AMETEK Rotron offers general application guidance; however, suitability of the particular blower selection is ultimately the responsibility of the purchaser, not the manufacturer of the blower.

COMPACT "T" STYLE VACUUM FILTERS
"CT Series" 2" - 6" FPT

SOLBERG®

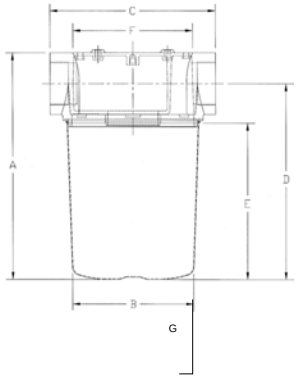
- **Compact Design**
- **Multi-Stage Filtration**
- **Quick Change Out**
- **Vacuum Tested**

BENEFITS

- **Compact** design for space restrictions; **Minimal** service area needed
- **Integrated Inlet Baffle**
- Inlet is above the element to **Extend** element life and maintenance intervals
- "T" style design **Minimizes** piping requirements
- "Drop-Down" housing for easy servicing and containment of particles
- Cast aluminum head **Resists** corrosion
- Pressure differential ports standard for monitoring
- Casting has 4 unthreaded tap holes for mounting bracket
- **Vacuum level**: Typically $1x10^{-3}$ mmHg ($1.3x10^{-3}$ mbar)
- Swing Bolts on 5" & 6" sizes for additional strength

OPTIONS (Inquires Encouraged)

- Various media alternatives
- **See Through Bottom for Visual Inspection Now available for 3" and 4" housings!**
- Swing Bolts for 2" - 4" Sizes



CT-851/850
2" & 2 1/2" FPT

CT-235P/234P
3" & 4" FPT

CT-275P/274P

Solberg – Discover the Possibilities

Models 215V and 337

KUNKLE

Model 215V is Non-code Vacuum and Model 337 is ASME Section VIII, Air/Gas Vacuum, 'UV' National Board Certified, Safety Valves. PED Certified for Non-Hazardous Gas.

Features

- **Large nozzle design** provides high capacity.
- **Flat bronze valve seats are lapped** for optimum performance.
- **Warn ring offers easy adjustability** for precise opening with minimum pre-open or simmer and exact blowdown control.
- **Pivot between disc and spring** corrects misalignment and compensates for spring side thrust.

Model Descriptions

- **Model 337 has 'pull-ring' lift device** for easy manual testing.
- **Every valve is 100% tested/inspected** for pressure setting, blowdown and leakage.
- **All adjustments are factory sealed** to prevent tampering or disassembly.

Option

- SS trim. (nozzle and disc) (Variation 03)

Applications

- Protection of low to medium pressure high volume blowers, compressors and pneumatic conveying systems.
- Bulk hauling trailers/equipment.
- Light gauge tanks.
- Protection of high volume vacuum pumps and conveying systems.

Vacuum Limits

Model 215V:
2-inch HG
to 29-inch HG
[67.7 to 982 mbarg]
-20° to 406°F [-29° to 208°C]

Pressure and Temperature Limits

Model 337:
1 to 60 psig [0.07 to 4.1 barg]
-20° to 406°F [-29° to 208°C]
