RE: Final Completion Report
Sub-Slab Vapor Mitigation Systems
SD-052-02 Building 775 Site (Buildings 774 and 776) and SD-052-01 Apron 2 Chlorinated Plume Site (Buildings 785 and 786)
Former Griffiss Air Force Base, Rome, New York
Project No. FA8903-04-D-8687-0017
FPM Project No. 1000-08-17
Revision 2.0
February 2013

Enclosed please find the Final Completion Report for the Sub-Slab Vapor Mitigation Systems at SD-052-02 Building 775 Site (Buildings 774 and 776) and SD-052-01 Apron 2 Chlorinated Plume Site (Buildings 785 and 786), for your review. This report details the completion and initial performance evaluation of the respective sub-slab vapor mitigation systems at the former Griffiss Air Force Base in Rome, NY.

If you have any questions or require additional information, please contact me or Katrina Mattice by phone at 315-336-7721, or e-mail at d.baldyga@fpm-remediations.com or k.mattice@fpm-remediations.com.

Very truly yours,

Daniel Baldyga, CE
Senior Environmental Scientist

1 INTRODUCTION

FPM Remediations, Inc. (FPM) has been contracted by the Air Force Civil Engineer Center (AFCEC) to perform Sub-Slab Vapor Mitigation (SSVM) at the former Griffiss Air Force Base (AFB) in Rome, NY. SSVM was performed at SD-52-02 Building 775 Site (Buildings 774 and 776) and SD-052-01 Apron 2 Chlorinated Plume Site (Buildings 785 and 786). These sites were investigated as part of the Soil Vapor Intrusion (SVI) Survey at the On-Base Groundwater Areas of Concern performed between October and December 2006 by Ecology and Environment Engineering P.C. (EEEPC). This SVI survey was reviewed by the Air Force, New York State Department of Environmental Conservation (NYSDEC), New York State Department of Health (NYSDOH) and United States Environmental Protection Agency (USEPA). During discussions among these parties, a plan for additional sampling was established. The additional sampling was conducted in April and May 2008 (FPM, April 2008).

Buildings 774, 776, 785 and 786 are shown in Figure 1-1. These sites are industrial/commercial and are not intended for future residential use. All current and future receptors at the sites are therefore industrial/commercial workers. The site use is currently restricted to industrial/commercial use through deed/lease restrictions.

1.1 Description of Sub-Slab Vapor Mitigation

SSVM addressed the SVI of chlorinated solvents at the sites. The SSVM was conducted in accordance with provisions of Contract # FA8903-04-D-8687, Delivery Order # 0017. The objectives, components and evaluation criteria of performance are as follows:

The objectives of the SSVM systems were:

- To envelope Buildings 774 and 776 sub-slabs with negative pressures using a horizontal system in order to create vapor barrier;
- To provide soil vapor extraction (SVE) for Buildings, 785 and 786 utilizing a horizontal SSVM system;
- To mitigate SVI sources at Buildings 774, 776, 785 and 786 through providing SSVM and to evaluate SSVM to protect potential future human receptors; and
- To evaluate chlorinated solvent mitigation due to the SSVM systems.

System designs and evaluation criteria were based on the Draft SSVM Design Work Plan (WP) (FPM, February 2011). The implementation and evaluation of the systems was also performed in consultation with the United States Army Corps of Engineers (USACE) Engineering Manual 1110-1-4001 (USACE, June 2002), specifically chapter 5 “Design of Full-Scale SVE and Bioventing (BV) Systems” and Assumptions and Screening Levels for SVI Evaluation (FPM, October 2007).

Components of the SSVM systems included:

- A horizontally-installed SSVM system at Buildings 774, 776, 785 and 786 with vacuum blower and associated piping and controls;
- Vapor treatment system using granular activated carbon (GAC); and
- Vapor monitoring points (VMPs) to evaluate the transport of chlorinated solvents resulting from SSVM systems operation.

Given the above objectives and components of the SSVM systems, the following performance evaluation criteria were used:

1. Design and performance of SSVM systems determined through stepped rate test.
2. Ability of SSVM systems to depressurize building slabs. Determined through vacuum radius of influence (ROI) test.
3. Understanding the transport and mitigation of chlorinated solvents. Determined through VMP sub-slab sampling and comparison to previous results from SVI evaluation.
4. Identifying the effectiveness of SVE and treatment. Determined through influent vapor sampling from the extraction wells and effluent vapor sampling after GAC treatment.

2 SITE INFORMATION

2.1 Buildings 774 and 776 Site Location and History

These two buildings are located between Phoenix Drive and Patrol Road on Strategic Air Command Hill at the former Griffiss AFB in Rome, NY and are associated with the Building 775 Site (SD-52-02) (Figure 2-1). Building 774 is a one-story, 18,990 square feet (sq ft) office building, currently occupied by a computer/security firm. The building is occupied on work days from 8 AM to 5 PM by approximately 45 people. Building 774 was built in 1959, but underwent major renovations in 2000. New windows and doors were installed, 36 new air handlers were installed, including new air ducts in ceilings and new cooling towers. The building is built on an 8-inch thick concrete slab, with no basement and most floors are covered with carpeting. Several floor drains exist in bathrooms, janitor closets and the boiler room.

Building 776 is a one-story, 27,410 sq ft office building, currently occupied by a software development firm. The building is occupied on work days from 7 AM to 6 PM by approximately 80 people. Building 776 was built in 1959, but underwent major renovations in 2002. New windows, which do not open, and doors were installed, the interior was refinished and most floors were covered with new carpeting. Heat and outdoor air are provided through 43 heat pumps. The building is built on a 3.5 to 6-inch thick concrete slab, with no basement. Several floor drains exist in bathrooms and one crack was observed in the concrete floor near the southeastern entrance door.

The Building 775 Site plume is located downgradient and south of former maintenance facilities in Buildings 774 and 776 and former fuel pump house Building 775. Although the source has not been identified, solvent use in Building 774 was thought to be a primary source of trichloroethylene (TCE) contamination. Solvent use was widespread in these facilities in the 1950s, 1960s, and early 1970s. The contaminated aquifer comprises silty sands with an average thickness extending from 60 ft below ground surface (bgs) to 120 ft bgs, where shale bedrock is encountered.

2.1.1 Groundwater Investigation

The primary contaminant exceeding NYSDEC Class GA Groundwater Standards is TCE, with minor detections of 1,1,1-trichloroethane (TCA) and perchloroethylene (PCE). Monitoring well 775VMW-5, located near the corner of Building 776, is the only well in the maintenance area that contains significant levels of TCE (99 micrograms per liter [µg/L] in September 2004). Most of the Building 775 plume appears to have migrated south toward Landfill 6. In September 2004, the maximum groundwater TCE concentration was 134 µg/L (detected at well 775-MW20, located near the leading edge of the plume near Perimeter Road). TCE was detected at 132 µg/L (in well 775VMW-10), which is also located near the leading edge of the plume near Perimeter Road. TCE in both of these wells was detected in the bottom half of the sandy aquifer in

screened intervals from 88 to 120 ft bgs. Nearby well LF6MW-1 is screened in the upper 10 ft of the aquifer and does not have detectable TCE concentrations (FPM, February 2005). Based on the current TCE distribution, it appears that the TCE was likely spilled in the vicinity of Building 774 and has migrated southward and downward in the aquifer.

Additional sampling was performed by E&E and FPM in 2006 as part of the feasibility study for the Building 775 Site. EEEPC performed pre-design investigation (PDI) activities at the Building 775 Site starting in September 2006. First, two monitoring wells were installed (775MW-27 and -28). The wells were developed and sampled at the end of October into the beginning of November 2006. Results showed that the primary contaminant exceeding NYSDEC Class GA Groundwater Standards is TCE, with minor detections of 1,1,1-TCA and PCE. FPM performed sampling at several other monitoring wells at the Building 775 Site in order to create a complete understanding of current site conditions. The results and conclusions were reported in the Final PDI Report (EEEPC, February 2007).

A remedial action was selected through the On-base Groundwater Record of Decision (ROD) [Air Force Real Property Agency (AFRPA), December 2008] and described in the Remedial Action Work Plan (RAWP) [Parsons, July 2008]. The SVI in Buildings 774 and 776 is being managed as a separate operable unit and therefore is not included in the On-base Groundwater ROD. The remedial action is a groundwater extraction system with a discharge to an off-site treatment facility. The groundwater extraction system is designed to contain the contaminated plume and extract the contaminants from the aquifer. The start-up date of the groundwater extraction system was January 5, 2009. At this time, FPM also started sampling at Building 775 Site to monitor the performance of the installed remedy. The most recent performance monitoring sampling results have shown TCE detections up to 68 µg/L occurring in 775VMW-5 (FPM, December, 2011). This is a decrease from the September 2004 sampling event, where monitoring results from 775VMW-5 showed a TCE detection of 99 µg/L.

2.1.2 2006 Soil Vapor Intrusion Evaluation

EEEPC also performed an SVI evaluation during the PDI activities. Sub-slab sampling at the Building 775 Site indicated that chloroform and TCE were present in the sub-slab vapor at Buildings 774 and 776 at concentrations above the Air Force (AF) screening levels (FPM, October 2007). Indoor air sampling at both buildings indicated that these contaminants were present, but at concentrations below the AF screening levels. The TCE and chloroform detections were likely associated with the groundwater contamination plume located in the area. TCE has been detected in groundwater at concentrations above screening levels, while chloroform has been detected in groundwater at concentrations below screening levels. The SVI evaluation sample locations are shown on Figure 2-1 and corresponding results are provided in Table 1.

2.1.3 Building 774 Soil Vapor Intrusion Results 2008

The indoor air TCE concentrations, reported for Building 774 during the April 2008 sampling round, were two orders of magnitude higher than those reported in the 2006 sampling round. The Building 774 point of contact (Dave Perella) confirmed that renovations, performed in Building 774 between December 2007 and May 2008, included carpet glue removal through solvent use. Indoor and outdoor air samples were recollected in May 2008 in Building 774. The recollected results show that indoor air TCE concentrations were similar to levels reported in 2006 (Table 2-1). Sub-slab vapor results for Building 774 slightly decreased in comparison to 2006 results. The highest sub-slab vapor result reported in 2006 was 1,700 micrograms per cubic meter (µg/m^3) at location 774SSV-1. The highest result reported in 2008 was 590 µg/m^3 at location 774SSV-2.

In Building 774, the 2008 indoor air concentrations were within an acceptable range and did not pose any unacceptable risk to building occupants. 2008 sub-slab vapor concentrations in Building 774 exceeded AF screening levels.

2.1.4 Building 776 Soil Vapor Intrusion Results 2008

The indoor air TCE concentrations reported for Building 776 during the April 2008 sampling round were comparable to levels reported in 2006. Sub-slab vapor results for Building 776 were lower compared to 2006 results. The highest sub-slab vapor result reported in 2006 was 3,000 µg/m^3 at location 776SSV-1. The highest result reported in 2008 was 110 µg/m^3 at location 774SSV-2.

In Building 776, the 2008 indoor air concentrations were within an acceptable range and did not pose any unacceptable risk to building occupants. 2006 sub-slab vapor concentrations in Building 776 exceeded AF screening levels, however concentrations in 2008 were below screening levels.

2.2 Buildings 785 and 786 Site Location and History

Buildings 785 and 786 are located on the Apron 2 Chlorinated Plume Site (SD-52-01) at the former Griffiss AFB in Rome, NY (Figure 2-2). Buildings 785 and 786 are 28,251 sq ft, unheated airplane hangars. The buildings are used for storage by the Griffiss International Airport. The buildings are largely open with several first and second floor offices in the southwest corners of the buildings. Building 785 and 786 were built in 1959 and were taken out of service in 1995 after the former Griffiss AFB was closed. The buildings are built on a 13.5 to 14-inch thick, unsealed concrete slab comprised of numerous concrete pads installed together with areas of caulked expansion gaps. Large visible cracks in the concrete floors were repaired. Two large trenches exist in the buildings; one along the large aircraft bay doors on the southeast side of the building and a smaller trench along the overhead door on the northwest side of the

buildings. These trenches may contain several cracks that act as conduits. All heating and air handling equipment is in a state of disrepair and assumed inoperable. The buildings are poorly sealed due to broken windows, doors left ajar and holes observed in the sheet metal outer covering of the building. According to drilling logs from the site, silty sand and gravelly sands are the predominant lithology encountered. Groundwater monitoring wells are currently present in Building 785 and outside in the vicinity of both buildings.

2.2.1 Groundwater Investigation

An extensive groundwater investigation has occurred surrounding Buildings 785 and 786, which is now in the performance monitoring phase. There are three primary contaminants in the plumes that exceed NYSDEC Class GA Groundwater Standards: TCE and its breakdown products cis-1,2-dichloroethylene (DCE) and vinyl chloride (VC). The southern plume is commingled with several petroleum fuel plumes originating from Apron 2 fueling system. At locations where chlorinated solvents and fuel contaminants are commingled, significant reductive dechlorination is occurring; therefore the selected remedy is monitored natural attenuation, as stated in the On-base Groundwater ROD (AFRPA, December 2008). The SVI in Buildings 785 and 786 is being managed as a separate operable unit and therefore is not included in the On-base Groundwater ROD. Monitored natural attenuation was initiated on September 24, 2008. The most recent groundwater sampling results have shown TCE detections up to 34.8 µg/L at monitoring well 782VMW-105B, cis-1-2-DCE detections up to 43.4 µg/L at monitoring well 782VMW-78 and VC detections up to 39.5 µg/L at monitoring well 782VMW-84 (FPM, December 2011).

2.2.2 2006 Soil Vapor Intrusion Evaluation

EEEPC performed an SVI Evaluation in 2006 at the Apron 2 Chlorinated Plume Site. Buildings 782, 783, 784, 785, and 786 were evaluated. No detection exceeding screening levels was reported for Buildings 782, 783, and 784. The Nosedocks 1 and 2 ROD (AFRPA, July 2011) included the selected remedy of No Further SVI action or evaluation for these buildings. Sub-slab sampling at the Apron 2 Chlorinated Plume Site indicated that PCE, TCE and chloroform were present in the sub-slab vapor beneath Buildings 785 and 786 at concentrations above the AF screening levels. Indoor air sampling indicated that PCE and TCE were present, but at concentrations below the AF screening levels. No chloroform was reported in the indoor air. TCE was detected consistently in groundwater samples from wells within the groundwater contamination plume. PCE was never detected in groundwater. Chloroform exceedances of the NYSDEC Class GA Groundwater Standards were reported in the March 2009 sampling round in virtually all monitoring wells at Building 786. These exceedances were attributed to a reported water line break which discharged drinking water for a significant time at the site. The chloroform exceedances have shown a decreasing trend after the leak was repaired. SVI evaluation sample locations are shown on Figure 2-2 and corresponding results are provided in Table 1, SVI Results Table.

2.2.3 Building 785 Soil Vapor Intrusion Results 2008

Sub-slab sampling in 2006 and 2008 at the Apron 2 Chlorinated Plume Site indicated that chloroform and TCE were present in the sub-slab vapor beneath Building 785 at concentrations above the screening levels. Indoor air sampling indicated that these contaminants were present, but at concentrations below the screening levels.

Sub-slab vapor sampling results for the 2006 sampling event showed exceedances for TCE of 11,000 $\mu g/m^3$ at 785SSV-1. The April 2008 sampling round data were lower at this location (identical to two orders of magnitude lower) than those reported for the 2006 sampling round data. TCE exceedances of the sub-slab vapor screening levels were reported for sub-slab vapor locations 785SSV-2 and -6 at 430 and 2,200 $\mu g/m^3$, respectively.

2.2.4 Building 786 Soil Vapor Intrusion Results 2008

Sub-slab sampling in 2006 and 2008 at the Apron 2 Chlorinated Plume Site indicated that PCE, and TCE were present in the sub-slab vapor beneath Building 786 at concentrations above the screening levels; indoor air sampling indicated that these contaminants were present, but at concentrations below the screening levels.

TCE was detected beneath Building 786 at concentrations ranging from 4,700 to 81,000 $\mu g/m^3$ in 2006 and PCE was detected at 2,200 $\mu g/m^3$at location 786SSV-1. Sub-slab vapor sampling results for the April 2008 sampling round were lower but within the same order of magnitude as those reported for the 2006 sampling round. Only TCE exceeded the sub-slab vapor screening levels at sampling locations 1, 2, 5, and 6 locations for the 2008 sampling ranging from 1,500 to 19,000 $\mu g/m^3$. Generally, small petroleum detections were reported in all samples, but none exceeded the sub-slab screening levels.

This page is intentionally left blank.

3 INSTALLATION OF SSVM SYSTEMS

3.1 Buildings 774 and 776 System

The Buildings 774 and 776 system is composed of four horizontal wells with a total combined screen length of 360 ft performing at a flow rate of 1 actual cubic feet per minute (acfm) per foot of screen. Building 774 has three horizontal wells with a total combined screen length of 180 ft and Building 776 has one horizontal well with a screen length of 180 ft. This system is illustrated on Figure 3-1.

3.1.1 Horizontal Wells

Initially, for this SSVM design, three horizontal wells were installed. During installation of these horizontal wells, rod number (15 ft increments), depth and pitch were recorded to track the spatial location of the borehole. The tracker used was a DitchWitch® 752, which operates electronically with a beacon placed in the rod head of the downhole tooling. The tracker operator followed the borehole path and communicated with the drill rig operator to confirm correct spatial location. The tracker operator positioned himself directly above the beacon based on signal strength. The borehole path location was marked on the floor at the end of each rod for visual confirmation. Adjustments made by the drill rig operator to the downhole tooling included varying pitch and direction.

The two horizontal wells in Building 774 (774SSVM-1 and -2) were constructed of a 80 ft screen at a depth of 6 ft and 8 ft bgs, respectively, of 0.010-slot size, 4-inch diameter Schedule 80 poly vinyl chloride (PVC). The wells were installed March 14 through April 14, 2011, using a horizontal directional drilling pull method.

During the installation of 774SSVM-2, horizontal drilling mud was pushed through small cracks in the foundation of Building 774, where a former garage door had been removed and rebuilt as a structural wall. Pressurized drilling mud appeared to have followed a preferential pathway pushing vertically into the southern wall of Building 774, then quickly spilling into the room above the horizontal boring. Once building tenants were alerted to the presence of drilling mud, drilling was stopped immediately. Following identification of the drilling mud, cleanup began including removal of the drywall interior and cleanup of all drilling fluid within the room. Following cleanup, the room was restored to previous conditions including new drywall and painting. Also the cracks in the foundation were sealed using self-leveling polyurethane construction sealant. Additionally, during the installation of horizontal well 774SSVM-2, several drilling attempts were executed to navigate a straight borehole path. Additional attempts may have flooded the adjacent unused borings with large amounts of drilling mud. This loss of drilling mud to the formation may have negatively affected porosity. Both of these events influenced significant vacuum loss and underperformance of the horizontal well.

An additional horizontal well (774SSVM-3) was installed using a pneumatic bullet on October 14, 2011 to compensate for underperformance of 774SSVM-2, which was observed and documented in Section 4 – Evaluation of Performance. 774SSVM-3 was constructed of a 20 ft screen at a depth of 6 ft bgs, of 0.010-slot size, 2-inch diameter Schedule 40 PVC. 774SSVM-3 has an individual well valve that is installed offset with a tee fitting from 774SSVM-2. This smaller well (774SSVM-3) operates together with the larger well (774SSVM-2) to achieve maximum influence in the southwestern corner of Building 774 where insufficient well flow and sub-surface response had minimized system effectiveness.

The horizontal well in Building 776 (776SSVM-1) was constructed of a 180 ft screen at a depth of 7 ft bgs, of 0.010-slot size, 4-inch diameter Schedule 80 PVC. The well was installed March 14 through April 14, 2011, using directional drilling pull method. Figure 3-2, 3-3 and 3-4 show a cross sectional view of the borehole path of horizontal wells 774SSVM-1, -2 and 776SSVM-1, respectively. Figure 3-5 shows a presumed cross sectional view of 774SSVM-3.

Once installation was completed the wells were developed (except 774SSVM-3 which was a pneumatic installation) using high pressure water and a cleaning solution as described in the SSVM Design WP (FPM, February 2011). The volume of solution each well received was a mixture of 1,000 gallons of flush water and Bentonite Mud Remover. Approximately 2,400 gallons of development water was surface discharged at the site. Returned development water was surface discharged at the site location based on prior development water sampling results acquired at Buildings 785 and 786 which showed all chlorinated solvents below reporting limits. Prior sampling results reported all chlorinated solvents below reporting limit. Therefore approximately 2,400 gallons of development water was surfaced discharged. A photo log to document installation is located in Appendix A.

3.1.2 Blower and Accessories

The horizontal extraction wells (774SSVM-1, -2, -3 and 776SSVM-1) were connected in line with a regenerative blower, including all blower components. The blower model is capable of achieving a maximum flow rate of 600 standard cubic feet per minute (scfm) and a maximum vacuum of 106 inches of water gauge (in w.g.). Blower components included control panel, vacuum relief valve, air dilution valve with filter, vacuum and temperature gauges, flow meter, in line filter, muffler, and 50 gallon moisture knockout tank. The blower and accessories were built by Schrader Environmental Services, Inc. Additionally, FPM installed a heat exchanger in line with the blower system in order to cool the air below 100 degrees Fahrenheit (maximum optimal temperature for carbon adsorption). A schematic of the blower system is included as Figure 3-6.

3.1.3 Vapor Monitoring Points

The sub-slab VMPs were installed as described in the SSVM Design WP (FPM, February 2011), where they were strategically placed to monitor effective ROI and vapor transport and mitigation. In Building 774, three sub-slab VMPs were installed, 774VMP-1, -2, and -3 which contain one interval less than a foot beneath the sub-slab. 774VMP-1 is located 30 ft off axis of horizontal well 774SSVM-2 and approximately 25 ft off axis of horizontal well 774SSVM-3, at the beginning of the well screen. 774VMP-2 is located in-between horizontal well 774SSVM-1 and -2, at approximately 15 ft off axis, in the middle of the well screen. 774VMP-3 is located 45 ft off axis of horizontal well 774SSVM-1, at the end of the well screen. Building 776 also has three sub-slab VMPs, 776VMP-1, -2 and -3. These VMPs are located 30 ft off axis at the end of the well screen, 35 ft off axis in the middle of the well screen, and 45 ft off axis at the beginning of the well screen, respectively.

3.1.4 Vapor Treatment

The regenerative blower was connected in line with a vapor-after-treatment system consisting of 140 pounds of GAC containerized in an air purification canister. The GAC was used to remove chlorinated solvents in the vapor phase. The calculated life span of 140 pounds of GAC was 2,208 days as referenced in the SSVM Design WP (FPM, February 2011). This calculation was based on the flow rate of the SSVM system, the adsorption capacity of the GAC and the combined chlorinated solvent concentrations from the most contaminated locations in Buildings 774 and 776 during the April 2008 sampling round.

3.1.5 Site Restoration

Buildings 774 and 776 are office buildings located in the portion of the former Griffiss AFB which is now a technology park. Therefore adequate site restoration was required including backfill, grading and seeding of all disturbed areas, construction of a fence surrounding the blower housing, paving of destroyed asphalt parking areas and installation of manholes to cover the ends of the horizontal wells. Photo number 22 in Appendix A, photo log, illustrates the site after restoration.

3.2 Buildings 785 and 786 System

The Buildings 785 and 786 system is composed of two horizontal wells with a total combined screen length of 300 ft performing under a flow rate of 1 acfm per foot of screen. Building 785 has one horizontal well with a screen length of 140 ft and Building 786 has one horizontal well with a screen length of 160 ft. This system is illustrated on Figure 3-7.

3.2.1 Horizontal Wells

For this SSVM design, two horizontal wells were installed. The horizontal well in Building 786 (786SSVM-1) was constructed of a 160 ft screen at a depth of 10 ft bgs, of 0.010-slot size, 3-inch diameter Schedule 40 PVC. The well was installed November 15 through November 23, 2010, using directional drilling pull method. Horizontal well 786SSVM-1 was installed as part of the pilot study and was also discussed in the Pilot Study Report (FPM, May 2011), located in Appendix G. The horizontal well in Building 785 (785SSVM-1) was constructed of a 140 ft screen at a depth of 8 ft bgs, of 0.010-slot size, 3-inch diameter Schedule 40 PVC. The well was installed February 15 through 28, 2011, using directional drilling pull method.

During installation of both horizontal wells, rod number (15 ft increments), depth and pitch were recorded to track the spatial location of the borehole. The tracker used was a DitchWitch® 752, which operates electronically with a beacon placed in the rod head of the downhole tooling. The tracker operator followed the borehole path and communicated with the drill rig operator to confirm correct spatial location. The tracker operator positioned himself directly above the beacon based on signal strength. The borehole path location was marked on the floor at the end of each rod for visual confirmation. Adjustments made by the drill rig operator to the downhole tooling included varying pitch and direction. Figure 3-8 and 3-9 shows a cross sectional view of the borehole path of horizontal well 786SSVM-1 and 785SSVM-1, respectively.

Once installation was completed the wells were developed using high pressure water and a cleaning solution as described in the SSVM Design WP (FPM, February 2011). The returned development water was sampled for full list volatile organic compounds (VOCs). The result data attached in Appendix B shows all chlorinated solvent results below the reporting limit. Therefore, Rome Water Pollution Control Facility (RWPCF) was contacted to receive approval for discharge into the sanitary sewer system. The discharge event for 786SSVM-1 occurred over the course of 4 days (December 16, 17, 20, and 21, 2010) totaling 3,500 gallons of development water. The first discharge event for 785SSVM-1 occurred on February 23, 2011 totaling 300 gallons of development water. The second discharge event occurred on March 30, 2011 totaling 500 gallons of development water. The second discharge event occurred when horizontal well 785SSVM-1 was redeveloped. This well was under performing during the initial start-up. The underperformance is discussed below in Section 4 – Evaluation of Performance. A photo log to document installation is located in Appendix A.

3.2.2 Blower and Accessories

The horizontal extraction wells (785SSVM-1 and 786SSVM-1) were connected in line with a regenerative blower, including all blower components. The blower model is capable of achieving a maximum flow rate of 420 scfm and a maximum vacuum of 110 in w.g. Blower components included control panel, vacuum relief valve, air dilution valve with filter, vacuum and temperature gauges, flow meter, in line filter, muffler, and 60 gallon moisture knockout tank.

The blower and accessories were built by Air Energy, Incorporated. Additionally, FPM installed a heat exchanger in line with the blower system in order to cool the air below 100 degrees Fahrenheit (maximum optimal temperature for carbon adsorption). A schematic of the blower system is shown in Figure 3-10.

3.2.3 Vapor Monitoring Points

The VMPs for Building 786, installed during the pilot study and documented in the Pilot Study Report (FPM, May 2011) located in Appendix G, were strategically placed on January 13 through 14, 2011, to assist the ROI test, where 786VMP-1, -2 and -3 were respectively 15 ft, 30 ft and 45 ft off the 786SSVM-1 well axis with design placement considering the middle of the well screen, beginning of the well screen and end of the well screen, respectively. The VMPs contain three intervals of depth, a shallow (2 to 2.5 ft bgs), a medium (5 to 5.5 ft bgs) and a deep (10 to 10.5 ft bgs).

Building 785 utilized one existing VMP installed during the pilot study, 785VMP-2. This VMP is located 15 ft off axis at the beginning of the well screen. The VMP contains three intervals of depth, a shallow (2 to 2.5 ft bgs), a medium (5 to 5.5 ft bgs) and a deep (10 to 10.5 ft bgs). Two additional sub-slab VMPs were installed to assist the full scale SSVM design. 785VMP-4 and 785VMP-5 were installed 30 ft and 60 ft off axis, in the middle and the end of the well screen, respectively. The sub-slab VMPs contains one interval less than 1 foot beneath the sub-slab.

785VMP-5 was originally installed south of horizontal well 785SSVM-1. During baseline sampling in Building 785, retaining water was observed at this location. Sub-slab VMP installation utilized a 4-inch diameter concrete core saw to advance an open hole, where water was used as lubrication for the cutting. This water most likely retained in the hole and therefore the sampling location was undermined. A new location was installed north of the horizontal well. A baseline sample was not collected at 785VMP-5, and the original location was never sampled.

3.2.4 Vapor Treatment

The regenerative blower was connected in line with a vapor-after-treatment system comprising of two air purification canisters each containing 140 pounds of GAC. The GAC was used to remove chlorinated solvents in the vapor phase. The calculated life span of 280 pounds of GAC was 162 days as referenced in the SSVM Design WP (FPM, February 2011). This calculation was based on the flow rate of the SSVM system, the adsorption capacity of the GAC and the chlorinated solvent concentration from the influent sample collected on January 21, 2011 during the pilot study at Building 786 (FPM, May 2011).

This page is intentionally left blank.

4 PERFORMANCE EVALUATION

The SSVM design focused on the soil vapor pathway of chlorinated solvent contamination in the vicinity of Buildings 774, 776, 785 and 786 associated with the Building 775 Site (SD-52-02) and the Apron 2 Chlorinated Plume Site (SD-52-01). This section of the report evaluates the performance criteria used to meet the objectives of the SSVM design. The overall performance-based objective is to provide effective SSVM to eliminate potential harm to human health and the environment due to chlorinated solvent vapors.

4.1 Buildings 774 and 776 System

4.1.1 Stepped Rate Test

The stepped rate test was performed on June 3, 2011 and the field forms are attached in Appendix C. The stepped rate test was performed in accordance with procedures specified in the USACE, Engineering Manual 1110-1-4001 (USACE, June 2002). This test is performed to determine the relationship between applied vacuum and the resulting flow rate from an extraction well. This data assists in the design and performance of blower selection to establish the vacuum level needed to achieve subsurface flow.

The results from the stepped rate test are shown in the graph, Figure 4-1. The graph depicts the three horizontal wells' vacuum versus flow rate, where all three horizontal wells were tested simultaneously with fully opened valves. 774SSVM-1 minimum flow rate was 99 acfm with a vacuum of 11 in w.g. The minimum flow rate was obtainable when the air dilution valve was fully opened. The valve was then closed with 1/6 turn revolutions each step with a total of 1 complete turn. When the valve was fully closed the air flow rate directly from subsurface flow was the maximum achievable at 156.5 acfm, with a vacuum of 17 in w.g. 774SSVM-2 minimum and maximum flow rate was 0 acfm, with a minimum vacuum of 12 in w.g. and a maximum vacuum of 18 in w.g. 774SSVM-2 did not have an observed flow rate within the well. 776SSVM-1 minimum flow rate was 141.3 acfm with a minimum vacuum of 10 in w.g. The maximum flow rate was 210 acfm with a maximum vacuum of 16 in w.g.

Figure 4-2 depicts the specific capacity of 774SSVM-1, -2 and 776SSVM-1. The specific capacity evaluates well efficiencies at various vacuum/flow conditions. The flow rate was divided by the wellhead vacuum. The downward slope of the curve illustrated on Figure 4-2 depicts the frictional loss in the screen due to vapor velocity. The frictional loss is expected to become greater as vacuum increases.

Due to horizontal well 774SSVM-2 observed underperformance, additional development procedures were initiated. The first development procedure was to run 774SSVM-2 horizontal well alone. During this operation, the blower system removed over 16 gallons of development water through extraction. Eventually, the maximum vacuum of the blower system was unable to

remove additional development water. Development water in the horizontal well (observed through gurgling noise) was monitored to identify when normal system operation was achieved. Next, a vacuum truck was employed on two separate occasions in efforts to achieve a higher vacuum than what was capable of the blower system. The vacuum truck connected in line with a 2 inch diameter hose to the 4 inch diameter horizontal well with a maximum vacuum of 245 in w.g., which was unable to vacuum additional development water. As a result, an additional horizontal well 774SSVM-3 was installed, which is discussed in Section 3.1.1 – Horizontal Wells.

The stepped rate test was then re-performed with the additional horizontal well 774SSVM-3 on November 11, 2011. The results of the test are shown in the graph, Figure 4-1, which is coupled with the previous results from June 3, 2011, and field forms are located in Appendix C. The graph depicts the four horizontal wells' vacuum versus flow rate, where all four horizontal wells were tested simultaneously with fully opened valves. 774SSVM-1 minimum flow rate was 98.8 acfm with a vacuum of 17 in w.g., and the maximum flow rate was 182.8 acfm, with a vacuum of 28 in w.g. 774SSVM-2, and -3 minimum combined flow rate was 31.2 acfm, with a minimum vacuum of 12 in w.g. and a maximum combined flow rate of 69.2 acfm with a vacuum of 22 in w.g. 776SSVM-1 minimum flow rate was 120.8 acfm with a minimum vacuum of 19 in w.g., and the maximum flow rate was 188.5 acfm with a maximum vacuum of 31 in w.g. The results of the re-performed stepped rate test show an increase in vacuum for all wells, and an increase in flow rate for 774SSVM-1, as well as an increase in flow rate for 774SSVM-2 combined with the new horizontal well, 774SSVM-3. Horizontal well 776SSVM-1 showed a decrease in flow rate, likely attributed to a balanced total flow rate of the system. Figure 4-2 depicts the re-performed stepped rate test specific capacity of 774SSVM-1, -2, -3 and 776SSVM-1.

4.1.2 Vacuum Radius of Influence Test

The vacuum ROI test consisted of field measurements at varying locations throughout the buildings' sub-slab to determine the outer boundaries where sufficient vacuum could be observed. A typical guidance value used for determining sufficient vacuum is 0.1 in w.g, where this amount of vacuum will enhance volatilization and extraction of the contaminants in the soil. This guidance value is referenced in the USACE Engineering Manual 1110-1-4001 (USACE, June 2002).

The ROI test was performed on 774SSVM-1, -2 and 776SSVM-1 on June 6, 2011, and field forms are located in Appendix C. The ROI test was performed as a constant rate test. The constant rate was measured at each well head and recorded. Pre-determined constant rates (1 acfm per foot of well screen) were achieved by balancing valves (774SSVM-2 was completely opened due to underperformance, while the other two horizontal well valves were slightly closed). 774SSVM-1 had a flow rate of 97 acfm and a vacuum of 35 in w.g. 774SSVM-2 had a flow rate of 97 acfm and a vacuum of 34 in w.g. 776SSVM-1 had a flow rate of 168 acfm and a vacuum of 35 in w.g. The sub-slab VMPs were used as vacuum measurement points, where a

Magnehelic® gauge was used for vacuum readings. For each test the vacuum was measured incrementally with time. Figure 4-3 (Building 774) and Figure 4-4 (Building 776) depict the results from the ROI test.

ROI test in Building 774 does not show sufficient vacuum at 774VMP-1 and -3 (Figure 4-3). 774VMP-1 is located next to the underperforming well 774SSVM-2. After the additional well was installed (774SSVM-3) vacuum measurement were observed in 774VMP-1 at 0.2 in w.g., which is a sufficient vacuum. For 774VMP-3, it has been determined that vacuum measurements are insufficient at this point because it is the worst case scenario installed at the end of the 774SSVM-1 well screen with the greatest distant off axis. This point was reinstalled to ensure it was working properly. When the point was reinstalled, it was drilled 6 inches deeper. A vacuum measurement was recorded once the new point was completed at 0.05 in w.g. This measurement is half the recommended sufficient vacuum.

ROI test in Building 776 does not show sufficient vacuum at 776VMP-2 (Figure 4-4). This point is 35 ft off the middle of the well axis, and is not the worst case scenario. Therefore it is assumed that the structural foundation and/or preferential paths are restricting vacuum in this location.

4.1.3 Vapor Monitoring Point Sub-Slab Sampling

The SSVM Design WP (FPM, February 2011) specifies a set of sampling events to evaluate SSVM, which consist of a baseline event and quarterly monitoring. All results are located in Table 2, SSVM Performance Monitoring Results Table. A baseline sample was collected prior to system start-up at each newly installed VMP location. This baseline sample provides comparison data to the sampling events. The baseline sampling event was on May 4, 2011 with results of TCE above the sub-slab vapor screening level at 774VMP-1, -2, and 776VMP-3 (580 µg/m^3, 2,900 µg/m^3, and 830 µg/m^3, respectively). 774VMP-3, 776VMP-1 and -2 had results for TCE below sub-slab vapor screening levels (300 µg/m^3, 21 µg/m^3, and 360 µg/m^3).

In addition to sub-slab sampling, indoor and outdoor air quality samples were also collected. The indoor air results in Building 774 for TCE was 4.4 µg/m^3, and the indoor air results in Building 776 for TCE was 3.6 µg/m^3, where both results are below screening levels. One outdoor air sampled was collected between the two buildings where the result for TCE was 0.98 µg/m^3.

The 774SSVM-1, -2 and 776SSVM-1 extraction wells began consistent operation on June 6, 2011 following the ROI test. The system operated for three months and was turned off for sampling evaluation. The sampling event occurred on August 24, 2011 in Building 774 and on September 6, 2011 in Building 776. The results indicated a decreasing trend where the only VMP above screening level was 774VMP-1 for TCE at 410 µg/m^3. This VMP is located next to the underperforming well 774SSVM-2. The remaining VMPs were below screening levels,

774VMP-2 and -3 TCE concentrations were at 84 µg/m^3, and 11 µg/m^3, respectively, and 776VMP-1, -2 and -3 TCE concentrations were at 38 µg/m^3, 3.8 µg/m^3, and 10 µg/m^3, respectively.

Indoor and outdoor air quality sampling was also conducted on September 6, 2011. Building 774 was below TCE screening levels at 2.3 µg/m^3, and Building 776 was below TCE screening levels at 1.9 µg/m^3. The outdoor air quality sample collected between the two buildings had detection for TCE at 2.6 µg/m^3.

The system was shut down again after five months of operation and a sampling event took place on October 21, 2011 to evaluate the performance of the newly installed horizontal well (774SSVM-3), which had been in operation for one week, and to evaluate overall vapor mitigation at the site. This event resulted in all VMPs below screening levels. 774VMP-1, -2 and -3 had TCE concentrations at 3.7 µg/m^3, 11 µg/m^3, and 3.0 µg/m^3, respectively. 776VMP-1, -2, and -3 had TCE concentrations at non-detected, 3.7 µg/m^3, and 7.3 µg/m^3, respectively.

Indoor and outdoor air quality sampling was also conducted on October 21, 2011. Building 774 was below TCE screening levels at 0.87 µg/m^3, and Building 776 was below TCE screening levels at 0.98 µg/m^3. The outdoor air quality sample collected between the two buildings had detection for TCE at 0.60 F µg/m^3.

Figure 4-5 illustrates a decreasing trend from sub-slab sampling results. All sampling events were documented on soil gas sampling field forms and recorded on a Chain of Custody (COC) for tracking. The field forms are located in Appendix C, the raw lab data is located in Appendix D, and the validated data is located in Appendix E.

4.1.4 Vapor Treatment Sampling

The effectiveness of the horizontal extraction wells at removing soil gas vapors from the sub-surface and the ability to treat the soil gas vapors with GAC is evaluated based on influent and effluent sampling. An influent sample was collected during the initial startup of 774SSVM-1, -2 and 776SSVM-1 extraction wells, on June 6, 2011, where the sample was grabbed before GAC treatment. The influent resulted in a TCE concentration of 510 µg/m^3. An effluent sample was collected on the same date, where the sample was grabbed after GAC treatment. The analytical results indicated TCE detection at 47 µg/m^3. For the three month sampling event an influent and effluent sample were collected. The influent TCE concentration was 240 µg/m^3, and the effluent sampling concentration was 250 µg/m^3. Following this sampling event the GAC was replaced for continued vapor treatment.

Initially, the life span of 140 pounds of GAC was calculated as 2,208 days as referenced in the SSVM Design WP (FPM, February 2011). This calculation has proven to be inaccurate possibly based on varying influent concentrations and temperatures which effect adsorption rates.

Therefore as discussed in Section 4.3.1 – Operation and Maintenance, the GAC will be changed on a more frequent basis of every two months.

For disposal operations, the spent GAC is emptied into a 55-gallon drum from the air purification canister. The air purification canister is then filled with activated GAC. The 55-gallon drum containing the spent GAC is then stored for shipment to an approved GAC reactivation facility. Prior to shipment to the GAC reactivation facility, one composite sample of the spent GAC is collected and analyzed for total VOCs, toxicity characteristic leaching procedure (TCLP) VOCs, and ignitability of solids. Once the GAC reactivation facility approves the GAC sample results, the GAC is shipped to be reactivated by thermal reactivation. The documentation for GAC disposal is located in Appendix F, Operation and Maintenance Field Forms and Manuals.

After the installment of horizontal well 774SSVM-3, two influent samples were collected on October 14, 2011 to evaluate vapor extraction of the newly installed well. The first sample collected was without 774SSVM-3 influence (valve closed) and the second sample collected was with 774SSVM-3 influence. Detected TCE concentrations were 670 µg/m^3, and 1,200 µg/m^3, respectively. Sampling was also performed to see if the method used for horizontal well installment (pneumatic bullet with oil for lubrication) had any effect on vapor concentrations. Vapor concentrations which were higher than the previous sampling rounds included acetone (300 µg/m^3, and 440 µg/m^3, respectively), methyl ethyl ketone from PVC cement (300 µg/m^3, and 400 µg/m^3, respectively) and tetrahydrofuran from PVC cement (600 µg/m^3, and 770 µg/m^3, respectively).

After five months of system operation, sampling occurred on October 25, 2011. The influent sample TCE concentration was 650 µg/m^3, and the effluent sample TCE concentration was non-detect, showing adequate GAC treatment. Overall, the TCE influent concentration has remained stable through the initial, three month and five month sampling events, where Figure 4-6 illustrates this trend.

All sampling events were documented on soil gas sampling field forms and recorded on a COC for tracking. The field forms are located in Appendix C, the raw lab dated is located in Appendix D, and the validated data is located in Appendix E.

4.1.5 Long-Term Operation

As part of the SSVM System Operation and Maintenance as defined in the SSVM Design WP (FPM, February 2011), well head vacuum and flow rate readings were collected and recorded to illustrate that normal operating conditions were established within the SSVM system design criteria. The well head vacuum and flow rate has been plotted versus time and can be viewed in Figure 4-7 and Figure 4-8. In Figure 4-7, over time vacuum for all three horizontal wells show a slightly decreasing trend. In Figure 4-8, over time flow rate for all three horizontal wells varies, especially in horizontal well 774SSVM-2, where flow rate was observed at 0 acfm on June 14

and 21, 2011. Efforts to increase the flow rate in 774SSVM-2 included adjusting the individual well valves (774SSVM-2 fully opened while 774SSVM-1 and 776SSVM-2 were partially closed), running 774SSVM-2 alone, redevelopment of the well utilizing a vacuum truck and lastly installing horizontal well 774SSVM-3. The last measurement was recorded on October 17, 2011 including the newly installed horizontal well 774SSVM-3, which is incorporated with 774SSVM-2 measurement. The last measurement shows and overall decrease in vacuum and increase in flow rate which is likely attributed to the newly installed well.

4.2 Buildings 785 and 786 System

4.2.1 Stepped Rate Test

The stepped rate test was performed on May 18, 2011, and the field form is attached in Appendix C. The results from the stepped rate test are shown in Figure 4-9. The figure depicts the minimum flow rate of 785SSVM-1 at 80.4 acfm with a vacuum of 24 inch w.g. and the minimum flow rate of 786SSVM-1 at 80.9 acfm with a vacuum of 22 in w.g. This minimum flow rate was obtained when the air dilution valve on the SSVM system was completely opened. The valve was then closed with 1/2 turn revolutions each step with a total of 7 complete turns. When the valve was fully closed the air flow rate was the maximum achievable for 785SSVM-1 at 111.2 acfm with a vacuum of 43 in w.g. and for 786SSVM-1 at 124.6 acfm with a vacuum of 41 in w.g. Figure 4-10 depicts the specific capacity of 785SSVM-1 and 786SSVM-1. The downward slope of the curve is due to the frictional loss in the screen due to vapor velocity.

4.2.2 Vacuum Radius of Influence Test

The ROI test was performed on 785SSVM-1 and 786SSVM-1 initially on March 24, 2011 and then again May 19, 2011. The initial ROI test determined that horizontal well 785SSVM-1 was underperforming because the influence of the vacuum did not cover the entire sub-slab. This horizontal well was redeveloped on March 29 and 30, 2011.

The initial ROI test was performed as a constant rate test. The constant rate measured at the 785SSVM-1 well head was a flow rate of 93.5 acfm and a vacuum of 52 in w.g., and the constant rate measured at 786SSVM-1 was a flow rate of 135.0 acfm and a vacuum of 49 in w.g. The second ROI test was performed as a constant rate test. The constant rate measured at the 785SSVM-1 well head was a flow rate of 111.5 acfm and a vacuum of 40 in w.g. and the constant rate measured at 786SSVM-1 was a flow rate of 124.5 acfm and a vacuum of 42 in w.g. After the redevelopment of 785SSVM-1, vacuum decreased and the flow rate increased. The VMPs were used as vacuum measurement points, and a Magnehelic® gauge was used for vacuum readings. For each test the vacuum was measured incrementally with time. The figures, Figure 4-11 (Building 785) and Figure 4-12 (Building 786) depict the results from the ROI test.

Figure 4-11 shows the initial ROI test and the second ROI test grouped together for Building 785. The initial ROI test on Building 785 shows a vacuum at 785VMP-5 below the sufficient vacuum of 0.1 in w.g. This VMP is the worst case scenario installed at the end of the well screen off axis by 60 ft. The second ROI test shows a sufficient vacuum at all VMPs in Building 785.

Figure 4-12 depicts the ROI test performed for Building 786, where the initial ROI test and the second ROI test are grouped together. 786VMP-1 and -3 show sufficient vacuum for both tests. 786VMP-2, located at the beginning of the well screen, 30 ft off axis, did not show sufficient vacuum (0.05 in w.g.). This point also did not show sufficient vacuum during the pilot study as reported in the Pilot Study Report (FPM, May 2011), located in Appendix G. An additional point was installed next to 786VMP-2 using the method described for sub-slab VMPs in the SSVM Design WP (FPM, February 2011). The additional point did not show a sufficient vacuum measurement, therefore it has been determined that this portion of Building 786 sub-slab is not seeing sufficient vacuum influence due to structural constraints and/or preferential pathways.

It is believed that an appreciable amount of indoor air is being pulled into the subsurface via large cracks and possible unidentified conduits in the hangar floors of Building 785 and 786. These buildings are selected for refurbishment by the county and are expected to have the building floors completely refinished and sealed as part of the building restoration.

4.2.3 Vapor Monitoring Point Sub-Slab Sampling

The SSVM Design WP (FPM, February 2011) specifies a set of sampling events to evaluate SSVM, which consist of a baseline event and quarterly monitoring. All results are located in Table 2, SSVM Performance Monitoring Results Table. A baseline sample was collected prior to system start-up at each newly installed VMP location. This baseline sample provides comparison data to the sampling events. The baseline sampling event in Building 785 was on March 18, 2011 and the baseline sampling event in Building 786 was on January 18, 2011 (part of the pilot study). In Building 785 there was a TCE exceedance in 785VMP-4 at 720 $\mu g/m^3$. 785VMP-5 was not sampled due to water observed in the point. In Building 786 there were TCE exceedances in 786VMP-1, -2 and -3 at 4,900 $\mu g/m^3$, 740 $\mu g/m^3$, and 2,200 $\mu g/m^3$, respectively. There was also a PCE exceedance in 786VMP-1 at 140 $\mu g/m^3$, and chloroform exccedances in 786VMP-2 and -3, at 620 $\mu g/m^3$, and 47 $\mu g/m^3$, respectively.

The 785SSVM-1 and 786SSVM-1 began consistent operation on May 19, 2011. After three months of the SSVM system operating, the system was shut off and the second sampling event occurred on August 24 and 25, 2011. The only TCE exceedance observed in both buildings was at 785VMP-5 (610 $\mu g/m^3$). All other points show a decreasing TCE trend and were below screening levels. The only other exceedance was observed in 786VMP-2 for chloroform at 100 $\mu g/m^3$.

Indoor and outdoor air quality sampling was also conducted on August 24, 2011. Building 785 was below TCE screening levels at 1.1 µg/m^3, and Building 786 was below TCE screening levels at 2.5 µg/m^3. The outdoor air quality sampled collected between the two buildings TCE detection was at 0.82 µg/m^3.

The system was shut down again after five months of operation and a sampling event took place on October 24, 2011 where results showed all VMPs below TCE sub-slab screening levels. 785VMP-2, -4, and -5 TCE concentrations were 8.9 µg/m^3, 33 µg/m^3, and 140 µg/m^3, respectively. 786VMP-1, -2 and -3 TCE concentrations were 49 µg/m^3, 140 µg/m^3, and 23 µg/m^3, respectively. The only exceedance for all VMPs was located in 786VMP-2 for chloroform at 72 µg/m^3.

Indoor and outdoor air quality sampling was also conducted on October 24, 2011. TCE was not detected at either Building 785 or Building 786. The outdoor air quality sampled collected between the two buildings had a TCE detection at 0.82 µg/m^3.

Figure 4-13 shows a decreasing trend from sub-slab sampling results. All sampling events were documented on soil gas sampling field forms and recorded on a COC for tracking. The field forms are located in Appendix C, the raw lab data is located in Appendix D, and the validated data is located in Appendix E.

4.2.4 Vapor Treatment Sampling

An influent sample was collected during the initial startup of 785SSVM-1 and 786SSVM-2 extraction wells, on May 19, 2011, where the sample was grabbed before GAC treatment. The influent resulted in a TCE concentration of 3,500 µg/m^3. An effluent sample was collected on the same date, where the sample was grabbed after GAC treatment. The analytical results indicated TCE detection at 1.3 µg/m^3. For the three month sampling event an influent and effluent sample were collected. The influent TCE concentration was 520 µg/m^3, and the effluent sampling concentration was 570 µg/m^3. Following this sampling event the GAC was replaced for vapor treatment.

Initially, the two GAC drum life spans were calculated as 162 days, as referenced in the SSVM Design WP (FPM, February 2011). This calculation has proven to be inaccurate possibly based on varying influent concentrations and temperatures which effect adsorption rates. Therefore as discussed in Section 4.3.1 – Operation and Maintenance, the GAC drum will be changed on a more frequent basis of every two months.

After five months of system operation, sampling occurred on October 25, 2011 where TCE influent concentration was 740 µg/m^3, and the effluent TCE concentration was 0.66 F µg/m^3, showing adequate treatment with GAC. Overall the influent TCE concentration has shown a

decreasing trend from the initial to the three month sampling event, and then a stable trend from the three month to the five month sampling event, which is depicted in Figure 4-14.

All sampling events were documented on soil gas sampling field forms and recorded on a COC for tracking. The field forms are located in Appendix C, the raw lab dated is located in Appendix D, and the validated data is located in Appendix E.

4.2.5 Long-Term Operation

As part of the SSVM System Operation and Maintenance as defined in the SSVM Design WP (FPM, February 2011), well head vacuum and flow rate readings were collected and recorded to illustrate that normal operating conditions were established within the SSVM system design criteria. The well head vacuum and flow rate has been plotted versus time and can be viewed in Figure 4-15 and Figure 4-16. In Figure 4-15, vacuum for the two horizontal wells show a stable trend over time. In Figure 4-16, flow rate for the two horizontal wells show a stable trend over time.

4.3 Conclusion and Recommendations

The effectiveness of the SSVM Systems Completion has been evaluated based on the design performance, ability to depressurize building slabs, transport and mitigation of chlorinated solvent vapors and SVE and treatment. Each criterion has been met except for the ability to depressurize the building slabs and SVE and treatment. The target vacuum was 0.1 in w.g., where the following VMPs did not observe this target vacuum; 774VMP-3 with a vacuum of 0.025 in w.g., 776VMP-2 with a vacuum of 0.05 in w.g. and 786VMP-2 with a vacuum of 0.05 in w.g. However, through the evaluation of transport and mitigation of chlorinated solvent vapors, each of these points showed decreasing TCE trends from the baseline to the three month sampling event. At the point of the five month sampling event, all sampling locations showed TCE concentrations below sub-slab screening levels.

The effectiveness of SVE and treatment was determined through influent vapor sampling from the extraction wells and effluent vapor sampling after GAC treatment. Through influent sampling it has been proven that the SSVM systems at both Buildings 774 and 776 and Buildings 785 and 786 have effectively extracted chlorinated solvent vapors. Treatment was effective during the initial startup and five month sampling event at both Buildings 774 and 776 and Buildings 785 and 786. Treatment was not effective during the three month sampling event at both Buildings 774 and 776 and Buildings 785 and 786. Treatment was not effective because initial GAC life span calculations were proven to be incorrect through influent and effluent sampling. These calculations were inaccurate based on varying influent concentrations and temperatures which effect adsorption rates. The problem has been corrected by changing the GAC on a more frequent basis.

Overall, the performance of the SSVM systems at both Buildings 774 and 776 and Buildings 785 and 786 has demonstrated effective mitigation of SVI. This data will be used for the SVI remedy selection.

4.3.1 Operation and Maintenance

The Buildings 774, 776, 785 and 786 sites are going to continue SSVM under the Performance Based Remediation Task Order for the former Griffiss AFB, Contract # FA8903-10-D-8595, Delivery Order # 0014. The SSVM systems will be operated and maintained as long as site conditions necessitate SSVM. Operation and Maintenance tasks are provided in Table 3, Buildings SSVM Systems Operation and Maintenance. The Operation and Maintenance forms and individual equipment manuals are provided in Appendix F. During the first year of long term operation, the operation and maintenance schedule for indoor, outdoor, sub-slab and influent sampling will occur semi-annually, during the cooling and heating seasons (summer and winter). Effluent sampling will occur monthly to ensure proper treatment. Based on monthly sampling results an accurate schedule for GAC replacement can be made. During this period, all system operation and maintenance data will be submitted quarterly. If all sampling results from the first year of long-term operation are below screening levels, then the systems' Operation and Maintenance will be re-evaluated.

SSVM Systems Operation and Maintenance

Field Activities	Rationale	Location	Parameters
System Component Readings	Weekly recording of system temperature, flow, vacuum and motor status to determine proper operation.	Building 774 / 776 Blower Shed and Building 785 / 786 Blower Shed	None
VMP Vacuum Measurements	Weekly recording to support sub-slab depressurization.	VMPs inside buildings as shown on Figure 3-1 and 3-6	None
Granular Activated Carbon Replacement	Predicted schedule is every two months to adsorb extracted chlorinated solvent vapors (value may changed based on effluent results from monthly sampling).	Building 774 / 776 Blower Shed and Building 785 / 786 Blower Shed	None
Indoor Air Sampling	Semi-Annually to evaluate current human exposure and to obtain site specific attenuation factors for risk assessment (ratio of indoor air to sub-slab vapor concentrations).	One sample per building as shown on Figure 3-1 and 3-6	VOC: Method TO-15 Full List
Outdoor Air Sampling	Semi-Annually to occur simultaneously with indoor air sampling to evaluate potential influence of outdoor air on indoor air sampled.	One sample per site as shown on Figure 3-1 and 3-6	VOC: Method TO-15 Full List
Sub-Slab Vapor Sampling	Semi-Annually to occur simultaneously with indoor air sampling to evaluate chlorinated solvent transport and mitigation and to obtain site specific attenuation factors for risk assessment (ratio of indoor air to sub-slab vapor concentrations).	VMPs inside buildings as shown on Figure 3-1 and 3-6	VOC: Method TO-15 Full List
Influent Sampling	Semi-Annually prior to sub-slab sampling to determine SVE.	SSVM System's exhaust stack before carbon treatment	VOC: Method TO-15 Full List
Effluent Sampling	Monthly to accurately predict schedule for GAC replacement (once an accurate prediction is obtained then effluent will not be sampled)	SSVM System's exhaust stack after carbon treatment	None

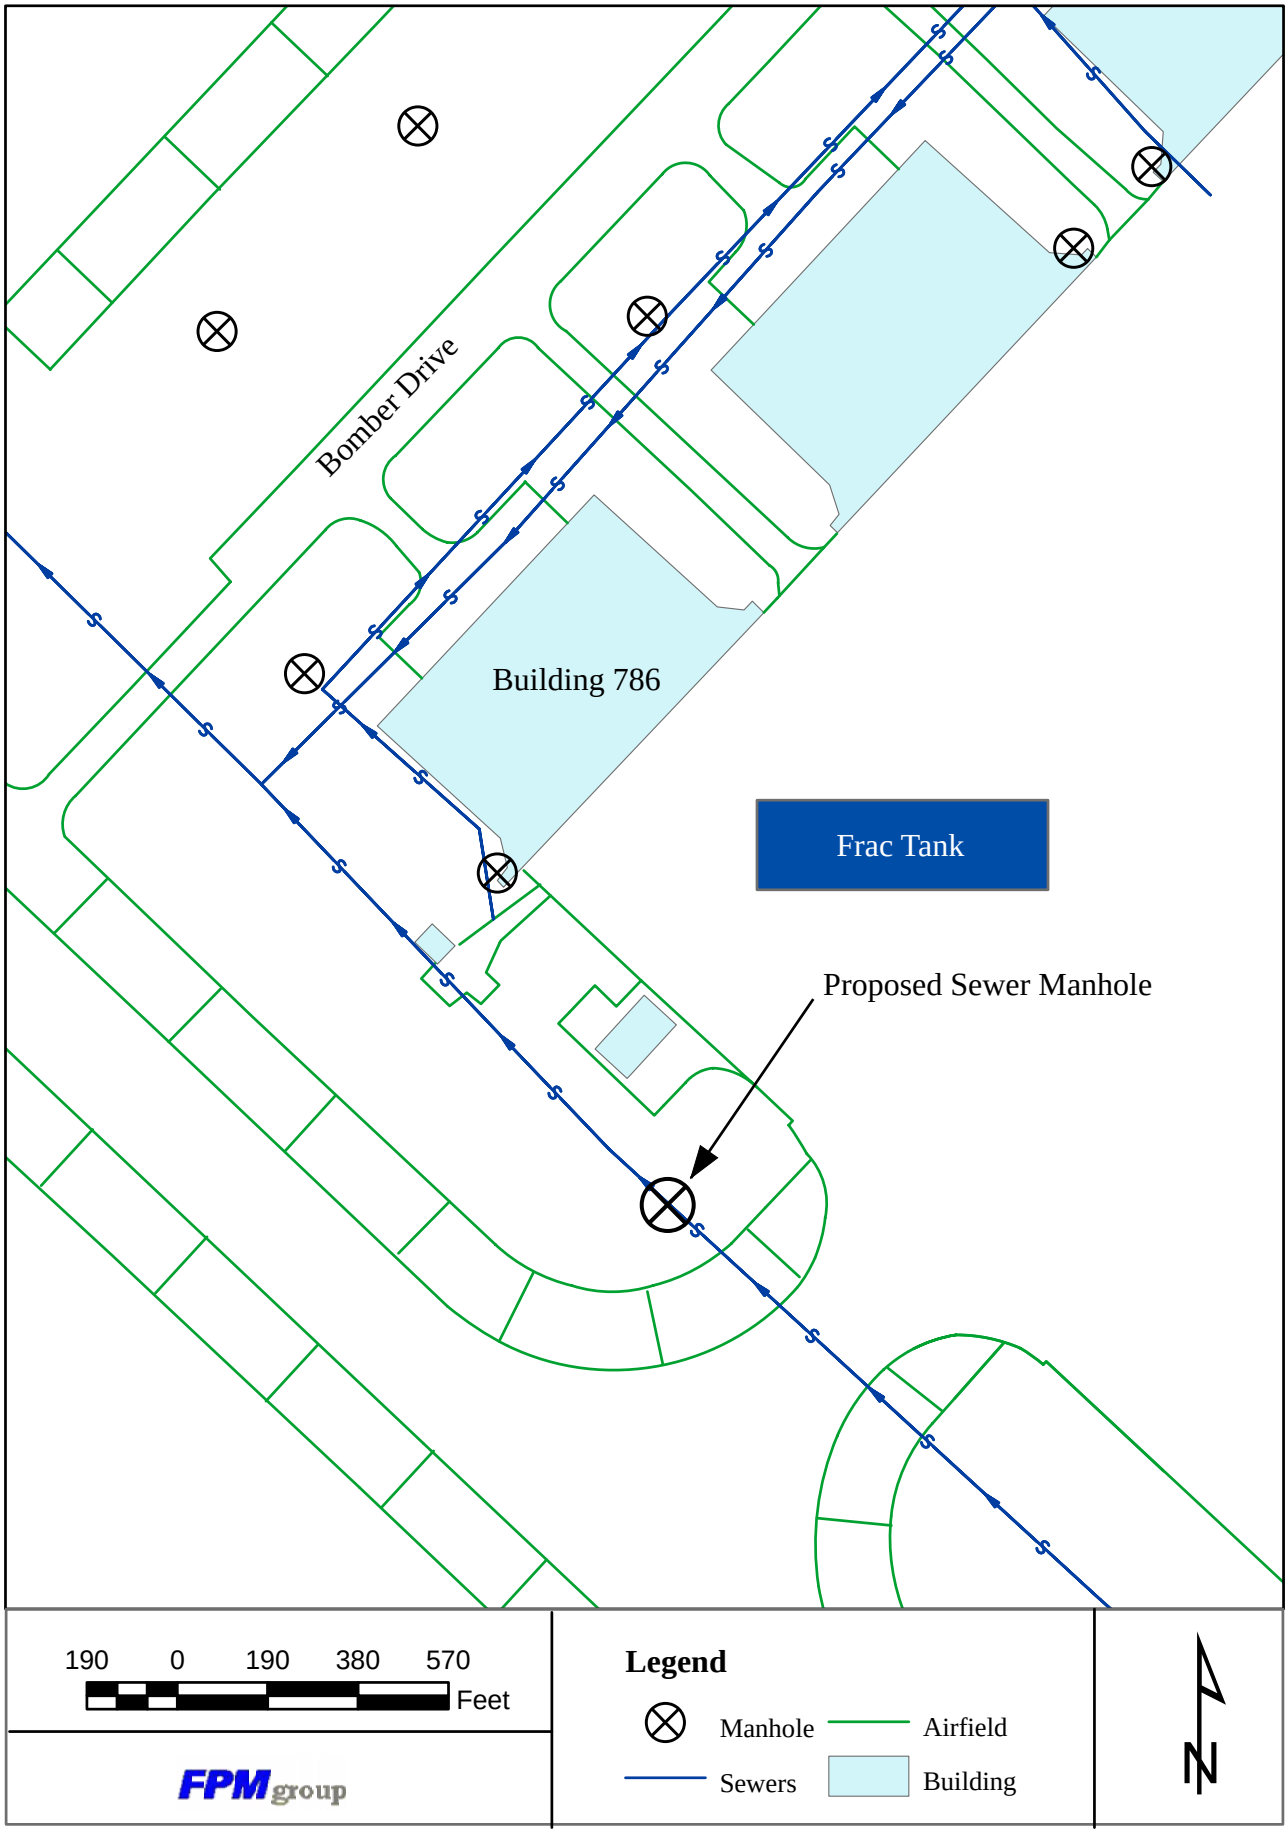
RE: Drilling Development Water Discharge Request at Building 786 (nosedock 5) Griffiss Business and Technology Park, Rome, New York.

FPM is requesting the temporary discharge of drilling development water from the Building 786 horizontal well installment to the sewer system on Griffiss Business and Technology Park that connects to the City of Rome Water Pollution Control Facility. The horizontal well was installed at 10 feet below grade, as part of a soil vapor extraction system. This site has been monitored for over 10 years, and the known contaminant in the groundwater (approximately 16 ft below grade) is trichloroethylene. There was no reported contamination in the soil.

The proposed discharge will be conducted using a trash pump/frac tank system. Drilling development water was pumped into the frac tank to serve as a settling basin for suspended solids including bentonite (used as drilling mud). Proposed, the water then will be pumped into a sewer system manhole. An estimated 3,500 gallons of development water is planned on being discharged in one event. If necessary, a silt bag can be utilized to eliminate all suspended solids.

Attached are raw lab data for full list VOCs (8260) and sampling chain of custody. Also included is a figure showing the Building 786 location including the proposed sewer manhole.



If you have any questions or require additional information, please call me at 315-336-7721 ext. 212, or e-mail me at k.mattice@fpm-group.com.

Sincerely,

Katrina J. Mattice

RE: Permission to discharge FRAC tank water. Con tract # 1000-0817

Dear Ms. Mattice,

After a review of sampling date submitted by email on December 13, 2010, permission is herby granted to discharge this wastewater water under the following conditions:

1. Water is discharged to designated manhole south, of FRAC tank, and you inform the POTW of time of discharge.

2. Provision is made so that grit, rocks, sand, or silt is not pumped into sanitary sewer.

3. Cost to discharge is $0.04 per gallon.

4. Permission may be rescinded at any time if the POTW determines discharge may affect treatment plant process, violates any sewer use ordinance, EPA or DEC regulations.

If you have any questions please or comments please call 315-339-7775 ext 222, or email me at bclifford@romecitygov.com

RE: Drilling Development Water Discharge Amount at Building 786 (nosedock 5) Griffiss Business and Technology Park, Rome, New York.

FPM discharged a total amount of 3,500 gallons of development water. The event was over a course of 4 days (December 16, 17, 20 and 21). The invoice PO number is 1000-08-17. The invoice can be sent directly to Katrina Mattice at the above address.

Attached for convenience are raw lab data for full list VOCs (8260) and sampling chain of custody.

If you have any questions or require additional information, please call me at 315-336-7721 ext. 212, or e-mail me at k.mattice@fpm-group.com.

RE: FRAC tank water discharge. PO # 1000-08-17

Dear Ms. Mattice,

Letter dated December 27, 2010 reported a discharge of 3,500 gallons of development water from FRAC tank located near building 786 or nose dock # 5. The discharge event occurred on 12/16, 17, 20, and 21, 2010.

The cost to discharge is $0.04 per gallon for a total of $140.00.

Enclosed is invoice in the amount of $140.00.

If you have any questions please or comments please call 315-339-7775 ext 222, or email me at bclifford@romecitygov.com

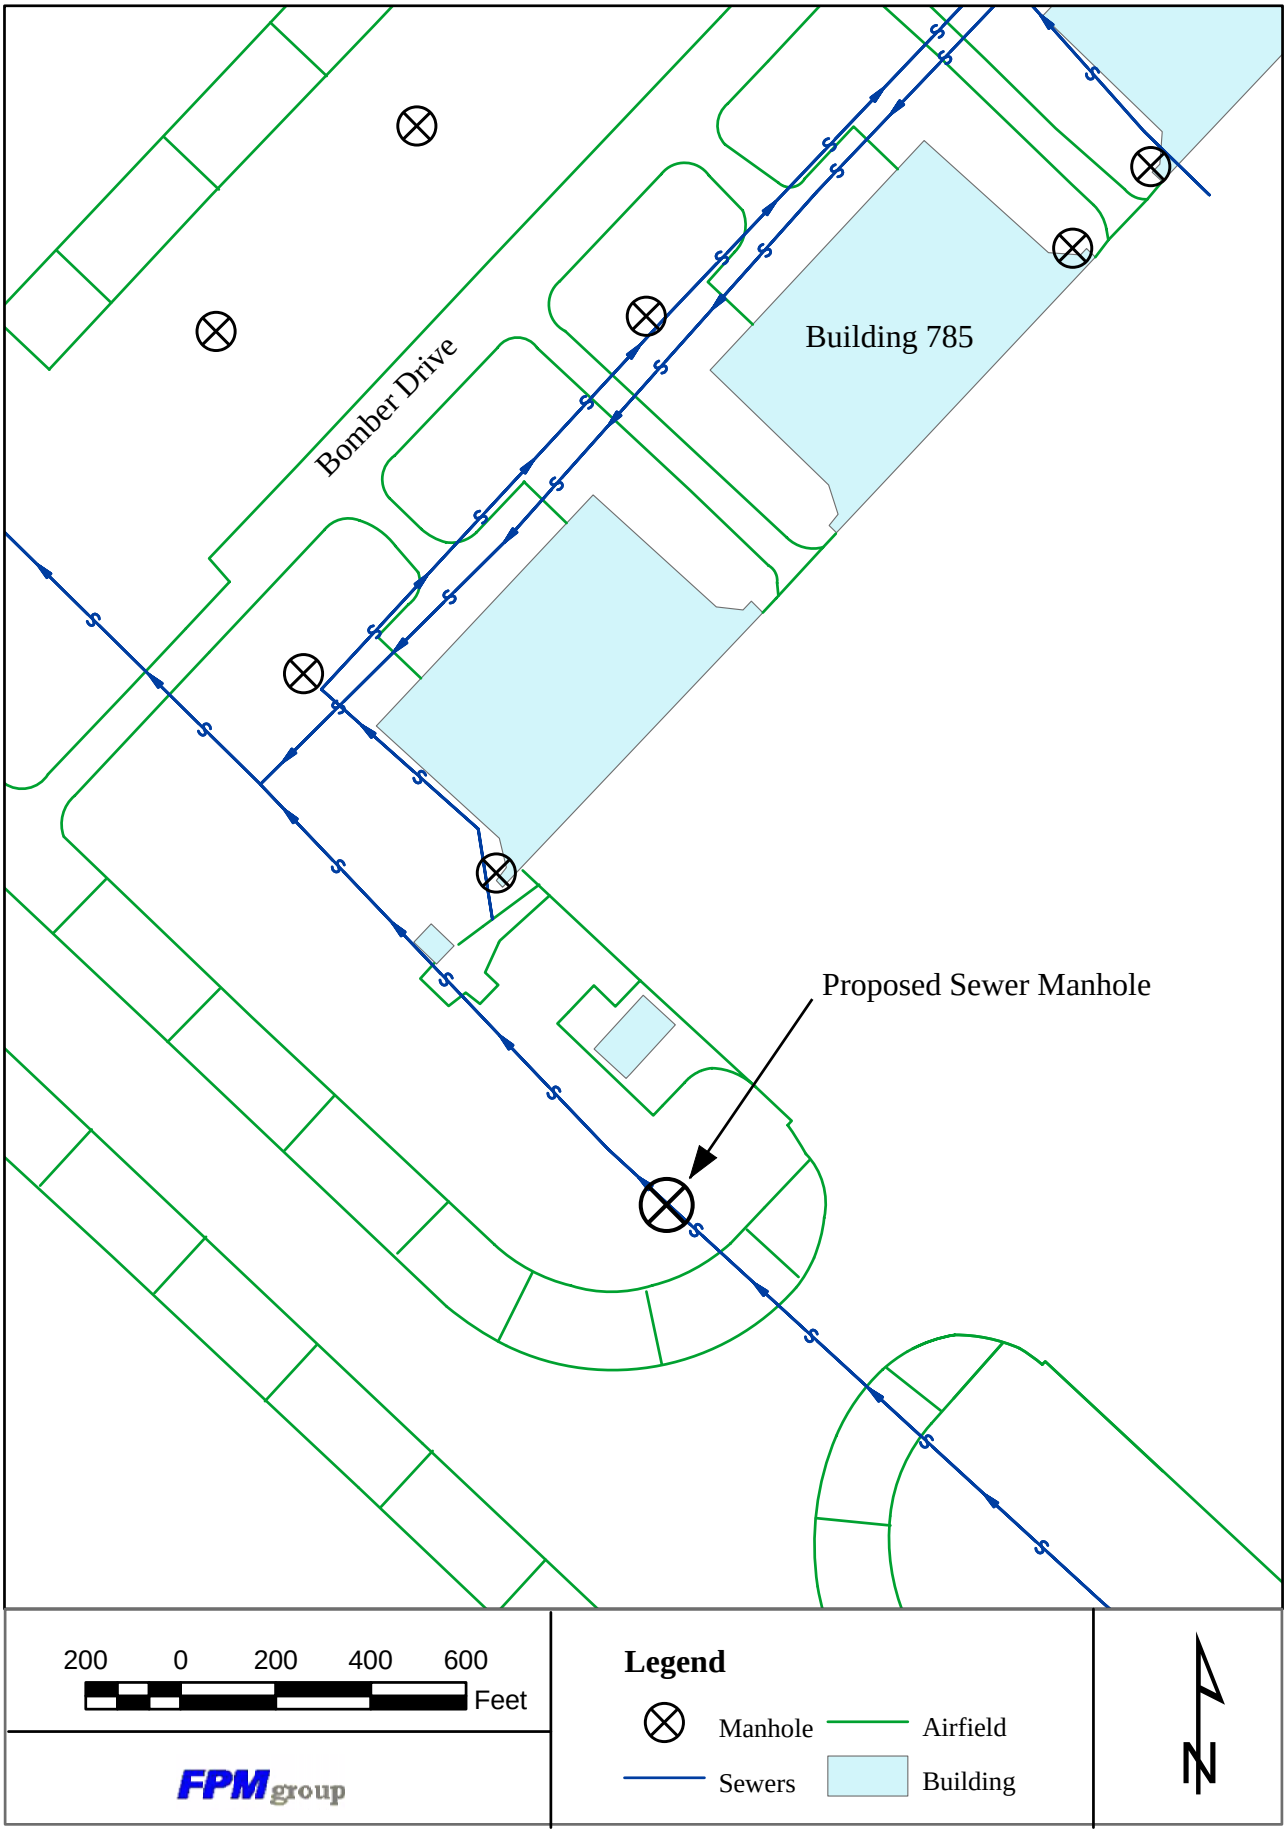
RE: Drilling Development Water Discharge Request at Building 785 (nosedock 5) Griffiss Business and Technology Park, Rome, New York.

FPM is requesting the temporary discharge of drilling development water from the Building 785 horizontal well installment to the sewer system on Griffiss Business and Technology Park that connects to the City of Rome Water Pollution Control Facility. The horizontal well was installed at 8 feet below grade, as part of a soil vapor extraction system. This site has been monitored for over 10 years, and the known contaminant in the groundwater (approximately 16 ft below grade) is trichloroethylene. There was no reported contamination in the soil.

The proposed discharge will be conducted using a vacuum truck where the water will be pumped into a sewer system manhole (site location map). An estimated 3,500 gallons of development water is planned on being discharged over the course of a week. If necessary, a silt bag can be utilized to eliminate all suspended solids.



Attached are raw lab data for full list VOCs (8260) and sampling chain of custody. Also included is a figure showing the Building 785 location including the proposed sewer manhole.

If you have any questions or require additional information, please call me at 315-336-7721 ext. 212, or e-mail me at k.mattice@fpm-group.com.

Sincerely,

Katrina Mattice
Associate Engineer

Project: GRIFFISS AFB - BLDG 786
RE: Analytical Results Order No.: K1102217

Dear Katrina Mattice:

Life Science Laboratories, Inc. received 1 sample(s) on 2/24/2011 for the analyses presented in the following report. Sample results relate only to the samples as received by the laboratory.

Very truly yours,
Life Science Laboratories, Inc.

Pamela J. Titus, P.M.

RE: Permission to discharge FRAC tank water.

Dear Ms. Mattice,

After a review of sampling date submitted by email on February 22, 2011, permission is herby granted to discharge this wastewater water under the following conditions:

1. Water is discharged to designated manhole south, of FRAC tank, and you inform the POTW of time of discharge.

2. Provision is made so that grit, rocks, sand, or silt is not pumped into sanitary sewer.

3. Cost to discharge is $0.04 per gallon.

4. Permission may be rescinded at any time if the POTW determines discharge may affect treatment plant process, violates any sewer use ordinance, EPA or DEC . regulations.

If you have any questions please or comments please call 315-339-7775 ext 222, or email me at bclifford@romecitygov.com

Sincerely,

Bruce Clifford

RE: Drilling Development Water Discharge Amount at Building 785 (nosedock 4) Griffiss Business and Technology Park, Rome, New York.

FPM discharged a total amount of 300 gallons of development water. The event was over a course of 1 day. The invoice PO number is 1000-08-17. The invoice can be sent directly to Katrina Mattice at the above address.

Attached for convenience are raw lab data for full list VOCs (8260) and sampling chain of custody.

If you have any questions or require additional information, please call me at 315-336-7721 ext. 212, or e-mail me at k.mattice@fpm-group.com.

Sincerely,

Katrina J. Mattice

RE: B785SSVM Sampling

Dear Katrina Mattice:

Centek Laboratories, LLC received 6 sample(s) on 1/25/2011 for the analyses presented in the following report.

I certify that this data package is in compliance with the terms and conditions of the Contract, both technically and for completeness. Release of the data contained in this hardcopy data package and/or in the computer readable data submitted has been authorized by the Laboratory Manager or his designee, as verified by the following signature.

All method blanks, laboratory spikes, and/or matrix spikes met quality assurance objective except as indicated in the case narrative. All samples were received and analyzed within the EPA recommended holding times. Test results are not Method Blank (MB) corrected for contamination.

Centek Laboratories is distinctively qualified to meet your needs for precise and timely volatile organic compound analysis. We perform all analyses according to EPA, NIOSH or OSHA-approved analytical methods. Centek Laboratories is dedicated to providing quality analyses and exceptional customer service. Samples were analyzed using the methods outlined in the following references:

Compendium of Methods for the Determination of Toxic Organic Compounds, Compendium Method TO-15, January 1999.

Analytical results relate to samples as received at laboratory. We do our best to make our reporting format clear and understandable and hope you are thoroughly satisfied with our services.

Please contact your client service representative at (315) 431-9730 or myself, if you would like any additional information regarding this report.

Thank you for using Centek Laboratories. This report can not be reproduced except in its entirety, without prior written authorization.

Sincerely,

Russell Pellegrino
Technical Director

Disclaimer: The test results and procedures utilized, and laboratory interpretations of the data obtained by Centek as contained in this report are believed by Centek to be accurate and reliable for sample(s) tested. In accepting this report, the customer agrees that the full extent of any and all liability for actual and consequential damages of Centek for the services performed shall be equal to the fee charged to the customer for the services as liquidated damages.

Centek Laboratories, LLC Terms and Conditions

Sample Submission

All samples sent to Centek Laboratories should be accompanied by our Request for Analysis Form or Chain of Custody Form. A Chain of Custody will be provided with each order shipped for all sampling events, or if needed, one is available at our website www.CentekLabs.com. Samples received after 3:00pm are considered to be a part of the next day's business.

Sample Media

Samples can be collected in an canister or a Tedlar bag. Depending on your analytical needs, Centek Laboratories may receive a bulk, liquid, soil or other matrix sample for headspace analysis.

Blanks

Every sample is run with a surrogate or tracer compound at a pre-established concentration. The surrogate compound run with each sample is used as a standard to measure the performance of each run of the instrument. If required, a Minican can be provided containing nitrogen to be run as a trip blank with your samples.

Sampling Equipment

Centek Laboratories will be happy to provide the canisters to carry-out your sampling event at no charge. The necessary accessories, such as regulators, tubing or personal sampling belts, are also provided to meet your sampling needs. The customer is responsible for all shipping charges to the client's destination and return shipping to the laboratory. Client assumes all responsibility for lost, stolen and any dameges of equipment.

Turn Around time (TAT)

Centek Laboratories will provide results to its clients in one business-week by 6:00pm EST after receipt of samples. For example, if samples are received on a Monday they are due on the following Monday by 6:00pm EST. Results are faxed or emailed to the requested location indicated on the Chain of Custody. Non-routine analysis may require more than the one business-week turnaround time. Please confirm non-routine sample turnaround times.

Reporting

Results are emailed or faxed at no additional charge. A hard copy of the result report is mailed within 24 hours of the faxing or emailing of your results. Cat "B" like packages are within 3-4

weeks from time of analysis. Standard Electronic Disk Deliverables (EDD) is also available at no additional charge.

Payment Terms

Payment for all purchases shall be due within 30 days from date of invoice. The client agrees to pay a finance charge of 1.5% per month on the overdue balance and cost of collection, including attorney fees, if collection proceedings are necessary. You must have a completed credit application on file to extend credit. Purchase orders or checks information must be submitted for us to release results

Rush Turnaround Samples

Expedited turn around times is available. Please confirm rush turnaround times with Client Services before submitting samples.

Applicable Surcharges for Rush Turnaround Samples:
Same day TAT = 200%
Next business day TAT by Noon = 150%
Next business day TAT by 6:00pm = 100%
Second business day TAT by 6:00pm = 75%
Third business day TAT by 6:00pm = 50%
Fourth business day TAT by 6:00pm = 35%
Fifth business day = Standard

Statement of Confidentiality

Centek Laboratories, LLC is aware of the importance of the confidentiality of results to many of our clients. Your name and data will be held in the strictest of confidence. We will not accept business that may constitute a conflict of interest. We commonly sign Confidential Nondisclosure Agreements with clients prior to beginning work. All research, results and reports will be kept strictly confidential. Secrecy Agreements and Disclosure Statements will be signed for the client if so specified. Results will be provided only to the addressee specified on the Chain of Custody Form submitted with the samples unless law requires release. Written permission is required from the addressee to release results to any other party.

Limitation on Liability

Centek Laboratories, LLC warrants the test results to be accurate to the methodology and sample type for each sample submitted to Centek Laboratories, LLC. In no event shall Centek Laboratories, LLC be liable for direct, indirect, special, punitive, incidental, exemplary or consequential damages, or any damages whatsoever, even if Centek Laboratories, LLC has been previously advised of the possibility of such damages whether in an action under contract, negligence, or any other theory, arising out of or in connection with the use, inability to use or performance of the information, services, products and materials available from the laboratory or this site. These limitations shall apply notwithstanding any failure of essential purpose of any limited remedy. Because some jurisdictions do not allow limitations on how long an implied warranty lasts, or the exclusion or limitation of liability for consequential or incidental damages, the above limitations may not apply to you. This is a comprehensive limitation of liability that applies to all damages of any kind, including (without limitation) compensatory, direct, indirect or consequential damages, loss of data, income or profit and or loss of or damage to property and claims of third parties.

CASE NARRATIVE

All method blanks, laboratory spikes, and/or matrix spikes met quality assurance objective except as indicated in the corrective action report(s). All samples were received and analyzed within the EPA recommended holding times. Test results are not Method Blank (MB) corrected for contamination. Samples were analyzed using the methods outlined in the following references:

Compendium of Methods for the Determination of Toxic Organic Compounds, Compendium Method TO-15, January 1999.

See Corrective Action: [2092] IS did not meet criteria.
See Corrective Action: [2093] LCSD did not meet criteria.

Centek Laboratories, LLC

Corrective Action Report

Date Initiated: 25-Jan-11 **Corrective Action Report ID:** 2092

Initiated By: Russell Pellegrino **Department:** MSVOA

Corrective Action Description

CAR Summary: IS did not meet criteria.

Description of Nonconformance: IS was high and did not meet criteria for samples C1101031-001 - 004. Based on the chromatographic evidence this is most likely due to matrix interference.

Description of Corrective Action: Samples were analyzed further as dilutions with results meeting criteria.

Performed By: Russell Pellegrino **Completion Date:** 28-Jan-11

Client Notification

Client Notification Required: No **Notified By:**

Comment:

Quality Assurance Review

Nonconformance Type: Deficiency

Further Action required by QA: No further corrective action taken. All sets of data submitted

Approval and Closure

Technical Director / Deputy Tech. Dir.: Russell Pellegrino Close Date: 30-Jan-11

QA Officer Approval: Nick Scala QA Date: 29-Jan-11

Centek Laboratories, LLC

Corrective Action Report

Date Initiated: 27-Jan-11 **Corrective Action Report ID:** 2093

Initiated By: Russell Pellegrino **Department:** MSVOA

Corrective Action Description

CAR Summary: LCSD did not meet criteria.

Description of Nonconformance: ALCS1UGD-012711 did not meet criteria for RPD and % recoveries for several compounds. The LCSD did not reproduce. All other QC met criteria for the compounds of interest. The LCS 6 Liter canister was independent of the 6 Liter continuing calibration canister.

Description of Corrective Action: Since all other QC met criteria for the associated samples and the LCS 6 Liter canister was independent of the 6 Liter continuing calibration canister, no corrective action taken at this time. If results continue to be outside established limits then a new LCS stock standard will be analyzed. All sets of data submitted.

Performed By: Russell Pellegrino **Completion Date:** 28-Jan-11

GC/MS-Whole Air Calculations

Relative Response Factor (RRF)

$$RRF = \frac{Ax * Cis}{Ais * Cx}$$

where: Ax = area of the characteristic ion for the compound being measured
Ais = area of the characteristic ion for the specific internal standard of the compound being measured
Cx = concentration of the compound being measured (ppbv)
Cis = concentration of the internal standard (ppbv)

Percent Relative Standard Deviation (%RSD)

$$\% RSD = \frac{\text{Standard deviation of RRF values} * 100}{\text{mean RRF}}$$

Percent Difference (%D)

$$\% D = \frac{(RRFc - \text{mean RRFi}) * 100}{\text{mean RRFi}}$$

where: RRFc = relative response factor from the continuing calibration
mean RRFi = mean relative response factor from the initial calibration

Sample Calculations

$$ppbv = \frac{Ax * Is * Df}{Ais * RRF}$$

where: Ax = area of the characteristic ion for the compound being measured
Ais = area of the characteristic ion for the specific internal standard of the compound being measured
Is = Concentration of the internal standard injected (ppbv)
RRF= relative response factor for the compound being measured
Df = Dilution factor

#12
Acetone
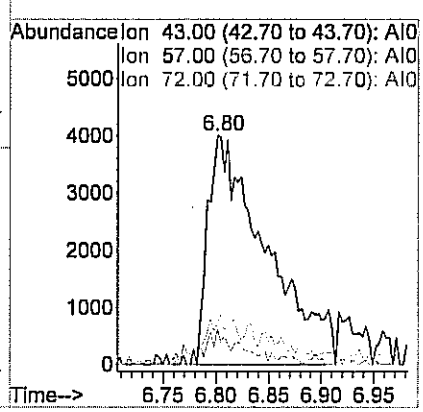
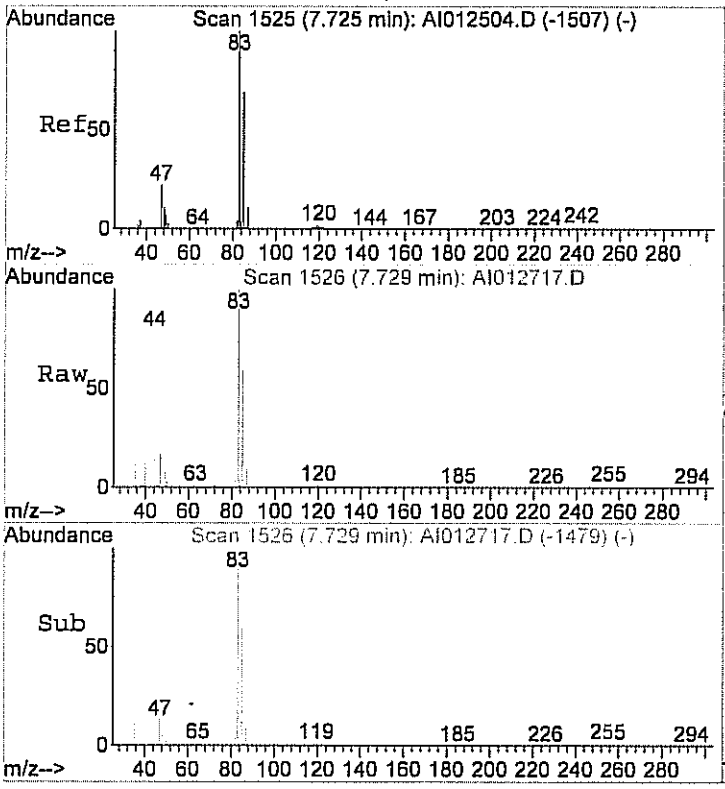
Concen: 4.22 ppb
RT: 4.23 min Scan# 435
Delta R.T. -0.00 min
Lab File: AI012717.D
Acq: 27 Jan 2011 7:03 pm

Tgt Ion: 58 Resp: 19185

Ion	Ratio	Lower	Upper
58	100		
43	368.0	329.0	389.0

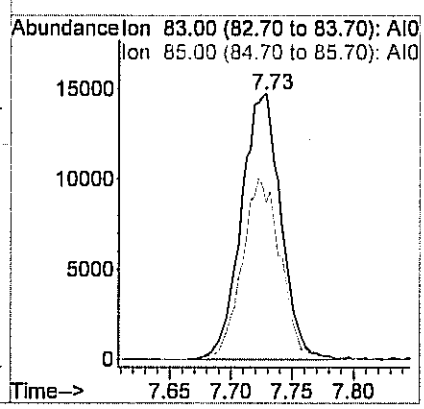


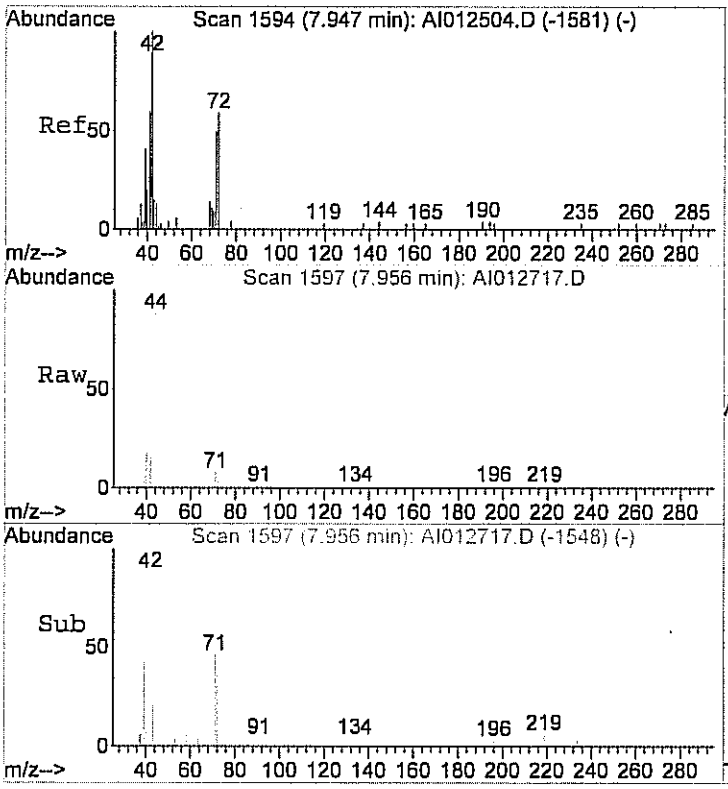


#23
Methyl Ethyl Ketone
Concen: 0.63 ppb
RT: 6.80 min Scan# 1237
Delta R.T. 0.01 min
Lab File: AI012717.D
Acq: 27 Jan 2011 7:03 pm

Tgt Ion: 43 Resp: 15387

Ion	Ratio	Lower	Upper
43	100		
57	8.9	37.8	77.8#
72	22.2	1.1	41.1

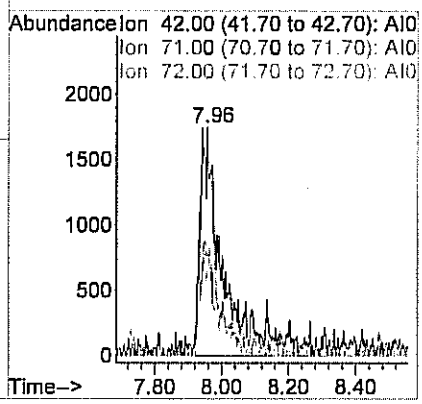


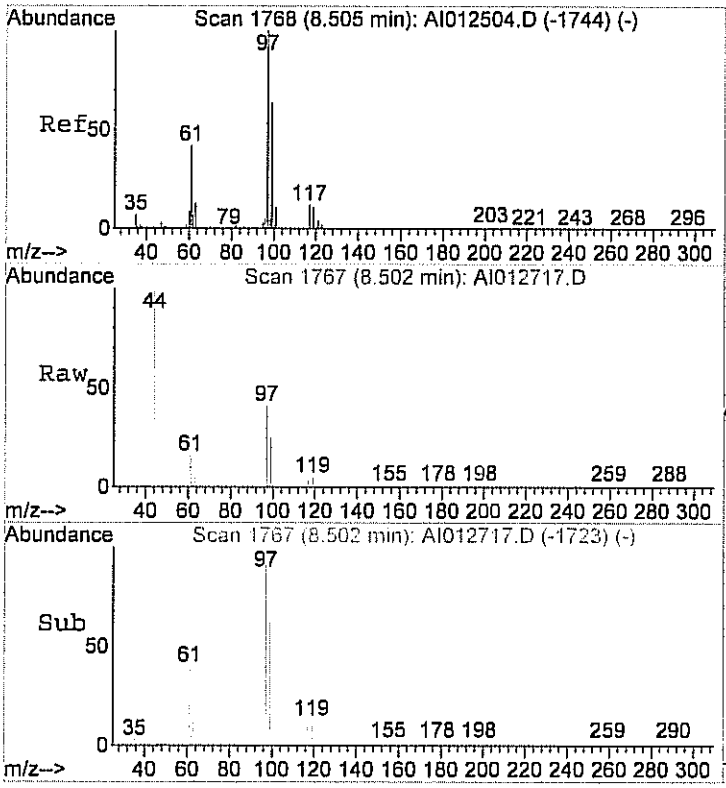


#27
Chloroform
Concen: 0.94 ppb
RT: 7.73 min Scan# 1526
Delta R.T. -0.00 min
Lab File: AI012717.D
Acq: 27 Jan 2011 7:03 pm

Tgt Ion: 83 Resp: 33107

Ion	Ratio	Lower	Upper
83	100		
85	66.8	46.5	86.5

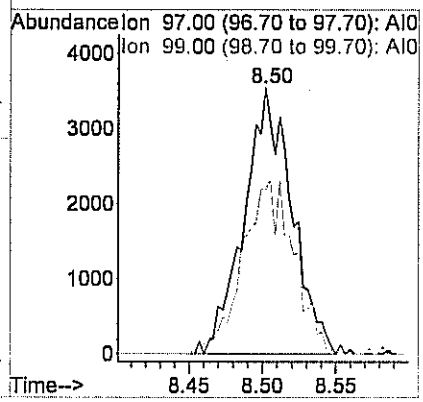


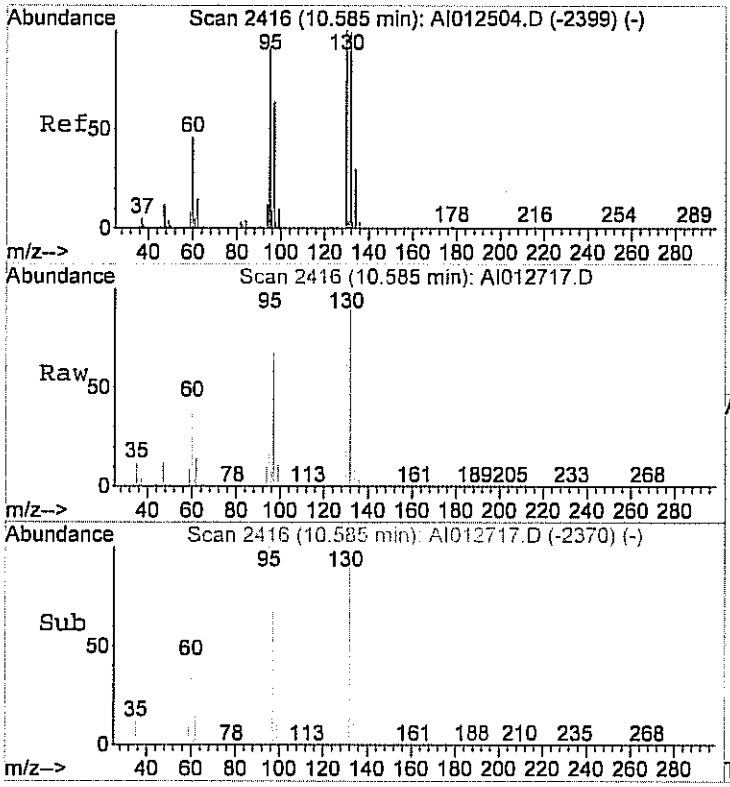


#28
Tetrahydrofuran
Concen: 1.20 ppb m
RT: 7.96 min Scan# 1597
Delta R.T. 0.01 min
Lab File: AI012717.D
Acq: 27 Jan 2011 7:03 pm

Tgt Ion: 42 Resp: 8910

Ion	Ratio	Lower	Upper
42	100		
71	36.4	37.9	77.9#
72	33.1	38.0	78.0#

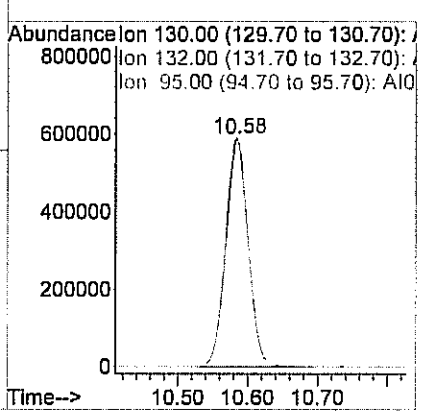


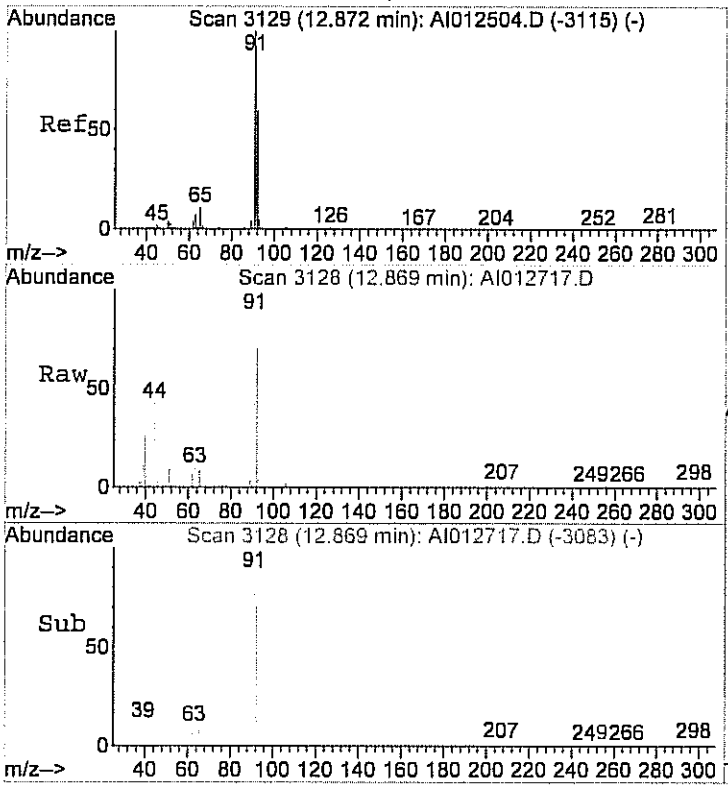


#31
1,1,1-trichloroethane
Concen: 0.28 ppb
RT: 8.50 min Scan# 1767
Delta R.T. -0.01 min
Lab File: AI012717.D
Acq: 27 Jan 2011 7:03 pm

Tgt Ion: 97 Resp: 7969

Ion	Ratio	Lower	Upper
97	100		
99	69.8	45.4	85.4

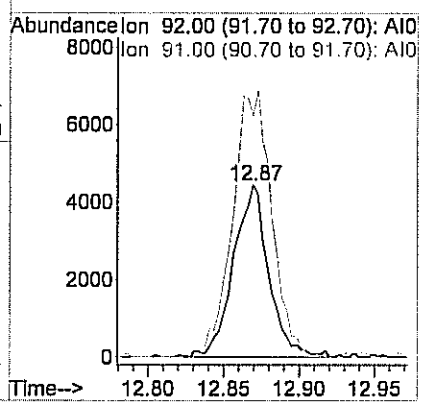


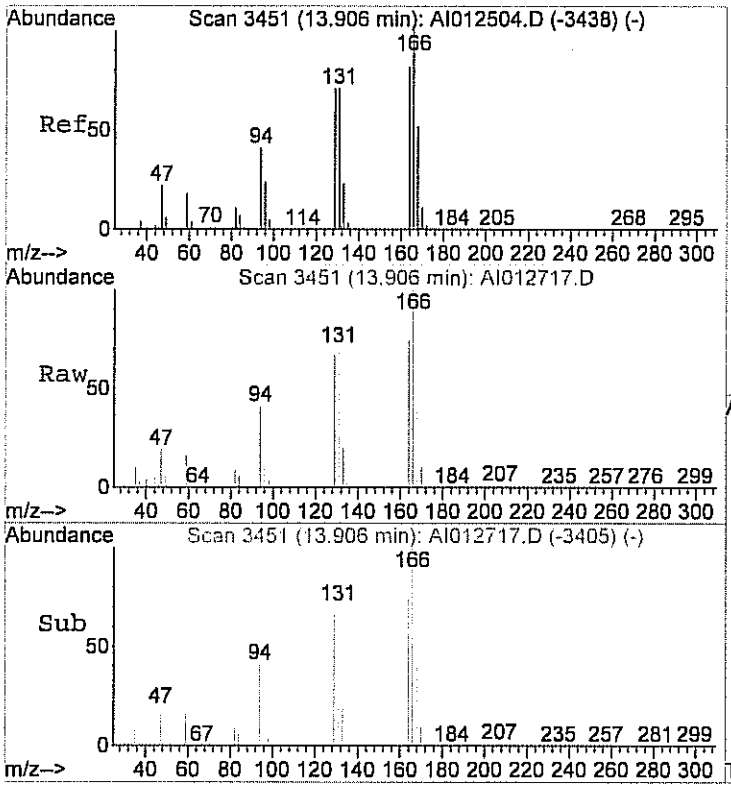


#38
Trichloroethene
Concen: 67.80 ppb
RT: 10.58 min Scan# 2416
Delta R.T. -0.00 min
Lab File: AI012717.D
Acq: 27 Jan 2011 7:03 pm

Tgt Ion:130 Resp: 1309324

Ion	Ratio	Lower	Upper
130	100		
132	97.9	77.0	117.0
95	99.8	70.8	110.8

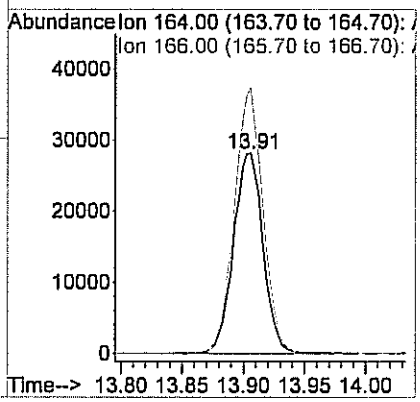


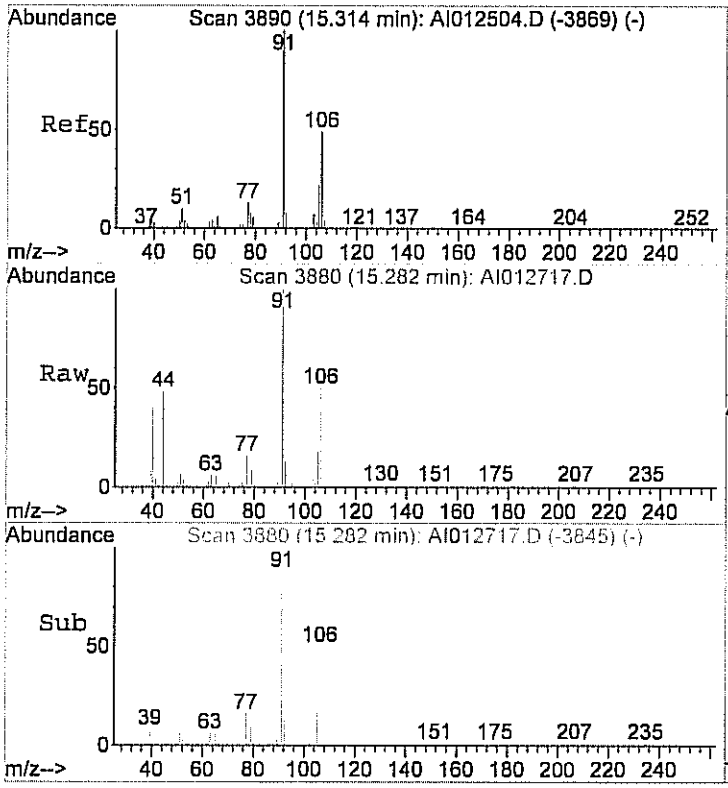


#45
Toluene
Concen: 0.41 ppb
RT: 12.87 min Scan# 3128
Delta R.T. -0.01 min
Lab File: AI012717.D
Acq: 27 Jan 2011 7:03 pm

Tgt Ion: 92 Resp: 7197

Ion	Ratio	Lower	Upper
92	100		
91	172.2	150.0	190.0

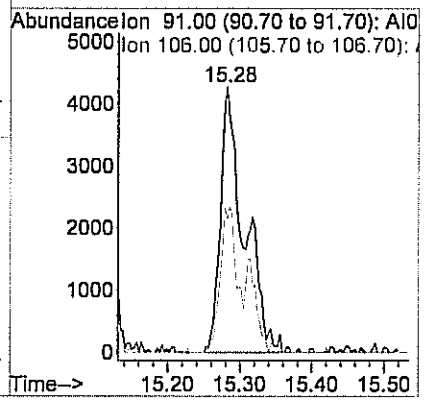


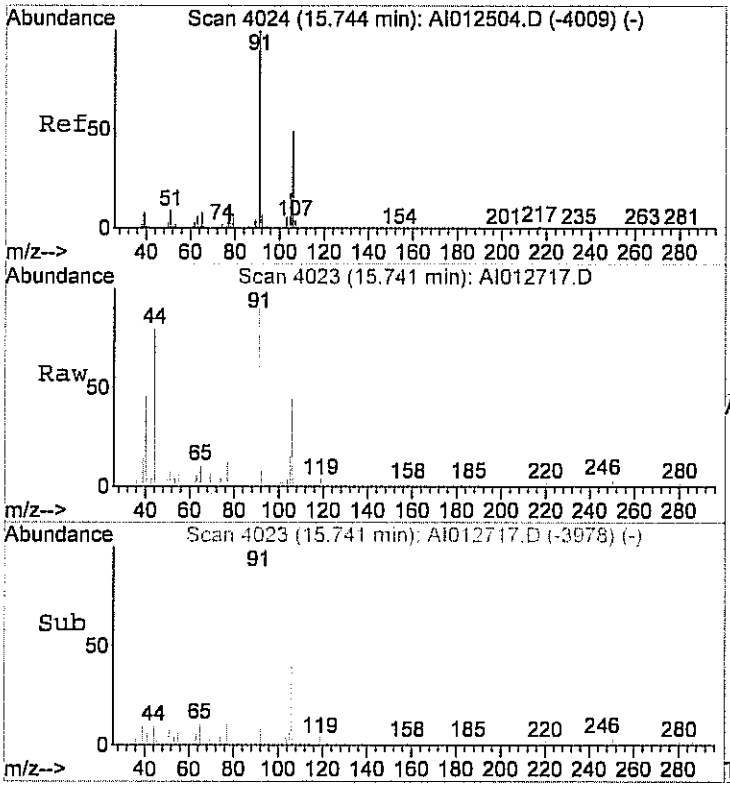


#50
Tetrachloroethylene
Concen: 2.35 ppb
RT: 13.91 min Scan# 3451
Delta R.T. -0.00 min
Lab File: AI012717.D
Acq: 27 Jan 2011 7:03 pm

Tgt Ion:164 Resp: 47092

Ion	Ratio	Lower	Upper
164	100		
166	128.6	109.0	149.0

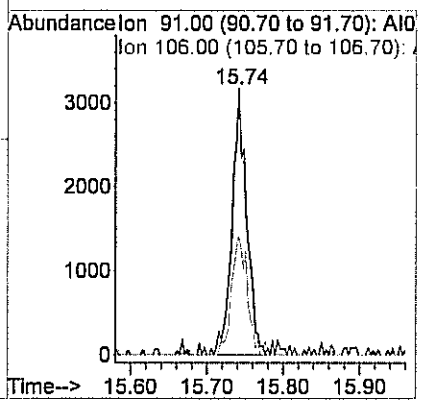


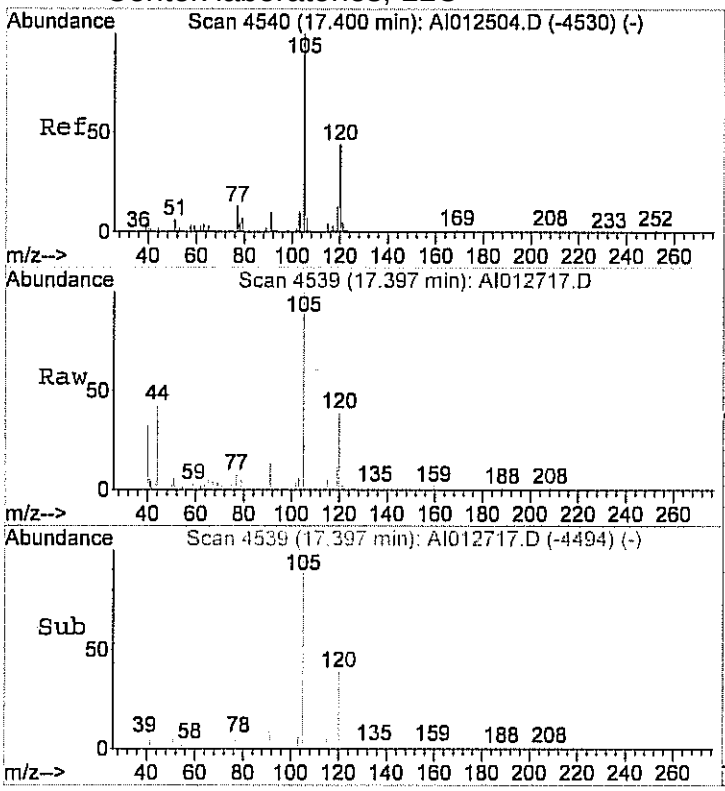


#53
m&p-xylene
Concen: 0.36 ppb m
RT: 15.28 min Scan# 3880
Delta R.T. -0.04 min
Lab File: AI012717.D
Acq: 27 Jan 2011 7:03 pm

Tgt Ion: 91 Resp: 9876

Ion	Ratio	Lower	Upper
91	100		
106	0.0	29.9	69.9#

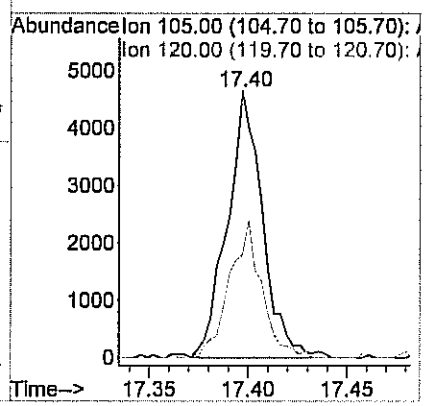




#56
o-xylene
Concen: 0.14 ppb m
RT: 15.74 min Scan# 4023
Delta R.T. -0.01 min
Lab File: AI012717.D
Acq: 27 Jan 2011 7:03 pm

Tgt Ion: 91 Resp: 4551

Ion	Ratio	Lower	Upper
91	100		
106	0.0	29.0	69.0#



#61
1,2,4-trimethylbenzene
Concen: 0.27 ppb
RT: 17.40 min Scan# 4539
Delta R.T. -0.01 min
Lab File: AI012717.D
Acq: 27 Jan 2011 7:03 pm

Tgt Ion:105 Resp: 5750

Ion	Ratio	Lower	Upper
105	100		
120	47.4	27.0	67.0

RE: B785 SSVM Sampling

Dear Katrina Mattice:

Centek Laboratories, LLC received 5 sample(s) on 3/24/2011 for the analyses presented in the following report.

I certify that this data package is in compliance with the terms and conditions of the Contract, both technically and for completeness. Release of the data contained in this hardcopy data package and/or in the computer readable data submitted has been authorized by the Laboratory Manager or his designee, as verified by the following signature.

Centek Laboratories performs all analyses according to EPA, NIOSH or OSHA-approved analytical methods. Centek Laboratories is dedicated to providing quality analyses and exceptional customer service. All method blanks, laboratory spikes, and/or matrix spikes met quality assurance objective except as indicated in the case narrative. All samples were received and analyzed within the EPA recommended holding times. Test results are not Method Blank (MB) corrected for contamination.

We do our best to make our reporting format clear and understandable and hope you are thoroughly satisfied with our services. Please contact your client service representative at (315) 431-9730 or myself, if you would like any additional information regarding this report.

Thank you for using Centek Laboratories. This report can not be reproduced except in its entirety, without prior written authorization.

Sincerely,

Russell J. Pellegrino
Technical Director

Disclaimer: The test results and procedures utilized, and laboratory interpretations of the data obtained by Centek as contained in this report are believed by Centek to be accurate and reliable for sample(s) tested. In accepting this report, the customer agrees that the full extent of any and

all liability for actual and consequential damages of Centek for the services performed shall be equal to the fee charged to the customer for the services as liquidated damages.

Centek Laboratories, LLC Terms and Conditions

Sample Submission

All samples sent to Centek Laboratories should be accompanied by our Request for Analysis Form or Chain of Custody Form. A Chain of Custody will be provided with each order shipped for all sampling events, or if needed, one is available at our website www.CentekLabs.com. Samples received after 3:00pm are considered to be a part of the next day's business.

Sample Media

Samples can be collected in an canister or a Tedlar bag. Depending on your analytical needs, Centek Laboratories may receive a bulk, liquid, soil or other matrix sample for headspace analysis.

Blanks

Every sample is run with a surrogate or tracer compound at a pre-established concentration. The surrogate compound run with each sample is used as a standard to measure the performance of each run of the instrument. If required, a Minican can be provided containing nitrogen to be run as a trip blank with your samples.

Sampling Equipment

Centek Laboratories will be happy to provide the canisters to carry-out your sampling event at no charge. The necessary accessories, such as regulators, tubing or personal sampling belts, are also provided to meet your sampling needs. The customer is responsible for all shipping charges to the client's destination and return shipping to the laboratory. Client assumes all responsibility for lost, stolen and any damages of equipment.

Turn Around time (TAT)

Centek Laboratories will provide results to its clients in one business-week by 6:00pm EST after receipt of samples. For example, if samples are received on a Monday they are due on the following Monday by 6:00pm EST. Results are faxed or emailed to the requested location indicated on the Chain of Custody. Non-routine analysis may require more than the one business-week turnaround time. Please confirm non-routine sample turnaround times.

Reporting

Results are emailed or faxed at no additional charge. A hard copy of the result report is mailed within 24 hours of the faxing or emailing of your results. Cat "B" like packages are within 3-4 weeks from time of analysis. Standard Electronic Disk Deliverables (EDD) is also available at no additional charge.

Payment Terms

Payment for all purchases shall be due within 30 days from date of invoice. The client agrees to pay a finance charge of 1.5% per month on the overdue balance and cost of collection, including attorney fees, if collection proceedings are necessary. You must have a completed credit application on file to extend credit. Purchase orders or checks information must be submitted for us to release results

CASE NARRATIVE

All method blanks, laboratory spikes, and/or matrix spikes met quality assurance objective except as indicated in the corrective action report(s). All samples were received and analyzed within the EPA recommended holding times. Test results are not Method Blank (MB) corrected for contamination. Samples were analyzed using the methods outlined in the following references:

Compendium of Methods for the Determination of Toxic Organic Compounds, Compendium Method TO-15, January 1999.

See Corrective Action: [2174] CC did not meet criteria.
See Corrective Action: [2175] LCSD did not meet criteria.
See Corrective Action: [2186] Surrogate did not meet criteria.
See Corrective Action: [2187] IS did not meet criteria.
See Corrective Action: [2189] CC did not meet criteria.
See Corrective Action: [2183] LCS and LCSD did not meet criteria.

Corrective Action Report

Date Initiated: 25-Mar-11
Initiated By: Leo Lucisano
Corrective Action Report ID: 2174
Department: MSVOA

Corrective Action Description

CAR Summary: CC did not meet criteria.

Description of Nonconformance: Continuing calibration did not meet criteria on 03/25/11 for hexachloro-1,3-butadiene. The compound in question was more sensitive. However, the compound in question was not detected for the associated samples. The results would have been biased high. All other QC met criteria.

Description of Corrective Action: Since the compound of interest was not detected for the associated samples and all other QC met criteria, no corrective action taken at this time. If results continue to be outside established limits then recalibrate system. All sets of data submitted.

Performed By: Leo Lucisano
Completion Date: 26-Mar-11

Client Notification

Client Notification Required: No
Notified By:
Comment:

Quality Assurance Review

Nonconformance Type: Deficiency

Further Action required by QA: At this time no further corrective action taken. If results continue to be outside acceptable limits than recalibrate system. All sets of data submitted.

Approval and Closure

Technical Director / Deputy Tech. Dir.: Russell Pellegrino
Close Date: 27-Mar-11

QA Officer Approval: Leo Lucisano
QA Date: 26-Mar-11

Corrective Action Report

Date Initiated: 25-Mar-11 **Corrective Action Report ID:** 2175

Initiated By: Leo Lucisano **Department:** MSVOA

Corrective Action Description

CAR Summary: LCSD did not meet criteria.

Description of Nonconformance: BLCSD1UG-032511 did not reproduce for methyl butyl ketone, methyl isobutyl ketone & 1,4-dioxane. The compounds were less sensitive. However, all other QC did meet criteria for the compounds in question. The LCS 6 Liter canister was independent of the 6 Liter continuing calibration canister.

Description of Corrective Action: Since the LCS 6 Liter canister was independent of the 6 Liter continuing calibration canister and all other QC met criteria for the associated samples, no corrective action taken at this time. If results continue to be outside established limits then recalibrate system. All sets of data submitted.

Performed By: Leo Lucisano **Completion Date:** 26-Mar-11

Corrective Action Report

Date Initiated: 30-Mar-11
Initiated By: Leo Lucisano
Corrective Action Report ID: 2186
Department: MSVOA

Corrective Action Description

CAR Summary: Surrogate did not meet criteria.

Description of Nonconformance: Surrogate was low and did not meet criteria for sample C1103055-001DL5. This is most likely due to matrix. The sample was analyzed at the 1x concentration and met criteria.

Description of Corrective Action: The sample was analyzed at the 1x concentration with criteria being met. All sets of data submitted.

GC/MS-Whole Air Calculations

Relative Response Factor (RRF)

$$RRF = \frac{Ax * Cis}{Ais * Cx}$$

where: Ax = area of the characteristic ion for the compound being measured
Ais = area of the characteristic ion for the specific internal standard of the compound being measured
Cx = concentration of the compound being measured (ppbv)
Cis = concentration of the internal standard (ppbv)

Percent Relative Standard Deviation (%RSD)

$$\% RSD = \frac{\text{Standard deviation of RRF values} * 100}{\text{mean RRF}}$$

Percent Difference (%D)

$$\%D = \frac{(RRFc - \text{mean } RRFi) * 100}{\text{mean } RRFi}$$

where: RRFc = relative response factor from the continuing calibration
mean RRFi = mean relative response factor from the initial calibration

Sample Calculations

$$ppbv = \frac{Ax * Is * Df}{Ais * RRF}$$

where: Ax = area of the characteristic ion for the compound being measured
Ais = area of the characteristic ion for the specific internal standard of the compound being measured
Is = Concentration of the internal standard injected (ppbv)
RRF= relative response factor for the compound being measured
Df = Dilution factor

RE: Griffis AFB B774/B776 SSVM

Dear Katrina Mattice:

Centek Laboratories, LLC received 10 sample(s) on 5/9/2011 for the analyses presented in the following report.

I certify that this data package is in compliance with the terms and conditions of the Contract, both technically and for completeness. Release of the data contained in this hardcopy data package and/or in the computer readable data submitted has been authorized by the Laboratory Manager or his designee, as verified by the following signature.

All method blanks, laboratory spikes, and/or matrix spikes met quality assurance objective except as indicated in the case narrative. All samples were received and analyzed within the EPA recommended holding times. Test results are not Method Blank (MB) corrected for contamination.

Centek Laboratories is distinctively qualified to meet your needs for precise and timely volatile organic compound analysis. We perform all analyses according to EPA, NIOSH or OSHA-approved analytical methods. Centek Laboratories is dedicated to providing quality analyses and exceptional customer service. Samples were analyzed using the methods outlined in the following references:

Compendium of Methods for the Determination of Toxic Organic Compounds, Compendium Method TO-15, January 1999.

Analytical results relate to samples as received at laboratory. We do our best to make our reporting format clear and understandable and hope you are thoroughly satisfied with our services.

Please contact your client service representative at (315) 431-9730 or myself, if you would like any additional information regarding this report.

Thank you for using Centek Laboratories. This report can not be reproduced except in its entirety, without prior written authorization.

Sincerely,

Russell Pellegrino
Technical Director

Disclaimer: The test results and procedures utilized, and laboratory interpretations of the data obtained by Centek as contained in this report are believed by Centek to be accurate and reliable for sample(s) tested. In accepting this report, the customer agrees that the full extent of any and all liability for actual and consequential damages of Centek for the services performed shall be equal to the fee charged to the customer for the services as liquidated damages.

Centek Laboratories, LLC Terms and Conditions

Sample Submission

All samples sent to Centek Laboratories should be accompanied by our Request for Analysis Form or Chain of Custody Form. A Chain of Custody will be provided with each order shipped for all sampling events, or if needed, one is available at our website www.CentekLabs.com. Samples received after 3:00pm are considered to be a part of the next day's business.

Sample Media

Samples can be collected in an canister or a Tedlar bag. Depending on your analytical needs, Centek Laboratories may receive a bulk, liquid, soil or other matrix sample for headspace analysis.

Blanks

Every sample is run with a surrogate or tracer compound at a pre-established concentration. The surrogate compound run with each sample is used as a standard to measure the performance of each run of the instrument. If required, a Minican can be provided containing nitrogen to be run as a trip blank with your samples.

Sampling Equipment

Centek Laboratories will be happy to provide the canisters to carry-out your sampling event at no charge. The necessary accessories, such as regulators, tubing or personal sampling belts, are also provided to meet your sampling needs. The customer is responsible for all shipping charges to the client's destination and return shipping to the laboratory. Client assumes all responsibility for lost, stolen and any dameges of equipment.

Turn Around time (TAT)

Centek Laboratories will provide results to its clients in one business-week by 6:00pm EST after receipt of samples. For example, if samples are received on a Monday they are due on the following Monday by 6:00pm EST. Results are faxed or emailed to the requested location indicated on the Chain of Custody. Non-routine analysis may require more than the one business-week turnaround time. Please confirm non-routine sample turnaround times.

Reporting

Results are emailed or faxed at no additional charge. A hard copy of the result report is mailed within 24 hours of the faxing or emailing of your results. Cat "B" like packages are within 3-4

weeks from time of analysis. Standard Electronic Disk Deliverables (EDD) is also available at no additional charge.

Payment Terms

Payment for all purchases shall be due within 30 days from date of invoice. The client agrees to pay a finance charge of 1.5% per month on the overdue balance and cost of collection, including attorney fees, if collection proceedings are necessary. You must have a completed credit application on file to extend credit. Purchase orders or checks information must be submitted for us to release results

Rush Turnaround Samples

Expedited turn around times is available. Please confirm rush turnaround times with Client Services before submitting samples.

Applicable Surcharges for Rush Turnaround Samples:
Same day TAT = 200%
Next business day TAT by Noon = 150%
Next business day TAT by 6:00pm = 100%
Second business day TAT by 6:00pm = 75%
Third business day TAT by 6:00pm = 50%
Fourth business day TAT by 6:00pm = 35%
Fifth business day = Standard

Statement of Confidentiality

Centek Laboratories, LLC is aware of the importance of the confidentiality of results to many of our clients. Your name and data will be held in the strictest of confidence. We will not accept business that may constitute a conflict of interest. We commonly sign Confidential Nondisclosure Agreements with clients prior to beginning work. All research, results and reports will be kept strictly confidential. Secrecy Agreements and Disclosure Statements will be signed for the client if so specified. Results will be provided only to the addressee specified on the Chain of Custody Form submitted with the samples unless law requires release. Written permission is required from the addressee to release results to any other party.

Limitation on Liability

Centek Laboratories, LLC warrants the test results to be accurate to the methodology and sample type for each sample submitted to Centek Laboratories, LLC. In no event shall Centek Laboratories, LLC be liable for direct, indirect, special, punitive, incidental, exemplary or consequential damages, or any damages whatsoever, even if Centek Laboratories, LLC has been previously advised of the possibility of such damages whether in an action under contract, negligence, or any other theory, arising out of or in connection with the use, inability to use or performance of the information, services, products and materials available from the laboratory or this site. These limitations shall apply notwithstanding any failure of essential purpose of any limited remedy. Because some jurisdictions do not allow limitations on how long an implied warranty lasts, or the exclusion or limitation of liability for consequential or incidental damages, the above limitations may not apply to you. This is a comprehensive limitation of liability that applies to all damages of any kind, including (without limitation) compensatory, direct, indirect or consequential damages, loss of data, income or profit and or loss of or damage to property and claims of third parties.

CASE NARRATIVE

All method blanks, laboratory spikes, and/or matrix spikes met quality assurance objective except as indicated in the corrective action report(s). All samples were received and analyzed within the EPA recommended holding times. Test results are not Method Blank (MB) corrected for contamination. Samples were analyzed using the methods outlined in the following references:

Compendium of Methods for the Determination of Toxic Organic Compounds, Compendium Method TO-15, January 1999.

See Corrective Action: [2209] LCSD did not meet criteria.
See Corrective Action: [2215] Continuing calibration did not meet criteria.

Centek Laboratories, LLC

Corrective Action Report

Date Initiated: 10-May-11 **Corrective Action Report ID:** 2209

Initiated By: Russell Pellegrino **Department:** MSVOA

Corrective Action Description

CAR Summary: LCSD did not meet criteria.

Description of Nonconformance: ALCS1UGD-051011 did not meet criteria for RPD and % recoveries for several compounds. The LCSD did not reproduce. All other QC met criteria for the compounds of interest. The LCS 6 Liter canister was independent of the 6 Liter continuing calibration canister.

Description of Corrective Action: Since all other QC met criteria for the associated samples and the LCS 6 Liter canister was independent of the 6 Liter continuing calibration canister, no corrective action taken at this time. If results continue to be outside established limits then a new LCS stock standard will be analyzed. All sets of data submitted.

Performed By: Russell Pellegrino **Completion Date:** 11-May-11

Centek Laboratories, LLC

Corrective Action Report

Date Initiated: 10-May-11 **Corrective Action Report ID:** 2215

Initiated By: Russell Pellegrino **Department:** MSVOA

Corrective Action Description

CAR Summary: Continuing calibration did not meet criteria

Description of Nonconformance: Continuing calibration did not meet criteria on 5/10/11 for MTBE &1,2,4-trimethylbenzene. The compounds are more sensitive and were not and not found associated samples.

Description of Corrective Action: Since the compound is more sensitive and was not found in the associated samples than continue with analysis.

Performed By: Russell Pellegrino **Completion Date:** 11-May-11

Client Notification

Client Notification Required: No **Notified By:**

Comment:

Quality Assurance Review

Nonconformance Type: Deficiency

Further Action required by QA: At this time no further corrective action taken. All sets of data submitted. Recalibrate the system if compounds remain outside criteria.

GC/MS-Whole Air Calculations

Relative Response Factor (RRF)

$$RRF = \frac{Ax * Cis}{Ais * Cx}$$

where: Ax = area of the characteristic ion for the compound being measured
Ais = area of the characteristic ion for the specific internal standard of the compound being measured
Cx = concentration of the compound being measured (ppbv)
Cis = concentration of the internal standard (ppbv)

Percent Relative Standard Deviation (%RSD)

$$\% RSD = \frac{\text{Standard deviation of RRF values} * 100}{\text{mean RRF}}$$

Percent Difference (%D)

$$\% D = \frac{(RRFc - \text{mean RRFi}) * 100}{\text{mean RRFi}}$$

where: RRFc = relative response factor from the continuing calibration
mean RRFi = mean relative response factor from the initial calibration

Sample Calculations

$$ppbv = \frac{Ax * Is * Df}{Ais * RRF}$$

where: Ax = area of the characteristic ion for the compound being measured
Ais = area of the characteristic ion for the specific internal standard of the compound being measured
Is = Concentration of the internal standard injected (ppbv)
RRF= relative response factor for the compound being measured
Df = Dilution factor

Qualifiers:

**	Reporting Limit	.	Results reported are not blank corrected
B	Analyte detected in the associated Method Blank	E	Value above quantitation range
H	Holding times for preparation or analysis exceeded	J	Analyte detected at or below quantitation limits
JN	Non-routine analyte. Quantitation estimated.	ND	Not Detected at the Reporting Limit
S	Spike Recovery outside accepted recovery limits

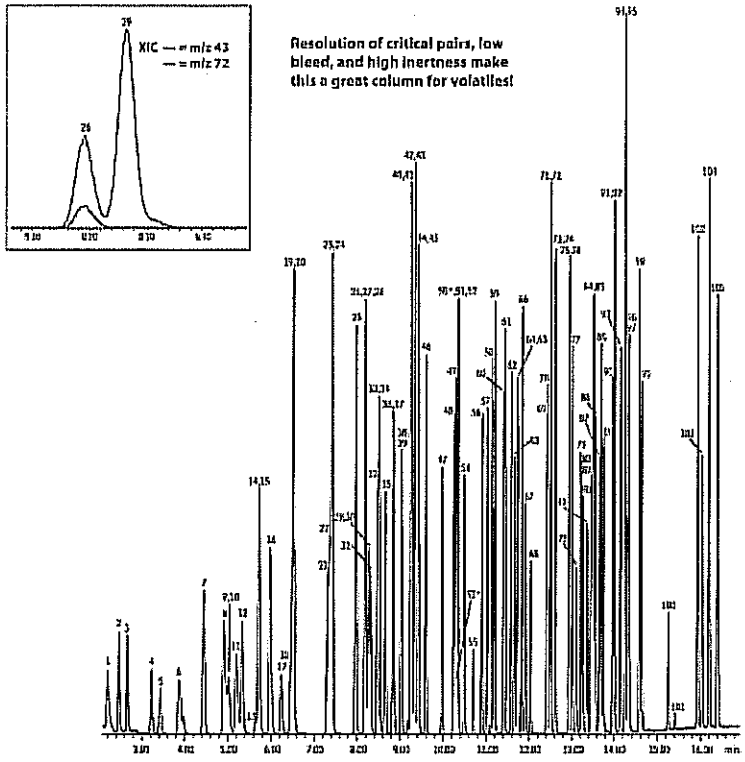
Volatiles by EPA Method 8260 on Rxi®-624Sil MS (30m, 0.25mm ID, 1.40µm)



Resolution of critical pairs, low bleed, and high inertness make this a great column for volatiles!

Column:	Rxi®-624Sil MS, 30 m, 0.25 mm ID, 1.40 µm (cat.# 13868)
Sample:	8260A Surrogate Mix (cat.# 30240) 8260A Internal Standard Mix (cat.# 30241) 8260B MegaMix® Calibration Mix (cat.# 30633) VOA Calibration Mix #1 (ketones) (cat.# 30006) 8260B Acetate Mix (revised) (cat.# 30489) California Oxygenates Mix (cat.# 30465) 502.2 Calibration Mix #1 (gases) (cat.# 30042)
Conc.:	25 ppb in RO water
Injection	purge and trap split (split ratio 30:1)
Inj. Temp.:	225 °C
Purge and Trap	
Instrument:	OI Analytical 4660
Trap Type:	10 Trap
Purge:	11 min. @ 20 °C
Desorb Preheat Temp.:	180 °C
Desorb:	0.5 min. @ 190 °C
Bake:	5 min. @ 210 °C
Interface Connection:	injection port
Oven	
Oven Temp:	35 °C (hold 5 min.) to 60 °C at 11 °C/min. to 220 °C at 20 °C/min. (hold 2 min.)
Carrier Gas:	He, constant flow
Flow Rate:	1.0 mL/min.
Detector:	MS
Mode:	Scan
Transfer Line Temp.:	230 °C
Analyzer Type:	Quadrupole
Source Temp.:	230 °C
Quad Temp.:	150 °C
Electron Energy:	70 eV
Solvent Delay Time:	1.5 min.
Tune Type:	BFB
Ionization Mode:	EI
Scan Range:	36-260 amu
Instrument:	
Agilent 7890A GC & 5975C MSD	
Notes	
Other Purge and Trap Conditions:	
Sample Inlet: 40°C	
Sample: 40°C	
Water Management:	
Purge 110°C, Desorb 0°C, Bake, 240°C	

Peaks	RT (min.)
1. Dichlorodifluoromethane (CFC-12)	2.198
2. Chloromethane	2.459
3. Vinyl chloride	2.659
4. Bromomethane	3.226
5. Chloroethane	3.434
6. Trichlorofluoromethane (CFC-11)	3.876
7. Diethyl ether (ethyl ether)	4.440
8. 1,1-Dichloroethene	4.909
9. 1,1,2-Trichlorotrifluoroethane (CFC-113)	4.998
10. Acetone	5.029
11. Iodomethane	5.195
12. Carbon disulfide	5.323
13. Acetonitrile	5.637
14. Allyl chloride	5.715
15. Methyl acetate	5.723
16. Methylene chloride	5.981
17. *tert*-Butyl alcohol	6.234
18. Acrylonitrile	6.451
19. Methyl *tert*-butyl ether (MTBE)	6.509
20. *trans*-1,2-Dichloroethene	6.512
21. 1,1-Dichloroethane	7.315
22. Vinyl acetate	7.359
23. Diisopropyl ether (DIPE)	7.407
24. Chloroprene	7.429
25. Ethyl *tert*-butyl ether (ETBE)	7.970
26. 2-Butanone (MEK)	8.193
27. *cis*-1,2-Dichloroethene	8.193
28. 2,2-Dichloropropane	8.193
29. Ethyl acetate	8.265
30. Propionitrile	8.276
31. Methyl acrylate	8.318
32. Methacrylonitrile	8.476
33. Bromochloromethane	8.507
34. Tetrahydrofuran	8.521
35. Chloroform	8.651
36. 1,1,1-Trichloroethane	8.843
37. Dibromofluoromethane	8.848
38. Carbon tetrachloride	9.026
39. 1,1-Dichloropropene	9.037
40. 1,2-Dichloroethane-d4	9.246
41. Benzene	9.262
42. 1,2-Dichloroethane	9.334
43. Isopropyl acetate	9.340
44. Isobutyl alcohol	9.421
45. *tert*-Amyl methyl ether (TAME)	9.421
46. Fluorobenzene	9.598
47. Trichloroethene	9.976
48. 1,2-Dichloropropane	10.243
49. Methyl methacrylate	10.290
50. 1,4-Dioxane (ND)	10.299*
51. Dibromomethane	10.326
52. Propyl acetate	10.346
53. 2-Chloroethanol (ND)	10.368*
54. Bromodichloromethane	10.496
55. 2-Nitropropane	10.698
56. *cis*-1,3-Dichloropropene	10.904
57. 4-Methyl-2-pentanone (MEK)	11.026
58. Toluene-D8	11.148
59. Toluene	11.210
60. *trans*-1,3-Dichloropropene	11.407
61. Ethyl methacrylate	11.435
62. 1,1,2-Trichloroethane	11.585
63. Tetrachloroethene	11.662
64. 1,3-Dichloropropane	11.729
65. 2-Hexanone	11.749
66. Butyl acetate	11.837
67. Dibromochloromethane	11.921
68. 1,2-Dibromoethane (EDB)	12.035
69. Chlorobenzene-d5	12.412
70. Chlorobenzene	12.440
71. Ethylbenzene	12.507
72. 1,1,1,2-Tetrachloroethane	12.507
73. *m*-Xylene	12.612
74. *p*-Xylene	12.612
75. *o*-Xylene	12.935
76. Styrene	12.949
77. *n*-Amyl acetate	13.018
78. Bromoform	13.118
79. Isopropylbenzene (cumene)	13.226
80. *cis*-1,4-Dichloro-2-butene	13.268
81. 4-Bromofluorobenzene	13.385
82. 1,1,2,2-Tetrachloroethane	13.456
83. *trans*-1,4-Dichloro-2-butene	13.496
84. Bromobenzene	13.515
85. 1,2,3-Trichloropropane	13.526
86. *n*-Propylbenzene	13.565
87. 2-Chlorotoluene	13.657
88. 1,3,5-Trimethylbenzene	13.699
89. 4-Chlorotoluene	13.751
90. *tert*-Butylbenzene	13.965
91. Pentachloroethane	14.007
92. 1,2,4-Trimethylbenzene	14.010
93. *sec*-Butylbenzene	14.140
94. 4-Isopropyltoluene (*p*-cymene)	14.254
95. 1,3-Dichlorobenzene	14.263
96. 1,4-Dichlorobenzene-D4	14.321
97. 1,4-Dichlorobenzene	14.340
98. *n*-Butylbenzene	14.579
99. 1,2-Dichlorobenzene	14.635
100. 1,2-Dibromo-3-chloropropane (DBCP)	15.252
101. Nitrobenzene	15.407
102. 1,2,4-Trichlorobenzene	15.935
103. Hexachloro-1,3-butadiene	16.040
104. Naphthalene	16.196
105. 1,2,3-Trichlorobenzene	16.396

* ND = not detected; retention time determined by wet needle injection

Volatiles by EPA Method 8260 on Rxi®-624Sil MS (30m, 0.25mm ID, 1.40µm)

Peaks	RT (min.)
1. Dichlorodifluoromethane (CFC-12)	2.198
2. Chloromethane	2.459
3. Vinyl chloride	2.659
4. Bromomethane	3.226
5. Chloroethane	3.434
6. Trichlorofluoromethane (CFC-11)	3.876
7. Diethyl ether (ethyl ether)	4.44
8. 1,1-Dichloroethene	4.909
9. 1,1,2-Trichlorotrifluoroethane (CFC-113)	4.998
10. Acetone	5.029
11. Iodomethane	5.195
12. Carbon disulfide	5.323
13. Acetonitrile	5.637
14. Allyl chloride	5.715
15. Methyl acetate	5.723
16. Methylene chloride	5.981
17. *tert*-Butyl alcohol	6.234
18. Acrylonitrile	6.451
19. Methyl *tert*-butyl ether (MTBE)	6.509
20. *trans*-1,2-Dichloroethene	6.512
21. 1,1-Dichloroethane	7.315
22. Vinyl acetate	7.359
23. Diisopropyl ether (DIPE)	7.407
24. Chloroprene	7.429
25. Ethyl *tert*-butyl ether (ETBE)	7.97
26. 2-Butanone (MEK)	8.193
27. *cis*-1,2-Dichloroethene	8.193
28. 2,2-Dichloropropane	8.193
29. Ethyl acetate	8.265
30. Propionitrile	8.276
31. Methyl acrylate	8.318
32. Methacrylonitrile	8.476
33. Bromochloromethane	8.507
34. Tetrahydrofuran	8.521
35. Chloroform	8.651
36. 1,1,1-Trichloroethane	8.843
37. Dibromofluoromethane	8.848
38. Carbon tetrachloride	9.026
39. 1,1-Dichloropropene	9.037
40. 1,2-Dichloroethane-d4	9.246
41. Benzene	9.262
42. 1,2-Dichloroethane	9.334
43. Isopropyl acetate	9.34
44. Isobutyl alcohol	9.421
45. *tert*-Amyl methyl ether (TAME)	9.421
46. Fluorobenzene	9.598
47. Trichloroethene	9.976
48. 1,2-Dichloropropane	10.243
49. Methyl methacrylate	10.29
50. 1,4-Dioxane (ND)	10.299*
51. Dibromomethane	10.326
52. Propyl acetate	10.346
53. 2-Chloroethanol (ND)	10.368*
54. Bromodichloromethane	10.496
55. 2-Nitropropane	10.698
56. *cis*-1,3-Dichloropropene	10.904
57. 4-Methyl-2-pentanone (MIBK)	11.026
58. Toluene-D8	11.148
59. Toluene	11.21
60. *trans*-1,3-Dichloropropene	11.407
61. Ethyl methacrylate	11.435
62. 1,1,2-Trichloroethane	11.585
63. Tetrachloroethene	11.662
64. 1,3-Dichloropropane	11.729
65. 2-Hexanone	11.749
66. Butyl acetate	11.837
67. Dibromochloromethane	11.921
68. 1,2-Dibromoethane (EDB)	12.035
69. Chlorobenzene-d5	12.412
70. Chlorobenzene	12.44
71. Ethylbenzene	12.507
72. 1,1,1,2-Tetrachloroethane	12.507
73. *m*-Xylene	12.612
74. *p*-Xylene	12.612
75. *o*-Xylene	12.935
76. Styrene	12.949
77. *n*-Amyl acetate	13.018
78. Bromoform	13.118
79. Isopropylbenzene (cumene)	13.226
80. *cis*-1,4-Dichloro-2-butene	13.268
81. 4-Bromofluorobenzene	13.385
82. 1,1,2,2-Tetrachloroethane	13.456
83. *trans*-1,4-Dichloro-2-butene13	.496
84. Bromobenzene	13.515
85. 1,2,3-Trichloropropane	13.526
86. *n*-Propylbenzene	13.565
87. 2-Chlorotoluene	13.657
88. 1,3,5-Trimethylbenzene	13.699
89. 4-Chlorotoluene	13.751
90. *tert*-Butylbenzene	13.965
91. Pentachloroethane	14.007
92. 1,2,4-Trimethylbenzene	14.01
93. *sec*-Butylbenzene	14.14
94. 4-Isopropyltoluene (*p*-cymene)	14.254
95. 1,3-Dichlorobenzene	14.263
96. 1,4-Dichlorobenzene-D4	14.321
97. 1,4-Dichlorobenzene	14.34
98. *n*-Butylbenzene	14.579
99. 1,2-Dichlorobenzene	14.635
100. 1,2-Dibromo-3-chloropropane (DBCP)	15.252
101. Nitrobenzene	15.407
102. 1,2,4-Trichlorobenzene	15.935
103. Hexachloro-1,3-butadiene	16.04
104. Naphthalene	16.196
105. 1,2,3-Trichlorobenzene	16.396

* ND = not detected; retention time determined by wet needle injection

RE: B774/B776 SSVM

Dear Katrina Mattice:

Centek Laboratories, LLC received 3 sample(s) on 6/6/2011 for the analyses presented in the following report.

I certify that this data package is in compliance with the terms and conditions of the Contract, both technically and for completeness. Release of the data contained in this hardcopy data package and/or in the computer readable data submitted has been authorized by the Laboratory Manager or his designee, as verified by the following signature.

All method blanks, laboratory spikes, and/or matrix spikes met quality assurance objective except as indicated in the case narrative. All samples were received and analyzed within the EPA recommended holding times. Test results are not Method Blank (MB) corrected for contamination.

Centek Laboratories is distinctively qualified to meet your needs for precise and timely volatile organic compound analysis. We perform all analyses according to EPA, NIOSH or OSHA-approved analytical methods. Centek Laboratories is dedicated to providing quality analyses and exceptional customer service. Samples were analyzed using the methods outlined in the following references:

Compendium of Methods for the Determination of Toxic Organic Compounds, Compendium Method TO-15, January 1999.

Analytical results relate to samples as received at laboratory. We do our best to make our reporting format clear and understandable and hope you are thoroughly satisfied with our services.

Please contact your client service representative at (315) 431-9730 or myself, if you would like any additional information regarding this report.

Thank you for using Centek Laboratories. This report can not be reproduced except in its entirety, without prior written authorization.

Sincerely,

Russell Pellegrino
Technical Director

Disclaimer: The test results and procedures utilized, and laboratory interpretations of the data obtained by Centek as contained in this report are believed by Centek to be accurate and reliable for sample(s) tested. In accepting this report, the customer agrees that the full extent of any and all liability for actual and consequential damages of Centek for the services performed shall be equal to the fee charged to the customer for the services as liquidated damages.

Centek Laboratories, LLC Terms and Conditions

Sample Submission

All samples sent to Centek Laboratories should be accompanied by our Request for Analysis Form or Chain of Custody Form. A Chain of Custody will be provided with each order shipped for all sampling events, or if needed, one is available at our website www.CentekLabs.com. Samples received after 3:00pm are considered to be a part of the next day's business.

Sample Media

Samples can be collected in an canister or a Tedlar bag. Depending on your analytical needs, Centek Laboratories may receive a bulk, liquid, soil or other matrix sample for headspace analysis.

Blanks

Every sample is run with a surrogate or tracer compound at a pre-established concentration. The surrogate compound run with each sample is used as a standard to measure the performance of each run of the instrument. If required, a Minican can be provided containing nitrogen to be run as a trip blank with your samples.

Sampling Equipment

Centek Laboratories will be happy to provide the canisters to carry-out your sampling event at no charge. The necessary accessories, such as regulators, tubing or personal sampling belts, are also provided to meet your sampling needs. The customer is responsible for all shipping charges to the client's destination and return shipping to the laboratory. Client assumes all responsibility for lost, stolen and any dameges of equipment.

Turn Around time (TAT)

Centek Laboratories will provide results to its clients in one business-week by 6:00pm EST after receipt of samples. For example, if samples are received on a Monday they are due on the following Monday by 6:00pm EST. Results are faxed or emailed to the requested location indicated on the Chain of Custody. Non-routine analysis may require more than the one business-week turnaround time. Please confirm non-routine sample turnaround times.

Reporting

Results are emailed or faxed at no additional charge. A hard copy of the result report is mailed within 24 hours of the faxing or emailing of your results. Cat "B" like packages are within 3-4

weeks from time of analysis. Standard Electronic Disk Deliverables (EDD) is also available at no additional charge.

Payment Terms

Payment for all purchases shall be due within 30 days from date of invoice. The client agrees to pay a finance charge of 1.5% per month on the overdue balance and cost of collection, including attorney fees, if collection proceedings are necessary. You must have a completed credit application on file to extend credit. Purchase orders or checks information must be submitted for us to release results

Rush Turnaround Samples

Expedited turn around times is available. Please confirm rush turnaround times with Client Services before submitting samples.

Applicable Surcharges for Rush Turnaround Samples:
Same day TAT = 200%
Next business day TAT by Noon = 150%
Next business day TAT by 6:00pm = 100%
Second business day TAT by 6:00pm = 75%
Third business day TAT by 6:00pm = 50%
Fourth business day TAT by 6:00pm = 35%
Fifth business day = Standard

Statement of Confidentiality

Centek Laboratories, LLC is aware of the importance of the confidentiality of results to many of our clients. Your name and data will be held in the strictest of confidence. We will not accept business that may constitute a conflict of interest. We commonly sign Confidential Nondisclosure Agreements with clients prior to beginning work. All research, results and reports will be kept strictly confidential. Secrecy Agreements and Disclosure Statements will be signed for the client if so specified. Results will be provided only to the addressee specified on the Chain of Custody Form submitted with the samples unless law requires release. Written permission is required from the addressee to release results to any other party.

Limitation on Liability

Centek Laboratories, LLC warrants the test results to be accurate to the methodology and sample type for each sample submitted to Centek Laboratories, LLC. In no event shall Centek Laboratories, LLC be liable for direct, indirect, special, punitive, incidental, exemplary or consequential damages, or any damages whatsoever, even if Centek Laboratories, LLC has been previously advised of the possibility of such damages whether in an action under contract, negligence, or any other theory, arising out of or in connection with the use, inability to use or performance of the information, services, products and materials available from the laboratory or this site. These limitations shall apply notwithstanding any failure of essential purpose of any limited remedy. Because some jurisdictions do not allow limitations on how long an implied warranty lasts, or the exclusion or limitation of liability for consequential or incidental damages, the above limitations may not apply to you. This is a comprehensive limitation of liability that applies to all damages of any kind, including (without limitation) compensatory, direct, indirect or consequential damages, loss of data, income or profit and or loss of or damage to property and claims of third parties.

CASE NARRATIVE

All method blanks, laboratory spikes, and/or matrix spikes met quality assurance objective except as indicated in the corrective action report(s). All samples were received and analyzed within the EPA recommended holding times. Test results are not Method Blank (MB) corrected for contamination. Samples were analyzed using the methods outlined in the following references:

Compendium of Methods for the Determination of Toxic Organic Compounds, Compendium Method TO-15, January 1999.See Corrective Action: [2234] IS did not meet criteria.

Centek Laboratories, LLC

Corrective Action Report

Date Initiated: 09-Jun-11 **Corrective Action Report ID:** 2234

Initiated By: Russell Pellegrino **Department:** MSVOA

Corrective Action Description

CAR Summary: IS did not meet criteria.

Description of Nonconformance: IS was high and did not meet criteria for samples C1106007-001. Based on the chromatographic evidence this is most likely due to matrix interference it appears to be a fuel.

Description of Corrective Action: Sample was analyzed further as dilutions with results meeting criteria. All other QC met criteria.

Performed By: Russell Pellegrino **Completion Date:** 13-Jun-11

Client Notification

Client Notification Required: No **Notified By:**

Comment:

Quality Assurance Review

Nonconformance Type: Deficiency

Further Action required by QA: No further corrective action taken. All sets of data submitted

2335

21-Jul-11

SHIPPED TO:

Company: FPM Group
Contact: Katrina Mattice
Address: 153 Brook Road
Rome, NY 13441
Phone: (315) 336-7721
Quote ID: 252
Project:

Submitted By:

Ship Date: 4/29/2011
VIA: FedEx
Due Date: 5/2/2011

Bottle Code	Bottle Type	TEST(s)	QTY
MC1000CC	1L Mini-Can	1ug/M3 by Method TO15	1
MC1000CC	1L Mini-Can	1ug/M3 by Method TO15	6

Can / Reg ID	Description
85	1L Mini-Can - 1098
94	1L Mini-Can - 1086
95	1L Mini-Can - 1087
128	1L Mini-Can - 1076
178	Time-Set Reg - 665
292	Time-Set Reg - 715
306	Time-Set Reg - 729
381	Time-Set Reg - 755
393	Time-Set Reg - 772
437	Time-Set Reg - 816
463	1L Mini-Can - 1366
464	1L Mini-Can - 1367
476	1L Mini-Can - 1378
797	Shipping Cooler L

Comments: 6 1L @ 12 hrs. Include a trip blank. She needs for sampling on Mkonday 5/2/11 WAC 041911 A-F, 042611 A

GC/MS-Whole Air Calculations

Relative Response Factor (RRF)

$$RRF = \frac{Ax * Cis}{Ais * Cx}$$

where: Ax = area of the characteristic ion for the compound being measured
Ais = area of the characteristic ion for the specific internal standard of the compound being measured
Cx = concentration of the compound being measured (ppbv)
Cis = concentration of the internal standard (ppbv)

Percent Relative Standard Deviation (%RSD)

$$\% RSD = \frac{\text{Standard deviation of RRF values} * 100}{\text{mean RRF}}$$

Percent Difference (%D)

$$\%D = \frac{(RRFc - \text{mean RRFi}) * 100}{\text{mean RRFi}}$$

where: RRFc = relative response factor from the continuing calibration
mean RRFi = mean relative response factor from the initial calibration

Sample Calculations

$$ppbv = \frac{Ax * Is * Df}{Ais * RRF}$$

where: Ax = area of the characteristic ion for the compound being measured
Ais = area of the characteristic ion for the specific internal standard of the compound being measured
Is = Concentration of the internal standard injected (ppbv)
RRF= relative response factor for the compound being measured
Df = Dilution factor
