1.0 INTRODUCTION

FPM Remediations, Inc. (FPM), in association with CAPE, Inc., under contract with the Air Force Civil Engineer Center (AFCEC), conducted a site closure investigation in 2013 and a removal action in 2014 at the Land Use Control/Institutional Control (LUC/IC) Site Area of Interest (AOI) 72 at the former Griffiss Air Force Base (AFB) in Rome, New York. The objective of the site closure activities is to achieve unrestricted reuse at the site. Detailed descriptions of the 2013 site investigation are provided in the Final Site Investigation Report for LUC/IC Site AOI 72 (CAPE/FPM, December 2013). This Site Closure Report has been prepared to document the 2014 Removal Action and to recommend unrestricted reuse at the site.

The removal action was conducted on April 16, 2014 in accordance with the Final Site Investigation Report for LUC/IC Site AOI 72, including Attachment 1 – Removal Action Plan for AOI 72 (CAPE/FPM, December 2013). The Updated 2013 Uniform Federal Policy Quality Assurance Project Plan (UFP QAPP) for Performance Based-Remediation at the Former Griffiss AFB (CAPE/FPM, May 2013) and Final Addenda Health and Safety Plan for Performance Based-Remediation at the Former Griffiss AFB (CAPE/FPM/AECOM, July 2012) were also used.

1.1 Site Background

A 1989 United States Environmental Protection Agency (USEPA) Site Analysis identified the area as a potential drum storage site in 1966. Based on the USEPA Site Analysis the site was identified as an AOI in a 1994 AOI Report (Law, June 1994). Review of historical aerial photographs verified the site was used as a storage area. An aerial photograph from May 1960 shows an open area stripped of vegetation with erosional channels. Aerial photographs from 1967 through 1973 show a storage area with rows of unknown material in the southern and central portion of the site. By 1974, the material had been removed. In photographs from 1975 through 1978, two small areas of storage materials and possible drums were observed. In 1982, the storage of material appeared sporadic (Ecology and Environment [E&E], September 1999).

A Preliminary Assessment/Site Inspection (PA/SI) was conducted for AOI 72 in 1999. During this investigation 30 soil samples were collected from 15 locations. Two samples, a surface (0 to 2 inches below ground surface (bgs)) and a near-surface (2 to 4 feet (ft) bgs) soil sample were collected at each location. Samples were analyzed for volatile organic compounds (VOCs), semi-volatile organic compounds (SVOCs), polychlorinated biphenyls (PCBs), pesticides, and metals. Based on the sampling results and human health risk assessment conducted at the site, no further sampling was recommended (E&E, September 1999). This report is provided in Appendix A. Comparison with the Title 6 - New York Codes, Rules and Regulations (6-NYCRR) Part 375 Residential Use Soil Cleanup Objectives (SCOs) (NYSDEC, December 2006) showed pesticide and metals exceedances.

A Record of Decision (ROD) was not required because the site was part of the AOI group and was closed during the PA/SI investigation period. LUC/ICs for the site, provided in the Parcel F9 deed, include:

"The grantee covenants and agrees to the requirement for additional evaluation of the portion of the property within AOI 72 should the property use change from institutional/educational to residential."

The restricted area is illustrated in Figure 1. The Parcel F9 deed is provided in Appendix A.

2.0 2013 SITE CLOSURE INVESTIGATION

The 2013 site closure investigation included a soil and groundwater investigation to delineate/confirm the presence of residual soil contamination at the site. The soil investigation included soil sampling at seven locations within the AOI 72 boundary and x-ray fluorescence (XRF) screening at six of the seven locations (as illustrated in Figure 1). The groundwater investigation consisted of two samples collected from a perched water table located within AOI 72 (as illustrated in Figure 2). The activities and screening/sampling results are summarized below. Details of these activities are provided in the Final Site Investigation Report for LUC/IC Site AOI 72 (CAPE/FPM, December 2013).

Confirmatory soil sampling was conducted at 28 soil borings (direct push) within the AOI 72 site boundary (Figure 1) on May 8 and 9, 2013. Samples were collected from 0 to 2 ft bgs and 2 to 4 ft bgs from each of the borings. Based on the results from the 1999 PA/SI, samples collected at four boring locations were analyzed for pesticides using USEPA Method SW8081 and the remaining 24 borings were analyzed for metals using USEPA Method SW6010. The results are presented in Table 1 and showed that all pesticide and metals concentrations were below the 6-NYCRR Part 375 Residential use SCOs.

To confirm the location of the elevated metals concentrations, XRF screening was used to determine the extent of the contamination at each of the previously identified sampling locations. Samples were screened from the 0 to 2 ft bgs and 2 to 4 ft bgs intervals at 28 soil borings (four soil borings each for locations 72SCS-2, -3, -4, -5, -6, and -7). XRF screening showed metal concentrations below the 6-NYCRR Part 375 Residential Use SCOs at all borings except for boring 72SCS-2B (see Figure 1). The copper concentrations in the 0 to 2 ft bgs interval at 72SCS-2B ranged from 271 to 400 ppm. The 6-NYCRR Part 375 Residential Use SCO for copper is 270 ppm. Based on the primary screening performed at 72SCS-2B, three additional step-out borings were advanced and screened to better assess the lateral extent of the metal exceedances. Results of the additional step-out screening showed metals concentrations were below 6-NYCRR Part 375 Residential use SCOs. The XRF screening at the primary locations to the west and south of 72SCS-2B also showed copper concentrations were below 6-NYCRR Part 375 Residential use SCOs.

A petroleum odor was observed during field screening at soil boring 72SCS-6D (72SCS-6 location) from the 0 to 2 ft bgs interval (Figure 1). A photoionization detector (PID) reading was collected with a result of 14.1 parts per million (ppm). Petroleum odor was not observed at locations 72SCS-6A, -6B, or -6C. As a result of the reported petroleum odor, additional delineation of the 72SCS-6D location was conducted on May 16, 2013. The delineation included PID reading collection, soil sampling, perched water sampling, and groundwater sampling. The delineation was conducted at nine borings positioned in a 10-ft grid using direct push (4-foot

macro core). The boring locations are illustrated in Figure 2. All borings were advanced until refusal (8 to 10 ft bgs). Groundwater was encountered at 8 ft bgs and a perched water layer was observed at several borings at approximately 4 ft bgs. Soil samples were collected at the intervals which exhibited the highest PID readings. The PID readings ranged from 0 ppm to 90 ppm. Soil samples were collected between 4 to 8 ft bgs if no elevated PID readings were observed in a boring. A water sample was also collected from the perched water layer at 72SCS-9 and a groundwater sample was collected at 72SCS-14. The decision to collect the water samples at these locations was made in the field as they showed the overall highest PID readings for all borings (above 50 ppm). The highest PID reading at 72SCS-9 was 60 ppm and the highest PID reading at 72SCS-14 was 90 ppm. Perched water was not observed at 72SCS-14. All soil and groundwater samples were analyzed for VOCs using USEPA method SW8260.

Soil sampling results showed that all VOC concentrations were below the 6-NYCRR Part 375 Residential Use SCOs (Table 1). Results from 72SCS-9, the perched water table sample, showed two VOCs above their respective NYSDEC Ambient Water Quality Standards and Guidance Values (NYSDEC, June 1998). Trichloroethylene (TCE) was detected at 11 micrograms per liter (µg/L) and 1,2,4-trimethylbenzene was detected at 11 µg/L. NYSDEC Ambient Water Quality Standards for these VOCs is 5 µg/L. Results from 72SCS-14 (the groundwater sample) showed that TCE and 1,2,4-trimethylbenzene were detected in this sample, but all VOCs were below NYSDEC Ambient Water Quality Standards and Guidance Values (NYSDEC, June 1998). Sampling results are presented in Table 2.

3.0 2014 REMOVAL ACTION

Based on the 2013 Site Closure Investigation, a removal action was conducted on April 16, 2014 to eliminate VOC impacts from the perched water table.

3.1 TOXICITY CHARACTERISTIC LEACHING PROCEDURE SAMPLING

Prior to soil disposal, one composite sample was collected and analyzed for toxicity characteristic leaching procedure (TCLP) VOCs, TCLP metals, and TCLP SVOCs in December 2013. Results showed that all VOCs, metals, and SVOC concentrations were below the hazardous waste characteristic levels (USEPA, October 2009). A waste profile for disposal was submitted to Oneida Herkimer Solid Waste Authority (OHSWA), which was approved. The sampling results are provided in Table 3. The daily chemical quality control report (CQCR) completed for this sampling event is provided in Appendix B. The raw laboratory data is provided in Appendix C. The approved waste profile form is provided in Appendix D.

3.2 SOIL REMOVAL ACTION

The approximate extent of the excavation was 40 ft by 20 ft by 6 ft bgs as shown in Figure 2. The excavation was conducted using a tracked excavator. During excavation, soils from 0 to 2 ft bgs were stockpiled for backfill. These soils were used as the 2013 Site Investigation and VOC delineation confirmed the absence of contamination in this interval. All soils from 2 to 6 ft bgs were removed and placed into 20-yard dump trucks for disposal. Approximately 180 cubic yards (cy) of contaminated soils were disposed of.

The excavation area is flat, topographically. Therefore, erosion controls were not implemented. In addition, no dewatering was conducted during the excavation. The only observed water (approximately 5 gallons) within the excavation was from surface runoff (snow melt). No water was observed entering the excavation through the excavation walls. The daily field form completed for the excavation is provided in Appendix B. All photos of the excavation are provided in Appendix E.

3.3 SOIL DISPOSAL

The soils were disposed of through the OHSWA at the Ava regional landfill in Ava, New York. Signed disposal manifests are provided in Appendix D.

3.4 SOIL CONFIRMATORY SAMPLING

Two grab confirmatory soil samples were collected from the bottom of the excavation. No sidewall confirmatory soil samples were collected as the excavation was completed to the uncontaminated points identified in the May 2013 delineation. The grab confirmatory soil samples from the bottom of the excavation were analyzed for VOCs using USEPA method SW8260. Results showed no VOC concentrations above 6-NYCRR Part 375 Residential Use or Protection of Groundwater SCOs. The confirmatory soil sampling results are presented in Table 4. The daily CQCR completed during this sampling event is provided in Appendix B. The raw laboratory data and the validated laboratory data are provided in Appendix C and F, respectively.

3.5 SITE RESTORATION

The site was initially restored following excavation on April 16, 2014. The initial restoration included the backfilling using clean sand (approximately 180 cy) to approximately 2 ft bgs. The stockpiled soils were then placed on the top of the sand to approximately 2-inch bgs. Final restoration activities were conducted during the week of May 27, 2014. This included the application of top soil (30 cy) to grade and reseeding with grass. The daily field forms completed for both restoration events are provided in Appendix B. All photos of the restoration and restored site are provided in Appendix E.

Prior to use, the backfill sand and top soil were sampled and analyzed for metals, SVOCs, VOCs, pesticides, and polychlorinated biphenyl (PCBs) to demonstrate that the backfill met applicable standards. The sampling results showed that the backfill material was below all SCOs as presented in Table 5. The raw laboratory data is provided in Appendix C. It should be noted that the same backfill material supply was used for two Griffiss removal actions, AOI 72 and the AOI 474 removal action. Therefore, only one sample was collected and identified as AOI474BF.

4.0 CONCLUSIONS AND RECOMMENDATIONS

Removal of LUC/ICs and site closure is recommended for AOI 72. The 2014 removal action was successful in removing all residual VOC contamination from the perched water table. Soil sampling results from the 1999 PA/SI, 2013 site investigation, and 2014 removal action showed all soil chemical concentrations were below the 6-NYCRR Part 375 Residential Use SCOs.

Purpose of Document

The purpose of the Parcel F9 investigation is to delineate and evaluate contamination in the surface soil and near surface soil from material storage areas, coal storage areas, and railroad tracks. The results of this investigation are being evaluated in a risk assessment to either confirm the no further study (NFS) recommendation or determine the potential risk to human health under future land use scenarios for Parcel F9. These additional investigations at Parcel F9 were completed in response to a request by the New York State Department of Environmental Conservation (NYSDEC), the New York State Department of Health (NYSDOH), and the United States Environmental Protection Agency (EPA) under a Findings of Suitability for Transfer (FOST) for future land development.

This quality control summary report (QCSR) presents the results of the analytical program and provides an opportunity to review the completeness and quality of the data collected. The purpose of this QCSR is to:

- Summarize sample collection, handling, and analytical procedures for the sampling event conducted for the Parcel F9 investigation;
- Identify any deviations from the proposed sampling and analysis procedures documented in Ecology and Environment, Inc's. (E & E's) addendum to the expanded site investigation (ESI) field sampling plan (FSP), health and safety plan (HASP), and quality assurance project plan (QAPjP) (E & E 1999);
- Present the analytical results for the field samples collected at seven areas of interest (AOIs); and Railroad Tracks; and
- Discuss the results of the data quality evaluation associated with the sampling event.

Evaluation of any contaminants detected from this sampling event will be provided in a separate report for the Parcel F9 investigation.

1 Introduction

Under contract to the United States Army Corps of Engineers (USACE), Kansas City District, E & E conducted a sampling investigation at seven AOIs and along a railroad track within Parcel F9 at the former Griffiss Air Force Base (Griffiss AFB) in Rome, New York). Parcel F9 is presently under a FOST for future land development.

Parcel F9 sampling was performed at the Group III AOIs listed below:

- Building 511 – Former Coal Storage Area (AOI 53);
- Ellsworth Road – Former Drum Storage Area (AOI 68);
- Woodhaven Housing – Former Drum Storage Area/Open Storage and Drainage Ditch (AOI 69/448);
- Current Trailer Park – Former Coal Storage Area (AOI 70);
- Trailer Park – Former Drum Storage Area-Tuscarora Drive (AOI 71);
- Mobile Avenue – Former Drum Storage Area (AOI 72);
- Building 5591 – Railroad Load/Unload Area (AOI 169).

Parcel F9 sampling was also performed along the Railroad Tracks crossing F9.

2 Data Collection, Data Management, and Quality Control Procedures

2.1 Sample Collection Procedures

The Parcel F9 field investigation consisted of the collection of near-surface soil (NS) and sediment (SD) samples in accordance with the July 1999 *Addendum to the ESI Field Sampling Plan (FSP), Health and Safety Plan, and Quality Assurance Project Plan for the Parcel F9 Investigation at Former Griffiss Air Force Base, Rome, New York* (E & E 1999) (see Appendix A). No variance in field methodologies occurred during the investigation. Daily Activity Summary reports were prepared by E & E and submitted to USACE and Air Force Base Conversion Agency (AFBCA) (see Appendix B). All field activities were carried out in accordance with the approved Quality Control Plan. An E & E QC inspector was present on site during the second day of the three-day field investigation.

Methodologies used for field notebooks; sample labeling, packaging, and custody; equipment decontamination; disposal of investigation-derived waste (IDW); and site survey were performed in accordance with the FSP. The collection of NS and SD samples were also conducted in accordance with the methodologies presented in the FSP.

2.2 Field QA/QC Sample Requirements

Quality assurance/quality control (QA/QC) samples were collected on a site-wide basis according to the criteria established in Section 10 of Law's Quality Assurance Project Plan (QAPP) (Law 1993), except as modified in E & E's QAPjP from the FSP (E & E 1999).

In summary, these field QA/QC sample requirements are as follows:

- Field QC duplicates would be collected at a frequency of 10 % of the number of field samples collected;

- Field QA split samples would be collected from the same sample points as the QC duplicate samples, at a frequency of 10% of the number of field samples collected;
- Rinsates would be collected at a frequency of 10% of the number of field samples collected if nondedicated equipment was used;
- Matrix spike/matrix spike duplicates (MS/MSDs) for laboratory QC would be collected at a frequency of 20% of the samples collected;
- No ambient condition blanks would be collected; and
- No field blanks would be collected.

2.3 Contracted Analytical Laboratories

All laboratory analyses were provided by E & E's Analytical Services Center (ASC) in Lancaster, New York. QA split samples were sent to the USACE Chemical Quality Assurance Branch (CQAB) in Omaha, Nebraska, for analysis.

2.4 Sample Handling and Custody Procedures

Field samples were collected, preserved, and transported to the appropriate laboratory according to the procedures described in FSP. Deviations from these sample handling and custody procedures are reported under the appropriate sampling area in Section 3 of this document.

All chain-of-custody documentation associated with the collection of samples for the F9 Parcel is included in Appendix C.

2.5 Equipment Calibration and Maintenance

Calibration procedures for the field and laboratory instruments are presented in Sections 8.1 and 8.2 of Law's QAPP (Law 1993), except as modified by E & E's FSP and QAPjP. Deviations from these calibration and maintenance procedures are reported under the appropriate sampling area in Section 3 of this document.

2.6 Quality Assurance Objectives

Data uses and QA objectives were determined by E & E and are included in E & E's FSP (E & E 1999).

2.7 Procedures for Data Quality Evaluation

Data quality evaluations focus on deviations from expected QC activities, problems encountered, and the acceptability of the methodologies used. Sample integrity is based on information provided on the cooler receipt form, the chain-of-custody documents, statements in the laboratory case narratives, and field notebooks. The evaluation of the analytical data with respect to project- and method-specific quality objectives was performed using the results of laboratory method blank analyses, laboratory control samples (LCS), matrix spike/matrix spike duplicate (MS/MSD) analyses, and surrogate recoveries, where applicable. Field duplicate data were used to evaluate the accuracy and precision of the analytical results and field sample collection methods.

The ASC prepares one data package per laboratory work order. One data validation memorandum is generated for each laboratory work order and describes the data qualifications in detail. These memoranda contain all the details of the data quality review. Copies of all data validation memoranda are provided in Appendix D. The key factors in the data quality review and validation procedures are highlighted for each sampling area in Section 3.

The sections that follow present the evaluation procedures used for laboratory and field QC samples.

2.7.1 Laboratory Data Quality Evaluation

The procedures used by E & E to evaluate and validate analytical data are described in Section 9.2.1 of Law's QAPP (Law 1993), except as modified by E & E's QAPjP in the FSP. Data validation requirements associated with this project are also presented in E & E's QAPjP. All data quality evaluation and qualification of the data summary tables were performed by a senior chemist. A project-specific data validation checklist was followed which ensured consistency and completeness of the data validation procedures. The data review was performed by reference to the following documents:

- USEPA Contract Laboratory Program *National Functional Guidelines for Organic Data Review* (EPA 1994); and
- USEPA Contract Laboratory Program *National Functional Guidelines for Inorganic Data Review* (EPA 1994).

Based on the guidance provided in these documents, professional judgment, and the QC limits presented in Law's QAPP (Law 1993) and E & E's QAPjP in the FSP (E & E 1999), data that meet acceptance limits for all laboratory and field QC were not qualified and should be considered usable as reported. Data with slight QC problems should be considered usable for this project, with qualifications.

The ASC also provided data on tentatively identified compounds (TICs) for Method 8270C in both the hard copy and electronic reports. The TICs were evaluated to determine potential background contamination and laboratory artifacts. Early eluting ketone-type compounds are typically associated as an aldol condensation product. Early eluting solvents are due to laboratory background. Acidic hydrocarbons such as hexadionic and pentadionic acids are background from the laboratory detergents used in glassware cleaning. Siloxane compounds typically arise from glassware leaching. Based on professional judgement and laboratory "B" flags, these compounds were flagged as non-reportable in the database. The remaining compounds were evaluated based on chemical structure, the quality of the library match, and the presence of the compounds relative to the known contamination in the sample. Only compounds with a greater than 90 percent match were reported. The remaining compounds were classified into analyte groups based on chemical structure (e.g., saturated hydrocarbons or oxygenated hydrocarbons). The TICs are then summarized in tables based on analyte group. The reported values represent the sum of all concentrations reported for that analyte group. The frequency of compounds is listed in parentheses.

2.7.2 Field Data Quality Evaluation

QA and QC samples were collected to assess the quality of the field sampling activities. These QA/QC field samples include duplicates, splits, and rinsate blanks. The evaluation of these samples was based on completeness of data, results of rinsate blank analysis, and relative percent differences (RPDs) of field duplicate results. The evaluation criteria (RPD categories) used for field duplicates can be found in Section 4.3.1 of Law's QAPP (Law 1993).

To facilitate the comparison of the original field, QC duplicate, and QA split sample data, all samples from a common sample point were assigned the same client ID number. The QC duplicate samples were assigned a suffix of "D," and QA split samples were assigned a suffix of "S."

Quality Control Sample Collection

The QC samples (duplicates and rinsate blanks) were collected with the field samples, placed in the same type of containers, treated in the same manner as the field samples, and analyzed by the ASC with the field samples. Although QC samples were not collected at separate field locations, they were considered separate field samples for analytical purposes.

Rinsate blanks were collected on a 10% basis during collection of samples with nondedicated equipment to determine whether cross-contamination from the sampling equipment occurred.

Quality Assurance Sample Collection

The QA split samples were collected with the corresponding QC duplicate and original field samples to assess the accuracy of the sampling method and the laboratory analyses. The QA samples were sent to the CQAB Laboratory in Omaha, Nebraska, for analysis.

2.8 Data Management

ASC laboratory data collection, data reduction, and data handling procedures are presented in the ASC's standard operating procedures (SOPs) and Laboratory QA Manual (E & E 1998).

Analytical results are stored by the ASC laboratory in both electronic and hard copy formats. Hard copy data packs for each laboratory work order are validated, and qualifiers are recorded on the data pack. Validation memoranda documenting the analytical procedures and results of the data evaluation are created for each laboratory work order. Validation memoranda and data packages associated with this investigation were sent to the USACE chemist one week after each data package was completed.

All analytical results are managed electronically using E & E's Laboratory Information Management System (LIMS). Analytical results are read directly off of the instruments, as applicable. The data is transmitted electronically and checked as part of the data validation process. Validation qualifiers are added to the appropriate samples in the database. Analytical results are electronically transferred to a final database used to generate data summary reports.

Results for surrogate parameters are reported with the standard analytical results on the "Complete Analytical Data" tables. Other laboratory QC results, including MS/MSDs and laboratory method blanks, are reported on separate tables.

Analytical data associated with the Parcel F9 investigation will be provided electronically to the Air Force Center for Environmental Excellence (AFCEE) in the required format for inclusion in the Environmental Resources Program Information Management System (ERPIMS). ERPTools/Lab will be used by the ASC and ERPTools/PC will be used by E & E to provide data to AFCEE in compliance with ERPIMS 1998 Data Loading Handbook, Version 4.0, October 1997. ERPTools/PC incorporates a number of automatic error checking routines to identify duplicate record sets; incorrect date/time/number formats; invalid codes; failure to complete key required data fields essential for file integrity; and field, record, and submission level validation.

2.9 Location of Data

A complete set of the analytical results are contained in summary tables presented in Section 3 of this report. The original data packages and a copy of this QCSR were forwarded to Mr. Frank McStay of the U.S. Army Corps of Engineers, Kansas City District. Duplicate data packages are kept in the ASC. An electronic copy of the data is kept in the ERPIMS database at Brooks AFB, Texas and in a project-specific database maintained by E & E.

3 AOC-Specific Sampling, Analysis, and Quality Control Results

This section describes the proposed sampling at each area within Parcel F9, any deviations from the work plan or the QAPjP, and includes a description of the data quality review on a sampling area-specific basis. Tabulations of the quality controlled analytical results are also included in this section. The appendices report supportive information, such as maps and tables describing the proposed work and AOI background information (Appendix A), daily activity reports forms (Appendix B), chain-of-custody (COC) documentation (Appendix C), validation memoranda (Appendix D), lab case narratives (Appendix E), and Systems Audit documentation (Appendix F). The data in the appendices are sorted in chronological order of the sampling events.

3.6 Mobile Avenue – Former Drum Storage Area (AOI 72)

3.6.1 Proposed Sample Collection and Analytical Requirements

According to the FSP, soil sampling at Mobile Avenue – Former Drum Storage Area (AOI 72) included:

- Thirty soil samples were collected at fifteen locations (see Figure 3-6 of the FSP). Two samples, a surface soil (0 to 2 inches) and a near-surface soil (2 to 4 feet), were collected at each location and analyzed for TCL SVOCs using Method 8270C, TCL Pesticides using Method 8081A, TCL PCBs using Method 8082, and TAL Metals using Methods 6010B/7471A.

3.6.2 Sampling and Analysis Performed

Soil samples (G072-NS01-Z1 through G072-NS15-Z1 and G072-NS01-Z2 through G072-NS15-Z2) were sampled on July 6 and 7, 1999. Near surface soil (0 to 2 inches) samples were collected with a dedicated stainless-steel spoon and near-surface soil (2 to 4 feet) samples were collected with a split spoon sampler. Duplicate and split samples were collected from G072-NS06-Z2 and G072-NS011-Z2. Extra volume was obtained from G072-NS10-Z2 for MS/MSD analysis. One field rinsate was obtained from the split spoon sampling equipment analyzed for site-specific methods.

Table 3.6-1 lists the proposed samples, as well as the sampling dates, sample depths, and analyses associated with the samples. (This table is a post-sampling update of the FSP table presented in Appendix A.)

There were no changes to the proposed sample analyses required for the samples collected at Mobile Avenue – Former Drum Storage Area (AOI 72) except that the rinsate sample was not originally included in the FSP (see Appendix A). This sample has been were added to this AOI as noted on Table 3.6-1. In addition, sample G072-NS11-Z1 was not included on the FSP, but was collected in the field.

3.6.3 Deviations From Sample Handling and Custody Procedures

No deviations occurred to the proposed sample handling and sample custody procedures at Mobile Avenue – Former Drum Storage Area (AOI 72).

3.6.4 Data Quality Evaluation

The data quality was evaluated based on sample integrity, holding times, method blank results, LCS results, MS/MSD recoveries, surrogate recoveries and duplicate precision as outlined in Section 2.7 of this document. The correlation between original samples collected at Mobile Avenue – Former Drum Storage Area (AOI 72) and the associated field and laboratory QA/QC samples used to confirm and qualify the original samples are reported in Table 3.6-2.

All of the data collected from Mobile Avenue – Former Drum Storage Area (AOI 72) are reported in two E & E ASC laboratory work orders 9907027 and 9907040. Detailed descriptions of the data quality review are reported by lab work order in the Data Validation Memorandum provided in Appendix D.

Based on QC criteria, all data collected and analyzed from Mobile Avenue – Former Drum Storage Area (AOI 72) are usable. Data qualification for the samples from Mobile Avenue – Former Drum Storage Area (AOI 72) is discussed by method in the following sections.

3.6.4.1 Soil Samples from AOI 72

Method 8270C

Internal standard recoveries were within QC limits except for the samples listed below. The samples were re-analyzed and gave similar results indicating a potential matrix effect. Any positive results associated with low or high internal standard recoveries outside the QC limits are qualified "J" as estimated. Any PQLs associated with internal standard recoveries below the QC criteria are qualified "UJ" as estimated. Since the estimated values are a result of matrix effects there is no impact on data usability.

Client Sample ID	No. of Parameters	Dilution Factor	Validation Flags
G072-NS01-Z1	2	1	UJ
G072-NS01-Z2	2	1	UJ
G072-NS02-Z1	5	1	UJ
G072-NS03-Z1	1	1	UJ
G072-NS05-Z1	5	1	UJ
G072-NS06-Z1	6	1	UJ
G072-NS12-Z1	4	10	UJ
G072-NS13-Z1	4	1	UJ
G072-NS13-Z1	5	1	J

The sample G072-NS14-Z2 was originally extracted for BNAs and gave low surrogate recoveries outside control limits in the range 10-25%. The sample was re-extracted and gave surrogate recoveries within control limits in the range of 50-80%. Both sets of results gave no positive hits. The data indicates an extraction efficiency problem with the first analysis. The re-extraction was done three days past NYSDEC holding times, but well within the EPA and USACE holding times. Of the related data, the Z1 interval of the sample had low level PAH hits and a small hydrocarbon envelope. The nearby boring at location NS12 was highly contaminated with hydrocarbons at the Z1 interval and showed low level hits at the Z2 interval.

Overall, the data are considered usable for the purposes of the F9 program. Based on any set of data validation rules the re-extraction data are acceptable. The original re-extraction was poor, but did not give recoveries below 10% thereby supporting the conclusion that the sample did not contain high levels of contaminants. In addition, the re-extraction notes indicate that the sample was clay material, which also may support the lack of contamination based on site geology. The related data clearly indicates a potential hydrocarbon problem at the site. Therefore any potential concerns from the regulators on this particular sample result would not change the overall conclusions from the site data.

Method 8081A/Method 8082

The MS/MSD results indicated potential matrix effects in the analysis. Samples were analyzed at a dilution, but interference affected recoveries of the MS compounds. The following samples and parameters were detected above the laboratory PQL and were flagged "J" as estimated. Since the estimated values are a result of matrix effects there is no impact on data usability.

Client Sample ID	Parameter	Result
G072-NS05-Z1	Heptachlor epoxide	4.88
G072-NS07-Z1	Heptachlor epoxide	9.03
G072-NS08-Z1	alpha-BHC	10.1

Several low-level pesticides were detected just below the PQL in the rinsate FIELDQC RB72. The rinsate sample was collected from the split spoon samples and is applicable only to the Z2 interval. No corrective action is required in the Law QAPP. However, the soil samples did contain many low-level hits of these compounds. The following samples are present at concentrations less than five times the blank levels in the rinsate. The blank level is corrected for a soil concentration. All soil results less than the

blank level are flagged "U" as non-detect. If the PQL is less than the five times blank level, than the PQL is elevated to that value.

The blank levels listed below were compared to risk-based screening criteria. All blank levels were at least 10 times below the risk-based criteria and therefore, data usability will not be impacted. The rinsate blank levels may have resulted from dirty glassware in the laboratory or from transferred of soil to the water. Overall, the blank levels used to flag data are very conservative. None of the other rinsate samples were contaminated and there does not appear to be any systematic QC problems in the field.

Client Sample ID	Analyte	Result (µg/Kg)	5X Level (µg/Kg)	Qualifier

G072-NS10-Z2	4,4´-DDD	0.61	8	UJ
G072-NS10-Z2	4,4´-DDE	1	6.67	UJ

Method 6010B/7471A

The MS/MSD results indicated potential matrix effects in the analysis. All LCS recoveries were acceptable. Samples were analyzed as a post-digestion spike to confirm the matrix effects. Metal results detected above the laboratory PQL were flagged "J" as estimated as indicated below. Also as indicated below, non-detected results were flagged "UJ" as estimated if the MS recoveries were low. Since the estimated values are a result of matrix effects there is no impact on data usability.

Low levels of metals were detected in the method blanks below the PQL. Metals in the rinsate and low levels of cobalt and beryllium in 12 samples were flagged "U" as non-detect due to the method blanks. There is no impact on data usability because the laboratory was in compliance and the PQLs are well below any risk-based criteria.

3.6.5 Analytical Results Tables

Table 3.6-3 summarizes the complete analytical results for the soil samples collected at the Mobile Avenue – Former Drum Storage Area (AOI 72) location. Table 3.6-4 summarizes the positive results for soil samples. Table 3.6-5 (A and B) present the field duplicate results and Table 3.6-6 reports the TICs detected in the soil samples. No TICs were detected above laboratory background in the rinsate blank. Tables 3.6-7 to 3.6-9 present the results for the associated QA/QC samples.

3.6.7 Data Completeness and Representativeness

3.6.7.1 Analytical Method Problems

For part of the samples analyzed under laboratory work order 9907027, the laboratory performed analysis for Method 6010B using a solid LCS and the manufacturer limits were used for QC criteria. This practice is consistent with the original requirements in the Law QAPP, but not the current USACE requirements as reflected in the E & E QAPjP in the FSP (E & E 1999). There is no difference in the analytical results for the soil samples whether a solid or water LCS is used. The data are directly comparable. The supporting MS/MSD analysis minimizes any differences in how the QC batches are evaluated. The MS/MSD results were generally within limits and any results outside limits were confirmed as matrix effect using a post-digestion spike. All future analysis should be performed using a water LCS, consistent with the current USACE requirements.

3.6.7.2 Needed QA/QC Change

No QA/QC changes were noted for the analytical methods used for samples collected at Mobile Avenue – Former Drum Storage Area (AOI 72).

3.6.8 Summary and Conclusions

No data points were rejected for the soil samples collected at the Mobile Avenue – Former Drum Storage Area (AOI 72) location; therefore, a completeness goal of 100% was achieved for analytical level III data. The analytical data meet specified QC criteria, with any exceptions or qualifications noted above. The data points that were qualified as estimated should be considered useable for the purposes of this project. A total of 4098 data points are associated with the Mobile Avenue – Former Drum Storage Area (AOI 72) location.

TCLP Soil Sampling at AOI-72. Collected soil samples using drilling from 2'-6' bgs at previously investigated site of AOI-72. SSB drilling used auger to remove soils from 0'-2' bgs and then collected soil samples in 2' increments from 2'-6' bgs. Soil was composited from the 4 boring locations and placed in 2 8oz jars for TCLP VOCs, SVOCs and Metals analysis.

CASE NARRATIVE
Client: FPM Remediations Inc
Project: Griffiss AFB Unknown #2
Report Number: 280-50385-1

With the exceptions noted as flags or footnotes, standard analytical protocols were followed in the analysis of the samples and no problems were encountered or anomalies observed. In addition all laboratory quality control samples were within established control limits, with any exceptions noted below. Each sample was analyzed to achieve the lowest possible reporting limit within the constraints of the method. In some cases, due to interference or analytes present at high concentrations, samples were diluted. For diluted samples, the reporting limits are adjusted relative to the dilution required.

Calculations are performed before rounding to avoid round-off errors in calculated results.

All holding times were met and proper preservation noted for the methods performed on these samples, unless otherwise detailed in the individual sections below.

RECEIPT

One sample was received on 12/17/2013; the sample arrived in good condition, properly preserved and on ice. The temperature of the cooler at receipt was 2.3ºC.

TCLP VOLATILE ORGANIC COMPOUNDS (GC-MS)

Sample AOI72TCLP01AA (280-50385-1) was analyzed for TCLP volatile organic compounds (GC-MS) in accordance with EPA SW-846 Methods 1311/8260B. The sample was leached on 12/20/2013 and analyzed on 12/24/2013.

No difficulties were encountered during the TCLP volatiles analysis.

All quality control parameters were within the acceptance limits.

TCLP SEMIVOLATILE ORGANIC COMPOUNDS (GC-MS)

Sample AOI72TCLP01AA (280-50385-1) was analyzed for TCLP semivolatile organic compounds (GC-MS) in accordance with EPA SW-846 Methods 1311/8270C. The sample was leached on 12/20/2013, prepared on 12/23/2013 and analyzed on 12/27/2013.

Pyridine exceeded the RPD limit for the matrix spike duplicate (MSD) of sample AOI72TCLP01AA (280-50385-1) in batch 280-206732. The matrix spike/matrix spike duplicate (MS/MSD) and associated laboratory control sample (LCS) recoveries met acceptance criteria, and the sample results have been flagged accordingly.

No other difficulties were encountered during the TCLP semivolatiles analysis.

All other quality control parameters were within the acceptance limits.

TCLP METALS

Sample AOI72TCLP01AA (280-50385-1) was analyzed for TCLP metals in accordance with EPA SW-846 Methods 1311/ 6010B. The sample was leached on 12/20/2013, prepared on 12/26/2013 and analyzed on 01/02/2014.

Barium was detected in method blank LB 280-206192/1-E at a level that was above the method detection limit but below the reporting limit. The value should be considered an estimate, and has been flagged “J”. However, because the result concentration was less than ½ the reporting limit, no corrective action was necessary.

No other difficulties were encountered during the TCLP metals analysis.

All other quality control parameters were within the acceptance limits.

TCLP MERCURY

Sample AOI72TCLP01AA (280-50385-1) was analyzed for TCLP mercury in accordance with EPA SW-846 Methods 1311/7470A. The sample was leached on 12/20/2013, and prepared and analyzed on 12/30/2013.

No difficulties were encountered during the TCLP mercury analysis.

All quality control parameters were within the acceptance limits.

CASE NARRATIVE
Client: FPM Remediations Inc
Project: Griffiss AFB AOI 72
Report Number: 280-54473-1

With the exceptions noted as flags or footnotes, standard analytical protocols were followed in the analysis of the samples and no problems were encountered or anomalies observed. In addition all laboratory quality control samples were within established control limits, with any exceptions noted below. Each sample was analyzed to achieve the lowest possible reporting limit within the constraints of the method. In some cases, due to interference or analytes present at high concentrations, samples were diluted. For diluted samples, the reporting limits are adjusted relative to the dilution required.

Calculations are performed before rounding to avoid round-off errors in calculated results.

All holding times were met and proper preservation noted for the methods performed on these samples, unless otherwise detailed in the individual sections below.

RECEIPT

Five samples were received on 4/18/2014 10:00 AM; the samples arrived in good condition, properly preserved and, where required, on ice. The temperature of the cooler at receipt was 0.7º C.

VOLATILE ORGANIC COMPOUNDS (GC-MS) - SOIL

Samples AOI72BT0106AA (280-54473-1) and AOI72BT0206AA (280-54473-2) were analyzed for volatile organic compounds (GC-MS) in accordance with EPA SW-846 Method 8260B. The samples were analyzed on 04/21/2014.

Carbon disulfide and Naphthalene were detected in method blank MB 280-222190/1-A at levels that were above the method detection limit but below the reporting limit. The value should be considered an estimate, and has been flagged. However, because the result concentration was less than ½ the reporting limit, no corrective action was necessary.

1,2,3-Trichloropropane failed the recovery criteria low, and exhibited RPD data outside of QC control limits for the MS/MSD of sample AOI72BT0106AA (280-54473-1) in batch 280-222190. The associated laboratory control sample (LCS) recoveries met acceptance criteria, and the sample results have been flagged accordingly.

No other difficulties were encountered during the VOC analysis.

All other quality control parameters were within the acceptance limits.

Samples 041614AE (280-54473-3), 041614AF (280-54473-4) and 041614AR (280-54473-5) were analyzed for volatile organic compounds (GC-MS) in accordance with EPA SW-846 Method 8260B. The samples were analyzed on 04/25/2014.

The %RPD of the laboratory control sample (LCS) and laboratory control standard duplicate (LCSD) recovered outside control limits for the following analytes: 4-Methyl-2-pentanone and/or 2-Hexanone. The associated LCS/LCSD recoveries were in control, demonstrating that operating procedures were in control; therefore; corrective action was deemed unnecessary. The associated data have been flagged accordingly.

No other difficulties were encountered during the VOC analysis.

All other quality control parameters were within the acceptance limits.

PERCENT SOLIDS

Samples AOI72BT0106AA (280-54473-1) and AOI72BT0206AA (280-54473-2) were analyzed for percent solids in accordance with EPA SW846 3550C. The samples were analyzed on 04/28/2014.

No difficulties were encountered during the % solids analysis.
