ICP Data Review Checklist

TestAmerica

LIMS Batch Number(s): 370355/54	Filename(s): 25B061217	Instrument ID (circle one): ICP25 ICP25
Analyst(s)/ Reviewer/Date: BJD 6/13/17		Method (circle): 200.7 6010B 6010C
		QC Type (circle): Standard DoD Q4 DoD Q5 QAPP Other
Matrix (circle): Water Solid Leachate		Circle: Total TR FD Dissolved

Review Items	Yes	No	NA	2nd Rev	If No, why is data reportable?
A. Calibration/Instrument Run QC					
1. Instrument calibrated per lab SOP?	✓			✓	
2. Reanalysis of Calibration Standards before samples: 95-105% recovery	✓			✓	
3. ICB/CCB: run before samples, 10% frequency, & closing Result ≤ ½ RL (routine) Result ≤ LOD/2x MDL (DoD or special project)	✓			✓	If no, list details:
4. ICV/CCV: frequency initial, 10%, & closing 90-110% recovery, 5% RSD (6010) 95-105% recovery, 3% RSD (200.7)	✓			✓	If no, list details:
5. ICVL/CCVL: 70-130% recovery (6010C)	✓			✓	If no, list details:
6. ICSA/ICSAB: run before samples ICSA detections for non-spiked elements ≤ | 2x RL | (≤LOD/2x MDL for DoD or special project) ICSAB for spiked elements 80-120% If no, list analytes:	✓			✓	☐ Results outside limits due to contamination. ☐ Concentration of affected analyte in sample is less than RL.
7. RL level check standard (CRI): 50-150% (routine) 80-120% recovery (DoD or special projects)	✓			✓	If no, list details:
B. Client Sample and QC Sample Results					
1. Samples with target element concentrations > 90% linear range diluted and reanalyzed? (200.7)	✓			✓	Comments:
2. Were all hits reported from a run with interfering elements < linear range? (L Flags investigated?)	✓			✓	Comments:
3. Internal standard (IS) response ± 30% of ICB IS? If no, list details:	✓			✓	☐ High IS response. Sample(s) rerun at dilution. ☐ Low IS response. Sample(s) rerun at dilution.
C. Preparation/Matrix QC					
1. Method Blank: one per preparation batch result < ½ RL (routine)		✓		✓	☐ No analyte > RL in associated samples ☐ Sample results >10x blank ☐ Insufficient sample for reanalysis
2. LCS: one per preparation batch 80-120% recovery or historical (routine) 85-115% recovery or historical (200.7); project limits (other)		✓		✓	☐ Insufficient sample for reanalysis ☐ LCS %R > QC limits & samples < RL
3. MS/MSD or MS/Dup frequency: a pair per batch (routine) a pair per 10 samples (200.7)	✓			✓	☐ Insufficient sample – LCS/LCSD analyzed
C. Preparation/Matrix QC (cont.)					
4. MS/MSD recovery & RPD: 75-125% recovery or historical (routine) 70-130% recovery or historical (200.7) 20% RPD project limits (other)		✓		✓	☐ LCS acceptable – matrix effects ☐ Native analyte > 4x spike level ☐ Matrix effect and native analyte > 4x spike

TestAmerica Denver

Review Items	Yes	No	NA	2nd Rev	If No, why is data reportable?
5. If TCLP MS <50% and sample result 80-106% of toxicity characteristic limit, was MSA run?	✓			✓	Comments:
6. Serial dilution: present for each prep batch (routine) Required if MS/MSD fail (DoD/Q5) run at 5x dilution of parent sample ≤ 10% difference	✓			✓	☐ Sample result < 50 x MDL
7. Post digestion spike: Required if MS/MSD fail (DoD and 6010C) or by client request 75-125% recovery	✓			✓	
D. Raw Data & TALS Data Entry					
1. TALS Sample List Tab	✓			✓	
a. LIMS Sample IDs / Containers are correct	✓			✓	
b. Method and matrix are correct	✓			✓	
c. Date and time are correct	✓			✓	
d. Dilutions are correct	✓			✓	
e. Correct suffix designated; e.g., DU, (where applicable)	✓			✓	
2. TALS Sample Results Tab	✓			✓	
a. All reported analytes are marked Primary or Secondary	✓			✓	
b. All unused data are marked Rejected or Accepted. Unused data are clearly identified with reason not used	✓			✓	
c. Out of control QC is clearly identified	✓			✓	
d. Any data that has a qualifier is reviewed with appropriate action taken (NCM if needed)	✓			✓	
e. The attached data file includes the filename, instrument, and analyst initials	✓			✓	
3. TALS Worksheet Tab is complete and correct	✓			✓	
4. TALS Reagent Tab is complete and correct	✓			✓	
5. TALS QC Links Tab is correct	✓			✓	
6. TALS Batch Information Screen documentation is complete	✓			✓	
7. TALS Status set to appropriate review level	✓			✓	
E. Final Report and NCMs (2nd level review only)					
1. Were all job/project requirements met?				✓	
2. Results for samples and QC correct on final report?				✓	
3. Are all necessary scanned documents in TALS?				✓	
4. NCMs reviewed for applicability, correct references to batches, grammar/typographical errors?				✓	
5. Raw Data PDF attached as document				✓

ICP Data Review Checklist

LIMS Batch Number(s): 317162	Filename(s): 25a060 254061217	Instrument ID (circle one): ICP25 ICP26
Analyst/1st Reviewer/Date: SP 6/13/17		Method (circle): 200.7 6010B 6010C
Matrix (circle): Water Solid Leachate		QC Type (circle): Standard DoD Q4 DoD Q5 QAPP Other
		Circle: Total TR PD Dissolved

Review Items	Yes	No	NA	2nd Rev	If No, why is data reportable?
A. Calibration/Instrument Run QC					
1. Instrument calibrated per lab SOP?	✓			✓	
2. Reanalysis of Calibration Standards before samples: 95-105% recovery	✓			✓	
3. ICB/CCB: run before samples, 10% frequency, & closing Result < ½ RL (routine) Result < LOD/2x MDL (DoD or special project)	✓			✓	If no, list details:
4. ICV/CCV: frequency initial, 10%, & closing 90-110% recovery, 5% RSD (6010) 95-105% recovery, 3% RSD (200.7)	✓			✓	If no, list details:
5. ICVL/CCVL: 70-130% recovery (6010C)	✓			✓	If no, list details:
6. ICSA/ICSAB: run before samples ICSA detections for non-spiked ◁ 2x RL | (<LOD/2x MDL for DoD or special project) ICSAB for spiked elements 80-120% *If no, list analytes:*	✓			✓	☐ Results outside limits due to contamination. ☐ Concentration of affected analyte in sample is less than RL.
7. RL-level check standard (CRI): 50-150% (routine) 80-120% recovery (DoD or special projects)	✓			✓	If no, list details:
B. Client Sample and QC Sample Results					
1. Samples with target element concentrations > 90% linear range diluted and reanalyzed? (2007)	✓			✓	Comments:
2. Were all hits reported from a run with interfering elements < linear range? (L Flags investigated?)	✓			✓	Comments:
3. Internal standard (IS) response ± 30% of ICB IS? *If no, list details:*	✓			✓	☐ High IS response. Sample(s) rerun at dilution. ☐ Low IS response. Sample(s) rerun at dilution.
C. Preparation/Matrix QC					
1. Method Blank: one per preparation batch result < ½ RL (routine)	✓			✓	☐ No analyte > RL in associated samples ☐ Sample results >10x blank ☐ Insufficient sample for reanalysis
2. LCS: one per preparation batch 80-120% recovery or historical (routine) 85-115% recovery or historical (200.7); project limits (other)	✓			✓	☐ Insufficient sample for reanalysis ☐ LCS %R > QC limits & samples < RL
3. MS/MSD or MS/Dup frequency: a pair per batch (routine) a pair per 10 samples (200.7)	✓			✓	☐ Insufficient sample – LCS/LCSD analyzed
C. Preparation/Matrix QC (cont.)					
4. MS/MSD recovery & RPD: 75-125% recovery or historical (routine) 70-130% recovery or historical (200.7) 20% RPD project limits (other)	✓			✓	☐ LCS acceptable – matrix effects ☐ Native analyte > 4x spike level ☐ Matrix effect and native analyte > 4x spike

Review Items	Yes	No	NA	2nd Rev	If No, why is data reportable?
5. If TCLP MS <50% and sample result 80-100% of toxicity characteristic limit, was MSA run?	✓			✓	Comments:
6. Serial dilution: present for each prep batch (routine) Required if MS/MSD fail (DoDV5) run at 5x dilution of parent sample ≤ 10% difference	✓			✓	☐ Sample result < 50 x MDL
7. Post digestion spike: Required if MS/MSD fail (DoD and 6010C) or by client request 75-125% recovery	✓			✓	
D. Raw Data & TALS Data Entry	✓			✓	
1. TALS Sample List Tab	✓			✓	
a. LIMS Sample IDs / Containers are correct	✓			✓	
b. Method and matrix are correct	✓			✓	
c. Date and time are correct	✓			✓	
d. Dilutions are correct	✓			✓	
e. Correct suffix designated; e.g., DU, (where applicable)	✓			✓	
2. TALS Sample Results Tab	✓			✓	
a. All reported analytes are marked Primary or Secondary	✓			✓	
b. All unused data are marked Rejected or Accepted. Unused data are clearly identified with reason not used	✓			✓	
c. Out of control QC is clearly identified	✓			✓	
d. Any data that has a qualifier is reviewed with appropriate action taken (NCM if needed)	✓			✓	
e. The attached data file includes the filename, instrument, and analyst initials	✓			✓	
3. TALS Worksheet Tab is complete and correct	✓			✓	
4. TALS Reagent Tab is complete and correct	✓			✓	
5. TALS QC Links Tab is correct	✓			✓	
6. TALS Batch Information Screen documentation is complete	✓			✓	
7. TALS Status set to appropriate review level	✓			✓	
E. Final Report and NCMs (2nd level review only)				✓	
1. Were all job/project requirements met?				✓	
2. Results for samples and QC correct on final report?				✓	
3. Are all necessary scanned documents in TALS?				✓	
4. NCMs reviewed for applicability, correct references to batches, grammar/typographical errors?				✓	
5. Raw Data PDF attached as document				✓

Hg Data Review Checklist

LIMS Batch Number: 377403	Filename: 170614 6a	Instrument ID (circle one): 033 (034)
Analyst/1st Reviewer/Date: Chris Henning 06/15/17	Method (circle): 245.1 7470A (7471A)	QC Type (circle): (Standard) DoD Q4 (DoD Q5) QAPP_____ Other_____
Matrix (circle): Water (Solid) Leachate		Circle: (Total) PD Dissolved

Review Items	Yes	No	NA	2nd Rev	If No, why is data reportable?
A. Calibration/Instrument Run QC					
1. Calibrated with at least 5 standards and a blank	/			/	
2. Linearity and intercept: r ≥ 0.995 |x-intercept| < RL or < ½ RL (special projects)	/			/	
4. ICV: run before samples 95-105% recovery (245.1) 90-110% recovery (7470A/7471A)	/			/	If no, list details:
5. CCV: run before samples, 10% frequency & closing 90-110% recovery (245.1 & 7470A) 80-120% recovery (7471A)	/			/	If no, list details:
6. ICB/CCB: run before samples, 10% frequency, & closing Result < ½ RL (routine) Result < LOD (DoD or special project)	/			/	If no, list details:
7. RL-level check standard 50-150% recovery (routine) 80-120% recovery (DoD)	/			/	If no, list details:
B. Client Sample and QC Sample Results					
1. Samples with results > linear range diluted and reanalyzed?			/	/	Comments:
C. Preparation/Matrix QC					
1. Method Blank: one per preparation batch result < ½ RL (routine)	/			/	☐ No analyte > RL in associated samples ☐ Sample results >10x blank ☐ Insufficient sample for reanalysis
2. LCS one per preparation batch Historical (routine) 85-115% recovery (245.1) Other (DoD or client specific)	/			/	☐ Insufficient sample for reanalysis ☐ LCS %R > QC limits & samples < RL
3. MS/MSD or MS/Dup frequency: a pair per batch (routine) a pair per 10 samples (245.1)	/			/	☐ Insufficient sample
4. MS/MSD recovery & RPD: 75-125% or historical 70-130% (245.1) 20% RPD	/			/	☐ LCS acceptable – matrix effects ☐ Native analyte > 4x spike level ☐ Matrix effect and native analyte > 4x spike
5. If TCLP MS <50% and sample result 80-100% of toxicity characteristic limit, was MSA run?			/	/	Comments:
6. Serial dilution: Required only for DoD and only if MS/MSD fail run at 5x dilution of parent sample ≤ 10% difference *If no, list details:*	/			/	☐ Sample result < 50 x RL

Review Items	Yes	No	NA	2nd Rev	If No, why is data reportable?
C. Preparation/Matrix QC (continued)					
7. Post digestion spike: Required only for DoD and only if MS/MSD fail 80-120% recovery *If no, list details:*	/			/	
D. Raw Data & TALS Data Entry					
1. TALS Sample List Tab					
a. LIMS Sample IDs / Containers are correct	/			/	
b. Method and matrix are correct	/			/	
c. Date and time match raw data	/			/	
d. Dilutions are correct	/			/	
e. Correct suffix designated (where applicable)			/	/	
2. TALS Sample Results Tab					
a. All reported analytes are marked Primary or Secondary	/			/	
b. All unused data are marked Rejected or Accepted. Unused data are clearly identified with reason not used	/			/	
c. Out of control QC is clearly identified			/	/	
d. Any data that has a qualifier is commented on with appropriate action taken (NCM if needed)			/	/	
e. The attached data file includes the filename, instrument, and analyst initials	/			/	
3. TALS Worksheet Tab is complete and correct	/			/	
4. TALS Reagent Tab is complete and correct	/			/	
5. TALS QC Links Tab is correct	/			/	
6. TALS Batch Information Screen documentation is complete	/			/	
7. TALS Status set to appropriate review level	/			/	
E. Final Report and NCMs (2nd level review only)					
1. Were all job/project requirements met?				/	
2. Results for samples and QC correct on final report?				/	
3. Are all necessary scanned documents in TALS?				/	
4. NCMs reviewed for applicability, correct references to batches, grammar/typographical errors?				/	
5. Raw Data PDF attached as document				/	

Comments: Some samples of job 98187 lack % moisture at the time of first level review. Samples left at batched status.

Question	Answer	Comment
Radioactivity wasn't checked or is </= background as measured by a survey meter.	N/A	
The cooler's custody seal, if present, is intact.	True	
Sample custody seals, if present, are intact.	True	
The cooler or samples do not appear to have been compromised or tampered with.	True	
Samples were received on ice.	True	
Cooler Temperature is acceptable.	True	
Cooler Temperature is recorded.	True	
COC is present.	True	
COC is filled out in ink and legible.	True	
COC is filled out with all pertinent information.	True	
Is the Field Sampler's name present on COC?	True	
There are no discrepancies between the containers received and the COC.	True	
Samples are received within Holding Time (excluding tests with immediate HTs)	True	
Sample containers have legible labels.	True	
Containers are not broken or leaking.	False	Refer to Job Narrative for details.
Sample collection date/times are provided.	True	
Appropriate sample containers are used.	True	
Sample bottles are completely filled.	True	
Sample Preservation Verified.	N/A	
There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs	True	
Containers requiring zero headspace have no headspace or bubble is <6mm (1/4").	N/A	
Multiphasic samples are not present.	True	
Samples do not require splitting or compositing.	True	
Residual Chlorine Checked.	N/A	

APPENDIX C
DATA VALIDATION REPORTS

This page intentionally left blank.

Data Validation Report

This report contains the results of the review and validation of the specified data package performed by Marcia Olive, Bhate Environmental Associates, Inc., Denver, Colorado.

Introduction

This data validation report covers samples taken from Griffiss Air Force Base, New York, on May 31, 2017. Eleven soil samples, one field duplicate, and associated quality control blanks were collected from Site SS025 (T-9 Storage Area) for site closure activities. All analyses were performed by TestAmerica Laboratories, Inc., Denver, Colorado. The specific samples included in this validation were:

Sample Identification	Matrix	Collection Date	Analyses (USEPA Method Number)
SS025-SS01	Soil	5/31/17	Volatile Organic Compounds (VOCs, by SW8260B), Polycyclic Aromatic Hydrocarbons (PAHs, by SW8270D Selective Ion Monitoring [SIM]), Pesticides/Polychlorinated Biphenyls (PCBs, by SW8081B/8082A), Target Analyte List (TAL) Metals (by SW6010C/7471A)
SS025-SS02			
SS025-SB02 (0-2)			
SS025-SS03			
SS025-SB03 (0-2)			
SS025-SS04			
SS025-SB04 (0-2)			
SS025-SS05			
SS025-SB05 (0-2)			
SS025-SB05 (2-4)			
SS025-SS06			
SS025-SS06-a			

Notes: -a = duplicate sample, USEPA = U.S. Environmental Protection Agency

TestAmerica Denver holds both Department of Defense (DoD) Environmental Laboratory Accreditation Program (ELAP) and New York National Environmental Laboratory Accreditation Program (NELAP) certifications for Method 8260B. The reporting limits for all analytes are much lower by 8260B compared to 8260C.

This data was validated against the laboratory's quality assurance (QA)/quality control (QC) limits using the guidelines and practices published in the *USEPA Contract Laboratory Program National Functional Guidelines for Superfund Organic Methods Data Review* (USEPA, August 2014), *USEPA Contract Laboratory Program National Functional Guidelines for Inorganic Superfund Data Review* (USEPA, August 2014) and per requirements of the DoD Quality Systems Manual (QSM), Version 5.0, as specified in the project-specific Quality Assurance Project Plan (QAPP).

Sample Handling and Holding Times

The samples were properly preserved and transferred under chain-of-custody to the laboratory for analysis and analyzed within the required holding times.

Method Blank

Calcium, chromium, iron, and magnesium were detected in method blank 375991/1-A. All these compounds were greater than 5 times the blank concentration, in the associated samples, and required no qualification.

Blank Spike Sample (Laboratory Control Sample)/Surrogates

The laboratory control sample (LCS) recovery of isopropyl ether was above control limits. This analyte was not detected in the associated samples and required no qualification.

The volatile surrogate recovery of 4-bromofluorobenzene was slightly below control limits in sample SS025-SB05(0-2). The sample was re-analyzed with similar results and matrix interference was confirmed. Therefore, the compounds associated with this surrogate were qualified as estimated non-detected, "UJ".

Multiple samples reported volatile surrogate recoveries of dibromofluoromethane and/or 1,2-dichloroethane-d4 slightly above control limits. No associated analytes reported detections in those samples and required no qualification.

The semi-volatile surrogates were diluted out of sample SS025-SS05. The method blank and LCS surrogates were within control limits and using professional judgment the sample did not require qualification.

The pesticide surrogate tetrachloro-m-xylene was recovered (177%) above control limits on the confirmatory column for sample SS025-SS03. Only Endosulfan I was detected in this sample and flagged as estimated, "J", to indicate a potentially high bias. DCB Decachlorobiphenyl was recovered (212%) above control limits on the primary column for sample SS025-SS06-a. Due to a potential high bias, numerous non-target peaks, and baseline rise; the two detected compounds, 4,4'-DDE and 4,4'-DDT, were qualified as estimated, "J".

Matrix Spike/Matrix Spike Duplicate

The matrix spike (MS)/matrix spike duplicate (MSD) recoveries for 4,4'-DDD, 4,4'-DDE, and gamma-chlordane were below control limits in parent sample SS025-SS01 used for the MS. The relative percent difference (RPD) for toxaphene exceeded control limits in parent sample SS025-SS03. These compounds have been qualified as estimated, "UJ/J", in the parent samples.

The MS/MSD recoveries for antimony, calcium, iron, manganese, potassium, and aluminum were outside control limits. Control limits did not apply to iron, manganese, and aluminum since the sample concentration exceeded the spike concentration by a factor of four or more. The remaining metals were qualified as estimated, "J/UJ", in the parent sample SS025-SS01.

Project Specific Quality Assurance/Quality Control

The RPD between the sample and duplicate was outside control limits for multiple PAH compounds. These compounds have been qualified as estimated, "J", in both sample and duplicate.

Acetone and methylene chloride were reported in the trip blank. When detected in the samples at a concentration of less than 10 times the blank result these analytes were qualified as non-detects and flagged, "UB", at the reported value.

In batch 376356, one of the continuing calibration blanks (CCBs) reported a detection of sodium. Associated sample SS025-SS01 reported a detection for sodium less than 5 times the blank concentration. It was considered an artifact of blank contamination and flagged, "UB".

Calibration Verification Data

In batch 376040, the continuing calibration verification (CCV) for chloroethane and isopropyl ether were above control limits. In batch 376196, the CCV for vinyl acetate, isopropyl ether, and methyl tert-butyl ether were above control limits. These compounds were not detected in the associated samples and required no qualification. Additionally, in batch 376196, the CCV for bromomethane was slightly below control limits. This compound is classified as a poor performer and per National Function Guidelines (NFGs) was within the allowable ±30% difference range. Using professional judgment, no qualification was necessary.

In batch 376356, the CCV for arsenic, zinc, iron, lead, and vanadium were above control limits and in batch 376450, the CCV for cadmium, iron, lead, aluminum, magnesium, manganese, and zinc were above QC limits. These compounds were qualified as estimated, "J", in the associated samples.

Overall Assessment of Data

All analyses were performed, and the data met the required QC criteria except where noted. The data is 100% complete. Where a dilution was required, elevated reporting limits are reported.

Notes: µg/kg – micrograms per kilogram, mg/kg = milligrams per kilogram, MS/MSD (<) (>) = Matrix spike and matrix spike duplicate (below) (above) control limits, RPD > = MS/MSD relative percent difference above control limits, surr > = surrogate above control limits, FD RPD = field duplicate RPD outside control limits, surr < = surrogate below control limits, CCB = continuing calibration blank outside control limits, CCV = continuing calibration verification outside control limits, TB = Trip blank contamination

Data Validation Report

This report contains the results of the review and validation of the specified data package performed by Marcia Olive, Bhate Environmental Associates, Inc., Denver, Colorado.

Introduction

This data validation report covers samples taken from Griffiss Air Force Base, New York, on June 5, 2017. Eighteen soil samples, two field duplicates, and associated quality control blanks were collected from Site SS025 (T-9 Storage Area) for site closure activities. All analyses were performed by TestAmerica Laboratories, Inc., Denver, Colorado. The specific samples included in this validation were:

Sample Identificaiton	Matrix	Collection Date	Analyses (USEPA Method Number)
SS025-SS07	Soil	6/5/17	Volatile Organic Compounds (VOCs, by SW8260B), Polycyclic Aromatic Hydrocarbons (PAHs, by SW8270D Selective Ion Monitoring [SIM]), Pesticides/Polychlorinated Biphenyls (PCBs, by SW8081B/8082A), Target Analyte List (TAL) Metals (by SW6010C/7471A)
SS025-SB06 (0-2)			
SS025-SB06 (2-4)			
SS025-SS08			
SS025-SB07 (0-2)			
SS025-SB07 (2-4)			
SS025-SB01 (0-2)			
SS025-SB01 (0-2)-a			
SS025-SB08 (0-2)			
SS025-SB08 (2-4)			
SS025-SS09			
SS025-SB09 (0-2)			
SS025-SB09 (2-4)			
SS025-SB09 (4-6)			
SS025-SB09 (6-8)			
SS025-SB10 (0-2)			
SS025-SB10 (2-4)			
SS025-SB10 (4-6)			
SS025-SB10 (2-4)-a			
SS025-SS10			
Notes: -a = duplicate sample, USEPA = U.S. Environmental Protection Agency TestAmerica Denver holds both Department of Defense (DoD) Environmental Laboratory Accreditation Program (ELAP) and New York National Environmental Laboratory Accreditation Program (NELAP) certifications for Method 8260B. The reporting limits for all analytes are much lower by 8260B compared to 8260C.			

This data was validated against the laboratory's quality assurance (QA)/quality control (QC) limits using the guidelines and practices published in the *USEPA Contract Laboratory Program National Functional Guidelines for Superfund Organic Methods Data Review* (USEPA, August 2014), *USEPA Contract Laboratory Program National Functional Guidelines for Inorganic Superfund Data Review* (USEPA, August 2014) and per requirements of the DoD Quality Systems Manual (QSM), Version 5.0, as specified in the project-specific Quality Assurance Project Plan (QAPP).

Sample Handling and Holding Times

The samples were properly preserved and transferred under chain-of-custody to the laboratory for analysis and analyzed within the required holding times. Sample SS025-SB10 (4-6) arrived with two broken terracore containers. Due to insufficient sample volume, the soil jar was used for this analysis and reported elevated reporting limits.

Method Blank

Acetone and/or methylene chloride were detected in multiple volatile method blanks. When these compounds were less than 10 times the blank concentration they were qualified as non-detects, "UB", and considered artifacts of blank contamination. Benzo(a)anthracene, fluoranthene, phenanthrene, and pyrene were detected in the method blank associated with the dilution analysis of SS025-SB01 (0-2) and SS025-SB01 (0-2)-a. The sample concentrations were well above the blank concentrations and therefore were not affected by blank contamination. Barium, calcium, chromium, iron, and magnesium were detected in the method blank but all sample concentrations were well above 5 times the blank concentration and required no qualification.

Blank Spike Sample (Laboratory Control Sample)/Surrogates

The laboratory control sample recoveries of chloromethane, dichlorodifluoromethane, and vinyl chloride were above control limits. No samples were associated with this batch LCS and required no qualification.

The semi-volatile surrogate recovery of nitrobenzene-d5 was below control limits for sample SS025-SB06 (2-4). Terphenyl-d14 was below control limits for SS025-SB07 (2-4). The samples were not re-extracted and re-run as it would have been performed beyond hold time. Therefore, all semi-volatile compounds were qualified as estimated, "J/UJ".

Nitrobenzene-d5 was diluted out of samples SS025-SB01 (0-2) and SS025-SB01 (0-2)-a. While the remaining two surrogates were within control limits for the latter sample, the remaining two were above control limits in the former sample. All detected semi-volatiles were qualified as estimated, "J", in sample SS025-SB01 (0-2).

The pesticide surrogate, DCB Decachlorobiphenyl (DCBP) was diluted out of the dilution analysis of SS025-SB01 (0-2). The remaining surrogate was within control limits and the sample data required no qualification. DCBP was recovered above control limits for SS025-SB01 (0-2)-a. The detected compounds were qualified as estimated, "J". DCBP was recovered below control limits on the primary column for samples SS025-SS07, SS025-SB07 (2-4), SS025-SB09 (2-4), and SS025-SB09 (6-8). The recoveries were within the National Functional Guidelines (NFGs) inclusive range of 30% - 150% and therefore required no qualification.

DCBP failed the surrogate recovery low for the PCB analysis of SS025-SB09 (4-6). All compounds were qualified as estimated, "J/UJ". DCBP (206.7%) was recovered above control limits on the primary column for sample SS025-SB01 (0-2). The detected compound (Arochlor 1260) was qualified as estimated, "J".

Matrix Spike/Matrix Spike Duplicate

The matrix spike (MS) recoveries for all pesticides, minus toxaphene, were below control limits in parent sample SS025-SB06 (0-2). The relative percent differences (RPDs) exceeded control limits (with the exception of toxaphene). These compounds have been qualified as estimated, "UJ/J", in the parent samples.

The MS and/or matrix spike duplicate (MSD) recoveries for aluminum, antimony, iron, manganese, and thallium were outside control limits. Control limits did not apply to iron, manganese, and aluminum since the sample concentration exceeded the spike concentration by a factor of four or more. Antimony and thallium were qualified as estimated, "J/UJ", in the parent sample SS025-SS07.

Project Specific Quality Assurance/Quality Control

Two field duplicates were collected with this data package. The RPD between sample SS025-SB01 (0-2) and duplicate was outside project defined control limits for calcium and mercury; all other compounds were within control limits when adjusted for the dilution factor. The RPD for calcium was outside control limits for sample SS025-SB10 (2-4) and it's duplicate. These compounds have been qualified as estimated, "J", in both sample and duplicate.

Fluoranthene, phenanthrene, and pyrene were reported in the ambient blank in trace amounts. All samples reported detections much higher and were not affected by the blank results. Therefore, no qualification was necessary.

The internal standard, 1,4-dichlorobenzene-d4, responded below the lower acceptance limit for sample SS025-SB08 (2-4). The sample was reanalyzed with similar results. The target compounds associated with this standard were qualified as estimated non-detected, "UJ".

In batches 376734, 376044, 377054, and 377162, multiple continuing calibration blanks reported various metals detections. Those samples reporting detections less than 5 times the blank concentration were considered artifacts of blank contamination and flagged, "UB".

Calibration Verification Data

In batch 376989, the initial calibration verification (ICV) percent difference (%D) for dichlorodifluoromethane, 2-hexanone, and acetone were above control limits. In batch 378395, the continuing calibration verification (CCV) %D for bromomethane, dichlorofluoromethane, and carbon disulfide were above control limits. These batches were not associated with any samples and required no qualification. The CCV for bromomethane (%D = -21.3%) in batch 377520 was below control limits. Bromomethane is classified as a poor performer and per NFGs was within the allowable $\pm$30% difference range and did not require qualification. Additionally, the closing CCV for this sample was not analyzed due to an instrument malfunction. The instrument did perform within DoD Version 5.0 criteria once restarted on the same tune parameters the next day.
In batches 376734, 377044, 377054, and 377162, the CCV for multiple metals were outside control limits. These compounds were qualified as estimated, "UJ/J", in the associated samples (see table below).

Overall Assessment of Data

All analyses were performed, and the data met the required QC criteria except where noted. The data is 100% complete. When a dilution was required, elevated reporting limits were reported.

Sample Identification	Compound	Qualifier (ug/kg) Metals (mg/kg)	Reason Code

EXECUTIVE SUMMARY

This Baseline Human Health Risk Assessment (HHRA) for the Former Griffiss Air Force Base (AFB) evaluates Site SS-025 (the "Site"), located in Rome, New York. The baseline HHRA evaluated cancer risks and non-cancer health hazards in the absence of the current Land Use Control (LUC). The LUC maintains use as non-residential, consistent with the Site's Record of Decision (ROD). The LUC prevents development of the Site for residential land use.

The goal of the Baseline HHRA is to evaluate the cancer risks and non-cancer hazards to the Reasonably Maximally Exposed Individual. The Reasonable Maximum Exposure (RME) is defined as the highest exposure that is reasonably expected to occur at a site, in the absence of current LUCs/Institutional Controls (ICs). RMEs are estimated for individual pathways (United States Environmental Protection Agency [USEPA], December 1989 – Risk Assessment Guidance for Superfund [RAGS] Part A). The Baseline HHRA evaluates exposures under an assumption of future residential land use. The receptors evaluated include: a future resident (adult and child) and a construction worker. The assessment assumes the future receptors may be exposed to soils at depths of 0 to 2 feet below ground surface (ft bgs) and 0 ft bgs to the water table. The exposures include direct contact with the soil at both depths in the event the soil is brought to the surface and not managed.

The risk assessment results for each receptor are summarized in the Table below:

	Cancer Risks		**Non-cancer Hazard**	
	Soil Depth		**Soil Depth**	
	0 to 2 ft bgs	**0 ft bgs to Water Table**	**0 to 2 ft bgs**	**0 ft bgs to Water Table**
Receptors				
Future Resident				
Adult/Child (combined) *	3.5 E-05	3.5 E-05		
Young Child			1.1	1.1
Adult			0.1	0.2
Future Construction Worker (Adult)	4.3E-08	4.2E-08	0.2	0.2
*Non-cancer hazards were not calculated since the young child is the most sensitive receptor.				

In general, the concentrations of chemicals of potential concern (COPCs) are comparable for both depths for both receptors. Evaluation of the data indicates minor differences in chemical concentrations based on depths. These slight differences result in slight differences in calculated cancer risks and non-cancer hazards.

All cancer risks are within or below the risk range established under the National Oil and Hazardous Substances Pollution Contingency Plan (NCP) of 1×10^{-6} (one in a million) to 1×10^{-4} (one in ten thousand). The cancer risks for the future resident were within this risk range while those for the future construction worker were below the goal of protection of 1×10^{-6}. The non-

cancer hazard is evaluated based on the goal of protection of a Hazard Index (HI) equal or less than 1 e.g., HI = 1. The HI for the young child was 1.1, for the adult was 0.1 and 0.2, respectively and the target organ Hazard Quotient (HQ) was less than 1 for both adult and young child. The non-cancer hazards for the future construction worker (adult) receptors are below the goal of protection of an HQ or an HI = 1.

1 INTRODUCTION

This document provides the Baseline Human Health Risk Assessment (HHRA) for the Former Griffiss Air Force Base (AFB) Site 25 (SS025), located in Rome, New York (the "Site"). The Baseline HHRA is being conducted under the authority of the United States Environmental Protection Agency (USEPA), pursuant to the Comprehensive Environmental Response, Compensation, and Liability Act of 1980 (CERCLA), the National Oil and Hazardous Substances Pollution Contingency Plan (NCP) (USEPA, 1990), and the Superfund Amendments and Reauthorization Act of 1986 (SARA). The Baseline HHRA is required to support Site decisions under Superfund law regarding the removal of Land Use Controls (LUCs).

The Baseline HHRA is a baseline evaluation assuming no Institutional Controls (ICs), such as the current LUCs to prevent use of the Site for residential use, and no remedial actions at the Site. The Baseline HHRA evaluated future exposures to Site soils at depths of 0 to 2 feet below ground surface (ft bgs) and 0 ft bgs to the Water Table. The assessment quantified potential health risks from exposure to chemicals collected in 2017 at both depths including chemicals on the Target Compound List (TCL), Target Analyte List (TAL), polynuclear aromatic hydrocarbons (PAHs), polychlorinated biphenyls (PCBs) evaluated as commercial Aroclor mixtures (e.g., Aroclor 1016), and Volatile Organic Compounds (VOCs).

The Baseline HHRA evaluated exposures to the Reasonably Maximally Exposed Individual under both current and future conditions. Evaluation of exposures to the RME individual provide the basis for decisions under CERCLA, including the decision regarding removing the current LUC to allow future residential development of the property.

1.1 Baseline Human Health Risk Assessment

The Baseline HHRA follows the four steps of the risk assessment process listed below:

- Hazard Identification – identifies contaminants at the Site that can pose a risk to human health under current and future land use conditions. This step, including data collection and analysis, involves gathering data to define the nature and extent of contamination and using the sample data to select chemicals of potential concern (COPCs). The COPCs are evaluated in the remaining steps of the Baseline HHRA listed in the bullets below.
- Exposure Assessment – identifies possible exposure pathways such as ingestion of soil, inhalation of particulates, or dermal contact with soil. The exposure assessment includes an estimation of human chemical intake, or dose, for each receptor based on default Superfund exposure assumptions representing residential and construction worker receptors (USEPA, 2014).
- Dose Response – evaluates the chemical toxicity of each COPC including the evaluation of cancer and non-cancer toxicity for each COPC.
- Risk Characterization – describes the likelihood and degree of chemical exposure and the possible adverse health effects associated with the exposure(s) including a discussion of the uncertainties.

The Baseline HHRA was performed in accordance with guidance, policies, and guidelines provided by the USEPA, including but not limited to:

- *Risk Assessment Guidance for Superfund* (RAGS) - Parts A, B, D, E and F (USEPA, December 1989, December 1991a, December 2001, July 2004, and January 2009, respectively).
- *Role of the Baseline Risk Assessment in Superfund Remedy Selection Decisions* (USEPA, April 1991).
- *Guidance for Data Useability in Risk Assessment* (Parts A and B) (USEPA, December 1991 and May 1992a).
- *Guidelines for Exposure Assessment* (USEPA, May 1992b).
- *Land Use in the CERCLA Remedy Selection Process* (USEPA, May 1995).
- *EPA Risk Characterization Program* (USEPA, March 1995).
- *Supplemental Guidance for Developing Soil Screening Levels for Superfund Sites* (USEPA, December 2002a).
- *Calculating Upper Confidence Limits for Exposure Point Concentrations at Hazardous Waste Sites* (USEPA, December 2002b).
- *Human Health Toxicity Values in Superfund Risk Assessments* (USEPA, December 2003).
- *Guidelines for Carcinogen Risk Assessment* (USEPA, March 2005a).
- *Supplemental Guidance for Assessing Susceptibility from Early-Life Exposure to Carcinogens* (USEPA, March 2005b).
- *Exposure Factors Handbook: 2011 Edition* (USEPA, September 2011).
- *Recommendations for Default Value for Relative Bioavailability of Arsenic in Soil* (USEPA, December 2012).
- *Human Health Evaluation Manual, Supplemental Guidance: Update of Standard Default Exposure Factors* (USEPA, February 2014).
- *ProUCL Version 5.1 Technical Guide Statistical Software for Environmental Applications for Data Sets with and without Nondetect Observations* (USEPA, October 2015).
- Regional Screening Levels (USEPA, May 2019).

1.2 Site Overview and Historical Perspective

The following site information was obtained from the *2015 Third Five-Year Review Former Griffiss Air Force Base* (FPM Remediations, Inc. [FPM]/Cape, June 2015). The information was obtained from the webpage link: https://semspub.epa.gov/work/02/350524.pdf. A site map is provided in Appendix A of this Baseline HHRA report.

Pursuant to Section 105 of CERCLA, the Former Griffiss AFB was included on the National Priority List (NPL) on July 15, 1987. On August 21, 1990, the United States Air Force, (USAF), USEPA, and

New York State Department of Environmental Conservation (NYSDEC) entered into a Federal Facility Agreement (FFA) under Section 120 of CERCLA. The Department of Defense (DOD) Installation Restoration Program (IRP) at the Former Griffiss AFB includes the investigation and clean-up of sites with CERCLA hazardous substance releases as well as the petroleum site being addressed under NYSDEC.

The Site is located in Rome, NY, in the County of Oneida, NY. The Site (Site T-9 Area of Concern [AOC]) is located near the east-central portion of the Former Griffiss AFB, at the intersection between Brooks Road and Selfridge Street, and covers about 30,000 square ft (Parcel F1). The Site was used for parking heavy equipment and storing herbicides and petroleum-based paving products. The Site, the Former Griffiss AFB, contained a 550-gallon kerosene aboveground storage tank (AST) 009-2. It was reported that former AST 009-2 leaked on several occasions and stained soils were observed at the AST location. Figure 12 of the Third Five Year Review (FPM/Cape, June 2015) illustrates the SS-025 Site (T-9 AOC) and identifies deed restrictions, as well as the LUC/ICs, as required by the Record of Decision (ROD) for the Site (Air Force Real Property Agency [AFRPA], June 2001).

In 1991, AST-009-2 was replaced with AST 009-3, a mobile 275-gallon kerosene tank, in the same location, but was relocated adjacent to Building 8 later. In December 1996, AST 009-3 was removed from Building 8. Also, trucks carrying asphalt were reportedly rinsed with kerosene and the rinsate was discharged onto the ground at Site T-9. On May 7, 1997, NYSDEC Spill #9702173 was assigned to the former location of AST-009-2 and -3 due to contaminated soil identified during a site assessment conducted by PEER Consultants, P.C. in the Fall of 1996.

As part of the Remedial Investigation (RI), a baseline risk assessment was performed to evaluate the current and future Site use, evaluating only industrial use, and potential risks to human health and the environment associated with chemicals of concern (COCs) found in the soils and groundwater at the Site. Receptors evaluated in the baseline risk assessment included landscape, industrial, utility, and construction workers. Total carcinogenic risks associated with exposure by these workers to contaminants in the soil or groundwater were all within the lower end of the acceptable risk range (1×10^{-6}) established under the NCP. The Hazard Index (HI), for non-cancer health hazards, was below the goal of protection of an HI = 1 for human exposure scenarios under an industrial land use assumption.

The ROD for the SS-025 Site (T-9 AOC) was issued by the USAF in June 2001 and signed by the USEPA in September 2001. Based on the previous investigations and environmental conditions at the Site, the selected remedy for the SS-025 Site (T-9 AOC) is No Further Action (NFA) for soils with LUC/ICs for industrial/commercial use and groundwater use restrictions. Groundwater was deferred to the NYSDEC Petroleum Spills Program.

The ROD for Site T-9 (including Site SS-025) stated that:

- The property will be designated for industrial/commercial use unless permission is obtained from the USEPA, NYSDEC, and the New York State Department of Health (NYSDOH);

- The owner or occupant of the property shall not extract, utilize, consume, or permit to be extracted, any water from the subsurface aquifer within the boundary of the property unless such owner or occupant obtains prior written approval from the NYSDOH; and
- The groundwater at the site requires further investigation under the NYSDEC Spills Program.

1.3 Land-Reuse Zoning

The land-reuse zoning for the Former Griffiss AFB is illustrated in Figure 3 of the ROD (AFRPA, June 2001). The Former Griffiss Local Development Corporation (GLDC), which is the Former Local Reuse Agency (LRA), designated Parcel F1, which includes the SS-025 Site (T-9 AOC), for industrial (light industrial development) use. The City of Rome adopted the LRA's zoning designation in 1998.

As discussed in the Third Five Year Review for the Site (FPM/Cape, June 2015), annual LUC/IC inspections have been performed at the site to ensure that the LUC/ICs continue to be implemented. The confirmation of the LUC/ICs was obtained through on-site inspections and LUC/IC confirmation forms signed by the owner/occupant of the property.

1.4 Baseline HHRA Purpose

The purpose of this Baseline HHRA is to evaluate whether exposures to COPCs on Site SS-025, in the absence of a LUC, by future residents, poses a risk above the NCP risk range of 10-6 to 10-4 (one in a million to one in ten thousand) and/or the goal of protection of a Hazard Quotient (HQ) = 1 for an individual chemical or a HI for several chemicals = 1 (e.g., HQ or HI = 1). The Baseline HHRA also evaluated future exposures to a construction worker who may be exposed to soils at depths from the surface to the Water Table during future development of the property. The Baseline HHRA for these receptors evaluated future exposures and whether exposures posed unacceptable cancer risks and non-cancer hazards.

The remaining sections of this report provide information on the analyses conducted during each step of the Baseline HHRA. This report is organized according to the four steps of the risk assessment process (Section 1.1).

2 HAZARD IDENTIFICATION

The purpose of the hazard identification section of the Baseline HHRA is:

- to evaluate the nature and extent of chemicals present at the Site, and
- to identify COPCs for further quantitative evaluation in the Baseline HHRA.

This Baseline HHRA focuses on the assessment of current and future risks, both cancer risks and non-cancer hazards, to human health associated with Site exposures at both depths, surface soil (0 to 2 ft bgs) and soils from the surface to the Water Table. Soils collected from the Site, at both depths, were quantitatively evaluated as a potential exposure media. The future exposure assessment, conducted in this Baseline HHRA, assumes future residential land use and no management of soils brought to the surface during excavation or other activities where future residents may be exposed. The assessment also evaluated a future construction worker exposed during digging, etc.

Sampling was conducted by the USAF on the property from May 31, 2017, to June 5, 2017. The samples were collected at depths from 0 to 2 ft bgs and 0 ft bgs to the Water Table. Samples were collected for TCL, TAL, PCBs, PAHs, and VOCs.

The samples were collected and analyzed under a Quality Assurance Project Plan. The data was evaluated and determined the data meet the quality assurance/quality control criteria and are appropriate for inclusion in the Baseline HHRA. The RAGS Part D Data Useability Worksheet is included in Appendix B of this Baseline HHRA.

2.1 Conceptual Site Model

The Conceptual Site Model (CSM) summarizes the sources of chemical contaminants, transport of contaminated media, routes of exposures, and receptors under current and future conditions. The CSM is presented in Appendix C - RAGS Part D Table 1 (USEPA, December 2001). The selection of exposure pathways and the rationale for inclusion of each pathway, using either quantitative or qualitative methods are as follows:

- Future Resident: The CSM identifies exposures to a future resident living on the Site who may be exposed to soils at both depths, under a future residential scenario. The assessment includes both a child (0 to 6 years) and an adult (older than 18 years) exposed for a total of 26 years (6 years as a child and 20 years as an adult) and a combined adult/child for the cancer assessment. Routes of exposure include inhalation, ingestion, and dermal contact with COPCs.
- Future Construction Worker: Exposures to a future construction worker were also evaluated in the assessment. The future construction worker is assumed to be an adult exposed to soils at both depths during future construction on the Site.

2.2 Selection of COPCs

Analytical data collected from soils at both depths is the basis for the COPC determination.

The selection of COPCs were based on the following criteria:

- Known human carcinogens or chemicals classified as "carcinogenic to humans" regardless of whether the concentration exceeds the screening level (USEPA, December 1989).
- Maximum detected chemical concentrations greater than the residential soil screening level available in the May 2019 USEPA Regional Screening Level (RSL) table (USEPA, May 2019). The screening concentration is based on residential exposures associated with a cancer risk of 1×10^{-6} (or 1 in a million).
- Maximum detected concentration is greater than the concentration associated with HQ = 0.1 to address potential exposures to multiple chemicals with the same non-cancer health effects.
- The lower of the cancer risk and non-cancer hazard concentration were used to identify COPCs.

The criteria for excluding chemicals as COPCs include:

- Maximum soil concentration is below the RSL (described above) provided that the chemical is not a known human carcinogen or carcinogenic to humans.
- Essential nutrients (e.g., potassium, calcium, etc.).
- Chemicals detected in less than 5% of samples provided they are not classified as known human carcinogens or carcinogenic to humans.
- Chemicals lacking toxicity values are excluded from further quantitative evaluation but are discussed in the Uncertainty Section of the Risk Characterization (Section 5.3).

Appendix C - RAGS Part D Table 2 provides the determination of the status of the COPCs. Consistent with USEPA guidance (USEPA, December 2001), information provided in Appendix C - RAGS Part D Table 2 includes the minimum and maximum concentrations of chemicals identified in Site sampling including data qualifiers. The Table includes information on location of the maximum concentration, frequency of detection, RSL, and the screening conclusions rationale e.g., COPC or non-COPC.

A total of 136 chemicals were screened. The Table below summarizes the results of the screening and the classification groups of the individual chemicals.

Screening Criteria	**Number of Chemicals**
Known Human Carcinogens	2
Non-detect, Below Screening Levels (ND, BSL)	71
Chemicals not detected in sampling that are Above Screening Levels (ND, ASL)	5
No Screening Level (NSL)	15
Maximum Concentration Exceeds Screening Level (MCE)	10
Maximum Concentration Below Screening Level (MCN)	29
Essential Nutrient (EN)	4
Total	136

The identified COPCs are listed below by chemical category. The listed COPCs will be further evaluated and the calculated cancer risks and non-cancer hazards for these chemicals will be discussed in the Risk Characterization section of this Baseline HHRA (Section 5).

Chemicals of Potential Concern
PAHs
Benzo(a)anthracene
Benzo(a)pyrene
Benzo(b)fluoranthene
Dibenzo(a,h)anthracene
Metals
Aluminum
Arsenic (inorganic)
Chromium (VI)
Cobalt
Iron
Manganese (non-diet)
Volatile Organic Compounds*
Benzene
Trichloroethylene
* Benzene and trichloroethylene were identified as COPCs based on the classification of each chemical as known human carcinogens.

Chromium III was screened out as a COPC based on comparison of the maximum concentration to the RSL concentration. In the absence of data on the valence of chromium, the chemical was also assessed assuming all results are chromium VI, in the selection of COPCs. Based on the classification of chromium VI as a Known Human Carcinogen, and the maximum concentration of chromium in soil, chromium VI was identified as a COPC assuming all data is chromium VI. This potential overestimate of cancer risks will be discussed in the Risk Characterization section of this Baseline HHRA (Section 5).

The screening level assessment also identified five chemicals with the maximum non-detect concentrations above the RSL concentration. This exceedance of the screening level based on a non-detect concentration indicates a potential underestimate in risk. This potential uncertainty will be discussed in the Uncertainty Section of the Risk Characterization (Section 5.3).

This page intentionally left blank.

3 EXPOSURE ASSESSMENT

This section of the Baseline HHRA evaluates potential exposures for human receptors that will be used to estimate the cancer risks and non-cancer health hazards from exposures to COPCs at the Site. USEPA guidance (USEPA; December 1989, February 1992, May 1992b, May 1992c, and March 1995) provides the framework to be used in exposure assessments at Superfund Sites. The exposure assessment includes the identification of potentially exposed individuals, development of exposure scenarios, analysis of potential exposure pathways, and estimation of exposure point concentrations (EPCs) where the receptor may contact contaminated soils at both depths by the future resident and construction worker.

Information on receptor activities and concentrations in soil are used to estimate potential exposure doses under current and reasonably foreseeable land use conditions. This assessment assumes future residential exposures. The exposure assessment evaluates pathways by which receptors can be exposed to the COPCs in soil in the future. Groundwater exposures will be investigated under the NYSDEC Spills Program and will not be addressed in this Baseline HHRA.

The quantification of exposure is based on exposure factors including concentrations in soil at both depths, the potential exposure frequency (number of days per year), amount of soil consumed during activities (milligrams of soil ingested per body weight in kilograms per day or mg/kg-day), and the duration of exposure (number of years). The exposure assessment is based on site-specific parameters that can reasonably be expected at the Site, under a future residential scenario. The estimated exposures are presented in units of mg/kg-day.

USEPA guidance and policy call for an evaluation of cancer risks and non-cancer health hazards to the Reasonably Maximally Exposed Individual defined as “the maximum exposure that is reasonably expected to occur at the site” (USEPA, December 1989 and 1990). An estimate for the Reasonably Maximally Exposed Individual is obtained by determining estimates of likely "high-end" exposure factors and then combining these high-end factors with average exposure factors to develop a point estimate, or single exposure value, for the Reasonably Maximally Exposed Individual. A combination of USEPA recommended exposure values and site-specific values are used as input parameters in this assessment (USEPA, February 2014).

Decisions to take remedial action at a Site are based on exposures to the Reasonably Maximally Exposed Individual. If the risk range for the Reasonably Maximally Exposed Individual is exceeded, a Central Tendency Exposure (CTE) scenario is evaluated. The CTE evaluation provides additional information to the risk manager; however, consistent with the NCP, decisions regarding remedial action are based on the risks to the Reasonably Maximally Exposed Individual.

3.1 Exposure Point Concentrations

Individual EPCs were developed for each COPC at both depths (Appendix C - RAGS Part D Tables 3.1 and 3.2). The EPCs were calculated using ProUCL Version 5.1 (USEPA, October 2015). The ProUCL computer program was developed for the USEPA to calculate EPCs that represent COPC exposures at Superfund sites. The EPC represents a 95% Upper Confidence Limit (UCL) on the

Mean for each COPC. The maximum concentrations were used where statistical analysis is not calculated based on a small number of samples or limited number of detections. The results of the EPC calculations are summarized in Appendix C - RAGS Part D Tables 3.1 and 3.2. The Tables include information on the sample concentrations, including the arithmetic mean, 95% UCL concentration, and maximum concentration along with the recommended EPC based on the computer output. The ProUCL outputs are provided in Appendix D.

The concentrations for benzene and trichloroethylene are based on the maximum concentration in soils at both depths. The maximum concentration was used based on the finding that all samples are non-detects at both depths.

Comparison of the EPCs at both depths (Appendix C - Tables 3.1 and 3.2) indicate the concentrations are comparable. The sample results from each depth will be used to calculate the exposure dose and the cancer risks and non-cancer hazards associated with the dose.

3.2 Exposure Receptors and Scenarios

The focus of this risk assessment was the evaluation of exposures at the Site for receptors who may come into direct contact with potentially contaminated soil at both depths. The Exposure Factors used in this assessment were primarily obtained from the *Human Health Evaluation Manual, Supplemental Guidance: Update of Standard Default Exposure Factors* (USEPA, February 2014). In the absence of default exposure factors, site specific exposure values were developed based on best professional judgment.

Receptors include:

- Future Resident: Future residents are the most sensitive receptors based on potential exposures to a young child (i.e. 6 years and younger). The assessment assumed exposures to an adult/child for the cancer assessment and to the young child (6 years and younger) for the non-cancer assessment. If future land use changes, the risk quantified in this assessment will likely be protective of all other potential receptors. The future resident is assumed to be exposed to contamination at both depths assuming the resident may dig in the upper 2 ft of soil on their property and/or be exposed to soil brought to the surface during construction activities where contaminated soils are not managed.

  The Baseline HHRA evaluated the following exposure pathways: incidental ingestion of soil, dermal contact with soil, and inhalation of volatiles and fugitive dust. The exposures included the young child (6 years and younger) and adults (18 years and older) exposed for 350 days/year for a period of 26 years (6 years as a child and 20 years as an adult).

  Adults and children exhibit different ingestion rates for soil. For example, the soil ingestion rate for a child resident is 200 milligrams per day (mg/day) while the adult rate is 100 mg/day. The ingestion rate assumes exposures to both soil and dust tracked into the residence. To account for changes in intake rates as the receptor ages, age adjusted intake equations are used for the adult/child in the cancer assessment. The calculations of exposure dose include adjustments for body weight and skin surface area based on age

(e.g., child and adult) as described in Section 3.5 and listed in Appendix C - Tables 4.1 and 4.2. The exposure assumptions for inhalation are provided in Appendix C - Table 4.3.

- Future Construction Worker: The future construction worker is assumed to be exposed to soils at both depths during future construction work on the property. The exposure pathway assumes the construction worker wears no protective equipment to prevent exposure. Exposures are assumed to be short-term during the construction activities such as digging, tilling, etc. for a period of less than 1 year.

  The activities for this receptor typically involve on-site exposure to soils at both depths during construction. The construction worker is expected to have an elevated soil ingestion rate (330 mg/day) and is assumed to be exposed to contaminants via the following pathways: incidental ingestion of soil, dermal contact with contaminants in soil, and inhalation of volatiles and fugitive dust based on modeling.

  This receptor is limited to a subchronic exposure with a duration of 1 year and less. Other unique aspects of this scenario are that the Particulate Emission Factor (PEF) is based on mechanical disturbance of the soil. Exposure to volatiles are addressed using a Volatilization Factor (VF). These values are discussed in Section 3.3.

  The exposure assumptions are provided in Appendix C – Tables 4.4 through 4.6.

3.3 Exposure Models

Consistent with the *Supplemental Guidance for Developing Soil Screening Levels for Superfund Sites* (USEPA, December 2002a), exposure to particulates and volatiles were evaluated in the Exposure Assessment. This equation relates the contaminant concentration in soil with the concentration of respirable particles in the air due to fugitive dust emissions. The variables used in the modeling include the PEF and the VF. Inhalation of contaminants adsorbed to respirable particles (PM10) were assessed using a default PEF equal to 1.36×10^9 cubic meters per kilogram (m^3/kg).

The model equations incorporate a soil-to-air VF. The VF relates the concentration of a contaminant in soil to the concentration of the contaminant in air resulting from volatilization. A VF is available for benzo(a)anthracene (i.e., 4.41×10^6), trichloroethylene (2.2×10^3), and benzene (3.54×10^3).

Equation 5-3 of the Supplemental Guidance (USEPA, December 2002a) was used to evaluate inhalation of volatiles and particulates emitted from soil. The following tables summarize the information used in these modeling calculations.

Volatilization factors for particulate emissions from soil to outdoor air are summarized below.

Parameter Code	Parameter Definition	Value	Units	Rationale/Reference
VF_p	Volatilization factor for particulate emissions	Chemical specific	kg-soil/m^3-air	Calculated

Parameter Code	Parameter Definition	Value	Units	Rationale/Reference
Q/C	Inverse of the mean concentration at the center of square source	62.55	$(g/m^2\text{-}s)/(kg/m^3)$	USEPA, July 1996
V	Fraction of Vegetative Cover	0.5	m^2/m^2	USEPA, 2018
U_m	Mean Annual Wind Speed	2.68	m/s	NOAA, 1998
U_t	Equivalent Threshold Value of Windspeed	11.32	m/s	USEPA, December 2002a
$F_{(x)}$	Windspeed Distribution Function from Cowherd et. al, 1985	0.194	unitless	USEPA, December 2002a
0.036	Empirical constant	0.036	$g/m^2\text{-}hr$	USEPA, December 2002a
Notes: $kg\text{-}soil/m^3\text{-}air$ = kilograms of soil per cubic meter of air; $g/m^2\text{-}s$ = grams per square meter-second; kg/m^3 = kilograms per cubic meter; m^2 = square meter; m/s = meters per second; $g/m^2\text{-}hr$ = grams per square meter-hour; NOAA = National Oceanic Atmospheric Administration				

Volatilization factors for air emissions from soil to outdoor air are summarized below.

Parameter Code	Parameter Definition	Value	Units	Rationale/Reference
$VF_{ss\text{-}i}$	Surface soils volatilization factor for infinite sources	Chemical specific	$kg\text{-}soil/m^3\text{-}air$	Calculated
$VF_{ss\text{-}m}$	Surface soils volatilization factor for finite (mass limit) sources	Chemical specific	$kg\text{-}soil/m^3\text{-}air$	Calculated
Q/C	Inverse of the mean concentration at the center of square source	62.55	$(g/m^2\text{-}s)/(kg/m^3)$	USEPA, December 2002a
D_A	Apparent diffusivity	Calculated	cm^2/s	Calculated
τ	Averaging time for vapor flux			
	Child	1.89E+08	seconds	Calculated
	Adult	6.31E+08	seconds	Calculated
ρ_s	Dry Soil Bulk Density in the Vadose Zone	1.62	g/cm^3	USEPA, July 2004
H	Dimensionless Henry's law constant	Chemical specific	unitless	USEPA, December 2002a
K_{oc}	Organic carbon adsorption coefficient	Chemical specific	L/kg	USEPA, December 2002a
D^a	Diffusivity in air	Chemical specific	cm^2/s	USEPA, December 2002a
D^w	Diffusivity in water	Chemical specific	cm^2/s	USEPA, December 2002a

Parameter Code	Parameter Definition	Value	Units	Rationale/Reference
f_{oc}	Fractional Organic Carbon Content in the Vadose Zone	0.002	g-C/g-soil	USEPA, July 2004
ϑ_T	Total Soil Porosity in the Vadose Zone	0.39	cc/cc	USEPA, July 2004
ϑ_{ws}	Volumetric Water Content in the Vadose Zone	0.049	cc/cc	USEPA, July 2004
ϑ_{as}	Volumetric Air Content in the Vadose Zone	0.341	cc/cc	Calculated
d_s	Lower Depth of Surficial Soil Zone			
	0 to 2 ft bgs	60.96	cm	Site-specific
	0 ft bgs to Water Table	161.85	cm	Site-specific
Notes: cm^2/s = square centimeters per second; g/cm^3 = grams per cubic centimeter; L/kg = liters per kilogram; g-C/g-soil = grams carbon per grams soil; cc = cubic centimeter; cm = centimeters				

3.4 Exposure Equations

Chemical intake is expressed in terms of dose units of mg/kg-day. In general, quantitative exposure estimates involve the following steps:

- Determining EPCs, the concentrations of COPCs in environmental media at the point of human exposure (Section 3.1);
- Identifying the applicable human exposure models and input parameters (exposure frequency, duration, etc.); and
- Estimating human intakes based on using exposure equations for ingestion, dermal contact, and inhalation.

The primary source for the exposure equations is USEPA's RAGS, Parts A, B, D, E, and F (USEPA, December 1989, December 1991a, December 2001, July 2004, and January 2009, respectively).

3.4.1 Soil Ingestion

The generalized equation for calculating soil chemical intakes is:

$$\text{Intake (I) (mg/kg-day)} = \frac{C \times CR \times EF \times ED \times CF}{BW \times AT}$$

Where:

I = *Intake* - the amount of chemical at the exchange boundary (mg/kg-day)
C = *EPC* - the chemical concentration contacted over the exposure period at the exposure point (*e.g.*, mg/kg-soil)
CR = *Contact Rate* - the amount of affected medium contacted per unit time or event (*e.g.*, soil ingestion rate in grams per day [g/day])
EF = *Exposure frequency* - describes how often exposure occurs (days/year)

ED = *Exposure duration* - describes how long exposure occurs in years
CF = *Conversion factor* – kilograms per gram (kg/g)
BW = *Body weight* - the average body weight over the exposure period (kilograms [kg])
AT = *Averaging times (ATs)* - the period over which exposure is averaged (days)
The cancer and non-cancer ATs are:
Carcinogenicity AT is 70 years x 365 days/year, and
Non-cancer AT is 26 years x 365 days/year for all ages for the resident; 6 years x 365 days/year for the young child; 20 years x 365 days/year for the adult; and 1 year x 365 days for the construction worker

3.4.2 Equations for Calculating Dermal Chemical Intakes

For soil dermal contact, absorbed doses are used (USEPA, July 2004). Dermal intake (the amount absorbed into the body) is calculated as:

$$\text{Intake (mg/kg-day)} = \frac{C_{soil} \times DA \times AF \times SA \times EF \times ED \times CF}{BW \times AT}$$

Where:

C_{soil} = Concentration of COPCs in soil (milligram per kilogram [mg/kg])
DA = Dermal absorption factor (unitless)
AF = Soil adherence factor (milligrams per square centimeter [mg/cm^2])
SA = Skin surface area exposed (cm^2/exposure event)
EF = Exposure frequency (exposure events/year)
ED = Exposure duration (years)
CF = Conversion factor (10^{-6} kg/mg)
BW = Body weight (kg)
AT = Averaging times are the period over which exposure is averaged (days)
The cancer and non-cancer ATs are:
Carcinogenicity AT is 70 years x 365 days/year, and
Non-cancer AT is 26 years x 365 days/year for all ages for the resident; 6 years x 365 days/year for the young child; 20 years x 365 days/year for the adult; and 1 year x 365 days for the construction worker

The dermal absorption factors are provided in Section 3.6.

3.4.3 Inhalation Exposures

$$\text{EC (micrograms per cubic meter [}\mu g/m^3\text{])} = \frac{CA \times ET \times EF \times ED}{AT \times ED}$$

Where:

EC = exposure concentration in $\mu g/m^3$
CA = contaminant concentration in air ($\mu g/m^3$)
ET = exposure time (hours/day)
EF = exposure frequency (days/year)

ED = exposure duration (years)

AT = Averaging times are the period over which exposure is averaged (days)
The cancer and non-cancer ATs are:
Carcinogenicity AT is 70 years x 365 days/year x 24 hours/day, and
Non-cancer AT is 26 years x 365 days/year x 24 hours/day for all ages for the resident; 6 years X 365 days/year x 24 hours/day for the young child; 20 years x 365 days/year x 24 hours/day for the adult; and 1 year x 365 days x 24 hours/day for the construction worker

Appendix C - RAGS Part D Tables 4.1 to 4.3 provide the specific exposure equations and parameters.

3.5 Exposure Parameters

Exposure parameters (e.g., contact rate, exposure frequency, exposure duration, body weight) describe the exposures of a receptor for a given exposure scenario. These values are input parameters for the exposure equations used to estimate chemical intake (USEPA, February 2014). Exposures to the future construction worker were based on assumptions for the worker exposed during the construction of a building. The exposure frequency and duration were adjusted to reflect the construction activities e.g., 1 year or less to complete the project.

Appendix C - RAGS Part D Tables 4.1 to 4.6 provide exposure assumptions for the individual receptors used to calculate cancer risk and non-cancer hazards.

3.6 Dermal Absorption Fractions

The dermal absorption fraction (DAF) accounts for absorption of chemicals through the skin. The DAFs for COPCs were compiled from RAGS Part E, Exhibit 3-4 (USEPA, July 2004). The DAFs used for the chemicals are listed below:

Chemicals of Potential Concern	Dermal Absorption Factors
PAHs	
Benz(a)anthracene	0.13
Benzo(a)pyrene	0.13
Benzo(b)fluoranthene	0.13
Dibenzo(a,h)anthracene	0.13
Metals	
Aluminum	Not Applicable
Arsenic (inorganic)	0.03
Chromium (VI)	Not Applicable
Cobalt	Not Applicable
Iron	Not Applicable
Manganese (non-diet)	Not Applicable
Volatile Organic Compounds	
Benzene	Not Applicable
Trichloroethylene	Not Applicable

3.7 Bioavailability

Absorption adjustment factors (AAFs) are used in risk assessment to account for differences in bioavailability between exposed humans and studies in laboratory animals used in deriving toxicity values. A bioavailability factor of 0.6 was applied for arsenic exposures (USEPA, December 2012). Bioavailability factors for the remaining chemicals are equal to 1.

4 TOXICITY ASSESSMENT – DOSE-RESPONSE

The toxicity assessment determines the types of adverse health effects potentially associated with exposures to COPCs at the Site and the relationship between the magnitude of exposure (dose) and severity of adverse effects (response). Toxicity relationships are developed using animal studies and theoretical concepts about what might occur in humans or where data is available based on human epidemiological evidence.

The result of a toxicity assessment is the development of toxicity values for both cancer and non-cancer health effects that are combined with exposure information (Section 3) to calculate cancer risks and non-cancer hazards. The calculated cancer risks and non-cancer hazards are then presented in the Risk Characterization Section (Section 5) with associated uncertainties. The calculated cancer risks and non-cancer hazards from the assessment are compared to the criteria identified in the NCP to support decisions regarding the LUC.

4.1 Toxicity Hierarchy

In December 2003, the Office of Solid Waste and Emergency Response (OSWER, now referred to as the Office of Land and Emergency Management) issued a directive (USEPA, December 2003) outlining the hierarchy of toxicity values to be used in a risk assessment. The toxicity values for COPCs come from the following sources.

- Tier 1: Integrated Risk Information System (IRIS), which represents the USEPA's consensus database for cancer and non-cancer toxicity information.
- Tier 2: USEPA's Provisional Peer Reviewed Toxicity Values (PPRTVs) developed by the USEPA's National Center for Environmental Assessment in the Office of Research and Development.
- Tier 3: Other sources of toxicity information such as the Agency for Toxicity Substances and Disease Registry (ATSDR) Toxicological Profiles, and other resources evaluated through the Superfund Technical Support Center and identified as appropriate for inclusion in the Baseline HHRA.

Appendix C provides the RAGS Part D Tables 5.1 through 5.4 and 6.1 and 6.2 that identify relevant endpoints and toxicity benchmarks. Tables 5.1 through 5.4 provide non-cancer toxicity values (i.e., reference doses [RfDs], and reference concentrations (RfCs, both chronic and subchronic). Tables 6.1 and 6.2 provide cancer toxicity information (e.g., cancer slope factors [CSFs], and inhalation unit risks [IURs]). Each table identifies the sources of the toxicity information consistent with the toxicity hierarchy Tiers listed above.

4.2 Non-cancer Health Effects

Non-cancer toxicity is evaluated using an oral RfD and/or an inhalation RfC. The following sections define the terms RfD and RfC and their derivation.

4.2.1 Oral Reference Dose

The RfD, in units of mg/kg-day, represents "an estimate (with uncertainty spanning perhaps an order of magnitude or greater) of a daily exposure level for the human population, including sensitive subpopulations, that is likely to be without an appreciable risk of deleterious effects during a lifetime". RfDs are derived by first identifying the highest dose level that does not cause observable adverse effects (the no-observed-adverse-effect-level, or NOAEL). If a NOAEL was not identified, a lowest observed-adverse-effect-level, or LOAEL, may be used. This dose level is then divided by uncertainty factors to calculate an RfD. There are four standard uncertainty factors that can be used when calculating an RfD:

- An up-to-10-fold factor to account for the variation in sensitivity among members of the human population.
- An up-to-10-fold factor to account for the uncertainty involved in extrapolating from animal data to humans.
- An up-to-10-fold factor to account for the uncertainty involved in extrapolating from less than chronic NOAELs to chronic NOAELs.
- An up-to-10-fold factor to account for the uncertainty involved in extrapolating from LOAELs to NOAELs.

Appendix C - RAGS Part D – Table 5.1 provides the chronic toxicity oral RfD values used to assess non-cancer toxicity for the future resident. Table 5.3 provides the subchronic RfDs that are used in the calculation of non-cancer hazards for the construction worker.

4.2.2 Inhalation Toxicity Concentrations

RfCs provide the non-toxicity values for inhalation. The RfC is "an estimate (with uncertainty spanning perhaps an order of magnitude) of a continuous exposure to the human population (including sensitive subgroups) that is likely to be without an appreciable risk of deleterious effects during a lifetime". Non-cancer toxicity values can be derived from a NOAEL, LOAEL, or benchmark concentration, with uncertainty factors, described above to reflect limitations of the data used. The RfC is expressed in units of milligrams per cubic meter (mg/m^3).

Appendix C - RAGS Part D - Tables 5.1 through 5.4 provide toxicity data and non-cancer health effects associated with each COPC. The non-cancer health endpoint (i.e., the target organ) associated with each derived toxicity value for each chemical was calculated. Table 5.2 provides the chronic inhalation RfCs while Table 5.4 provides the subchronic RfCs.

The subchronic toxicity values for the COPCs are used in the calculation of the non-cancer HQ for the construction worker. The exposure frequency and duration for the construction worker are less than 1 year requiring evaluation of non-cancer hazards using subchronic values. Chemicals lacking subchronic RfCs are discussed in the Uncertainty Section of Section 5.

4.2.3 Interpretation of Non-Cancer Assessments

The potential for non-cancer health effects is evaluated by comparing an exposure level over a specified time period (i.e., lifetime) with a RfD (expressed in the same units) derived for a similar exposure period (i.e. chronic). This ratio of exposure to toxicity is referred to as the HQ. A target organ HQ ≤ 1 indicates that a receptor's dose of a single contaminant is less than the RfD, and that toxic non-cancer health effects from that chemical are unlikely. A determination that the HQ is greater than 1 indicates the potential for non-cancer health effects depending on the magnitude of the HQ.

The potential for non-cancer health effects is evaluated by comparing an exposure level over a specified time frame (e.g., chronic or subchronic) with the RfC. The HI is generated by adding the HQs for the individual COPCs that affect the same target organ or act through the same mechanism of action within a medium or across all media to which an individual may reasonably be exposed. An HI ≤ 1 indicates that, based on the sum of all HQs from different contaminants and exposure routes, adverse toxic non-cancer health effects from all contaminants are unlikely. An HI > 1 indicates that a site related exposure may present a hazard to human health and it is important to evaluate toxicity by target organ based on the critical effect used in the development of the toxicity value.. Those chemicals posing effects on the same target organ with an HI > 1 require further discussion in the Risk Characterization section of the Baseline HHRA.

Chemicals lacking non-cancer toxicity information are qualitatively evaluated in the Risk Characterization and the Uncertainty Sections (Section 5).

4.3 Carcinogenic Effects

Chemicals with the potential to cause cancer are classified based on the weight of evidence (WOE) for each chemical. The WOE is used to characterize the extent to which the available human epidemiology and animal studies indicate that a chemical may cause cancer in humans. The WOE includes classifications such as known human carcinogens, likely to be carcinogenic to humans, possible human carcinogen, not classifiable as to carcinogenicity, or not carcinogenic to humans (USEPA, March 2005a).

The cancer slope factor, or CSF, is a plausible upper bound estimate of carcinogenic potency used to calculate cancer risk from exposure to carcinogens, by relating estimates of lifetime average chemical intake to the incremental probability of an individual developing cancer over a lifetime. The CSFs developed by the USEPA are plausible upper bound estimates, which means that the USEPA is reasonably confident that the actual cancer risk will not exceed the estimated risk calculated using the CSF.

An IUR is used to assess exposures through inhalation. The IUR is an upper-bound excess lifetime cancer risk estimated to result from continuous exposure to an agent at a concentration in air in units of micrograms per cubic meter $(\mu g/m^3)^{-1}$.

Appendix C - RAGS Part D - Tables 6.1 and 6.2 provide dose-response information in the form of the CSF for the ingestion and dermal contact routes and the IUR for exposure via inhalation,

where toxicity information is available. The Tables also provide the WOE and the CSF and IUR for each chemical with adequate information.

For PAHs, a Relative Potency Factor (RPF) was applied (USEPA, July 1993). The RPF reflects the toxicity based on the base chemical, benzo(a)pyrene.

For carcinogens, cancer risks are generally expressed as the incremental probability of an individual developing cancer over a lifetime from exposure to the carcinogen. The upper-bound excess lifetime cancer risk is estimated by multiplying the lifetime exposure estimated in the exposure assessment by the CSF or IUR identified in the toxicity assessment. These risks represent probabilities usually expressed in scientific notation. An excess lifetime cancer risk of 1×10^{-6} indicates that an individual experiencing the reasonable maximum exposure (RME) estimated in the exposure assessment has a 1 in 1,000,000 probability of developing cancer from Site-related exposure(s).

The NCP, the regulation that implements the Superfund law, defines the range for determining whether action is necessary as an individual excess lifetime cancer risk of 1 in a million (1×10^{-6}) to 1 in 10,000 (1×10^{-4}). The decision to take remedial action is based on the cancer risk to the Reasonably Maximally Exposed Individual. Risks to the average or CTE individual are calculated when the risks exceed the risk range but this information is not used in the evaluation of the need for remedial action.

4.4 COPCs with a Mutagenic Mode of Action

The *Supplemental Guidance for Assessing Susceptibility from Early-Life Exposure to Carcinogens* (USEPA, March 2005b) recommends the application of Age Dependent Adjustment Factors (ADAFs) for chemicals identified with a mutagenic mode of action (MMOA). The ADAFs are:

- Ages 0-2: ADAF = 10
- Ages 2-6: ADAF = 3
- Ages 6-16: ADAF = 3
- Ages >16: ADAF = 1

The COPCs with a MMOA include: chromium VI; the PAHs including benzo(a)anthracene, benzo(a)pyrene, benzo(b)fluoranthene, and dibenzo(a,h)anthracene; and the VOC trichlorethylene. The assessment applied ADAFs consistent with the Supplemental Guidance (USEPA, March 2005b). For chemicals such as trichloroethylene, the recommendations in the IRIS file for evaluating the MMOA were followed. The following sections provide the general calculations for assessing exposures for future residents and construction workers. The exposure assumptions are the standard default exposure assumptions used for non-MMOA chemicals (USEPA, February 2014).

4.4.1 MMOA Calculation for Ingestion of Soil

The calculation of exposures for ingestion are provided below.

$$CDI_{res\text{-}soil\text{-}mu\text{-}ing}\left(\frac{mg}{kg\text{-}day}\right)=\frac{C_{soil}\left(\frac{mg}{kg}\right)\times IFSM_{res\text{-}adj}\left(\frac{166{,}833\ mg}{kg}\right)\times RBA\times\left(\frac{10^{-6}\ kg}{1\ mg}\right)}{AT_{res}\left(\frac{365\ days}{year}\times LT\left(70\ years\right)\right)}$$

where:

$$IFSM_{res\text{-}adj}\left(\frac{166{,}833\ mg}{kg}\right)=\left(\begin{array}{l}\frac{ED_{0\text{-}2}\left(2\ years\right)\times EF_{0\text{-}2}\left(\frac{350\ days}{year}\right)\times IRS_{0\text{-}2}\left(\frac{200\ mg}{day}\right)\times 10}{BW_{0\text{-}2}\left(15\ kg\right)}+\\ \frac{ED_{2\text{-}6}\left(4\ years\right)\times EF_{2\text{-}6}\left(\frac{350\ days}{year}\right)\times IRS_{2\text{-}6}\left(\frac{200\ mg}{day}\right)\times 3}{BW_{0\text{-}2}\left(15\ kg\right)}+\\ \frac{ED_{6\text{-}16}\left(10\ years\right)\times EF_{6\text{-}16}\left(\frac{350\ days}{year}\right)\times IRS_{6\text{-}16}\left(\frac{100\ mg}{day}\right)\times 3}{BW_{6\text{-}16}\left(80\ kg\right)}+\\ \frac{ED_{16\text{-}26}\left(10\ years\right)\times EF_{16\text{-}26}\left(\frac{350\ days}{year}\right)\times IRS_{16\text{-}26}\left(\frac{100\ mg}{day}\right)\times 1}{BW_{16\text{-}26}\left(80\ kg\right)}\end{array}\right)$$

4.4.2 MMOA Calculation for Dermal Exposure to Soil

The calculation of exposures for dermal contact with soil are provided below.

$$CDI_{res\text{-}soil\text{-}mu\text{-}der}\left(\frac{mg}{kg\text{-}day}\right)=\frac{C_{soil}\left(\frac{mg}{kg}\right)\times DFSM_{res\text{-}adj}\left(\frac{428{,}260\ mg}{kg}\right)\times ABS_{d}\times\left(\frac{10^{-6}\ kg}{1\ mg}\right)}{AT_{res}\left(\frac{365\ days}{year}\times LT\left(70\ years\right)\right)}$$

where:

$$DFSM_{res\text{-}adj}\left(\frac{428{,}260\ mg}{kg}\right)=\left(\begin{array}{l}\frac{ED_{0\text{-}2}\left(2\ years\right)\times EF_{0\text{-}2}\left(\frac{350\ days}{year}\right)\times AF_{0\text{-}2}\left(\frac{0.2\ mg}{cm^2}\right)\times SA_{0\text{-}2}\left(\frac{2{,}373\ cm^2}{day}\right)\times 10}{BW_{0\text{-}2}\left(15\ kg\right)}+\\ \frac{ED_{2\text{-}6}\left(4\ years\right)\times EF_{2\text{-}6}\left(\frac{350\ days}{year}\right)\times AF_{2\text{-}6}\left(\frac{0.2\ mg}{cm^2}\right)\times SA_{2\text{-}6}\left(\frac{2{,}373\ cm^2}{day}\right)\times 3}{BW_{2\text{-}6}\left(15\ kg\right)}+\\ \frac{ED_{6\text{-}16}\left(10\ years\right)\times EF_{6\text{-}16}\left(\frac{350\ days}{year}\right)\times AF_{6\text{-}16}\left(\frac{0.07\ mg}{cm^2}\right)\times SA_{6\text{-}16}\left(\frac{6{,}032\ cm^2}{day}\right)\times 3}{BW_{6\text{-}16}\left(80\ kg\right)}+\\ \frac{ED_{16\text{-}26}\left(10\ years\right)\times EF_{16\text{-}26}\left(\frac{350\ days}{year}\right)\times AF_{16\text{-}26}\left(\frac{0.07\ mg}{cm^2}\right)\times SA_{16\text{-}26}\left(\frac{6{,}032\ cm^2}{day}\right)\times 1}{BW_{16\text{-}26}\left(80\ kg\right)}\end{array}\right)$$

4.4.3 MMOA Calculation for Inhalation Exposure to Soil

The calculation of exposures for inhalation of soil particulates and vapors are provided below.

$$CDI_{res\text{-}soil\text{-}mu\text{-}inh}\left(\mu g/m^3\right)=\frac{\left(\begin{array}{l}\left(ED_{0\text{-}2}\left(2\text{ years}\right)\times EF_{0\text{-}2}\left(\frac{350\text{ days}}{\text{year}}\right)\times ET_{0\text{-}2}\left(\frac{24\text{ hours}}{\text{day}}\right)\times 10\right)+\\ \left(ED_{2\text{-}6}\left(4\text{ years}\right)\times EF_{2\text{-}6}\left(\frac{350\text{ days}}{\text{year}}\right)\times ET_{2\text{-}6}\left(\frac{24\text{ hours}}{\text{day}}\right)\times 3\right)+\\ \left(ED_{6\text{-}16}\left(10\text{ years}\right)\times EF_{6\text{-}16}\left(\frac{350\text{ days}}{\text{year}}\right)\times ET_{6\text{-}16}\left(\frac{24\text{ hours}}{\text{day}}\right)\times 3\right)+\\ \left(ED_{16\text{-}26}\left(10\text{ years}\right)\times EF_{16\text{-}26}\left(\frac{350\text{ days}}{\text{year}}\right)\times ET_{16\text{-}26}\left(\frac{24\text{ hours}}{\text{day}}\right)\times 1\right)\end{array}\right)}{AT_{res}\left(\frac{365\text{ days}}{\text{year}}\times LT\left(70\text{ years}\right)\right)\times\left(\frac{1\text{ mg}}{1000\ \mu g}\right)}\times C_{soil}\left(\frac{mg}{kg}\right)\times\left(\frac{1\text{ day}}{24\text{ hours}}\right)\times\left(\frac{1}{VF_s\left(\frac{m^3}{kg}\right)}+\frac{1}{PEF_w\left(\frac{m^3}{kg}\right)}\right)\times$$

4.4.4 MMOA Calculation for Trichloroethylene

The cancer risks from exposure to trichloroethylene were evaluated consistent with the process outlined in the IRIS chemical file.

4.5 Gastrointestinal Absorption Factors

Gastrointestinal Absorption Factor (GIABs) values are used to convert oral slope factors (administered dose) to dermal slope factors (administered dose) by factoring out the percentage eliminated in bodily waste. GIABs were applied consistent with the RAGS Part E Guidance regarding dermal assessment (USEPA, July 2004).

4.6 Subchronic Toxicity Values

Only a limited number of chemicals had subchronic toxicity values for inclusion in the non-cancer hazard assessment for the construction worker. Subchronic toxicity values were applied consistent with the RAGS Part A Guidance (USEPA, December 2001). Specifically, the May 2019 Subchronic Toxicity Supporting Table does not provide information for inorganic arsenic nor trichloroethylene and therefore are not assessed for the construction worker.

5 RISK CHARACTERIZATION

The final step in a Baseline HHRA combines exposure and toxicity information to provide a quantitative assessment of Site cancer risks and non-cancer hazards. Exposures are evaluated based on the potential risk for developing cancer and the non-cancer health hazards (Sections 3 and 4, respectively).

The calculated cancer risks and non-cancer hazards are provided based on sampling depths for the future resident and construction worker. A current assessment was not conducted since the area is currently vacant.

5.1 Calculated Cancer Risks and Non-cancer Health Hazards-Future Resident

5.1.1 Future Resident Exposures to Depths 0 to 2 ft bgs

Appendix C - Table 7.1 provides the cancer risks and non-cancer (child) hazards from exposure to soils under a future residential land use based on soils at depths of 0 to 2 ft bgs. The total cancer risk was 3.5×10^{-5} and the non-cancer HI was 1.1. The cancer risk is within the risk range established under the NCP and the non-cancer HI slightly exceeded the goal of protection of an HI = 1.

Appendix C - Table 7.1a provides the cancer risks and non-cancer (adult) hazards from exposure to soils under a future residential land use based on soils at depths of 0 to 2 ft bgs. The non-cancer HI for the future adult resident was less than the goal of protection of an HI = 1 for potential exposures at depths of 0 to 2 ft bgs.

Appendix C - Table 9.1 provides the calculated cancer risks across exposure pathways and the non-cancer health hazards across pathways with associated health effects for each chemical. The cancer assessment indicates the risks are within the risk range established under the NCP. The main chemicals exceeding the risk range were chromium VI (2.4×10^{-5}), inorganic arsenic (6×10^{-6}), and benzo(a)pyrene (3.5×10^{-6}). The total non-cancer HI was 1.1 which slightly exceeds the goal of protection of an HI = 1. Consistent with the Supplemental Chemical Mixtures Guidelines (USEPA, August 2000), the assessment also evaluated non-cancer hazards based on target organ associated with toxicity values and this HQ was less than 1. The highest HI for impacts was 0.4 for the nervous system from exposures to manganese. The next highest HI for impacts on the gastrointestinal (GI) tract was 0.3 from exposure to iron and chromium VI.

5.1.2 Future Resident Exposures to Depths of 0 ft bgs to the Water Table

Appendix C - Table 7.2 provides the cancer risks and non-cancer (child) hazards from exposure to soils under a future residential land use based on soils at depths of 0 ft bgs to the Water Table. The total cancer risk was 3.5×10^{-5} and the non-cancer HI was 1.1. The cancer risk is within the risk range established under the NCP and the non-cancer HI slightly exceeded the goal of protection of an HI = 1.

Appendix C - Table 7.2a provides the cancer risks and non-cancer (adult) hazards from exposure to soils under a future residential land use based on soils at depths of 0 ft bgs to the Water Table. The non-cancer HI for the future adult resident was less than the goal of protection of an HI = 1 for potential exposures at depths of 0 ft bgs to the Water Table.

Appendix C - Table 9.2 provides the calculated cancer risks across exposure pathways and the non-cancer health hazards across pathways with associated health effects for each chemical based on soils at depths of 0 ft bgs to the Water Table. The cancer assessment indicates the risks are within the risk range established under the NCP. The main chemicals driving the risk range were chromium VI (2.6×10^{-5}), inorganic arsenic (5.8×10^{-6}), and benzo(a)pyrene (2.5×10^{-6}). The total non-cancer HI was 1.1 which slightly exceeds the goal of protection of an HI = 1. Consistent with the Supplemental Chemical Mixtures Guidelines (USEPA, August 2000), the assessment also evaluated non-cancer risk based on target organ associated with toxicity values and this HQ was less than 1. The highest HI for impacts was 0.4 for the nervous system from exposures to manganese. The next highest HI for impacts on the GI tract was 0.3 from exposure to iron and chromium VI. The remaining HI target organs were below 0.1 mg/kg.

5.2 Calculated Cancer Risks and Non-cancer Health Hazards-Construction Worker

5.2.1 Future Construction Worker Exposures to Depths 0 to 2 ft bgs

Appendix C - Table 7.3 provides the cancer risks and non-cancer hazards from exposure to soils under future construction worker exposures based on soils at depths of 0 to 2 ft bgs. The total cancer risk was 4.3×10^{-8} and the non-cancer HI was 0.2. The cancer risk is below the risk range established under the NCP and the non-cancer HI is below the goal of protection of an HI = 1.

Appendix C - Table 9.3 provides the calculated cancer risks across exposure pathways and the non-cancer health hazards across pathways with associated health effects for each chemical. The Table also provides an analysis of the non-cancer hazards. The cancer assessment indicates the risks are within the risk range established under the NCP. Based on the results with the cancer risk below the risk range and the non-cancer HI below 1, further analysis of the results is not necessary.

5.2.2 Future Construction Worker Exposures-0 ft bgs to the Water Table

Appendix C - Table 7.4 provides the cancer risks and non-cancer hazards from exposure to soils under a future construction worker scenario based on soils at depths of 0 ft bgs to the Water Table. The total cancer risk was 4.2×10^{-8} and the non-cancer HI was 0.2. The cancer risk is below the risk range established under the NCP and the non-cancer HI is below the goal of protection of an HI = 1.

Appendix C - Table 9.4 provides the calculated cancer risks across exposure pathways and the non-cancer health hazards across pathways with associated health effects for each chemical. The Table also provides an analysis of the non-cancer hazards. The cancer assessment indicates the risks are within the risk range established under the NCP. Based on the results with the cancer

risk below the risk range and the non-cancer HI below 1, further analysis of the results is not necessary.

5.3 Uncertainty

The process of evaluating human health cancer risks and non-cancer health hazards involves multiple steps. As in any risk assessment, the estimates of potential health effects (cancer risks and non-cancer health hazards) have numerous associated uncertainties. The primary areas of uncertainty and limitations are qualitatively discussed here. The main areas of uncertainty in this Baseline HHRA include the environmental data used to conduct the risk assessment, the exposure parameter assumptions, the toxicological information used in the assessment, and the risk characterization when there is a mixture of chemicals present at a site. In general, the main sources of uncertainty include:

- Environmental chemistry sampling and analysis
- Environmental parameter measurement
- Fate and transport modeling
- Exposure parameter estimation
- Toxicological data

Uncertainty in environmental sampling arises in part from the potentially uneven distribution of chemicals in the media sampled. Consequently, there is significant uncertainty as to the actual levels present. Environmental chemistry-analysis error can stem from several sources including the errors inherent in the analytical methods and characteristics of the matrix being sampled.

Uncertainties in the exposure assessment are related to estimates of how often an individual would contact the COPC, the time period over which such exposures would occur, and in the models used to estimate the concentrations of the COPCs at the point of exposure. The Baseline HHRA assumes that concentrations of contaminants remain constant for the duration of exposure, which is most likely not the case.

Uncertainties in toxicological data occur in extrapolating both from animals to humans and from high to low doses of exposure, as well as from the difficulties in assessing the toxicity of a mixture of chemicals. These uncertainties are addressed by making exposure assumptions consistent with the RME concerning risk and exposure parameters throughout the assessment. As a result, the risk assessment provides upper-bound estimates of the risks to populations near the site, and is unlikely to underestimate actual risks related to the Site.

For the dermal exposure to soil pathway, there are also uncertainties, such as: a) not all chemicals have scientifically established dermal absorption values for soil and therefore may be left out of the quantitative assessment, b) sometimes soil to skin adherence factors do not match exactly with site conditions, and c) exposed skin surface area and exposure frequency may change seasonally, which may not be adequately accounted for in the exposure parameters used to represent the RME scenario.

Additional sources of uncertainty identified in this Baseline HHRA include the following:

- Chromium: The assumption that the concentration of chromium is 100% chromium VI may overestimate cancer risks and non-cancer hazards. In the environment, the potential exists that exposures may include concentrations of various species of chromium.
- Lack of toxicity information: Seventeen chemicals were not screened in the selection of COPCs based on a lack of toxicity information. This may result in a potential underestimate of cancer risks and non-cancer hazards.
- Screening Level Above Detection Limit: Five chemicals had detection limits above the screening levels that did not allow for the evaluation of potential risks. This may lead to an underestimate in risks.
- Subchronic Toxicity Information: Only a limited number of chemicals had subchronic toxicity values for inclusion in the non-cancer hazard assessment for the construction worker. As noted in Section 4.6 and Table 5.3, the May 2019 Subchronic Toxicity Supporting Table does not provide information for inorganic arsenic nor trichloroethylene and are therefore not assessed for the construction worker. Lack of subchronic toxicity values for COPCs may lead to an underestimate in the non-cancer health assessment.
- Bioavailability: Data on bioavailability of chemicals is limited to arsenic. USEPA's guidance (USEPA, December 2012) indicates: "… recent bioavailability studies conducted in animal models show that bioavailability of arsenic in soil is typically less than that of highly water soluble forms of arsenic (e.g., sodium arsenate dissolved in water). This suggests that bioavailability of arsenic in soil will typically be less than that of arsenic dissolved in drinking water (i.e., [relative bioavailability] RBA <100%)." This assessment used the default value of 60% that may over estimate risks based on the species of arsenic in soil.

6 SUMMARY AND CONCLUSIONS

The results of the risk assessment indicate that the risks to the receptors (future resident and construction worker) are within the risk range and below the goal of protection of a HI = 1 based on total non-cancer hazards or target organ non-cancer hazards.

APPENDIX B
DATA USEABILITY WORKSHEET

This page intentionally left blank.

DATA USEABILITY WORKSHEET
SS025 Griffiss AFB
Medium: Soil

Activity	Comment
Field Sampling	
Discuss sampling problems and field conditions that affect data useability.	No problems affected data useability.
Are samples representative of receptor exposure for this medium (e.g. sample depth, grab vs composite, filtered vs unfiltered, low flow, etc.)?	Yes. Soil samples are representative of receptor exposure for this medium.
Assess the effect of field QC results on data useability.	A trip blank detected the common laboratory contaminants acetone and methylene chloride of which acetone was qualified "UB" in some samples since it was present at less than 10x the blank concentration. Fluoranthene, phenanthrene, and pyrene were detected in an ambient blank but all sample results were much higher than the blank concentrations (>5x) and required no qualification.
Summarize the effect of field sampling issues on the risk assessment, if applicable.	There are no field sampling issues that should affect the risk assessment.
Analytical Techniques	
Were the analytical methods appropriate for quantitative risk assessment?	Yes. Samples were analyzed for organic compounds according to the Contract Laboratory Program (CLP) Statement of Work (SOW) for Organic Superfund Methods Multi-Media, Multi-Concentration, SOM02.4. The exception was for VOCs; TestAmerica Laboratory holds both DoD ELAP and NY NELAP certifications, along with reporting lower reporting limits for all analytes, for Method 8260B. Therefore, this method was utilized instead of Method 8260C. Inorganic soil samples were analyzed according to CLP SOW for Inorganic Superfund Methods Multi-Media, Multi-Concertation, ISM02.4. Additionally, samples were analyzed for organic and inorganic compounds in accordance with DoD ELAP certification and/or New York NELAP certification.
Were detection limits adequate?	Yes. The detection limits were less than the screening criteria with the exception of thallium. Thallium was non-detect in 29 samples. Three samples reported detections.
Summarize the effect of analytical technique issues on the risk assessment, if applicable.	There are no analytical technique issues that should affect the risk assessment.
Data Quality Objectives	
Precision - How were duplicates handled?	Relative percent differences (RPDs) were calculated for the duplicate pairs. When the RPDs were greater than the project defined RPD of 50%, the analyte was qualified as estimated, "J", in both samples.
Accuracy - How were split samples handled?	Split samples were not collected.
Representativeness - Indicate any problems associated with data representativeness (e.g., trip blank or rinsate blank contamination, chain of custody problems, etc.).	Analytes qualified with a UB due to blank contamination were considered non-detects during the risk assessment.
Completeness - Indicate any problems associated	No problems were associated with data completeness.

DATA USEABILITY WORKSHEET
SS025 Griffiss AFB
Medium: Soil

Activity	Comment
with data completeness (e.g., incorrect sample analysis, incomplete sample records, problems with field procedures, etc.).	
Comparability - Indicate any problems associated with data comparability.	No problems were associated with data comparability.
Were the DQOs specified in the QAPP satisfied?	Yes.
Summarize the effect of DQO issues on the risk assessment, if applicable.	There are no DQO issues to affect risk assessment.
Data Validation and Interpretation	
What are the data validation requirements?	For organic samples, validation checks included the following items: holding times, instrument performance checks, initial and continuing calibrations, blanks, laboratory control samples, matrix spike/matrix spike duplicates, internal standards, field duplicates, and overall assessment of data. For inorganic samples, validation checks included holding times, calibration, blanks, interference checks, laboratory control samples, lab duplicate samples, matrix spike samples, ICP serial dilution, field duplicates, and perform an overall assessment of the data.
What method or guidance was used to validate the data?	USEPA Contract Laboratory Program National Functional Guidelines for Superfund Organic Methods Data Review, August 2014; USEPA Contract Laboratory Program National Functional Guidelines for Inorganic Superfund Data Review, August 2014; and the Uniform Federal Policy-Quality Assurance Project Plan [UFP-QAPP], Supplemental Investigation at Sites SS017: Lot 69, DP022: Building 222, and SS025: T-9 Storage Area, Former Griffiss Air Force Base, Rome, New York (February 2017).
Was the data validation method consistent with guidance? Discuss any discrepancies.	Yes. The data validation method was consistent with regional guidance.
Were all data qualifiers defined? Discuss those which were not.	Yes. All data qualifiers were defined.
Which qualifiers represent useable data?	UB, J, and UJ
Which qualifiers represent unusable data?	R; but no data were rejected.
How are tentatively identified compounds handled?	No TICS were reported.
Summarize the effect of data validation and interpretation issues on the risk assessment, if applicable.	All data, both qualified and unqualified, were used in the risk assessment.
Additional notes:	None.

APPENDIX C
RAGS PART D TABLES

This page intentionally left blank.

RAGS Part D - Table 1 Conceptual Site Model
Selection of Exposure Pathways
Site SS-025, Former Griffiss Air Force Base, Rome, New York

Scenario Timeframe	Medium	Exposure Medium	Exposure Point	Receptor Population	Receptor Age	Exposure Route	Type of Analysis	Rationale for Selection or Exclusion of Exposure Pathway
Future Residential Land Use	Soil *	Ambient air vapors	Breathing zone based on modeling	Resident	Child (for non-cancer), and Age-adjusted for Cancer Assessment	Outdoor inhalation of vapors from soil	Quantitative	The assessment evaluated future residential use of the property. The assessment considered future residents are exposed to soils at depths of 0 ft bgs to 2 ft and depths of 0 ft bgs to the Water Table. Potential soil exposures include ingestion, dermal contact, and inhalation of soil particulates and vapors from soil. Under a future scenario, soil exposures consider the potential for soils at both depths to be brought to the surface where exposures may occur without appropriate management. Exposure of future residents to soils is considered a potentially complete exposure pathway. This exposure scenario will be quantitatively evaluated in the risk assessment for the adult/child adjusted for cancer and the young child separately for non-cancer as the child is the most sensitive receptor.
		Ambient particulates				Outdoor inhalation of particulates from soil	Quantitative	
		Soil	Soil from 0 to 2 feet below ground surface (ft bgs) and 0 ft bgs to the Water Table			Dermal contact with soil	Quantitative	
						Incidental ingestion of soil at both depths	Quantitative	
		Ambient air vapors	Breathing zone based on modeling	Construction worker	Adult	Outdoor inhalation of vapors from soil	Quantitative	Under a future scenario, if the property is developed for residential land use, the potential exists that a construction worker may be exposed to contaminated soils from 0 to 2 ft bgs and/or 0 ft bgs to the Water Table. The assessment will quantitatively evaluate potential soil exposures through direct contact (ingestion and dermal contact) and inhalation of vapors and particulates by a construction worker.
		Ambient particulates				Outdoor inhalation of particulates from soil	Quantitative	
		Soil	Soil from 0 ft bgs to 2 ft bgs and 0 ft bgs to the Water Table			Dermal contact with soil	Quantitative	
						Incidental ingestion of soil at both depths	Quantitative	

* Soil concentrations were used to calculate ambient air vapors and ambient particulates depending on information for the individual chemicals. The calculations include particulate emission factors and volatilization factors for individual chemicals from the Supplemental Guidance for Developing Soil Screening Levels for Superfund Sites (USEPA, 2002a).

RAGS Part D Table 2 - Chemicals of Potential Concern

Occurrence, Distribution, and Selection of Chemicals of Potential Concern (0 to Water Table)

Site SS-025, Former Griffiss Air Force Base, Rome, New York

Scenario Timeframe: Future

RAGS Part D Table 2 - Chemicals of Potential Concern

Occurrence, Distribution, and Selection of Chemicals of Potential Concern (0 to Water Table)

Site SS-025, Former Griffiss Air Force Base, Rome, New York

Scenario Timeframe: Future
Medium: Soil (0 ft bgs to the Water Table - All Data)
Exposure Medium: Soil

Exposure Point	CAS Number	Chemical	Minimum Concentration (Qualifier) (1)	Maximum Concentration (Qualifier) (1)	Units	Location of Maximum Concentration	Detection Frequency (%)	Range of Detection Limits	Concentration Used for Screening (2)	Background Value (3)	Screening Toxicity Value (N/C) (4)	Potential ARAR/TBC Value	Potential ARAR/TBC Source	COPC Flag (Y/N)	Rationale for Selection or Deletion (5)
	7440-23-5	Sodium	59 (J)	110 (J)	mg/kg	SS09	17	68-230	110		NA			N	EN
	7440-28-0	Thallium	0.64 (J)	0.92 (J)	mg/kg	SB09	10	2-11	0.92		0.078* N			N	NSL
	7440-62-2	Vanadium	5.7 (J)	27 (J)	mg/kg	SB09	97	5.6-5.6	27		39 N			N	MCN
	7440-66-6	Zinc	12	67	mg/kg	SB09	100		67		2,300 N			N	MCN

Footnote Instructions:

(1) J: Estimated value that is below reporting limit and above method detection limit.

(2) Maximum detected concentration.

(3) This information is not included in the risk assessment. Background is addressed in the feasibility study (FS).

(4) Screening toxicity values, developed based on a target risk (TR) of 1×10^{-6} and a hazard quotient (HQ) of 0.1, were obtained from EPA regional screening level (RSL) tables (USEPA, May 2019).

(5) Define the codes used for the "Rationale for Selection or Deletion". C: Carcinogenic N: Non-carcinogenic NA: Not Applicable

EN: Essential nutrient. NSL: Screening level not available. MCN: Maximum detected concentration below screening level.

ND: Chemical not detected. MCE: Maximum detected concentration exceeded screening level. KHC: Known Human Carcinogen

ASL: Detected concentration above screening level. ND, ASL: Not Detected but maximum concentration greater than screening level. BSL: Below Screening level

*There is uncertainty associated with the toxicity value used to calculate the screening level, therefore this is not a COPC.

Table 3.1 - RAGS Part D Tables (Calculation of Exposure Point Concentrations)

Exposure Point Concentration Summary for Future Resident (Soil depth 0 to 2 ft bgs)

Reasonable Maximum Exposure

Site SS-025, Former Griffiss Air Force Base, Rome, New York

Scenario Timeframe: Future
Medium: Soil
Exposure Medium: Soil (depth 0 to 2 feet bgs)

Exposure Point	Chemical of Potential Concern	Units	Arithmetic Mean	95% UCL (Distribution) (1)	Maximum Concentration (Qualifier)	Exposure Point Concentration			
						Value	Units	Statistic (2)	Rationale
Soil from 0 to 2 ft bgs	Benzene	mg/kg			0.16	0.16	mg/kg	Maximum	Maximum concentration
	Benzo[a]anthracene	mg/kg	0.13	0.471 (NP)	1.4 (J)	0.471	mg/kg	95% UCL - Non Parametric	ProUCL Recommended statistic
	Benzo[a]pyrene	mg/kg	0.12	0.405 (NP)	1.22 (J)	0.405	mg/kg	95% UCL - Non Parametric	ProUCL Recommended statistic
	Benzo[b]fluoranthene	mg/kg	0.16	0.559 (NP)	1.71 (J)	0.559	mg/kg	95% UCL - Non Parametric	ProUCL Recommended statistic
	Dibenz(a,h)anthracene	mg/kg	0.02	0.0701 (NP)	0.212 (J)	0.0701	mg/kg	95% UCL - Non Parametric	ProUCL Recommended statistic
	Aluminum	mg/kg	5,780	6,736 (N)	11,000	6,736	mg/kg	95% UCL - Normal Data	ProUCL Recommended statistic
	Arsenic	mg/kg	3.29	4.043 (NP)	6.2 (J)	4.043	mg/kg	95% UCL - Non Parametric	ProUCL Recommended statistic
	Chromium (VI)	mg/kg	6.12	7.28 (NP)	12	7.28	mg/kg	95% UCL - Non Parametric	ProUCL Recommended statistic
	Cobalt	mg/kg	4.09	4.782 (N)	9.3	4.782	mg/kg	95% UCL - Normal Data	ProUCL Recommended statistic
	Iron	mg/kg	11,280	12,941 (N)	21,000 (J)	12,941	mg/kg	95% UCL - Normal Data	ProUCL Recommended statistic
	Manganese	mg/kg	524	676.1 (T)	1,200	676.1	mg/kg	95% UCL - Log transformed data	ProUCL Recommended statistic
	Trichlorethylene	mg/kg			0.08	0.08	mg/kg	Maximum	Maximum concentration

Footnote Instructions:

Average of duplicate samples was used in calculating the arithmetic mean, 95% UCL, and maximum concentrations.

J: Estimated value

mg/kg - milligrams/kilogram

UCL = Upper Confidence Limit

(1) Definition of codes describing the type of distribution for the "95% UCL" term.

N: Normal

NP: Non parametric

T: Transformed (lognormal)

(2) Define the codes used for the "EPC Statistic".

95% UCL - N: 95% UCL of normal data

95% UCL - NP: Mean of nonparametric data

95% UCL - T: 95% UCL of log-transformed data

Iron	7439-89-6	NA	NA	NA	NA	NA	2.5E+01	NA	No
Manganese (Non-diet)	7439-96-5	NA	NA	NA	NA	NA	6.5E+01	NA	No

Notes:

NA: Not available. COPC: Chemical of Potential Concern.

Source: USEPA, May 2019. Regional Screening Level (RSL) Chemical-specific Parameters Supporting Table.

Per USEPA, a chemical is considered volatile if its dimensional Henry's Law Constant is greater than or equal to 1×10^{-5} atm-m^3/mole or vapor pressure greater than or equal to 1 mm Hg.

Table 3.2 - RAGS Part D Table (Calculation of Exposure Point Concentration)

791												
792	**Gamma ROS Statistics using Imputed Non-Detects**											
793	GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs											
794	GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)											
795	For such situations, GROS method may yield incorrect values of UCLs and BTVs											
796	This is especially true when the sample size is small.											
797	For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

790					k hat (MLE)	5.412	k star (bias corrected MLE)					4.79
791					Theta hat (MLE)	1.339	Theta star (bias corrected MLE)					1.513
792					nu hat (MLE)	270.6	nu star (bias corrected)					239.5
793					Mean (detects)	7.246						
794												
795	**Gamma ROS Statistics using Imputed Non-Detects**											
796	GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs											
797	GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)											
798	For such situations, GROS method may yield incorrect values of UCLs and BTVs											
799	This is especially true when the sample size is small.											
800	For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates											
801					Minimum	1.078	Mean					6.602

Gamma GOF Tests on Detected Observations Only

A-D Test Statistic	0.2822295	**Anderson-Darling GOF Test**
5% A-D Critical Value	0.7284885	Detected data appear Gamma Distributed at 5% Significance Level
K-S Test Statistic	0.1535973	**Kolmogorov-Smirnov GOF**
5% K-S Critical Value	0.2819881	Detected data appear Gamma Distributed at 5% Significance Level

Detected data appear Gamma Distributed at 5% Significance Level

Gamma Statistics on Detected Data Only

k hat (MLE)	2.4314678	k star (bias corrected MLE)	1.6950526
Theta hat (MLE)	0.5337425	Theta star (bias corrected MLE)	0.7656268
nu hat (MLE)	43.766421	nu star (bias corrected)	30.510947
Mean (detects)	1.2977778		

Gamma ROS Statistics using Imputed Non-Detects

GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs

54	GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)											
55	For such situations, GROS method may yield incorrect values of UCLs and BTVs											
56	This is especially true when the sample size is small.											
57	For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates
