1.0 **Introduction**

ESC Engineering of New York, P.C. (ESC Engineering) prepared this Remedial Action Report on behalf of the Respondents for the Tri-Cities Barrel Superfund Site in Fenton, New York (Figure 1). Specifically, this report documents actions taken to properly implement the selected remedy for the Work Element I component of the site remedial action. Work Element I addresses soil and sediment. Work Element II for groundwater will be addressed via separate submittals and schedule.

The Remedial Action Report has been prepared in accordance with guidance¹ issued by the United States Environmental Protection Agency (USEPA) and includes the following sections:

- Section 1.0 - Introduction
- Section 2.0 - Background Information
- Section 3.0 - Construction Activities
- Section 4.0 - Chronology of Events
- Section 5.0 - Performance Standards and Construction Quality
- Section 6.0 - Inspections and Certification
- Section 7.0 - Operation and Maintenance
- Section 8.0 - Summary of Project Costs
- Section 9.0 - Contact Information
- Section 10.0 - Town of Fenton Coordination
- Section 11.0 - References

The remedial action was conducted to satisfy the requirements set forth by the 2000 Record of Decision (ROD, USEPA 2000) and Statement of Work. The ROD and Statement of Work are summarized in the following sections.

1.1 **Elements of the Selected Remedy from the 2000 Record of Decision**

The main goal of the remedial action was to address the requirements of the selected remedy presented in the 2000 ROD. As outlined in the ROD, the elements of the selected remedy for Work Element I include:

¹ "Close Out Procedures for National Priorities List Sites." Office of Emergency and Remedial Response, United States Environmental Protection Agency. January 2000 (OSWER Directive 9320.2-09A-P)

- excavation of approximately 50,000² cubic yards of unsaturated (above the water table) soil and sediment with concentrations of constituents that exceed the site cleanup goals
- backfilling the excavations with clean fill
- characterization, transportation, and offsite disposal or treatment of contaminated soil and sediment

1.2 Statement of Work Summary

The Statement of Work divides the remedial design and remedial action into two separate components; Work Element I and Work Element II. Work Element I addresses soil and sediment and Work Element II addresses groundwater. This report only addresses Work Element I.

Work Element I requirements included:

- 40,000 cubic yards (based on pre-and post-excavation surveys) of contaminated unsaturated soil and sediments with concentrations of constituents that exceeded soil and sediment cleanup objectives were excavated. Based on this surveyed volume and the tonnage provided by the disposal facilities, the actual density of the soil was calculated to be approximately 1.8 tons per cubic yard. For soil contaminated with semivolatile organic compounds, pesticides, and metals, the preliminary remediation goals (PRGs defined in Tri-Cities Barrel ROD, March 2000) were used to define the limits of the excavation. For soil containing polychlorinated biphenyls (PCBs) or volatile organic compounds (VOCs) at concentrations that exceeded New York State Department of Environmental Conservation (NYSDEC) Technical and Administrative Guidance Memorandum No. 94-HWR-4046 (TAGM) objectives, the respective TAGM objectives were used. The depth of soil excavation was limited to the top of the potentiometric surface. Sediment with constituents at concentrations exceeding NYSDEC's sediment criteria (*Technical Guidance for Screening Contaminated Sediments*, January 1999) were excavated.
- All excavated sediment was dewatered, as necessary.

² The actual volume based on pre- and post-excavation survey was calculated to be 40,000 cubic yards. The 50,000-cubic-yard volume, based on available data at the time, was taken directly from the ROD and SOW.

- Each excavated area, except the man-made pond north of I-88, was backfilled (to promote positive drainage) with clean, imported fill from an offsite location, covered with topsoil, then seeded with grass.
- All excavated material was characterized and transported for treatment and disposal at an offsite Resource Conservation and Recovery Act (RCRA) or Toxic Substances Control Act (TSCA) compliant facilities, as appropriate.
- Wetlands impacted by remedial activities were restored. The restored wetlands require routine inspection for 5 years to ensure adequate establishment of the planted vegetation.

The Statement of Work allowed for further evaluation to be conducted before sediment was excavated. An ecological study was conducted as part of the pre-design studies as described in the Statement of Work:

“An abbreviated ecological study will be conducted during the pre-design activities in the site tributaries and the floodplain area. The following three criteria will be utilized to assess the abbreviated ecological study: bioavailability, mobility and relationship to the Sediment Guidance Criteria of the contaminants. The results of the abbreviated ecological study will determine if and/or to what extent the sediments in the tributary and the floodplain would require excavation.”

The results of the abbreviated ecological study, provided in the Final Design Report (ESC Engineering 2002), indicated that limited sediment excavation was necessary.

2.0 Background Information

The Tri-Cities Barrel Superfund site is located approximately 5 miles northeast of Binghamton, New York, adjacent to Old Route 7, in the town of Fenton, Broome County, New York (Figure 1). The site comprises approximately 14.9 acres and is bordered by rural residential areas, farmland, and woodlands.

2.1 Site Description

The description of the site has been divided into three portions. The portion of the site north of Interstate 88 (I-88) is referred to herein as "north of I-88" and includes approximately 5.1 acres. This parcel is bordered to the north by Osborne Creek and to the south by the I-88 right-of-way. The portion of the site south of I-88 and north of Osborne Hollow Road is referred to herein as "south of I-88" and includes approximately 6.9 acres. This parcel is bordered to the north by I-88, to the south by Osborne Hollow Road, and to the east and west by private property. The far southern portion of the site (referred to herein as "south of Osborne Hollow Road") includes approximately 2.9 acres and is bordered to the north by Osborne Hollow Road, to the south by the D&H railroad tracks, and to the east and west by private properties.

The former operational portion of the site occupies approximately 3.5 acres within the portion of the site south of I-88. During July 1995, a perimeter fence was constructed to surround and secure the former operational portion of the site, and "Keep Out" signs were posted at uniform intervals along all sides of the fence. A time critical removal action was conducted and all structures were removed between October 1996 and January 1997 (see Section 2.2).

The southern portion of the site is relatively flat, except in the vicinity of I-88, where the ground surface slopes steeply down to the highway. North of I-88, the ground surface slopes gradually northward toward Osborne Creek. In the vicinity of Osborne Creek, the ground surface slopes steeply to the creek and the associated floodplain. The elevation of the site ranges from 930 - 1,025-feet above mean sea level (MSL).

Two small unnamed intermittent tributaries parallel the eastern and the western sides of the parcel of the site located South of I-88. The eastern tributary is located outside the property boundary of the site, while the western tributary is located within the property boundary of the site.

Both streams collect surface water runoff from south of the site including Osborne Hollow Road, Old Route 7, and the railroad tracks. Both tributaries flow north and discharge to Osborne Creek.

A former man-made pond (former lagoon) on the portion north of I-88 occupied approximately 6,000 square feet (approximately 0.14 acre). The pond received water from precipitation and storm water runoff from I-88 and the area between I-88 and the pond. The size of the pond varied greatly with seasonal precipitation and was often dry or nearly dry during the summer months. Based on field observations, the pond covered the greatest amount of land surface and was deepest (approximately 2 feet to 3 feet) during Spring seasons.

2.2 Site History

The site was operated as a barrel reclamation facility from 1955 to 1992. The former drum reclamation process involved cleaning the interior and exterior of drums and barrels using a combination of physical, chemical, and mechanical means.

Drums were received on the western side of the process building and staged west and north of the process building. The reclamation process was initiated at the drum decapitation shed where the tops of closed-top drums were removed. Next, the drums were processed through the barrel burner and then transferred to the process building for reconditioning, which included particle blasting, chemical cleaning using a 10 percent sodium hydroxide solution, reforming, and repainting. The source of the water used to clean and rinse the drums was an onsite production well. Reconditioned drums were staged in box trailers and outdoors, east of the process building. Aerial photographs from 1965 until 1991 show that much of the available property south of I-88 was used for drum storage.

Barrel reclamation operations ceased at the facility in Spring 1992, in accordance with a cooperative agreement between the Respondents³ and Gary Warner. Gary Warner is the former operator of the site and president of the Tri-Cities Barrel Company. During 1992 and 1993, the Warners used the site to sell clean drums that were brought to the site from offsite and to sell the existing inventory of empty plastic drums. Since 1994, no commercial operations have been conducted at the site. The site was listed on the National Priorities List (NPL) on October 4, 1989.

³ A complete list of the Respondents is provided near the end of Section 2.2.

The Respondents entered into an administrative order on consent (AOC) with the USEPA on May 14, 1992, and retained Environmental Strategies Corporation as the environmental consultant to conduct the remedial investigation (RI) and feasibility study (FS). The RI was conducted in 4 phases from July 1993 through December 1997, and included the installation of monitoring wells and piezometers and the collection of groundwater, soil, surface water, sediment, ecological, air, and building material samples. The final RI report is dated March 25, 1999 (Environmental Strategies 1999).

From October 14, 1996, to January 10, 1997, a time critical removal action was conducted as set forth in the AOC for Removal Actions, Index Number II-CERCLA-96-0207, dated September 25, 1996. The objectives of the removal action were to locate, characterize the contents, if any, and properly dispose of all containers, drums, tanks, and wastes located on the site; decontaminate and remove remaining equipment that was previously used during operations at the site; and decontaminate, demolish, and dispose of all buildings and structures located on the site. The objectives of the removal action were successfully achieved. The only remaining structures (post removal action) included the security fence, the concrete foundations of the former building and pole barn, and a CLOW machine that was decontaminated and wrapped in polyethylene sheeting.

Various versions of the FS were prepared and submitted to the USEPA for review between Spring 1997 and Summer 1999. The final version of the FS is dated August 25, 1999 and is followed by an addendum prepared by USEPA that is dated December 9, 1999.

In January 2000, USEPA issued the Proposed Remedial Action Plan that identified excavation and offsite disposal of contaminated sediment and soil as the Work Element I remedy and collection and treatment of contaminated groundwater as the Work Element II remedy. The public comment period extended from January 21, to February 19, 2000. As a result, the USEPA preferred remedy was upheld and a corresponding ROD was issued in March 2000. The Consent Decree and Statement of Work were lodged on May 1, 2001. The Respondents, as listed by this Consent Decree, include the following:

Agway, Inc.	GAF Corp.
Alcan Rolled Products Company	General Electric Company
AlliedSignal Inc.	General Motors Corporation
Amphenol Corporation	IBM Corporation
Ashland Inc.	International Paper Company
Azon Corporation	Jones Chemicals, Inc.

BASF Corporation	Kaplan Container Corporation
BMC Industries, Inc.	Malchak Salvage Company, Inc.
Borden, Inc.	Masonite Corporation
Bristol-Myers Squibb Company	Newton Falls, Inc.
Bronstein Container Company, Inc.	Potter Paint Co., Inc.
Carrier Corporation	PPG Industries, Inc.
Champion International Corporation	Rome Cable Corporation
Chemcoat, Inc.	Schenectady International, Inc.
Chrysler Corporation	Sonoco Flexible Packaging, Inc. d/b/a The Morrill Press
Cooper Industries, Inc.	State of New York (For New York State Department of Transportation)
Crash's Auto Parts and Sales, Inc. d/b/a C.A.P. Surplus & Metals	Tri-Cities Barrel Co., Inc.
Drake Oil Company, Inc.	Underwood Industries of New York, Inc. d/b/a Viking Products
E.I. du Pont de Nemours & Company	Wainwright Oil Co., Inc.
EJ Footwear Corp.	Francis Warner
Elf Atochem North America, Inc.	Gary F. Warner
Emerson Power Transmission Corp.	

The Final Design Report (ESC Engineering 2002) defined the remedial action for Work Element I. The Final Design Report outlined the activities necessary to satisfy the requirements set forth by the ROD and Statement of Work.

3.0 Construction Activities

Earth Tech, Inc. performed the construction work associated with Work Element I remedial action with quality assurance oversight from ESC Engineering on behalf of the Respondents. Malcolm Pirnie, Inc., under the direction of the USEPA, provided oversight of both Earth Tech and ESC Engineering. As described in the Final Design Report (ESC Engineering 2002), Work Element I remedial action included soil and sediment media. In general, contaminated soil and sediment were excavated and transported offsite to appropriate disposal facilities. Pre- and post- excavation samples were collected and analyzed to verify that site cleanup objectives were met (Table 1). Three main criteria were applied during execution of the work to verify that the performance standards for the project were satisfied⁴:

- excavation extended to pre-excavation sample locations that satisfied the site cleanup objectives
- excavation continued until post-excavation sample results satisfied the site cleanup objectives
- excavation continued to the elevation of the groundwater table

Significant pre-excavation sampling and analysis were conducted by the Respondents (ESC Engineering 2002). The USEPA was responsible for the collection and analysis of post-excavation samples. Pre- and post-excavation survey data was collected to verify that the design depths and coordinates were achieved.

The following sections describe the scope of work in approximate sequence of construction. References to the As-Built Drawings are provided as applicable.

3.1 Field Changes

As necessary, field changes were executed during construction to address unanticipated conditions or situations. The majority of the work was conducted in strict accordance with the Final Design Report (ESC Engineering 2002) and Remedial Action Work Plan (Earth Tech 2003). The following Field Change Requests (FCRs) were submitted by Earth Tech:

⁴ The only exception to satisfying this criteria involves the placement of a liner over an area adjacent to Osborne Hollow Road (see Sections 3.4.1 and 3.4.2).

FCR No.	Description	Disposition
1	Waive certain testing criteria for common fill due to coarse nature of the material	Rejected
2	Modify the handling of Area A to include stockpiling and characterization of the 3- to 5-foot interval based on disposal facility discussions	Approved
3	Waive the 3-inch maximum particle size for common fill to allow use of the Abbey borrow source	Rejected
4	Modify the haul road layout located North of I-88 to better accommodate truck traffic	Approved
5	Manage the area in the vicinity of PB-57 as RCRA hazardous for lead	Approved
6	Disposal of a minor volume of concrete to offsite facility due to staining	Approved
7	Excavate around the utility pole adjacent to Osborne Hollow Road	Approved
8	Modify the handling of Area B to include Stockpiling of the 2-foot to 5-foot interval and combining with Area A Stockpile material	Approved
9	Geomembrane installation details for 30-mil LDPE required in Area N (north of Osborne Hollow Road)	Approved
10	Install trench drain to divert seep in Area N to west tributary	Approved

FCR No. 1 and No. 3 were rejected by the USEPA because particle sizes greater than 3 inches were deemed unacceptable for use as backfill. As a result, an alternative source of common fill was identified for use as backfill. All other FCRs were approved by the USEPA and were implemented during remedial action activities. Each of the executed FCRs will be discussed, as appropriate, within the following sections. The actual executed FCR forms are presented as Appendix A.

3.2 Site Preparation

Site preparation activities included mobilizing equipment, materials, supplies, and personnel to the project site in Fenton, New York. Equipment used during the remedial action consisted of hydraulic excavators, loaders, bulldozers, vibratory compactors, off-road dump trucks, and water conveyance and storage systems. Site preparation activities involved setting up temporary facilities, clearing trees and vegetation, abandoning monitoring wells, constructing access roads, setting up dust and vapor controls, and placing erosion and sedimentation controls.

3.2.1 Temporary Facilities

Temporary office trailers, storage trailer, and associated utilities were set up in the main portion of the site (South of I-88). The area used for the temporary facilities was cleared, covered with approximately 6 inches of gravel and remained enclosed by the existing chain link fence with a locking gate. Office space was provided for Earth Tech, ESC Engineering, USEPA, and Malcolm Pirnie personnel. Storage tanks were staged to provide for temporary storage of construction water (i.e., storm water that accumulated in excavations) before offsite disposal and potable water for use during dust control and hydroseeding activities. A decontamination pad was also constructed as part of the set up of temporary facilities. Figure 2 shows the locations of the major temporary facilities used during construction. A gravel parking area was left near the former main construction site entrance.

3.2.2 Clearing

Trees and brush were cleared before the start of excavation activities. Vegetative debris and smaller trees were relocated to areas of the site outside of work limits. The majority of the cleared vegetation was ultimately removed from the site. Larger trees (greater than 12 inches) were transported offsite for appropriate disposal. Some smaller vegetation (e.g., branches) were chipped and stockpiled onsite. Chipping activities were discontinued as debris (i.e., rock and soil) became mixed with the vegetation and created the potential for damage to equipment. Approximately 6 acres of land were cleared to accommodate the work.

3.2.3 Monitoring Well Abandonment

Monitoring wells within the excavation areas were properly abandoned before excavation activities began. The monitoring wells were abandoned in accordance with NYSDEC's Groundwater Monitoring Well Decommissioning Procedures (NYSDEC 1996). The monitoring wells located in proposed excavation areas that were abandoned included:

- MW-1
- MW-3
- MW-3S
- MW-5S
- MW-6
- MW-6S
- MW-13S
- MW-15
- MW-15S
- MW-16
- MW-16S
- MW-17
- MW-17S
- P-1
- P-3

MW-18 and MW-18S were originally designated for abandonment, as indicated by the Final Design Report (ESC Engineering 2002). However, a field decision was made to protect the MW-18 well cluster during construction so that the wells could be used for future groundwater monitoring and not require replacement. The MW-18 well cluster location is outside of excavation limits. The USEPA agreed with this approach during the July 1, 2003 weekly teleconference, as formally documented by July's progress report. The driller's monitoring well abandonment report is provided as Appendix B.

3.2.4 Access Roads

Primary access roads were constructed to provide for the transportation of haul trucks through the main portion of the site as well as the parcel located North of I-88. Secondary access roads were constructed at several locations throughout the site, as needed to accommodate truck traffic and excavation activities. The access roads (constructed of large cobble size aggregate) served as a stable and clean surface for the haul trucks to efficiently make way through the site and receive loads of soil. Use of the access roads minimized decontamination requirements and prevented trucks from getting stuck in unstable soils. The access roads were removed as necessary to satisfy the excavation requirements for the project.

3.2.5 Dust and Vapor Control

Dust and vapor control systems were established to control onsite and fugitive dust and vapor emissions, as required, based on the results of the air monitoring. Potable water was stored onsite for use as dust suppression throughout the duration of the project. The principal method of dust control was a water spray that was delivered from a water truck or other water distribution source. Vapor suppression controls included placing plastic sheeting (e.g., tarps) over stockpiles and applying a vapor suppression product (e.g., Biosolve) over the areas with elevated VOC concentrations in soil.

3.2.6 Erosion and Sedimentation Controls

Erosion and sedimentation controls were established before commencing with excavation activities. Silt fence was placed downgradient of excavation and stockpile areas. Soil berms or

swales were constructed upgradient of work areas, where feasible, to minimize the amount of surface water contacting disturbed areas. Rip rap was placed along portions of the west tributary to control the velocity of surface water and protect the entrance to the culvert that passes beneath I-88. Erosion mat was placed on steeper areas of the site to provide additional protection against erosion. The erosion and sedimentation controls were maintained throughout the duration of the work and additional controls (e.g., silt fence) were established, as deemed necessary.

3.3 Concrete Demolition

Several concrete slabs and building foundations were present at the site. To allow excavation of soil, the concrete slabs were removed and the bottom portions pressure washed. The top portions were pressure washed during the Removal Action conducted in 1996. The concrete was cut into manageable sizes for transportation via heavy equipment. The individual pieces were transported to a decontamination area and pressure washed. After decontamination, the concrete was placed within the bottom of excavation Area Z-1 (Figure 2). The actual location of the buried concrete was recorded via survey and is identified by the As-Built Drawings (Sheet 2 of 3). A minor volume of concrete was shipped offsite along with other nonhazardous soil because pressure washing did not remove staining. This work pertains to FCR No. 6.

3.4 Soil Excavation and Transportation and Disposal

Soil containing constituents at concentrations that exceeded the cleanup objectives summarized in Table 1 was excavated for offsite disposal or treatment. A combination of direct loading and stockpiling approaches were employed to remove the soil efficiently. In general, excavation proceeded from higher elevations (south) to lower elevations (north). During excavation of the areas North of I-88 and Area ZZ (near culvert entrance within the west tributary), appropriate traffic lanes of I-88 were closed in accordance with Highway Work Permit No. 9-02-0372. In addition, construction signs were placed along Old Route 7 warning of truck traffic. During periods of high truck traffic, a flag person was used at the entrance of Old Route 7 to provide additional caution to motorists.

Based on the actual truck weight tickets, the following bulk waste types and tons of soil were excavated and shipped offsite:

- 71,455 tons of nonhazardous soil (2,065 truck loads)
- 2,550 tons of TSCA soil for direct landfill (78 truck loads)
- 222 tons of RCRA/TSCA soil for incineration (10 truck loads)
- 742 tons of RCRA soil for incineration (30 truck loads)

The nonhazardous soil was transported to Hyland Landfill in Angelica, New York and Waste Management's landfills in Millseat, New York and High Acres, New York. Detailed information pertaining to each nonhazardous load is provided in Table 2.

The TSCA soil was transported to Waste Management's facility in Model City, New York. Detailed information pertaining to each TSCA load is provided in Table 3.

The RCRA/TSCA soil (PCB concentrations greater than 50 milligrams per kilogram [mg/kg]) was transported to Onyx Environmental Services' facility in Port Arthur, Texas for incineration. The soil was deemed RCRA hazardous based on toxicity characteristics due to lead (D008 waste code) and TSCA-regulated due to PCB concentrations above 50 mg/kg. Due to the concentrations of Underlying Hazardous Constituents ([UHCs], primarily chlordane), the soil was required to be incinerated by a facility permitted to receive RCRA/TSCA waste. Land Disposal Restrictions require significant reduction of the concentrations of UHCs before placement into a landfill. Incineration was the only technology identified that could satisfy these requirements. This soil was designated as "Stockpile A/B" and characterization and handling of this soil was performed in accordance with FCR No. 2 and No. 8. Analytical data for Stockpile A/B are provided as Appendix C. Detailed shipping information pertaining to Stockpile A/B is provided in Table 4.

The RCRA soil was transported to Von Roll America's facility in East Liverpool, Ohio for incineration. This soil was deemed RCRA hazardous based on toxicity characteristics due to lead (D008 waste code). Based on sampling and analysis, this soil did not contain concentrations of PCBs above 50 mg/kg. Due to the concentrations of UHCs (primarily chlordane), the soil was incinerated. The soil was designated as "PB-57 Area Stockpile " and characterization and handling of this soil was performed in accordance with FCR No. 5. Analytical data for PB-57

Area Stockpile are provided as Appendix D. Detailed shipping information pertaining to PB-57 Area Stockpile is provided in Table 5.

In addition to bulk shipments, a minor volume of drummed soil and sludge was shipped offsite. Two drums of soil from Area A and two drums of soil from the PB-57 area were shipped offsite for incineration. The disposal of the drummed soil was completed to perform "hot spot" removal for incineration purposes. However, additional characterization sampling and analysis in Area A and the PB-57 area required additional excavation and segregation. The additional soil from Area A and B and PB-57 was subsequently stockpiled for characterization; thereby creating Stockpile A/B and PB-57 Area Stockpile. Subsequent composite sampling and waste characterization analyses from these stockpiles indicate this soil also required incineration. Ashland Distribution Company handled the transportation and disposal of the drums of soil. Additional details are provided on Table 6.

Four drums of sludge were also recovered from a vessel excavated from Area Z. Characterization data revealed that the sludge was nonhazardous. The material was considered sanitary waste generated during active operations at the former facility. Ashland Distribution Company handled the transportation and disposal of the four drums of sludge. Additional details are provided on Table 6. The corresponding analytical data are provided as Appendix E.

Survey information used to confirm that excavation extended to the required depths or elevation is summarized on Table 7. Copies of signed hazardous waste manifests are provided as Appendix F.

3.4.1 Utility Pole Along Osborne Hollow Road

During site preparation activities, an obstruction due to an existing utility pole located just to the North side of Osborne Hollow Road (within Area N) was identified. The location of the utility pole prevented the advancement of the excavation to the limits shown on the design drawings. Via approval of FCR No. 7, the USEPA allowed excavation around the utility pole to avoid relocating the supported utilities. Based on analytical results from this area, the USEPA recommended the area be covered with a liner. Liner installation was addressed by FCR No. 9 (See Section 3.4.2).

3.4.2 Installation of Liner Over Area N Sidewall

The excavation of Area N (just West of the utility pole) extended to the limits shown on the design drawings while not jeopardizing the integrity and function of Osborne Hollow Road. After reaching these limits, a thin seam of staining was identified. The staining appeared as a tar-like substance similar to products used for road construction. The staining was approximately 2 inches thick and black in color. Based on confirmation analytical results, the USEPA recommended this area also be covered with a liner, similar to the utility pole area. The liner consisted of 30-mil low density polyethylene. The limits of the liner are shown on the As-Built Drawings (Sheet 2 and 3 of 3).

3.4.3 Additional Excavation

Based on odor, staining, or elevated PID readings, additional excavation was required in the vicinity of the MW-2 cluster and the northernmost portion of Area L. In addition, confirmation samples collected by the USEPA indicated that additional excavation was required. As a result, approximately 2,200 additional tons of soil (66 truck loads) were removed from these areas to satisfy project objectives. Subsequent sampling and analyses provided verification that Area L excavation ultimately satisfied the cleanup objectives. The excavation in the vicinity of MW-2 cluster (in the northwest corner of area Q) extended vertically to the elevation of the groundwater table and horizontally beyond the MW-2 Cluster to the north and west. Post excavation confirmation samples collected by the USEPA from the north and west sidewalls indicated that the cleanup objectives were satisfied in that area.

3.4.4 Trench Drain Installation

After backfilling operations were completed, a seep was identified within Area N. This seep was considered by the USEPA as a long-term erosion concern. Subsequently, the seep was addressed via FCR No. 10. A grab sample of the surface water (SW-101603), taken by the USEPA, indicated that the water emerging at the ground surface was not contaminated. Earth Tech constructed a trench drain to divert the seep flow to the west tributary. The trench drain was excavated and aggregate and two 4-inch diameter corrugated polyethylene pipes were installed in the trench to divert the seep flow. The trench drain outlets on the riprap-lined slope associated with the west tributary. The surface water sample location is shown on the As-Built

Drawings (Sheet 2 of 3) and described on Table 8. The surface water analytical results are provided in Appendix G.

3.5 Water Management

To the extent possible, water was prevented from entering open excavations through the use of temporary berms or swales. Water that accumulated in the bottoms of excavations was pumped to temporary holding tanks. The collected water was characterized as nonhazardous and approved for discharge to the Endicott Wastewater Treatment Plant. Approximately 286,000 gallons of water were collected and transported offsite to accommodate the earthwork activities. Analytical data for the water are provided as Appendix G.

3.6 Backfilling and Compaction

After excavation of individual areas was deemed complete by USEPA or its onsite representative (Malcolm Pirnie) as confirmed by independent survey, backfilling activities were executed. Depending on the location, approval to backfill was based on verification of extending the excavation to the groundwater table elevation, satisfying cleanup objectives via pre-excavation confirmation sampling, or satisfying cleanup objectives via post-excavation confirmation sampling. The only area not satisfying this criteria applies to the area along Osborne Hollow Road where the liner was installed (see Section 3.4.1 and 3.4.2). All post-excavation sampling and analyses were conducted by the USEPA or Malcolm Pirnie. Post-excavation sample locations were chosen by the USEPA and are summarized in Table 8. Laboratory data for post-excavation confirmation samples are provided as Appendix H.

Based on survey information, approximately 17,000 cubic yards of common fill and approximately 4,600 cubic yards of top soil were imported to reach the final grade. All common fill was placed in 12-inch loose lifts and compacted to satisfy the project requirements (85 percent of the maximum dry density using standard effort). *In situ* compaction tests were conducted for verification purposes (1 test per 10,000 square feet per lift [Table 9]). Top soil was spread into place with a bulldozer. No compaction requirements were required for top soil. Geotechnical and analytical data for common fill and top soil are provided as Appendices I through L.

3.7 Equipment and Personnel Decontamination

Equipment decontamination areas were established at locations convenient to the egress of truck traffic and other heavy equipment. A permanent decontamination pad was constructed along Osborne Hollow Road (Figure 2). Temporary decontamination pads were also used when the permanent location was not accessible due to the location of the work (i.e., south of Osborne Hollow Road and north of I-88). The temporary and permanent decontamination areas were constructed as specified by the details provided by the final RAWP (Earth Tech 2003). As-Built detail drawings of the decontamination pads are not provided because the construction did not deviate from the approved RAWP. The equipment decontamination facilities consisted of a potable water source, pressure washer, and a wash water containment system. Vehicles and equipment entering a contaminated work zone were decontaminated before exiting to any public roadway or clean area. Wash water was disposed along with storm water that was pumped from the excavations. The permanent decontamination pad located at the main site exit was demolished, combined with nonhazardous soil, and disposed offsite.

Personnel decontamination stations were established at convenient locations outside exclusion areas. Personnel decontamination stations consisted of wash and rinse tubs and brushes, disposal containers, and potable water for washing of hands. Personnel decontamination water was also combined with storm water for offsite disposal.

3.8 Restoration

Samples of topsoil were collected and analyzed for chemical and geotechnical parameters required to ensure compliance with the specifications. Based on the results of the testing, the appropriate soil amendments (pH adjuster and fertilizer) and application rates were recommended and applied. All areas disturbed by remedial action construction activities were seeded with grass seed mixtures, in accordance with the technical specifications prepared for this project (ESC Engineering 2002). Erosion mat was also placed over areas of the site where final slopes were greater than 10 percent and riprap was placed in the west tributary to provide for enhanced erosion control.

Replacement wetlands were established North of I-88 as required by the design documents. The planting and seeding applications were performed in accordance with the

Wetland Mitigation Plan. The 5-year monitoring plan described within the Wetland Mitigation Plan will be executed to properly establish and document that establishment has occurred.

After the earthwork was completed, all truck access roads and the pre-existing chain-link fence were removed. The welded wire fabric highway fence was replaced on both the north and south sides of I-88.

Monitoring well clusters MW-3 and MW-16 were replaced after excavation and backfilling operations were completed. Groundwater monitoring wells are associated with Work Element II. Details applicable to this work will be reserved for documents pertaining to Work Element II. This Remedial Action Report applies to Work Element I (addressing soil and sediment). A stone access road was constructed after backfill operations were completed for convenient access to monitoring wells. The access roads will be removed and disturbed areas vegetated at the completion of groundwater monitoring activities.

4.0 Chronology of Events

The following table lists the dates of key events leading up to the completion of the remedial action of Work Element I.

<u>Date</u>	<u>Event</u>
October 4, 1989	USEPA places the Tri-Cities Barrel Superfund Site on the National Priorities List
May 14, 1992	Administrative Order on Consent for RI/FS executed
October 1996 to January 1997	Time critical removal action conducted
May 15, 1999	Remedial Investigation completed
August 25, 1999	Feasibility Study completed
March 2000	Record of Decision executed
May 1, 2001	Remedial Design / Remedial Action Consent Decree executed
November 15, 2001	Pre-Design and Remedial Design Work Plan submitted
December 2001 and May/June 2002	Pre-Design Soil Sampling and Analysis
October 30, 2002	Pre-Bid site meeting held with 6 pre-qualified bidders
December 20, 2002	Final Design Report submitted
January 16, 2003	USEPA conditionally approved Final Design Report for Element I
March 31, 2003	Remedial action contract signed with Earth Tech
May 11, 2003	USEPA provides comments to the Draft Remedial Action Work Plan
May 30, 2003	USEPA accepts responses to comments for the Draft Remedial Action Work Plan (mobilization date of June 9, 2003 is approved)
June 9, 2003	Remedial action work started by Earth Tech
October 9, 2003	Pre-final inspection conducted by USEPA, NYSDEC, Respondents, ESC Engineering, and Earth Tech
November 20, 2003	Final inspection conducted by USEPA, ESC Engineering, and Earth Tech; work substantially completed
November 25, 2003	Construction Completion Notification issued by the USEPA
January 21, 2004	Remedial Action Report submitted

5.0 Performance Standards and Construction Quality

The remedial design strategy was developed to satisfy the Remedial Action Objectives (RAOs) applicable to Work Element I. To satisfy the RAOs, numeric performance standards were developed (Table 1). Pre-excavation and post-excavation samples were collected and analyzed to confirm that the numeric performance standards were achieved across the site.

The Final Design Report (ESC Engineering, 2002) provides a detailed summary of the pre-excavation analytical results and corresponding excavation limits. The analytical results from soil samples (using both RI and pre-design data) were compared to the cleanup objectives. If a sample contained one or more constituents above the cleanup objectives, then additional soil samples were collected from locations farther from the area of affected soil, or from greater depths. This process continued until the soil contamination could be delineated or surrounded by soil samples that satisfy the cleanup objectives. The horizontal and vertical limits of excavation in each area were defined as the distance to the next "clean" sample.

Post-excavation sample collection and analysis was conducted by the USEPA, or its representative, at selected locations. Excavation continued until both pre- and post-excavation analytical results satisfied the numeric performance standards or until reaching the elevation of the groundwater table.

During remediation, Earth Tech followed the Construction Quality Control Plan (Appendix E of the RAWP, Earth Tech 2003). ESC Engineering implemented its Construction Quality Assurance Plan (CQAP, Appendix G of the Final Design Report, ESC Engineering 2002) to verify that Earth Tech was performing the remediation in substantial accordance with the remedial design, technical specifications, construction drawings, and appurtenant plans. Pre- and post-excavation survey data were collected to verify that design depths and coordinates were satisfied.

5.1 Quality Assurance

A CQAP was implemented by ESC Engineering to provide a system for monitoring construction procedures and practices during performance of the remedial action. The CQAP provided a means to document that each construction activity conformed to the design through inspection and monitoring. The CQAP described the key responsibilities for the quality

assurance personnel, requirements for construction meetings and teleconferences, inspection and documentation methods, and procedures for documenting field changes and non-conforming portions of the work.

5.2 Construction Meetings and Teleconferences

Monthly construction quality assurance meetings and weekly teleconferences were held throughout the project to provide a forum in which construction progress and quality issues could be discussed with all parties involved with the remedial action. The results of the meetings and teleconferences were documented within the monthly progress reports.

More frequent meetings were held informally between ESC Engineering and Earth Tech. During these meetings, construction progress, planned activities, review of testing procedures, submittals requirements, and inspection findings were discussed.

5.3 Inspections and Documentation

The ESC Engineering Construction Quality Assurance Inspector was onsite every day as the work progressed. Major construction activities that were inspected during remedial action implementation included:

Erosion and Sedimentation Controls

- Silt fences installed and maintained properly
- Temporary diversion dikes properly conveyed surface water around remediation areas
- Riprap erosion protection properly installed

Excavation of Contaminated Soil

- Site utilities properly located, protected, or relocated
- Excavation performed in a manner that minimizes mixing of contaminated and uncontaminated materials
- Pre- and post-excavation surveys conducted to confirm removal of soil to appropriate depths and coordinates
- Vehicles transporting contaminated materials follow designated routes
- Excavation not more than 6 inches beyond extent shown on the drawings

- Adequate dust and vapor suppression performed, as necessary
- Stockpiles covered during idle periods (i.e., nights and weekends)

Transportation and Disposal

- Manifests accompany each truck load of soil
- Track each truck load of soil leaving the site
- Obtain weight tickets of each load
- Verify the shipping location of each load as appropriate

Common Fill Placement

- Common fill spread and compacted in 12-inch lifts
- Representative samples of common fill collected and analyzed for geotechnical parameters at a rate of 1 per 10,000 cubic yards
- Common fill compacted to 85 percent of the maximum dry density as determined by the standard proctor tests
- Compaction testing performed at a rate of 1 test per 10,000 square feet per lift
- Samples of common fill collected and analyzed for analytical parameters at a rate of 1 test per borrow source

Topsoil Placement

- Topsoil spread in one 6-inch lift
- Representative samples of topsoil collected and analyzed for analytical parameters at a rate of 1 test per borrow source
- Representative samples of top soil collected and analyzed for geotechnical and agronomy parameters at a rate of 1 test per 2,000 cubic yards
- Final grade contours obtained by surveyor

Revegetation

- Certifications received for seed, fertilizer, and mulch
- Seed mixtures and application rates conform to the specifications
- Seeded areas adequately protected and maintained

Field inspection activities were documented with daily reports and field book entries describing the activity performed, applicable references to the design drawings and technical specifications, description of the inspection activity, and corrective action measures (if necessary). A photographic log was prepared to visually document construction activities. Electronic copies of all photos are maintained in ESC Engineering's Pittsburgh, Pennsylvania office.

6.0 Final Inspection and Certification

6.1 Inspections

On October 9, 2003, the USEPA, NYSDEC, Respondents, Earth Tech, and ESC Engineering conducted the pre-final inspection and identified several punchlist items to be addressed. Many of the punchlist items were related to damage by erosion and lack of vegetation or original contract items not completed by the date of the inspection. Subsequent to the inspection, the punchlist items were addressed.

On November 20, 2003, the final inspection was conducted by the USEPA, Earth Tech, and ESC Engineering to assure that the punchlist items were adequately addressed. All punchlist items, except for those related to the erosion and lack of vegetation, were addressed by Earth Tech. The USEPA agreed to allow time for seeding conditions to become favorable to completely address erosion and establish vegetation. No additional punchlist items were identified during the final inspection. Earth Tech will resume work to repair erosion damage and establish vegetation in Spring 2004.

A one-year warranty period was established in the remedial action contract with Earth Tech. The warranty period began after substantial completion of the remedial action work, which was agreed to be November 20, 2003, the date of the final inspection. If, within 1 year of substantial completion, any work is found to be defective or not meeting the intent of the design drawings or specifications, Earth Tech will repair the defective work in accordance with the remedial action contract. Defective work includes any damage caused by erosion or lack of vegetation.

6.2 Health and Safety and Air Monitoring

No health and safety problems were encountered during construction. Level D or modified Level D personal protective equipment (PPE) was required for all site personnel who came in direct contact with the contaminated soil or performed work within the exclusion zones. The work was conducted in strict accordance with Earth Tech's site-specific Health and Safety Contingency Plan (Earth Tech 2003). The equipment included coveralls, safety boots, gloves,

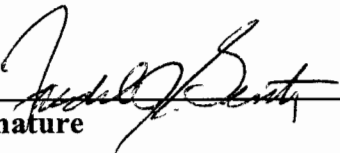

and air purifying respirators⁵. Air monitoring results dictated the level of PPE required for execution of the work.

Perimeter air monitoring was conducted as described by Earth Tech's Community Air Monitoring Plan (Appendix E of the RAWP, Earth Tech 2003). No problems with vapor or dust emissions were encountered during execution of the work. The results satisfied the short-term guideline concentrations (SGCs) for applicable chemicals of concern. Perimeter air analytical results are provided as Appendix M.

6.3 Certification

"To the best of my knowledge, after thorough investigation, I certify that the information contained in or accompanying this submission is true, accurate and complete and that the Work Element I Remedial Action was completed in full satisfaction of the requirements of the Consent Decree. I am aware that there are significant penalties for submitting false information, including the possibility of fine and imprisonment for knowing violations."

⁵Air purifying respirators were applicable to modified Level D PPE only.

7.0 **Operation and Maintenance**

Long-term operation and maintenance activities are not required for Work Element I because the soil medium was returned to residential conditions. Short-term maintenance will be conducted by Earth Tech until vegetation is fully established and approved by ESC Engineering and the USEPA. The restored wetlands require routine inspection for 5 years to ensure adequate establishment of the planted vegetation.

8.0 Summary of Project Costs

The following table provides a summary of the RD/RA costs for the Work Element I of the Tri-Cities Barrel Superfund Site:

Pre-Design and Remedial Design Work Plan	\$43,000
Pre-Design and Remedial Design Management	\$50,000
Ecological Study and Wetlands Delineation	\$43,000
Pre-Excavation Soil Sampling and Analysis	\$523,000
Cultural Resources Survey	\$30,000
Design	\$130,000
Design Management	\$35,000
RA Bid Process	\$25,000
Meetings - Preparation and Participation	\$25,000
Construction	\$5,000,000
Construction Oversight/Management	\$220,000
Remedial Action Report	\$31,000
	<hr/>
	\$6,155,000

The Work Element I costs presented in the ROD (Alternative SS-3) were \$17,430,000. The actual costs were approximately 35 percent of the costs presented in the ROD.

The major cost difference can be attributed to the actual quantity of soil requiring excavation and the actual quantity of hazardous soil being significantly less than the quantities assumed in the ROD. Significant pre-design analytical data for waste characterization and delineation were collected subsequent to preparation of the ROD. Only RI data was available at the time the ROD was prepared. Hundreds of pre-design (pre-excavation) samples were collected to accurately define the limits of excavation necessary to satisfy the numerical performance standards dictated by the ROD. By applying the incremental sampling process, the overall soil requiring excavation was reduced from 50,000 cubic yards to 40,000 cubic yards, while satisfying the same numerical performance standards. Waste characterization sampling and analyses (i.e., testing for hazardous characteristics) revealed that the majority of the soil could be disposed offsite as nonhazardous. Absent characterization data, the costs presented in the ROD assumed that approximately half of the quantity of the soil was potentially hazardous. Disposal of hazardous soil costs five to ten times more than disposal of nonhazardous soil. As a

result, the actual costs to perform Work Element I were significantly less than the estimated and conservative costs presented in the ROD.

9.0 Contact Information

10.0 Town of Fenton Coordination

The Town of Fenton has provided support and input throughout the remediation process. The Town of Fenton provided a meeting area for the USEPA's Public Availability Session held on May 28, 2003 and was very instrumental in providing notice to the public ahead of construction work and identifying the preferred truck route to and from the site.

Via correspondence dated November 24, 2003, the Town of Fenton expressed significant satisfaction pertaining to the execution and outcome of the remedial action. The overall project team (Earth Tech and ESC Engineering) was recognized as providing outstanding service toward getting the work done properly and providing excellent community relations.

Note(s)

- (1) Sample obtained by Malcolm Pirnie, Inc. Samples were obtained by Joseph T. Palka.
- (2) Sample obtained by Earth Tech, Inc.
- (3) After the slab for the former concrete block was removed, SUBSLAB-E and SUBSLAB-W were obtained outside the excavation area. Therefore no excavation area identification can be used to identify the general location. SUBSLAB-E and SUBSLAB-W was taken under the slab east and west of Area Z-2 respectively.
- (4) Analytical results may exceed site cleanup criteria. However, the excavation in these areas was to groundwater as required by the ROD.

Total = 71456.66 tons

Notes:

- (1) Manifest Document Nos. 25, 1152, 1153, 1154, and 1242 were not used (inadvertently skipped).
- (2) Soil received as cover material is used by the landfill to cover waste material to reduce odor and improve aesthetics during evenings and other times when the landfill is not in operation.
- (3) Soil received as non-cover material is placed in the landfill as waste material.

07/03/2003	NYG 1499112	78	31.14	Model City	US Bulk Transport Inc.	Y

Total = 2550.71 tons

Notes:

- (1) The waste was disposed at the CWM Chemical Services facility located in Model City, New York.
- (2) The summary above is for TSCA hazardous waste excavated from Hazardous Areas A, B, and C.
- (3) Refer to Appendix E for copies of manifests and certificates of disposal.

09/04/2003	3670506	70506	PB-57 Area	25.03	Von Roll	US Bulk Transport Inc.	Y	XT-00364 PA

Total = 742.29 tons

Notes:

- (1) The waste was incinerated at the Von Roll America facility located in East Liverpool, Ohio.
- (2) The waste from the PB-57 area was classified as a RCRA hazardous waste due to lead concentrations.
- (3) Refer to Appendix E for copies of manifests and certificates of destruction.

Table 6

**Drum Container Shipping Information
Element I Remedial Action
Tri-Cities Barrel Superfund Site
Fenton, NY**

Hazardous Drums

Date of Shipment	State Manifest Document No.	Manifest Document No.	Quantity	Disposal Facility	Transporter
07/25/2003	NYG 2864502	64502	818 kilograms	Model City	Ashland Distribution Co.
07/25/2003	NYG 2864682	64682	1800 pounds	Ashland	Ashland Distribution Co.

Nonhazardous Drums

Date of Shipment	State Manifest Document No.	Manifest Document No.	Quantity	Disposal Facility	Transporter
09/26/2003	N/A	03822	220 gallons	Ashland	Ashland Distribution Co.

Notes:

- (1) The waste for Manifest Document No. NYG 2864502 was classified as RCRA/TSCA. The material in the two drums was excavated from Areas A and B.
- (2) The waste for Manifest Document No. NYG 2864682 was classified as RCRA for lead. The material in the two drums was excavated from PB-57 area.
- (3) The four nonhazardous drums (Manifest Document No. 03822) were filled with sludge material from a vessel excavated from the border of Areas Z/W.

-	2501	-	-	1,010.6	1,008.5	>2	2.1	AREA D	06/17/2003

Note:

- (1) The areas are identified on Figure 2 of the Remedial Action Report.
(2) In Area 22, groundwater was encountered at a higher elevation than anticipated during design.
(3) Units for depth and elevation are feet and feet mean sea level, respectively.

Table 8

Post-Excavation Sample Locations
 Element I Remedial Action
 Tri-Cities Barrel Superfund Site
 Fenton, New York

Sample Identification	Collected By	Area	Description
AREA L1	MP ⁽¹⁾	L-3 and L-4	Sample obtained after additional excavation in northern portion of Area L (Areas L-3 and L-4)
PEX-0904	MP	E	Sidewall
PEX-1004	MP	F	Sidewall
PEX-0505	MP	S-1	Eastern sidewall of Area S-1
PEX-0104	MP	N (sidewall)	Area N sidewall (south of PB-167)
PEX-0202	MP	X	Area X (composite sample from floor of excavation)
PEX-01A02	MP	N (sidewall)	Suspicious material in Area N sidewall (10 feet west of PEX-0104)
SUBSLAB-E	MP	N/A ⁽³⁾	Sample obtained after slab for former concrete block building was removed
SUBSLAB-W	MP	N/A ⁽³⁾	Sample obtained after slab for former concrete block building was removed
PEX-0302	MP	Z-2	Triangular area bounded by points PB-139, PB-52, and PB-51
PEX-0402	MP	L	Bottom of [L], bounded by PB-45, 63, 62, 137, border of [M] north of PB-161, and PB-138
PEX-06WT	MP	Q-3	Purple stained area (Area Q-3 was excavated to groundwater ⁽⁴⁾)
PEX-07WT	MP	O	Bottom of excavation (Area O was excavated to groundwater ⁽⁴⁾)
PEX-0802	MP	Z-2	Sample was obtained under the primary haul road
MW-2 Black NW-SS	MP	MW-2	Sample which indicated additional excavation was required near MW-2 well cluster
MW-2 Cluster Black NW	ET ⁽²⁾	MW-2	Sample which indicated additional excavation was required near MW-2 well cluster
MW-2 Cluster Grey NE	ET	MW-2	Sample which indicated additional excavation was required near MW-2 well cluster
MW-2 Cluster Grey S	ET	MW-2	Sample which indicated additional excavation was required near MW-2 well cluster
MW-2 WALL-N	MP	MW-2	Sample obtained after additional excavation was performed near MW-2 well cluster
MW-2 WALL-W	MP	MW-2	Sample obtained after additional excavation was performed near MW-2 well cluster
Tele Pole (0-2)	ET	Pole (Area N)	Sample obtained near pole located north of Osborned Hollow Road in Area N

Note(s)

- (1) Sample obtained by Malcolm Pirnie, Inc. Samples were obtained by Joseph T. Palka.
- (2) Sample obtained by Earth Tech, Inc.
- (3) After the slab for the former concrete block was removed, SUBSLAB-E and SUBSLAB-W were obtained outside the excavation area. Therefore no excavation area identification can be used to identify the general location. SUBSLAB-E and SUBSLAB-W was taken under the slab east and west of Area Z-2 respectively.
- (4) Analytical results may exceed site cleanup criteria. However, the excavation in these areas was to groundwater as required by the ROD.

9

Notes:

- (1) Specifications require that common fill be compacted to a minimum of 85% of the maximum dry density per Technical Specification Section 02140 Part 3.4.2.
- (2) Density testing performed after August 28, 2003 used an average of the values for Hastings Pit CF-1, CF-2, and CF-3 as required by Technical Specification Section 02140 Part 3.4.2.
- (3) CF-1 = Common fill sample no. 1.
CF-2 = Common fill sample no. 2.
CF-3 = Common fill sample no. 3.

Field Change Request (FCR)

FCR No. 1

PART 1 (Contractor completes Part 1)

ESC Engineering Project No. 148153

Project: Tri-Cities Barrel Superfund Site

Location: Fenton, New York

Reference(s): Technical Specification No.: Section 02140
Construction Drawing No.: _____

Description of Change Requested:
Substitute weathered rock with fines (various sizes)
for common fill as identified by specification.

Reason for Change:

- ① Constructibility and dust minimization during placement
- ② Local source

William Lusk
Originator's Signature

PART 2 (ESC Engineering completes Part 2)

Disposition: Accepted as minor change Rejected
 Major FCR, accepted, requires USEPA approval before implementation

Remarks:

- ① waive atterberg, particle size, moisture content due to granular nature of the material
- ② Waive proctor testing / compaction testing and replaced with visual inspection (nonmovement by weight of compaction equipment)

Dispositioned By: Joseph M. Amicid
Project Engineer or designee Date

Distribution: _____

Note: The Field Change Request procedures are outlined in Attachment A-1.

Field Change Request (FCR)

FCR No. 0004

PART 1 (Contractor completes Part 1)

ESC Engineering Project No. 148153

Project: Tri-Cities Barrel Superfund Site

Location: Fenton, New York

Reference(s): Technical Specification No.: _____
Construction Drawing No.: Sheet 3 Dwg # 148153-D13 & Figure 2 of RAWP

Description of Change Requested:
Earth Tech has changed the position of the access road to have a separate entrance and exit for trucks to exit I-88 and enter back onto I-88. The cones and signage has been adjusted to accommodate the extended work area. The new configuration is U-shaped instead of the proposed shape shown on Figure 2 or the RAWP.

Reason for Change:
Earth Tech spoke to the NYSDOT representative and all agreed that this approach would be safer due to the angle at which the trucks would exit and re-enter the highway.

Field Change Request (FCR)

FCR No. 0005

PART 1 (Contractor completes Part 1)

ESC Engineering Project No. 148153

Project: Tri-Cities Barrel Superfund Site

Location: Fenton, New York

Reference(s): Technical Specification No.: _____
Construction Drawing No.: _____

Description of Change Requested:

Area around PB-57 sample location to a depth of two feet will be excavated and managed as RCRA Hazardous Soil for Lead. This soil was not identified in the original bid specifications and will be managed as a new waste stream.

Reason for Change:

During the waste approval process one of the disposal facilities identified PB-57 as having an elevated total lead concentration of 10,000 ppm. The disposal facility requested that this area be sampled and analyzed for TCLP lead. The initial sample location and four locations surrounding the PB-57 location were analyzed. PB-57 and samples to the North and West still contained concentrations greater than 5ppm. A decision was made to excavate 2 feet of material out to historic locations that contained concentrations of lead that are below the site recommended clean up goals of 400 ppm. Material will be stockpiled for analysis of Underlying Hazardous Constituents.

Field Change Request (FCR)

FCR No. 0006

PART 1 (Contractor completes Part 1)

ESC Engineering Project No. 148153

Project: Tri-Cities Barrel Superfund Site

Location: Fenton, New York

Reference(s): Technical Specification No.:
Construction Drawing No.:

Description of Change Requested:
During the removal of the concrete foundations approximately 10 cubic yards of concrete debris was removed that was visibly stained. The specifications called for decontamination of the concrete and then using the concrete as fill material.

Reason for Change:
Earth Tech attempted to decontaminate the concrete and the staining could not be removed. Earth Tech consulted with ESC Engineering and a decision was made to incorporate the stained concrete soil into soil destined for disposal as non-cover material to the Subtitle D landfill. The remaining concrete that did not have any visual signs of contamination will still be placed as fill at a discreet surveyed location on-site.

PART 1 (Contractor completes Part 1)

ESC Engineering Project No. 148153

Project: Tri-Cities Barrel Superfund Site

Location: Fenton, New York

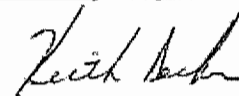

Reference(s): Technical Specification No.: _____
Construction Drawing No.: _____

Description of Change Requested:

As part of excavation N from the RAWP an active utility (electric and telephone) pole is in the excavation. Based on conversations with the electrician the pole is most likely set approximately 4-5 feet in the ground. The requested change is to excavate and slope away from the telephone pole as to not compromise the base of the pole and its stability.

Reason for Change:

This pole was not identified on the drawings and moving the pole would involve moving other poles outside of excavation. The lines attached to the pole would most likely have to be lengthened to accommodate moving the pole.

Field Change Request (FCR)

FCR No. 0008

PART 1 (Contractor completes Part 1)

ESC Engineering Project No. 148153

Project: Tri-Cities Barrel Superfund Site

Location: Fenton, New York

Reference(s): Technical Specification No.: Section 0211

Construction Drawing No.: Sheet 4 Drawing Number 148153-D18

Description of Change Requested:

Area B to be excavated in lifts. Based on the TCLP Lead results from PB-57 a decision was made to manage the top two feet of Area B in the same manner the 2-5 foot interval was managed in Area A and FCR #2. The material will be analyzed for TCLP lead and UHCs to determine disposal method. The material is already characterized as TSCA.

Reason for Change:

The results of further TCLP lead analysis started to encroach on Area B. Since this material was already slated for TSCA disposal this material was deemed potentially RCRA for Lead and will be analyzed with the Area B fraction for Lead and UHCs.

PART 1 (Contractor completes Part 1)

ESC Engineering Project No. 148153

Project: Tri-Cities Barrel Superfund Site

Location: Fenton, New York

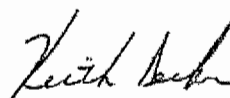

Reference(s): Technical Specification No.: Not Applicable
Construction Drawing No.: See Attached Sheets

Description of Change Requested:

Earth Tech is proposing to line the excavation with a 30 mil linear low density polyethylene (LLDPE) liner. The existing excavation will be backfilled with clean soil on a 1:1 slope. An anchor trench 1'x 1' will be installed at the toe of the slope. The area around the telephone pole will be graded to allow for a smooth transition to eliminate the need for any joints in the liner. The liner will be installed above the existing groundwater seeps. The top edge of the liner will be installed in a similar anchor trench once the chain link fence has been removed. The liner will be buried with backfill to meet the specified grade as shown on the design drawings.

Reason for Change:

During the remediation of Area N, a seam of what appeared to be road tar was encountered in the South wall of the excavation. EPA sampled the sidewall in two locations and both areas were above the site specific clean-up goals. The existing telephone pole area was also sampled by Earth Tech and the soil showed concentrations of pesticides that exceeded site specific clean-up goals.

RUFECO 3010B

PRODUCT NAME AND PART

RUFECO 3010B

PART # 3010B

PRODUCT DESCRIPTION:

RUFECO 3010B is a mono-layer membrane consisting of a blended polyethylene. Carbon black provides protection from UV rays and harsh weather conditions. RUFECO 3010B does not contain plasticizers which can migrate to the surface, causing premature aging. It is manufactured from virgin and select reprocessed resins.

PRODUCT USE:

RUFECO 3010B is used in applications that require a long lasting material. The carbon black additive assures long outdoor life. It is a flexible material that will conform to almost any surface while resisting punctures and tears.

COMMON APPLICATIONS:

- ◆ Decorative Ponds
- ◆ Oilfield Pitliners
- ◆ Ditch Linings
- ◆ Fire Ponds
- ◆ Brine Ponds
- ◆ Farm Ponds
- ◆ Canal Linings
- ◆ Closures

SIZE & PACKAGING:

RUFECO 3010B is available in widths up to 200' wide and up to 27,000 square foot panels. All panels are accordion folded every 5 feet and tightly rolled on a heavy-duty core for ease of handling and time saving installation.

RUFECO 3010B

Field Change Request (FCR)

FCR No. 0010

PART 1 (Contractor completes Part 1)

ESC Engineering Project No. 148153

Project: Tri-Cities Barrel Superfund Site

Location: Fenton, New York

Reference(s): Technical Specification No.: Not Applicable

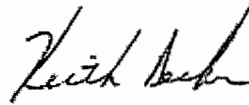

Construction Drawing No.: _____

Description of Change Requested:

Earth Tech in coordination with ESC Engineering is proposing to install a drainage trench to pick up groundwater flow that originates from under Osborne Hollow Road and enters the Tri-Cities Barrel Site in the newly established backfill on the southwest portion of the site. The trench would include installation of a stone filled trench with 4" perforated pipe to collect water and divert to the creek.

Reason for Change:

During the excavation of the sidewall adjacent to Osborne Hollow Road groundwater was encountered in the sidewall. The groundwater flows at various rates depending on rain events, but does tend to run constantly. It was thought that the backfill would create enough pressure to dissipate the groundwater beneath the newly established backfill. Instead, however the groundwater migrates to the top of the fill and topsoil and saturates the ground in the general area. In order to install a drainage trench the water was first analyzed and found to be clean by a New York Certified Laboratory. This drainage trench will allow for the area to dry and vegetative growth to establish.

Appendix B - Monitoring Well Abandonment Records

July 9, 2003

Mr. Keith Decker
Earth Tech
40 British American Boulevard
Albany, New York 12205

Re 03120A
Well Abandonments
Former Tri-Cities Barrel
Town of Fenton, New York

Dear Mr Decker:

Recently, our field crews abandoned a total of fifteen wells at the former Tri-Cities Barrel site, all in accordance with the specifications prepared for this project. The enclosed summary table details the wells abandoned, the dates of our work, the method of abandonment, the initial well depth and volume of grout used to abandon each well.

Thank you for this opportunity to work with you.

Very truly yours,

PARRATT-WOLFF, INC

William Morrow

P-1	6/13/03	Pull & grout	20.8	8	6.2
P-3	6/10/03	Overdrill	30.5	60	

Notes:

1. All wells abandoned were 2" diameter PVC.
2. All overdrilling was done with a 9" OD hollow stem auger
3. All wells were checked for settlement while onsite. Any grout settlement that occurred was less than a foot. At these locations, soil was placed on top of the grout
4. MW-18 and MW-18S were not abandoned as scheduled based on field decision by Earth Tech's onsite representative.
5. Grout backfill consisted of 1 bag of Portland cement, 5% bentonite and 6 gallons of water

These test results meet all the requirements of NELAC. All questions regarding this test report should be directed to the STL Project Manager who signed this test report.

*F4 = The reported value was determined by the method of standard additions (MSA).

*F33 = Control limits are established only for surrogate concentration levels specified by EPA methods. Because the sample was diluted prior to analysis, surrogate recoveries are not reported.

*F53 = Because surrogate recoveries were outside established limits, the sample was re-extracted and/or reanalyzed. Comparable results were obtained.

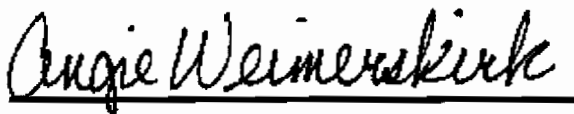

*F65 = Elevated detection limits were reported due to sample matrix interference which required sample or extract dilution.

Appendix D - Analytical Data for PB-57 Area Stockpile

Analytical Report

For: Mr. Keith Decker
Earth Tech
40 British American Blvd.
Latham, NY 12110
CC:

Order Number: S385416
SDG Number:
Client Project ID: 65429
Project: TriCities Barrel
Report Date: 07/22/2003
Sampled By: Client
Sample Received Date: 07/15/2003
Requisition Number:

Angie Weimerskirk, Project Manager
aweimerskirk@stl-inc.com
07/28/2003

The test results in this report meet all NELAP requirements for parameters for which accreditation is required or available. Any exceptions to NELAP requirements are noted in this report. Pursuant to NELAP, this report may not be reproduced, except in full, without the written approval of the laboratory.

These test results meet all the requirements of NELAC. All questions regarding this test report should be directed to the STL Project Manager who signed this test report.

*F33 = Control limits are established only for surrogate concentration levels specified by EPA methods. Because the sample was diluted prior to analysis, surrogate recoveries are not reported.

QUALITY ASSURANCE METHODS

REFERENCES AND NOTES

Report Date: 01/12/2004

The test results in this report meet all NELAP requirements for parameters for which accreditation is required or available. Any exceptions to NELAP requirements will be noted in a case narrative.

Report Comments

- 1) All pages of this report are integral parts of the analytical data. Therefore, this report should be reproduced only in its entirety.
- 2) Soil, sediment and sludge sample results are reported on a "dry weight" basis.
- 3) Reporting limits are adjusted for sample size used, dilutions and moisture content if applicable.

Glossary of flags and qualifiers.

Inorganic Qualifiers (Q-Column)

- U Indicates that the compound was analyzed for but not detected.
- 1 Result fails applicable drinking water standards.
- * Duplicate analysis not within control limits.
- N Spiked sample recovery not within control limits.
- E Indicates an estimated value because of the presence of interferences.
- W Post digestion spike for furnace AA analysis is out of the control limits (85-115%) while sample absorbance is less than 50% of spike absorbance.
- + Correlation coefficient for the MSA is less than 0.995
- B The reported value is less than the Contract Required Detection Limit (CRDL), but greater than the Instrument Detection Limit (IDL).

Organic Qualifiers (Q-Column)

- U Indicates that the compound was analyzed for but not detected.
- J Indicates an estimated value. This compound meets the identification criteria, but the result is less than the specified detection limit.
- B Indicates that the analyte was found in both the sample and its associated laboratory blank.
- D Indicates all compounds identified in an analysis at a secondary dilution factor.
- E Indicates that the analyte in an analysis has exceeded the linear calibration range.

Glossary of Terms

Surrogates (Surrogate Standards) - an organic compound which is similar to the target analyte(s) in chemical composition and behavior in the analytical process. For semi-volatiles, volatiles and pesticides/Arochlors, surrogate compounds are added to every blank, sample, matrix sample, matrix spike, matrix sample duplicate, matrix spike blank, and standard. These are used to evaluate analytical efficiency by measuring recovery. Poor surrogate recovery may indicate a problem with the sample composition.

Matrix Spike - an aliquot of a sample (water or soil) fortified (spiked) with known quantities of specific compounds (target analytes) and subjected to the entire analytical procedure in order to indicate the appropriateness of the method for the matrix by measuring recovery. The spiking occurs prior to sample preparation and analysis. Poor spike recovery may indicate a problem with the sample composition.

Internal Standards - an organic compound which is similar to the target analyte(s) in chemical composition and behavior in the analytical process. For GC/MS semi-volatiles and volatiles, internal standards are added to every blank, sample, matrix spike, matrix spike duplicate, matrix spike blank, and standard. Internal standard responses outside of established limits will adversely affect the quantitation and final concentration of target compounds.

CERTIFICATE OF DISPOSAL

CWM CHEMICAL SERVICES, L.L.C. has received waste material from TRI CITIES BARREL CO INC on 06/26/03 as described on Hazardous Waste Manifest number NYG1160163 Sequence number 01. CWM CHEMICAL SERVICES, L.L.C. hereby certifies that the above described material was landfilled in accordance with the 40 CFR part 761 as it pertains to the land disposal of polychlorinated biphenyl contaminated materials.

Profile Number: CW7341
CWM Tracking ID: 8157432401
CWM Unit #: 1*0
Disposal Date: 06/26/03

Under civil and criminal penalties of law for the making or submission of false or fraudulent statements or representations (18 U.S.C 1001 and 15 U.S.C. 2615) I certify that the information contained in or accompanying this document is true accurate and complete. As to the identified section(s) of this document for which I cannot personally verify truth and accuracy, I certify as the company official having supervisory responsibility for the persons who, acting under my direct instructions, made the verification that this information is true accurate and complete.

CERTIFICATE OF DISPOSAL

CWM CHEMICAL SERVICES, L.L.C. has received waste material from TRI CITIES BARREL CO INC on 06/27/03 as described on Hazardous Waste Manifest number NYG1160289 Sequence number 01. CWM CHEMICAL SERVICES, L.L.C. hereby certifies that the above described material was landfilled in accordance with the 40 CFR part 761 as it pertains to the land disposal of polychlorinated biphenyl contaminated materials.

Profile Number: CW7341
CWM Tracking ID: 8157439601
CWM Unit #: 1*0
Disposal Date: 06/27/03

Under civil and criminal penalties of law for the making or submission of false or fraudulent statements or representations (18 U.S.C 1001 and 15 U.S.C. 2615) I certify that the information contained in or accompanying this document is true accurate and complete. As to the identified section(s) of this document for which I cannot personally verify truth and accuracy, I certify as the company official having supervisory responsibility for the persons who, acting under my direct instructions, made the verification that this information is true accurate and complete.

CERTIFICATE OF DISPOSAL

CWM CHEMICAL SERVICES, L.L.C. has received waste material from TRI CITIES BARREL CO INC on 07/02/03 as described on Hazardous Waste Manifest number NYG1161792 Sequence number 01. CWM CHEMICAL SERVICES, L.L.C. hereby certifies that the above described material was landfilled in accordance with the 40 CFR part 761 as it pertains to the land disposal of polychlorinated biphenyl contaminated materials.

Profile Number: CW7341
WM Tracking ID: 8157457601
CWM Unit #: 1*0
Disposal Date: 07/02/03

Under civil and criminal penalties of law for the making or submission of false or fraudulent statements or representations (18 U.S.C 1001 and 15 U.S.C. 2615) I certify that the information contained in or accompanying this document is true accurate and complete. As to the identified section(s) of this document for which I cannot personally verify truth and accuracy, I certify as the company official having supervisory responsibility for the persons who, acting under my direct instructions, made the verification that this information is true accurate and complete.
