1 INTRODUCTION

The New York State Department of Environmental Conservation (NYSDEC) issued a Work Assignment (# D004443-4) to Arcadis CE, Inc. (Arcadis) for Operation, Maintenance, and Monitoring at the Vestal Water Supply Site (site) in New York State (Site # 7-04-009A) (Figure 1-1).

The NYSDEC is evaluating the efficiency, effectiveness, environmental benefit, and cost of existing environmental remedies by performing a Remedial System Optimization (RSO). The purpose of the RSO is to assess the site's Conceptual Site Model (CSM), provide a summary of the performance of the remedy, document current cleanup practices, provide a summary of progress toward the cleanup goals, and provide recommendations for improvements, if required.

The Well 1-1A groundwater treatment plant was shut down on February 28, 2014 as part of the RSO to evaluate the impacts to groundwater quality while the treatment plant is not operating. In particular, plume migration is being monitored to assess the effects of groundwater withdrawals from the Town of Vestal water supply wells 1-2A and 1-3 on the groundwater plume distribution and migration. In addition, soil and groundwater samples have been collected to further evaluate the horizontal and vertical distribution of VOCs in the area of the site.

The following recommendations that were included in the 4th quarter 2018 RSO report were approved by the NYSDEC via email on March 26, 2019:

- The groundwater sampling frequency has been reduced to occur semi-annually with sampling conducted in the spring (March/April) and fall (September/October) months until remedial activities commence at the source area (ECO International property), located upgradient of the site. The groundwater sampling frequency may be increased when source area remedial activities are initiated.
- The quarterly post-RSO sampling data has demonstrated that there are minimal impacts to groundwater in several areas of the shallow groundwater that are currently included in the monitoring program. This includes several wells that have had no detections of contaminants over several years. Based on these data, the current sample list (Table 1-1) was revised and the following monitoring wells were eliminated from the sampling program: 4009-10, 4009-11A, 4009-13A, and 4009-30A. This recommendation was implemented during the second 2019 semiannual event in September 2019.

This Semiannual Report has been prepared to summarize the July 2019 through December 2019 field activities. The second 2019 semiannual sampling event PDB deployment took place on September 26, 2019 and PDB samples were collected on October 10, 2019.

2 SITE ACTIVITIES

The scope of work for the RSO was designed to provide data for use in evaluation of the existing remedy and to further characterize the nature and extent of contamination in soil and groundwater at the site. The RSO provides information that is being used to assess the efficiency of the remedy and evaluate potential alternative remedial approaches. These data are summarized in the Final Focused Feasibility Study (FFS), which was submitted to the NYSDEC on September 25, 2015.

The basic scope of work included field oversight of subcontractors (i.e., driller and surveyor), preparation of daily field logs, collection of subsurface and surface soil samples, installation of monitoring wells, monitoring well development and hydraulic conductivity testing, measuring groundwater levels, installation of groundwater level data loggers, shut-down of the Well 1-1A groundwater treatment plant for a period of at least one year, collection of groundwater samples from new and existing wells, evaluation of data, and reporting of conclusions and recommendations.

Currently the investigation includes monthly pre-treatment and post treatment (Well 1-3) sampling of the Town of Vestal water supply wells 1-2A and 1-3 and semiannual groundwater sampling. In addition to the above field activities, pre and post-treatment samples were collected from supply Wells 1-2A and 1-3 and analyzed for 1,4-dioxane and per-and polyfluoroalkyl substances (PFAS) during the monthly sampling event in October 2019 per the instructions of the NYSDEC project manager.

2.1 Groundwater Sampling

The semiannual groundwater monitoring is being conducted to evaluate the distribution of the VOC groundwater plume on the north side of NYS Route 17 over time. The sampling includes wells surrounding the Town of Vestal water supply wells 1-2A, 1-3, and 1-1 (Figure 2-1). The sample list followed for the March 2019 sampling event (Table 1-1) was approved by the NYSDEC on January 26, 2017 as part of 2016 RSO recommendations and has been applicable through March 2017 to March 2019. The 2017 revisions included three additional monitoring wells, 4009-7, 4009-8, and 4009-26. These wells were added to the sample list to evaluate whether the ERT source area is the cause of elevated benzene concentrations noted in the data for the past several years. The most recent sample list revision as detailed in Section 1, was approved on March 26, 2019 and was implemented during this reporting period for the first time on September 26, 2019. Monitoring wells 4009-10, 4009-11A, 4009-13A, and 4009-30A, all screened in the shallow groundwater zone, were removed from the sampling list.

Groundwater samples were collected using passive diffusion bags (PDBs) in accordance with the RSO Work Plan. All samples were submitted for analysis of TCL VOCs by USEPA Method 8260 to Eurofins-TestAmerica-Buffalo following chain-of-custody sample handling procedures.

2.1.1 Water Level Data

On September 26, 2019 groundwater levels were measured at all wells to be sampled using an electronic water-level meter. As indicated in Section 1, the Well 1-1A treatment plant continues to be shut down, therefore, groundwater levels are representative of static (non-pumping) conditions. Groundwater levels were used to calculate groundwater elevations and assess groundwater flow conditions across the site. A summary of groundwater elevation data is provided in Table 2-1. Groundwater flow in the shallow and

intermediate groundwater monitoring zones is generally west to northwest and north to northwest in the deep groundwater monitoring zone toward the Susquehanna River.

2.1.2 October 2019 Groundwater Sampling

Groundwater samples were collected using PDBs that were deployed on September 26, 2019 in the wells identified on Table 1-1.

2.1.2.1 October 2019 Groundwater Sampling Results

Groundwater results from the October 2019 groundwater sampling event are provided in Table 2-3, and presented on Figures 2-2 (shallow groundwater), 2-3 (intermediate groundwater), and 2-7 (deep groundwater), respectively. Detected constituents were compared to NYSDEC Technical and Operation Guidance Series (TOGS 1.1.1) Class GA Groundwater Quality Criteria (Class GA Standard). The VOCs detected at the highest concentrations were benzene, 1,1,1-trichloroethane (1,1,1-TCA), 1,1-dichloroethane (1,1-DCA), 1,1-dichloroethene (1,1-DCE), cis-1,2-dichloroethene (cis-1,2-DCE), trichloroethene (TCE), and vinyl chloride (VC).

Total VOC results discussed below do not include acetone or methylene chloride results, as these compounds are common laboratory contaminants.

Shallow Groundwater Zone Monitoring Wells

As mentioned in Section 2.1, four shallow monitoring wells were removed from the sampling list. Three shallow groundwater zone monitoring wells were sampled in October 2019. Of the three monitoring wells, two samples (4009-7 and 4009-9) contained VOC concentrations greater than their respective Class GA Standard. The highest concentrations in the shallow zone are consistently observed in monitoring well 4009-7, which is located on the south side of Route 17, downgradient of the source area (ECO International property) (Figure 2-2 and in Table 2-3). A summary of the shallow groundwater zone results is presented below:

- **cis-1,2-DCE** was detected at concentrations greater than its Class GA Standard (5 µg/L) in the groundwater sampled from 4009-7 (31 µg/L) and 4009-9 (21 µg/L).
- **Vinyl chloride** was detected at a concentration greater than its Class GA Standard (2 µg/L) in the groundwater sample from 4009-7 (5.70 µg/L).
- With the exception of an estimated concentration of acetone less than the Class GA Standard, no other VOCs were detected in the shallow groundwater zone monitoring well 4009-16A.

As shown on Figure 2-2, VOCs have not been detected at concentrations greater than the Class GA Standards in samples from monitoring well 4009-16A in the past eight sampling events. VOC concentrations in groundwater samples from wells 4009-7 and 4009-9 have generally been consistent the past eight sampling events, showing slight fluctuations (Figure 2-2).

Intermediate Groundwater Zone Monitoring Wells

Six intermediate groundwater zone monitoring wells were sampled in October 2019. The highest concentrations of VOCs are in the intermediate groundwater zone, downgradient of the source area (ECO

International property) (Figure 2-3 and in Table 2-3). Samples collected from five of the six intermediate groundwater zone monitoring wells contained concentrations that exceeded the Class GA Standards including; 4009-8, 4009-26, 4009-27S, 4009-29S, and 4009-29I. Wells 4009-8 and 4009-26 are located on the south side of NYS Route 17, just west of the source area. Well 4009-29S is on the north side of NYS Route 17, farther downgradient of the source area where higher concentrations are typically reported for the intermediate groundwater zone.

A summary of the results in the intermediate groundwater zone wells is listed below:

- **1,1,1-TCA** was detected at a concentration greater than the Class GA Standard (5 µg/L) in five intermediate wells with groundwater concentrations ranging from 60 µg/L (4009-27S) to 3,300 µg/L (4009-8).
- **1,1-DCA** and **1,1-DCE** were detected at concentrations greater than the Class GA Standard (5 µg/L) in four intermediate wells with groundwater concentrations ranging from 20 µg/L (4009-26) to 100 µg/L (4009-29S) for 1,1-DCA and 1,1-DCE groundwater concentrations ranging from 16 µg/L (4009-26) to 210 µg/L (4009-8).
- **Cis-1,2-DCE** and **TCE** were detected at a concentration greater than the Class GA Standard (5 µg/L) in five intermediate wells with groundwater concentrations ranging from 21 µg/L (4009-27S) to 670 µg/L (4009-8) for cis-1,2-DCE, and TCE groundwater concentrations ranging from 20 µg/L (4009-27S) to 990 µg/L (4009-8).
- **VC** was detected at a concentration greater than the Class GA Standard (2 µg/L) in two intermediate wells with the groundwater concentrations of 140 µg/L (4009-29S) and 81 µg/L (4009-29I).

As shown on Figure 2-3, the majority of the detected analytes in samples from monitoring wells 4009-27S, 4009-27I, and 4009-29I are showing consistent or slightly increasing concentrations over the past eight events. VOC groundwater concentrations in the wells immediately downgradient monitoring of the source area (4009-8, 4009-26, and 4009-29S) continue to fluctuate; however, recent monitoring results are showing an increasing trend as shown on Figures 2-4 through 2-6. These trends will continue to be monitored during the next quarter.

Deep Groundwater Zone Monitoring Wells

Fifteen monitoring wells screened in the deep groundwater zone were sampled in October 2019. All fifteen deep wells monitor the area north of Route 17. Ten monitoring wells screened in the deep groundwater monitoring zone contained concentrations of VOCs that exceeded the Class GA Standards (Figure 2-7, Table 2-3). Of the ten monitoring wells, benzene was the only VOC exceeding a standard in seven of the samples.

A summary of the results in the deep groundwater zone wells is listed below:

- **Benzene** was detected at a concentration greater than the Class GA Standard (1 µg/L) in seven deep wells with groundwater concentrations ranging from 1.20 µg/L (4009-22) to 9.20 µg/L (4009-15).
- **1,1,1-TCA, 1,1-DCA, 1,1-DCE, and cis-1,2-DCE** were detected at a concentration greater than the Class GA Standard (5 µg/L) in three deep wells with groundwater concentrations ranging from:
 - 1,1,1-TCA: 51 µg/L (4009-11) to 250 µg/L (Well 1-1)
 - 1,1-DCA: 15 µg/L (4009-11) to 21 µg/L (Well 1-1)

- 1,1-DCE: 5.50 µg/L (4009-11) to 32 µg/L (4009-29D)
- Cis-1,2-DCE: 16 µg/L (4009-11) to 93 µg/L (4009-29D).
- **TCE** and **VC** were detected at a concentration greater than the Class GA Standard (5 µg/L) in two deep wells. TCE concentrations were 71 µg/L (Well 1-1) and 100 µg/L (4009-29D), and VC concentrations were 11 µg/L (4009-11) and 42 µg/L (4009-29D).
- Groundwater samples from five of the fifteen deep groundwater zone monitoring wells were either non-detect or had low-level detections less than their respective Class GA Standards including: 4009-12, 4009-13, 4009-18, 4009-19, and 4009-27D.

As shown in Figure 2-7 there have been no VOC groundwater concentrations exceeding the Class GA Standards in samples from monitoring wells 4009-13, 4009-18, and 4009-27D for the past eight events. The majority of the detected analytes in groundwater samples from monitoring wells 4009-11, 4009-12, 4009-29D, and Well 1-1 are generally consistent with the range of results reported in the last eight events showing some fluctuations.

Summary of Results

Semiannual groundwater monitoring data continue to indicate that there is little change in the shallow and deep groundwater plume distribution and migration since the shutdown of the Well 1-1A groundwater treatment plant. However, intermediate zone monitoring wells immediately downgradient of the source area (wells 4009-8, 4009-26, and 4009-29S) have shown an overall increasing trend in VOC groundwater concentrations over the last two years (Figures 2-4 through 2-6 respectively). With the exception of these wells, total VOCs detected in the groundwater samples collected during the October 2019 sampling event were generally consistent with the range of results reported during the last two years.

Benzene Concentrations in Deep Wells

Benzene has been observed in deep groundwater zone monitoring wells during sampling events over the past several years. Benzene was detected in groundwater samples from seven deep groundwater zone monitoring wells in October 2019 at concentrations that exceeded the Class GA Standard of 1.0 µg/L. Exceedances were observed in groundwater samples collected from monitoring wells 4009-14 (1.30 µg/L), 4009-15 (9.20 µg/L), 4009-16 (4.20 µg/L), 4009-21 (3.70 µg/L), 4009-22 (1.20 µg/L), 4009-28 (2.40 µg/L), and 4009-30 (4.50 µg/L). As shown in Table 2-3, these concentrations are similar to previous sampling results. Benzene concentrations have continued to fluctuate in the central portion of the study area over the past several years in the groundwater samples from five of the deep groundwater zone monitoring wells 4009-14, 4009-15, 4009-16, 4009-21 and more recently 4009-30. Benzene concentrations from groundwater sampled in 4009-22 remain stable but continue to fluctuate in groundwater samples from monitoring wells 4009-11 and 4009-12. During the past two events, benzene concentrations have been either non-detect or less than the Class GA Standard in the groundwater samples collected from 4009-11 and 4009-12.

Benzene continues to not be detected at concentrations greater than the Class GA Standard in the samples collected from the shallow and intermediate zones during the October 2019 sampling event. This includes the three monitoring wells; 4009-7, 4009-8, and 4009-26 which were added to the first quarter 2017 sampling list in an attempt to identify the source of the benzene increases. However, benzene was

not detected at concentrations greater than the Class GA Standard in the samples from those monitoring wells during the 2017, 2018, and 2019 sampling events.

Monitoring Wells in Vicinity of Town of Vestal Supply Wells

Concentrations of VOCs in groundwater samples from the monitoring wells in the vicinity of the Town of Vestal's water supply wells 1-2A and 1-3 (monitoring wells 4009-16/16A, 4009-18, 4009-19, 4009-21, 4009-30/30A) are generally consistent with the previous sampling events. VOCs were not detected at concentrations greater than the Class GA Standards in samples collected from monitoring wells 4009-16A, 4009-18, and 4009-19. Similar to previous sampling results, benzene was detected at a concentration exceeding the Class GA Standard (1.00 µg/L) in samples from wells 4009-16 (4.20 µg/L), 4009-30 (4.50 µg/L), and 4009-21 (3.70 µg/L).

2.1.3 Town of Vestal Municipal Well Sampling

Monthly analytical data are provided by the Town of Vestal Water Superintendent for Well 1-2A and 1-3. Samples were collected on July 22, August 26, September 30, October 28, November 25, and December 20, 2019. Pre-treatment groundwater samples were also collected by Arcadis from the Town of Vestal water supply wells 1-2A and 1-3 and post-treatment samples from Well 1-3 on July 12, August 12, September 26, October 10, November 22, and December 13, 2019. These samples were used to supplement the Town's monthly influent sampling data and to evaluate potential impacts to the Town's water supply wells related to the shutdown of the Well 1-1A treatment plant. Samples were collected in consultation with the Town of Vestal Water District Superintendent and submitted to Eurofins-TestAmerica for analysis of VOCs by USEPA Method 8260. As mentioned in Section 2, pre and post-treatment groundwater samples were collected on October 10, 2019 and analyzed for 1,4-dioxane and PFAS per the instructions of the NYSDEC project manager.

Until April 2018, chlorinated VOCs had not been detected in any of the pre-treatment effluent samples collected from the Town of Vestal water supply wells 1-2A and 1-3 since the RSO evaluation has been implemented through 2017. In April 2018, 1,1,1-TCA was detected at an estimated concentration of 0.29 ug/L in Well 1-3 pre-treatment sample. The Class GA Standard for this compound is 5 µg/L. As part of the RSO contingency plan, Arcadis has continued to collect a post-treatment sample from Well 1-3 since May 2018. With the exception of low concentrations of methylene chloride, which were flagged by the laboratory as being detected in the associated blank, VOCs were not detected in any of the monthly samples for this reporting period (July through December 2019) collected by Arcadis from Well 1-2A, Well 1-3, and Well-1-3 post-treatment. The monthly analytical data provided by the Town of Vestal Water Superintendent for Well 1-2A and 1-3 were also non-detect during three of the six months of this reporting period. Bromoform was detected in samples collected from Well 1-2A and Well 1-3 during the October through the December 2019 sampling events as well as concentrations of dibromochloromethane in Well 1-2A. Concentrations of dibromochloromethane was also detected in samples collected from Well 1-3 during the October and November 2019 sampling events. The detected concentrations did not exceed the Class GA Standard of 50 µg/L for both analytes. As approved by the NYSDEC (May 24, 2018 via email), Arcadis will continue with routine monthly sampling of the pre-treatment (Well 1-2A, 1-3) and post-treatment of Well 1-3. A summary of the monthly analytical data is provided in Table 2-4. Laboratory analytical reporting forms are provided in Appendix A.

SEMI-ANNUAL REMEDIAL SYSTEM OPTIMIZATION REPORT - JULY-DECEMBER 2019

In August 2019, the NYSDEC requested the Town of Vestal water supply wells (Wells 1-2A and Well 1-3 pre and post-treatment) be sampled for PFAS and 1,4-dioxane. Samples were collected during the second semiannual event on October 10, 2019. Analytical results are summarized below and in Table 2-5.

Validation of the PFAS and 1,4 dioxane analytical data was performed by Data Validation Services (DVS) to ensure that the quality of the data is sufficient to meet the project objectives. A Data Usability Report (DUSR) was prepared by DVS upon the receipt of the PFAS and 1,4-dioxane data and concluded the analyses were conducted in compliance with the protocols and results are usable as reported. The DUSR is included in Appendix B.

1,4-Dioxane

Concentrations of 1,4-dioxane were not detected in the pre and post-treatment samples from Well 1-3 during the October 2019 sampling event. Concentrations of 1,4-dioxane were detected in samples collected from the pre and post-treatment samples from Well 1-2A and Well 1-2A post at concentrations of 0.70 and 0.72 ug/L, respectively, during the October 2019 event. Similar to the June 2017 sampling event, 1,4-dioxane was detected in the pre-treatment sample of Well 1-2A and was not detected in the pre-treatment sample of Well 1-3. Post-treatment samples for Wells 1-2A and 1-3 were not collected during the June 2017 event.

There are currently no federal maximum contaminant level (MCL) for 1,4-dioxane for drinking water.

Per- and Polyfluoroalkyl Substances (PFAS)

Concentrations of PFAS were not detected in the pre and post treatment samples collected from Well 1-2A or Well 1-2A post. Consistent with the June 2017 sampling event, concentrations of PFAS were not detected in the sample collected from pre-treatment Well 1-2A. Well 1-2A post was not sampled during the June 2017 event. As detailed below, several PFAS analytes were detected in the samples collected from the pre and post-treatment samples from Well 1-3 during the October 2019 sampling event:

- Perfluoroheptanoic acid (PFHpA) was detected at estimated concentrations in the pre and post treatment samples at 0.89 nanograms per liter (ng/L) and 0.83 ng/L, respectively.
- Perfluorooctanoic acid (PFOA) was detected at estimated concentrations in the pre and post treatment samples at 1.43 ng/L and 1.18 ng/L, respectively.
- Both perfluorooctanesulfonic acid (PFOS) and perfluorononanoic acid (PFNA) were detected in the pre-treatment sample at estimated concentrations of 1.84 and 0.78 ng/L, respectively.

The United States Environmental Protection Agency (USEPA) is currently using the health-based criteria for drinking water for perfluorooctanoic acid (PFOA) and perfluorooctanesulfonic acid (PFOS) compounds (individually and as a sum) of 70 ng/L. New York State is in the process of finalizing and promulgating the proposed maximum contaminant level (MCL) of 10 ng/L for (PFOA) and 10 ng/L for (PFOS) in drinking water and an MCL of 1.0 parts per billion for 1,4-dioxane.

3 RECOMMENDATIONS

Based on the data presented herein, Arcadis recommends the following:

1. Town of Vestal Wells 1-2A and 1-3 (pre-and post-treatment) should continue to be sampled for VOCs on a monthly basis to supplement the Town's sampling program at least until the final remedy for the source area (ECO International property) is implemented.
2. Semiannual sampling should continue while Well 1-1A treatment plant is shut down. The revised sample list will remain in place during the next sampling event, spring of 2020 As noted herein, the sampling schedule may be revised once the final remedy for the source area is implemented.

4 JANUARY THROUGH JUNE 2020 SCHEDULED ACTIVITIES

Scheduled activities for the next semiannual period are summarized below.

- Monthly sampling at Town of Vestal Wells 1-2A and 1-3 (pre and post treatment).
- Semiannual groundwater sampling (March/April 2020).

The samples were received on 7/13/2019 9:30 AM; the samples arrived in good condition, properly preserved and, where required, on ice. The temperature of the cooler at receipt was 4.2° C.

GC/MS VOA

Method(s) 8260C: The continuing calibration verification (CCV) associated with batch 480-482394 recovered above the upper control limit for Dibromochloromethane. The samples associated with this CCV were non-detect for the affected analyte; therefore, the data have been reported. The following samples are impacted: WELL 1-2A (480-156164-1), WELL 1-3 (480-156164-2), WELL 1-3 POST (480-156164-3) and TRIP BLANK (480-156164-4).

Method(s) 8260C: The laboratory control sample (LCS) for analytical batch 480-482394 recovered outside control limits for the following analytes: Bromoform and Dibromochloromethane. These analytes were biased high in the LCS and were not detected in the associated samples; therefore, the data have been reported. The following samples are impacted: WELL 1-2A (480-156164-1), WELL 1-3 (480-156164-2), WELL 1-3 POST (480-156164-3) and TRIP BLANK (480-156164-4).

Method(s) 8260C: Due to the coelution of Ethyl Acetate with 2-Butanone (MEK) in the full spike solution, 2-Butanone (MEK) exceeded control limits in the laboratory control sample (LCS) associated with batch 480-482394. The following samples were affected: WELL 1-2A (480-156164-1), WELL 1-3 (480-156164-2), WELL 1-3 POST (480-156164-3) and TRIP BLANK (480-156164-4).

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

GC/MS VOA

Method 8260C: The continuing calibration verification (CCV) associated with batch 480-499057 recovered outside acceptance criteria, low biased, for 2-Hexanone, Dichlorodifluoromethane, Chloromethane, 4-Methyl-2-pentanone (MIBK), 2-Butanone (MEK). A reporting limit (RL) standard was analyzed, and the target analyte was detected. Since the associated samples were non-detect for this analyte, the data have been reported.

Method 8260C: The laboratory control sample (LCS) for analytical batch 480-499057 recovered outside control limits for the following analytes: Dichlorodifluoromethane, 4-Methyl-2-pentanone (MIBK), Methyl acetate. Dichlorodifluoromethane, 4-Methyl-2-pentanone (MIBK), Methyl acetate have been identified as a poor performing analyte when analyzed using this method; therefore, re-extraction/re-analysis was not performed. These results have been reported and qualified.

Method 8260C: The Laboratory Control Sample (LCS) was outside laboratory/project quality control limits for the following analyte: Chloromethane. All other spike recoveries and quality control indicators, including sample specific surrogate recoveries, were acceptable. A reporting limit (RL) standard was analyzed, and the target analyte was detected. Since the associated samples were non-detect for this analyte, the data have been reported. The following samples are impacted: WELL 1-2A - 101019 (480-160863-1), WELL 1-3 POST - 101019 (480-160863-2), WELL 1-3 - 101019 (480-160863-3) and TRIP BLANK - 101019 (480-160863-4).

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

No additional comments.

Receipt

The samples were received on 10/12/2019 8:00 AM; the samples arrived in good condition, properly preserved and, where required, on ice. The temperatures of the 2 coolers at receipt time were 3.1° C and 3.4° C.

GC/MS Semi VOA

Method 8270D SIM ID: The 1,4-Dioxane result reported for samples WELL 1-2A (480-160866-1[MS]), WELL 1-2A (480-160866-1[MSD]) and (LCS 480-498433/2-A) have an E flag qualifier indicating the results are over the calibration range on the raw data. The actual amounts are within the calibration range; however, the E flag is generated based upon the bias corrected concentration. The LIMS system calculates a bias correction based on the recovery of the 1,4-Dioxane-d8 isotope.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

LCMS

Method WS-LC-0025 Att1: Due to a shortage in the marketplace for 13C3-PFBS, the target analyte Perfluorobutanesulfonic acid (PFBS) could not be quantitated against 13C3-PFBS (its labeled variant) as listed in the SOP. PFBS was quantitated versus 18O2-PFHxS instead. (ICV 320-331689/11)

Method WS-LC-0025 Att1: Isotope Dilution Analyte (IDA) recovery is above the method recommended limit for 13C4 PFOS for the following samples: WELL 1-2A (480-160866-1) and WELL 1-2A (480-160866-1[MS]). Quantitation by isotope dilution generally precludes any adverse effect on data quality due to elevated IDA recoveries.

Method WS-LC-0025 Att1: The matrix spike / matrix spike duplicate (MS/MSD) recoveries for Perfluorohexanesulfonic acid (PFHxS), Perfluorooctanesulfonic acid (PFOS) and Perfluorononanoic acid (PFNA)preparation batch 320-332082 and analytical batch 320-332118 were outside control limits. Sample matrix interference are suspected because the associated laboratory control sample (LCS) recovery was within acceptance limits.

Method WS-LC-0025 Att1: Due to a shortage in the marketplace for 13C3-PFBS, the target analyte PFBS could not be quantitated against 13C3-PFBS (its labeled variant) as listed in the SOP. PFBS was quantitated versus 18O2-PFHxS instead. (ICV 320-334429/11)

Method WS-LC-0025 Att1: The following Post sample was re-extracted to confirm results: WELL 1-3 POST (480-160866-4). Re-analysis confirmed; therefore original results were reported.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

Organic Prep

Method PFAS Prep: Insufficient sample volume was available to perform a matrix spike/matrix spike duplicate (MS/MSD) associated with preparation batch 320-334757.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

Receipt

The samples were received on 11/23/2019 12:05 PM; the samples arrived in good condition, properly preserved and, where required, on ice. The temperature of the cooler at receipt was 3.4° C.

GC/MS VOA

Method 8260C: The continuing calibration verification (CCV) analyzed in batch 480-506741 was outside the method criteria for the following analyte: Methylene Chloride, a known common laboratory contaminant. As indicated in the reference method, sample analysis may proceed; however, any detection for the affected analyte should be evaluated accordingly.

Method 8260C: The LCS for 480-506741 recovered outside control limits for the analyte Methylene Chloride due to laboratory contamination. The following samples are impacted 480-163236-A-1, 480-163236-A-2, 480-163236-A-3, and 480-163236-A-4.

Method 8260C: The method blank for analytical batch 480-506741 contained Methylene Chloride above the reporting limit (RL). This compound is considered a common laboratory contaminant. The associated sample was not re-extracted and/or re-analyzed because the concentration of the common lab contaminant in the method blank was less than 5 times the RL.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

RE: **Data Usability Summary Report (DUSR) for the NYSDEC Vestal Site**
Eurofins TA SDG No. 480-160866-1

Dear Ms. Mullins:

Review has been completed for the analytical data package noted above, generated by Eurofins TestAmerica that pertains to samples collected 10/10/19 at the NYSDEC Vestal site. Four aqueous samples and a field duplicate were processed for six site-specific per- and polyfluoroalkyl substances (PFAS) by a modified method ISO 25101 and 1,4-dioxane by SW846 method 8270D Selective Ion Monitoring (SIM).

The data packages submitted contain full deliverables for validation, and this DUSR is generated from review of the summary form information, with full validation review of sample raw data, and limited review of associated QC raw data. The reported summary forms have been reviewed for application of validation qualifiers, using guidance from the USEPA Region 2 validation SOPs, the USEPA CLP National Functional Guidelines for Organic Data Review, the specific laboratory methodologies, and professional judgment. The following items were reviewed:

- * Laboratory Narrative Discussion
- * Custody Documentation
- * Holding Times
- * Surrogate, Isotopic Dilution, and Internal Standard Recoveries
- * Preparation/Field/Trip Blanks
- * Laboratory Control Samples (LCSs)
- * Instrumental Tunes
- * Calibration Standards
- * Instrument IDLs
- * Sample Result Verification

The data review includes evaluation of the specific items noted in The NYS DER-10 Appendix B section 2.0 (c). The items listed above that show deficiencies are discussed within the text of this narrative. The laboratory QC forms illustrating the excursions can be found within the laboratory data packages.

In summary, analyses were conducted in compliance with the protocols, and results are usable as reported, with the exception of the minor qualification of one analyte result.

The sample identification summary is attached to this text. Also included with the report are validation qualifier definitions and the laboratory EQuIS EDD that is annotated in red to reflect the qualification recommended within this report.

Data completeness, accuracy, precision, comparability, and representativeness are acceptable.

The following text discusses quality issues of concern.

Blind Field Duplicate

The field duplicate evaluation of WELL 1-3 POST shows acceptable correlations.

1,4-Dioxane by EPA 8270D SIM

Holding times were met, and the blank shows no contamination. Calibration standards showed acceptable responses, and surrogate and internal standard recoveries are within laboratory acceptance ranges.

Matrix spikes of WELL 1-2A shows acceptable recoveries and correlations. LCS recoveries are compliant.

PFAS by Modified ISO 25101

Matrix spikes of WELL 1-2A show outlying recoveries (64%) for PFOS, the result for which is qualified as estimated, with a low bias, in the parent sample. LCS recoveries are compliant.

Holding times were met. Isotopic dilution/surrogate and internal standard recoveries are within validation action limits. The blank shows no contamination. Calibration standards show compliant responses.

Please do not hesitate to contact me if you have comments or questions regarding this report.

Very truly yours,

Judy Harry

VALIDATION DATA QUALIFIER DEFINITIONS

- U** The analyte was analyzed for, but was not detected above the level of the associated reported quantitation limit.
- J** The analyte was positively identified; the associated numerical value is an approximate concentration of the analyte in the sample.
- J-** The analyte was positively identified; the associated numerical value is an estimated quantity that may be biased low.
- J+** The analyte was positively identified; the associated numerical value is an estimated quantity that may be biased high.
- UJ** The analyte was analyzed for, but was not detected. The associated reported quantitation limit is approximate and may be inaccurate or imprecise.
- NJ** The detection is tentative in identification and estimated in value. Although there is presumptive evidence of the analyte, the result should be used with caution as a potential false positive and/or elevated quantitative value.
- R** The data are unusable. The sample results are rejected due to serious deficiencies in meeting Quality Control limits. The analyte may or may not be present.
- EMPC** The results do not meet all criteria for a confirmed identification. The quantitative value represents the Estimated Maximum Possible Concentration of the analyte in the sample.
