Re: Transmittal of Annual Groundwater Monitoring Status Report for 2006
Order on Consent Index #A7-0502-0104, Site #704014

Dear Mr. Knizek:

The purpose of this letter is to transmit the Annual Groundwater Monitoring Status Report for 2006 in accordance with the April 15, 2007 submission date specified in the Operation, Maintenance, and Monitoring Plan, Second Update, Appendix A-3 (Groundwater Monitoring Plan), Section 6.2.

Should you have any questions concerning the contents of this Annual Report for the Site, please contact me at 703-257-2587.

Sincerely,

M. E. Meyers

Mitchell E. Meyers

1 INTRODUCTION

This Annual Groundwater Monitoring Status Report for 2006 has been prepared by Groundwater Sciences Corporation (GSC) and Groundwater Sciences, P.C. (GSPC) at the request of International Business Machines Corporation (IBM) pursuant to Order on Consent Index # A7-0502-0104 (Order), for the former IBM Endicott facility (Site # 704014), located in the Village of Endicott and the Town of Union, Broome County, New York (Site) (Figure 1-1). The section of the Order titled, “Miscellaneous Activity C: Operation, Maintenance and Monitoring” describes the requirements for a comprehensive operation, maintenance and monitoring plan (OM&M Plan). This report has been prepared in accordance with the document titled, “Draft Groundwater Remediation Systems Operations, Maintenance and Monitoring Plan, Second Update,” dated and submitted to the New York State Department of Environmental Conservation (NYSDEC) on February 1, 2006 and approved on December 20, 2006. Figure 1-2 details the area of the Site and the operable units identified in the Order. Also shown on this figure are various capture zones and the area of Miscellaneous Activity A identified in the Order as an Interim Remedial Measure for Off-Site Capture Zone A.

1.1 Background Information

The corrective action history at the Site covers a period of roughly 27 years, beginning with the discovery of contamination in groundwater at the Site in 1979.

In early 1980, IBM began to control and remove sources of contamination beneath its former IBM facility at the Site through the use of vertical extraction wells to remove both groundwater and separate-phase volatile organic compounds (VOCs). Since 1980, extraction operations have been performed at 31 extraction wells operating over various time periods. This report presents the results of the groundwater remediation activities for the calendar year 2006.

1.2 2006 Highlights

The following subsections summarize the activities and results from the operation, maintenance and monitoring of groundwater remediation systems at the Site in 2006. The highlights of operation and monitoring for 2006 include:

- The operation of four (4) extraction wells in the On-Site Capture Zone continues to control potential flux from sources in the Railroad Corridor Source Area (Operable Unit #1 (OU#1)) and is responsible for the removal of nearly 3500 pounds of volatile organic compounds (VOCs) from the groundwater in OU#1.
- The installation of 12 additional wells (8 monitoring wells and 4 new or replacement extraction wells and extraction test wells) brought the total number of wells installed since 1979 to 467.
- A total of twenty-eight (28) groundwater extraction wells operating at the Site in 2006 removed more than 4000 pounds of VOCs, bringing the total mass of VOCs extracted since 1979 to approximately 795,000 pounds.
- Groundwater sampling was performed at 341 monitoring and extraction wells and water levels were measured in 377 wells in accordance with the Groundwater Monitoring Program.
- The operation of four new extraction wells in Off-Site Capture Zone A for part of 2006 in conjunction with upgrades to existing extraction wells and operation of other extraction wells has increased the VOC mass removal rate in this area from 97 pounds per year in 2003 to 224 pounds per year in 2006, generating the following benefits:
 - Virtually all chemical flux crossing North Street (Operable Unit #2) continues to be intercepted before reaching Off-Site Capture Zone A.
 - Eighteen (18) monitoring or extraction wells in Off-Site Capture Zone A (Miscellaneous Activity A) exhibit decreasing concentrations of one or more VOCs.
 - Chemical concentration maps of the various compounds of concern show the core of the plume continues to be fragmented and steadily extracted through the operation of new and existing extraction wells.
- Extraction well EN-CAF was replaced by new extraction well EN-D49 to maintain control of the plume of VOCs in bedrock groundwater.

- Completion of additional upgrades to the Garfield Avenue and Adams Avenue groundwater treatment facilities (Garfield and Adams GTFs) and design and construction of new groundwater treatment facilities including:
 - Completion of design and construction of the B046S groundwater transfer station upgrade located in Operable Unit #1;
 - Completion of design and construction of a new groundwater treatment facility within Operable Unit #7 referred to as the Robble Avenue GTF. This new facility began groundwater treatment operations in March 2007; and
 - The initiation of design and construction of a new groundwater treatment facility located on Clark Street in Operable Unit #1. This new facility is scheduled to begin treatment operations by the end of 2007 and is referred to as the Clark Street GTF.

1.2.1 Site Characterization

In the time period from early 1979 through the end of 2006, 467 wells were installed as part of the corrective action program or ongoing investigations at this Site; 12 of these wells were installed during 2006. The total includes 183 wells (monitoring and extraction) installed north of North Street on the manufacturing portion of the former IBM facility at the Site, and another 284 wells (monitoring and extraction) installed south of North Street off the manufacturing portion of the former IBM facility at the Site. Plate 1 shows the locations of monitoring wells and extraction wells that were completed through the end of 2006. These wells are also coded on this map according to the geologic unit in which they are completed. Water levels and groundwater samples collected from these wells have been used to characterize the pattern of groundwater flow beneath the Site and adjacent areas. The most recent comprehensive interpretations of these data is provided in the annual reports for 2004 and 2005 and in the *Supplemental Groundwater Assessment Final Report* (SGA Final Report, December 31, 2003, revised and updated May 17, 2004), which presents extensive analysis and interpretation of the geology, hydrogeology and groundwater chemistry at and in the vicinity of the Site. Additionally, a comprehensive interpretation of the most recent bedrock groundwater data is presented in the *Annual Groundwater Monitoring Status Report for*

2005 (2005 Annual Report, dated April 14, 2006) and in the *Bedrock Groundwater Supplemental Remedial Investigation (SRI) Report* dated December 19, 2005.

Following recommendations made in the SGA Report and in accordance with the Order, additional investigations were performed in 2004 and work plans were prepared for additional investigations, some of which are ongoing or were completed in 2005 and 2006. As prescribed in the Order, these additional investigations are organized within seven distinct operable units (OUs), as shown on Figure 1-2. Also shown on this figure are areas corresponding to various capture zones (e.g., Off-Site Capture Zone A). As extraction well operations are altered or expanded, the boundaries of these capture zones change. However, the terminology for these areas originally established in the SGA and carried over into the Order will be maintained where practical. Finally, this figure has a label titled, "Miscellaneous Activity A: Plume Reduction in Off-Site Capture Zone A." This corresponds to the fast-track start-up of additional extraction wells in Off-Site Capture Zone A that commenced in 2004 and was completed in the first quarter of 2005 as an Interim Remedial Measure (IRM). Operation of wells installed as part of this fast-track IRM is ongoing.

1.2.2 Groundwater Extraction and Treatment Systems

At the end of 2006, groundwater containment and recovery operations included 23 extraction wells generating a total average annual yield of nearly 400 gallons per minute (gpm), based on the last four months of 2006. The locations of these extraction wells are shown on Figure 1-3. Individual well yields ranged from less than 1 gpm at wells EN-89R and EN-623 to more than 80 gpm at extraction test well EN-447T. Groundwater pumped from each of these extraction wells was treated during 2006 at one of five separate treatment systems. One of these is the Huron Organic Treatment Facility (OTF) located in B096 (Figure 1-3). The other four are standalone treatment facilities operated by IBM on Hayes, Jefferson, Garfield, and Adams Avenues, which are also shown on Figure 1-3. Significant activities in 2006 relating to extraction and treatment operations are described in Appendix H.

1.2.3 Groundwater Monitoring

In August 2004, the groundwater monitoring program activities that were being performed pursuant to the RCRA Permit for Corrective Action were incorporated into the Order. The Order, which

became effective in August 2004, terminated the RCRA Permit for Corrective Action. In 2006, quarterly sampling was performed in February and May in accordance with the sampling schedule presented in Appendix A-3 of the First Update to the OM&M Plan submitted to NYSDEC on February 28, 2005. Sampling during the second half of 2006 was performed in accordance with Tables 2-1 and 2-2 of the 2005 Annual Report. A total of 364 hydraulic effectiveness monitoring wells are included in the groundwater monitoring program that was implemented on July 1, 2006. Groundwater sampling is performed at 256 of these wells.

In addition to these routine sampling activities, substantial numbers of samples were collected as part of investigations to further characterize the Site. Some of this sampling data has previously been reported to NYSDEC in Supplemental Remedial Investigation (SRI) reports or Analytical Summary Reports (ASRs). Although these data were included in the previous reports, the results of all groundwater samples collected during the 2006 calendar year are included in this annual report.

1.3 Organization of Report

The remainder of this report is organized as follows. Section 2 describes the Groundwater Monitoring Program (GMP) activities conducted in 2006. Sections 3 and 4 discuss updated analysis and interpretation of the geology, hydrogeology, and hydrogeochemistry of the Site. Sections 5 and 6 discuss the remediation systems, including contaminant recovery, and the progress of remediation. Finally, Section 7 provides a list of references.

2 GROUNDWATER MONITORING PROGRAM

Field activities for the groundwater monitoring program consist of groundwater elevation measurements, groundwater sampling, and monitoring well inspections. These activities were performed by qualified field personnel from Groundwater Sciences Corporation and from the IBM Hudson Valley Environmental Laboratory in Hopewell Junction, New York.

2.1 Groundwater Extraction Wells

As described in Section 1.3, the groundwater collection and treatment system in 2006 consisted of 28 extraction wells operating at various times throughout the year, with 22 extraction wells operating at the end of 2006. Except for periods of testing and maintenance, the system has operated continuously since 1980. Prior to 2006, between 110 and 140 million gallons of groundwater were being extracted and treated annually.

Pumping volumes are recorded daily for each extraction well. The first table in Appendix A summarizes the monthly pumping volumes and average flow rates for each extraction well for the period January 1, 2006 through December 31, 2006. Also shown on this table is the volume treated at each of the five treatment systems. For the 12-month period ending December 31, 2006, approximately 176 million gallons of groundwater was extracted and treated. The mass of VOCs recovered through groundwater treatment is discussed in Section 5.1.

Of 12 wells installed in 2006, four were extraction wells installed for various purposes, as follows:

- EN-451T was installed in January 2006 in an effort to further accelerate plume reduction in Off-Site Capture Zone A. Long-term testing of EN-451T began in June 2006, and vacuum-assist technology was applied to the lower screened interval in September 2006, boosting the yield from the well. A proposed design for a permanent extraction well, EN-451P, was approved by NYSDEC on December 27, 2006, and well EN-451P was installed inside the 12-inch casing for EN-451T on March 1, 2007. The groundwater pumped from EN-451T is treated at the Jefferson Avenue GTF.
- EN-284P was installed in Off-Site Capture Zone A in February 2006 as a permanent replacement for long-term extraction test well EN-284TD, which operated from June 29,

2004 through January 10, 2007. EN-284P is located 10 feet southwest of EN-284TD and its groundwater discharge is treated at the Garfield Avenue GTF.

- In the OU#1 area, extraction well EN-219R was installed in April 2006 as a replacement for extraction well EN-219 after the yield of EN-219 failed to increase following extensive well rehabilitation efforts in 2005. EN-219 was shut down and pumping from EN-219R began on June 15, 2006. NYSDEC had previously approved the use of vacuum-assist technology at EN-219R in a meeting on July 22, 2005, and vacuum-assist was applied in late July 2006 to lower the water level in the Upper Aquifer and to maintain dewatering of the aquifer in OU#1. The initial report of these activities was presented in the IRM Work Plan for Vacuum-assisted Extraction Wells in OU#1 and OU#2 dated July 17, 2006 and approved by NYSDEC on October 20, 2006.
- In OU#6, extraction well EN-D49 was installed as a replacement for bedrock extraction well EN-CAF in accordance with the Bedrock Groundwater IRM Work Plan for Replacement Extraction Well Installation and Testing dated April 17, 2006 and approved by NYSDEC on May 9, 2006. The replacement of well EN-CAF was recommended in the Bedrock Groundwater Supplemental Remedial Investigation (SRI) Report dated December 19, 2005 and approved on January 11, 2006. The SRI Report recommended that the replacement well be installed outside the southwest corner of Building 42 along an apparent structural discontinuity in the bedrock extending from EN-CAF to monitoring well EN-D11. This location is more accessible than EN-CAF, which is located in the basement of Building 42. Pumping of EN-CAF ceased on August 31, 2006 and pumping of EN-D49 began on September 19, 2006 following the performance of a shutdown test approved by NYSDEC as part of the IRM Work Plan. Groundwater pumped from EN-D49 is treated at the Adams Avenue GTF.

2.2 Groundwater Monitoring Wells

Groundwater monitoring well activities performed during 2006 included: installation of new monitoring wells; measurement of groundwater elevations; inspection and maintenance of

monitoring wells, including repairs to surface seals; and collection of samples for chemical analysis. Each of these activities is described in one of the subsections that follow.

2.2.1 Installation of New Monitoring Wells

Eight monitoring wells were installed in 2006 to support various activities at the Site. Installation of these wells is described in the following sections, which are organized based on the operable unit or miscellaneous activity for which each well was intended.

2.2.1.1 OU#1: Railroad Corridor Source Area Monitoring Wells

Well EN-507 was installed in June 2006 as a replacement for monitoring well EN-118, which had been used as an observation well for extraction well EN-428. Wells EN-25 and EN-118 were abandoned in 2006 with NYSDEC's approval during the expansion of the Building 46S transfer station, which houses extraction wells EN-428 and EN-428P in hot boxes attached to the building. Well EN-507 is located 10 feet east of EN-428, outside Building 46S.

2.2.1.2 MA-A: Off-Site Capture Zone A Effectiveness Monitoring Wells

Wells EN-502, EN-503, and EN-504 were installed in January 2006 as observation wells for extraction test well EN-451T. These three wells were proposed in a Design Memorandum dated December 13, 2005 and approved by NYSDEC on December 29, 2005. The wells are located approximately 100 feet north and south of well EN-451T, and between EN-451T and test well EN-91T.

2.2.1.3 OU#3 and OU#4: Southern Area and Ideal Cleaners Area Monitoring Wells

Wells EN-505 and EN-506 were installed in late January 2006 in accordance with the IRM Aquifer Test Plan for OU#3 dated January 12, 2006 and approved by NYSDEC on February 14, 2006. The purpose of these two observation wells is to monitor the performance of extraction test wells EN-491T and EN-492T, which were installed to enhance capture of the OU#4 plume along Monroe Street. EN-505 is located across Monroe Street from EN-492T. EN-506 is located across Monroe Street from EN-491T on Monroe Street.

Well EN-490 was installed in December 2006 in accordance with a letter request dated October 13, 2006 and written approval from NYSDEC dated November 21, 2006. The purpose of well EN-490 is to provide groundwater quality data between monitoring wells EN-443 and EN-506 in the area southwest of extraction well EN-491T.

Well EN-492 was installed in June 2006. It is located outside the hot box for extraction test well EN-492T and supplements observation well EN-492A, which is located inside the hot box. Because of its location outside the hot box, EN-492 is more accessible than EN-492A.

2.2.2 Groundwater Elevation Measurements

Groundwater elevation data is maintained in a spreadsheet and is calculated by subtracting the measured depth to water from the surveyed elevation of the measurement point listed in Appendix C. For most wells, the designated measurement point is the top of the inner well casing (the "TOC Elevation"). This measurement reference point is typically notched into the top of the well casing.

2.2.2.1 Comprehensive Water Level Measurement Events

In addition to the water level recorded each time a well is sampled, more than 2,000 manual water level measurements were obtained during comprehensive water level measurement events in 2006. The principal events are listed below.

1. The quarterly sampling event in February 2006 (242 measurements).
2. The semiannual sampling event in May 2006 in accordance with Table A-1 of the Groundwater Monitoring Plan, published as Appendix A-3 of the OM&M Plan, Second Update (368 measurements, including additional wells not listed on Table A-1).
3. The annual sampling event in August 2006 in accordance with the list of hydraulic effectiveness monitoring wells presented on Table 2-1 of the 2005 Annual Report (378 measurements, including additional wells not listed on Table 2-1). This list was effective July 1, 2006.

4. Monthly water level measurements beginning in March 2006 of monitoring wells associated with the OU#3 aquifer tests (840 measurements).
5. Semi-monthly water level measurements beginning in August 2006 of bedrock monitoring wells associated with the aquifer test at bedrock extraction well EN-D49 (226 measurements).

All of these data are presented in groundwater elevation tables in Appendix C of this report.

2.2.2.2 Continuous Water Level Monitoring

Continuous water level recorders were installed in 2004 in more than 50 monitoring wells as part of the Interim Operation and Monitoring Plan (IOMP) for extraction well EN-284TD and long-term aquifer testing of EN-91T and EN-92T. These measuring and recording devices consist of a pressure transducer and datalogger that electronically records periodic readings from the transducer. Water level data was periodically downloaded from these dataloggers throughout 2006 and was converted to groundwater elevations. Manual water level measurements were used to calibrate the data collected by the dataloggers. Continuous water level recorders were also installed in 18 monitoring wells in accordance with the IRM Aquifer Test Plan for OU#3 (January 12, 2006); supplemental recorders were installed in five other wells. In addition, continuous water level recorders installed in five monitoring wells in the Southern Area (EN-210, EN-401, and the three-well cluster consisting of EN-460A, EN-460B and EN-460C) continued to monitor background groundwater levels and potential effects of river level changes on groundwater levels in that area.

2.2.3 Monitoring Well Specifications and Inspections

All wells have been surveyed for planar coordinates (northing and easting on the state coordinate grid), ground surface elevation and measurement point elevation (typically top of casing). The table of Physical Well Data and Well Specifications in Appendix B presents all of this data plus other information, including a location description, installation date, depth, well screen intervals, casing and screen size and materials, and depth to the bottom of the Upper Aquifer (where the lacustrine silt was encountered).

In addition to the inspection performed when each monitoring well is sampled, a comprehensive annual inspection of the well field was performed from mid-July to early September 2006. This annual inspection covered 409 wells and included the following items: 1) measurement of the depth to bottom and comparison of this depth to the well's reference depth to determine the need for redevelopment due to buildup of silt; 2) assessment of the legibility of the well tag, visibility of the survey mark, and need for painting or maintenance of the standpipe or manhole; 3) assessment of the condition of the well seal; and 4) assessment of the general downhole condition of the well, including the presence of bends or obstructions.

2.2.4 Groundwater Sampling

The groundwater sampling and analysis plan for 2006 is summarized in Appendix D. The principal quarterly sampling events occurred in February, May, August, and November 2006. The semiannual sampling events occurred in May and August 2006 and the annual sampling event occurred in August 2006. Monthly samples were collected from all active extraction wells. Except for interlaboratory duplicate samples, groundwater samples collected in 2006 were analyzed by the IBM Hudson Valley Environmental Laboratory in Hopewell Junction, New York. Interlaboratory duplicate samples were analyzed for VOCs by Severn Trent Laboratories of Newburgh, New York and are discussed in Section 2.2.4.2.1.

Groundwater samples were also collected from the eight new monitoring wells installed during field investigation activities in 2006 and described in Section 2.2.1. With the exception of EN-490, which was dry, three groundwater characterization samples were collected from each of the new monitoring wells.

The remainder of this section presents the analytical results for environmental samples collected during 2006, including QA/QC samples and samples from groundwater monitoring wells and extraction wells.

2.2.4.1 Groundwater Chemistry Results

Groundwater chemistry data generated in 2006 from groundwater monitoring activities is maintained in relational databases that allow for the efficient storage of all parameters analyzed and

concentrations reported for a particular combination of field and laboratory sample identification numbers. The relational databases also include fields such as laboratory name, analytical method, sample date and time, sampling personnel, analytical parameter, parameter value or concentration, and units of measure.

Full report packages of analytical chemistry data (“data deliverables packages”) were prepared for samples collected and analyzed in 2006. Information regarding the analytical method, sample results, QA/QC results, chain-of-custody documentation, laboratory correspondence, and raw data was provided with these data deliverables packages.

Following review and verification of the data deliverables, analytical data were submitted to a third-party data validator (Trillium, Inc.), who assessed the acceptability and usability of the data according to criteria contained in EPA Region II validation criteria for organic and inorganic data. Laboratory analytical results were assessed by the data validator for compliance with chain of custody procedures, holding times, system monitoring compound (surrogate) recovery, matrix spikes, blanks, contamination, GC/MS instrument performance check, compound quantitation and reported detection limits, instrument calibration, and internal standards.

When performing analytical data validation, the validator marked the laboratory hard copy reports as appropriate using a red or blue pen, and initialed and dated the marks. Upon completion of validation, a data assessment, data validation summary, and validation checklist was prepared for each data deliverables package. Limitations on the use of laboratory data were reported by means of qualification codes attached to the validated analytical reports. The most common qualification code is a “J”, which indicates that the reported concentration is estimated. The relational databases were then updated accordingly with the data qualification codes and corrected concentrations, where necessary.

A summary printout of the groundwater chemistry data for all samples collected in 2006, including duplicate samples, is presented in Appendix E. The data presented in Appendix E are shown in alphanumeric ascending order by sample location (well number) and then chronologically within each sampling location.

2.2.4.2 Quality Assurance/Quality Control Results

QA/QC analytical data for 2006, including duplicate samples, equipment rinse blanks, field blanks, and trip blanks, is discussed in the following subsections. Analytical data for blank samples is presented in Appendix F.

2.2.4.2.1 Duplicate Samples

Duplicate samples were collected by filling multiple sample containers from the same sampling device during each sampling round at a frequency of at least one duplicate sample per 20 groundwater samples (i.e., a minimum of five percent of all groundwater samples). One hundred two duplicate samples were collected in 2006, which is 5.8 percent of all groundwater samples collected. The duplicate samples were analyzed by the secondary laboratory for Method 8021 or Method 8260 VOCs plus Freon 113 and Freon 123a. Duplicate samples were used to assess interlaboratory comparability and were assigned blind field identification numbers.

Comparative results for a portion of the data from the duplicate samples collected during the annual sampling event in August 2006 are presented in Table F-1 at the end of Appendix F. (A similar table was presented in previous annual reports.) The relative percent difference (RPD) between the result for each primary sample and duplicate sample was calculated as recommended by NYSDEC data validation guidance. Based on criteria including the results of the calculations, the parameters analyzed and reported, the absolute differences given sample dilutions, concentration levels, and professional judgment, the duplicate results for the August 2006 sampling event are generally in good agreement and do not show gross variations that would indicate serious analytical quality control problems. Where the RPD is greater than 50%, one must consider the very low concentrations being measured and realize that an absolute difference of only a few micrograms per liter (ug/l) can produce a high RPD. The difference in concentrations at these low levels is considered to be acceptable.

2.2.4.2.2 Trip Blanks

In addition to duplicate split samples, 179 trip blanks for VOCs were prepared by the laboratories in 2006 using analyte-free deionized (DI) water for each cooler containing VOC samples to be delivered to the laboratory. The purpose of the trip blanks is to detect contamination in sample

transportation or storage. A trip blank was the first item placed into each cooler by the laboratory and accompanied the sample containers from the laboratory to the field sampling locations and back to the laboratory. Analytical results for these trip blanks are presented in Appendix F. Environmental samples associated with each trip blank can be determined by noting the dates over which the trip blanks are valid (refer to “Sample Description” heading in Appendix F).

2.2.4.2.3 Field Blanks

Eighty-five field blanks for VOCs were collected during 2006 to detect potential contamination during sample collection procedures. The results are presented in Appendix F. These field blanks were collected in the field by pouring analyte-free DI water from laboratory-prepared vials into empty VOC sample vials such that there was no headspace in the sample vials.

2.2.4.2.4 Equipment Rinse Blanks

Equipment rinse blanks were collected to confirm the efficiency of decontamination procedures for each sampling round by rinsing non-dedicated equipment with laboratory-supplied analyte-free DI water. Eighty-five equipment rinse blanks for VOCs were collected during 2006 from non-dedicated submersible pumps, bailers, and water level indicators. These results are presented in Appendix F.

3 GEOLOGY AND HYDROGEOLOGY

This section of the report reviews the geology and hydrogeology of the Site and presents updates regarding geologic and hydrogeologic interpretations, particularly as relates to the hydraulic effectiveness of various groundwater extraction wells.

3.1 Summary of Site Geology and Hydrogeology

The geology of the Site is characterized by a sequence of unconsolidated glacial and post-glacial sediments overlying a buried bedrock valley. That bedrock unit is the Devonian Age Catskill Formation, which is comprised primarily of gray siltstone and shale and, in some places, sandstone. The unconsolidated sediments occur in a general sequence from the surface downward as follows:

1. ***Post-glacial alluvium***: Present within or near the Site in only two localities - beneath a low terrace adjacent to the Susquehanna River and in a shallow late-deglacial channel near the north valley wall.
2. ***Outwash***: Typically 25-30 feet thick but thicker where downwarped or collapsed in a few ice-block depressions. To the extent that it is saturated (i.e., below the water table) this outwash unit constitutes the Upper Aquifer, which is an unconfined, water table aquifer.
3. ***Lacustrine deposits***: Fine-grained lake-bottom deposits, typically varved silt with pink clay seams, but locally grading to silty very fine sand. The top of this unit generally defines the bottom of the Upper Aquifer. Where the lacustrine deposits are absent, the bottom of the Upper Aquifer rests on till or on coarse-textured ice contact deposits that comprise the Lower Aquifer (where they are not silt-bound). Where the lacustrine deposits are present, they form an effective aquitard between the overlying Upper Aquifer and the underlying Lower Aquifer (where the latter is present).
4. ***Ice contact deposits***: Stratified drift deposited by sub-glacial meltwater in tunnels or crevasses. This stratified drift, when present and of proper texture and sorting, makes up the Lower Aquifer. Based on the interpretation provided in the SGA Report, which has been confirmed by subsequent drilling of five wells to the top of bedrock, ice contact deposits such as those comprising the Lower Aquifer are not present as a continuous layer in the area north of

Broad Street in the west and East Main Street in the east, although such materials may be present in isolated areas. Thus, the Lower Aquifer in the Endicott area is apparently confined to a thick sequence of ice contact deposits along the axis of the valley where it is used for both municipal and industrial water supply.

5. *Glacial till*: Dense, poorly sorted mixtures of clay, silt, sand and angular rock fragments deposited directly by glacial action. While till is the lowest unit in this overall section, it is not always present. Therefore it is not always the “basal” unit in contact with bedrock. Available borehole data indicate that where the till is absent in some areas near the axis of the valley, ice contact deposits directly overly bedrock.

3.2 Top of Lacustrine Silt Unit

The lacustrine silt unit is nearly continuous throughout the valley with the exception of discrete areas where the presence of ice blocks prevented its deposition onto ice-contact sand and gravel and/or glacial till strata. An updated lacustrine silt surface elevation contour map that includes additional information gathered during 2006 is provided as Plate 2. The principal revisions made to the lacustrine silt surface map in 2006 are based on data from new wells and borings. Notable features updated to reflect results of investigation activities performed during 2006 include the following:

1. Further refinement of the lacustrine silt surface on the northeastern and eastern sides of Building 18 based on borings and monitoring wells installed in January 2007.
2. Further refinement of a topographic high in the lacustrine silt surface based on data from well EN-490 located in the all east of McKinley Avenue and south of Monroe Street. The bottom of the well screen at EN-490 lies at the base of the Upper Aquifer and the well has been dry since it was installed.
3. Further refinement of a large dry area in the Upper Aquifer north of North Street and west of Oak Hill Avenue. Additional data for the lacustrine silt surface in this area was obtained from south-central Endicott Area 1-G of the Area-Wide Study, a state-directed investigation.

3.3 Upper Aquifer

This section presents a discussion of the hydrogeology of the Site and vicinity that focuses on the geometry, groundwater flow, and groundwater capture zones in the Upper Aquifer. In general, results of remedial investigations in 2005 and 2006 have further refined the understanding of hydrogeologic conditions for the Upper Aquifer, especially in the areas of groundwater withdrawal via extraction wells. The addition of groundwater extraction wells EN-284TD, EN-215T, EN-447T, and EN-499T together with efforts at enhancement of groundwater extraction via vacuum assist and lower target operating levels (elevations) has resulted in significant changes in the overall geometry of the Upper Aquifer, as well as in apparent groundwater flow directions and capture zones.

3.3.1 Aquifer Geometry

The geometry of the Upper Aquifer is defined by the difference between two surfaces: the surface that defines the top of the lacustrine silt, and the surface that defines the top of the saturated zone in the outwash unit (i.e., the water table). Plate 2 presents the latest revision to the top-of-silt contour map after incorporating data from wells or borings drilled in 2006. While there are some small adjustments to the contours in some areas, the most meaningful change is at the location of the new monitoring well EN-490. The top-of-silt data for this location has identified a small ridge in the top-of-silt topography that effectively separates the line of flux control wells along Monroe Street between McKinley Avenue and Adams Avenue from the OU#3 IRM wells south of Monroe Street.

For the purpose of determining the saturated thickness of the Upper Aquifer in each previous annual report, the top of the saturated zone has been determined from the groundwater elevation survey performed in August of each year and the associated groundwater elevation contours. These data and contours are shown on Figure 3-1 for August 2006. However, the water levels shown on this figure in the Upper Aquifer were substantially impacted by a major recharge and flooding event that had occurred in the area in late June and early July of 2006. For this reason, NYSDEC has approved the use of the water level data and associated contours for January 2007 (Figure 3-2) to characterize the extent of dewatering that was accomplished in 2006. While these contours focus solely on the area comprised of Off-Site Capture Zone A and the Southern Area, these are, in fact, the principal areas of the Site where substantial changes in saturated thickness occurred in 2006 due

to enhanced dewatering resulting from the implementation of the fast-track Southern Area IRM in the second quarter. Therefore, to derive a map showing the variation in saturated thickness of the Upper Aquifer in this area, it was necessary to cross-contour the top-of-silt contour map (Plate 2) with the January 2007 groundwater elevation contour map (Figure 3-2). The resultant Upper Aquifer saturated thickness contour map is provided as Figure 3-3. This map and Figure 3-2 show substantial increases in dry areas within the Upper Aquifer compared even to those shown on the August 2006 groundwater elevation contour map (Figure 3-1). Also posted on Figure 3-2 is the difference between the water level in January 2007 and June 2004, the latter being the final round of water levels measured before the beginning of fast-track IRM measures in Off-Site Capture Zone A. (Long-term extraction began at EN-284TD in late June 2004.) From these postings it is possible to see that as much as twelve feet of dewatering has occurred near extraction wells EN-284TD (now EN-284P) and EN-447T. Throughout most of the remaining area of Off-Site Capture Zone A, more than four feet of dewatering has occurred in the three and one-half years since enhanced extraction began. Dewatering of this magnitude extends as far into the Southern Area as EN-206 on Tracy Street and even wells farther south exhibit as much as two and one-half feet of dewatering in an area where the initial saturated thickness was only four to five feet (e.g., EN-401).

3.3.2 Groundwater Flow and Capture Zones

This subsection examines groundwater flow within the Upper Aquifer under pumping conditions with all of the extraction wells operating. As noted above, Figure 3-1 shows the groundwater elevation contours for the Upper Aquifer based on a comprehensive water level monitoring round of groundwater elevations recorded on August 22 and 23, 2006. Apparent groundwater flow directions based on contouring the groundwater elevation data indicate the groundwater withdrawals have established three general capture zones. As described in the SGA Report, these three general areas include (1) the On-Site Capture Zone, including the Railroad Corridor Source Area (OU#1) and the Northwestern Area (OU#7); (2) Off-Site Capture Zone A, including the North Street Area (OU#2); and (3) Off-Site Capture Zone B, including the Ideal Cleaners Area (OU#4). A fourth area of interest consists of the Southern Area (OU#3), most of which lies beyond the limits of Off-Site Capture Zones A and B.

3.3.2.1 On-Site Capture Zone

The On-Site Capture Zone is well-defined by groundwater elevation data on the Site. Control of groundwater flow in the vicinity of the railroad is primarily the result of groundwater withdrawals from extraction wells located in three areas along the north side of the railroad tracks. From west to east, the extraction wells in these three areas consist of (1) well EN-107, (2) well EN-428P and nearby well EN-253, and (3) well EN-219 and replacement well EN-219R. The addition of well EN-219R in June 2006 appears to have enhanced control in the easternmost area of the On-Site Capture Zone.

As shown on Figure 3-1, groundwater flow in the western portion of the On-Site Capture Zone is controlled via withdrawals from extraction well EN-154, located near the railroad corridor, and extraction well EN-218, located south of Clark Street. Consistent with past monitoring results, apparent groundwater flow directions suggest that groundwater extracted at EN-218 would nonetheless be prevented from discharging off the plant site by the operation of EN-154. In aggregate, the 2006 water level data suggest similar hydraulic capture as with past extraction operations at EN-154 and EN-218.

3.3.2.2 Off-Site Capture Zone A

Off-Site Capture Zone A was further defined from 2004 through 2006 with the addition of many new Upper Aquifer monitoring wells in the area between North Street and East Main Street. Overall, this capture zone is created by four general pumping centers:

- (1) EN-133, EN-451T, and EN-91T located east of Jefferson Avenue and west of Washington Avenue;
- (2) EN-276 located between Building 18 (B018) and Building 14 (B014) on the north side of North Street;
- (3) EN-284TD located in the ice-block depression about 200 feet south of North Street; and
- (4) The line of seven extraction wells extending from EN-92P east of Garfield Avenue, southeast to the extraction well cluster near the intersection of Garfield Avenue and Monroe Street (extraction wells EN-120, EN-160, and EN-194, otherwise referred to as

the “Garfield Avenue Well Cluster”), southeast to extraction wells EN-215T and EN-499T located on Grant Avenue south of Monroe Street, and southeast again to extraction well EN-447T located at the northern end of the McKinley Avenue interchange.

Pumping began at EN-451T in June 2006 to enhance groundwater extraction in the area between extraction wells EN-133 and EN-91T. Long-term pumping at EN-447T and EN-499T began in the second quarter of 2006 and was augmented by EN-215T from August to December 2006 to aid in removing the effects of the major recharge event that occurred in June and July of 2006. These three wells are being operated to enhance extraction in the silt surface trough located south of Monroe Street between Garfield and Adams Avenues where the saturated thickness is on the order of 15 feet (Figure 3-3). Approximate capture zones for these four pumping centers are shown on Figure 3-1.

However, in the fall of 2006, the dewatering effects from the operation of EN-215T, EN-447T and EN-499T had reduced the saturated thickness in the Upper Aquifer to the extent that there was no longer sufficient available drawdown to permit operation of several of these extraction wells. Therefore, with NYSDEC’s approval issued on December 21, 2006, operations were suspended at EN-91T, EN-92P, EN-120, EN-160, EN-194 and eventually at EN-215T. The basis for shutting down these wells is apparent on Figures 3-2 and 3-3. Figure 3-2 shows that by January 2007, the capture zone of the principal OU #3 IRM wells (EN-447T and EN-499T) had expanded to such a degree to the west that these wells were now capturing groundwater flow from the wells that had been shut down in late 2006. Furthermore, Figure 3-3 shows that the operation of these wells had accelerated dewatering of the Upper Aquifer to such an extent in Off-Site Capture Zone A the thickness of the Upper Aquifer had diminished generally in this area to less than five feet, which is insufficient to sustain the operation of an extraction well at any reasonable rate. From Figure 3-2 it is also possible to see that the OU #3 IRM wells are now capturing a substantial area in the western portion of the Site that was previously within the capture zone of EN-133. This has been reflected by an approximately 25% reduction in the extraction rate at EN-133 during the latter half of 2006.

3.3.2.3 Off-Site Capture Zone B

Off-Site Capture Zone B is associated with the former Ideal Cleaners Area (OU#4). Consistent with past monitoring results, the aggregate water level data suggest operation of extraction wells EN-195, EN-185, and EN-222, together with extraction test wells EN-491T and EN-492T, provides capture of groundwater flow originating from the area of the former Ideal Cleaners property and areas farther west and north. EN-491T and EN-492T were installed to enhance capture of the OU#4 plume along Monroe Street. As shown on Figure 3-1, operation of the three extraction wells in this area has resulted in similar limits of capture suggested by past monitoring.

3.3.2.4 Southern Area

In aggregate, the groundwater monitoring data for 2006 continue to suggest this area is hydraulically isolated from Off-Site Capture Zones A and B, which implies groundwater flow in this area of investigation is derived primarily from direct recharge to the Upper Aquifer within the limits of the Southern Area. However, due to the operation of additional extraction wells in Off-Site Capture Zone A, the apparent groundwater flow divide separating the Southern Area from Off-Site Capture Zone A (shown on Figure 3-1) has shifted further to the southeast such that in August 2006 the divide was located southeast of East Main Street. This is approximately 400 feet farther to the southeast from the position of this divide in August 2005, when the divide was centered on wells at the EN-214 location.

As depicted on Figure 3-3, the surface topography of the lacustrine silt in this area appears to influence groundwater flow directions, with at least some portions of the western and eastern groundwater flow divides corresponding to high spots in the silt surface. The eastern boundary of this area has been determined by monitoring completed in 2005 to be essentially coincident with the boundary shown in the SGA Report. Based on the location of this divide in August 2006, the groundwater flow in the Southern Area and associated chemistry are distinctly separate from groundwater flow in the area to the east on the opposite side of this divide. However, water level declines in the Southern Area have also resulted in the emergence of apparent dry areas, including one along this eastern flow divide in the vicinity of well EN-465 (Figure 3-1).

3.4 Bedrock Groundwater

Figure 3-4 is a bedrock potentiometric surface contour map for August 2006. The August 2006 potentiometric levels indicate that hydraulic capture associated with the operation of bedrock extraction well EN-CAF extends east toward the intersection of Adams Avenue and North Street, and west beyond the intersection of Grant Avenue and North Street. The groundwater elevation contours also reveal a closed depression in the potentiometric surface that encompasses well EN-CAF and monitoring well EN-D11, located roughly 500 feet farther south. As noted in Section 2.1, replacement extraction well EN-D49 was installed outside the southwest corner of Building 42 along an apparent structural discontinuity in the bedrock extending from EN-CAF to monitoring well EN-D11. Pumping of EN-CAF ceased on August 31, 2006 and pumping of EN-D49 began on September 19, 2006 following a shutdown test performed in accordance with the NYSDEC-approved IRM Work Plan.

4 HYDROGEOCHEMISTRY

This section of the annual report presents an analysis of the chemical concentration data collected in 2006, including an assessment of trends that may be occurring at specific monitoring locations.

4.1 Chemicals of Concern

The chemicals of concern at this Site include chlorinated ethenes, chlorinated ethanes, and other compounds.

4.1.1 Chlorinated Ethenes

The chlorinated ethenes present in groundwater at this Site include tetrachloroethene (PCE), trichloroethene (TCE), cis-1,2-dichloroethene (cis12-DCE), 1,1-dichloroethene (11-DCE), and vinyl chloride (VC). All of these chlorinated ethenes are present in some portion of the source zones or groundwater plumes being remediated by IBM. PCE is a primary solvent used typically in degreasing operations and dry cleaning operations and does not occur in groundwater as a degradation product of another compound. TCE is also a primary solvent used for various industrial applications, and historically in dry cleaning operations, and can either be a degradation product of PCE by reductive dechlorination or a primary solvent itself. cis12-DCE is a degradation product of PCE and TCE by reductive dechlorination. 11-DCE is a transformation product of 1,1,1-trichloroethane (111-TCA) by an abiotic elimination reaction. Finally, vinyl chloride is a reductive dechlorination product of either cis12-DCE or 11-DCE.

4.1.2 Chlorinated Ethanes

111-TCA is a primary solvent used in many industrial applications and in printing operations among other uses. Its principal transformation products are 1,1-dichloroethane (11-DCA) by reductive dechlorination and 11-DCE by the abiotic elimination reaction. As noted above, 11-DCE may transform by reductive dechlorination to vinyl chloride and 11-DCA may transform to chloroethane (CEA) again by reductive dechlorination.

4.1.3 Other Compounds

Other compounds that are present in groundwater at this Site include methylene chloride (dichloromethane, DCM), Freon 113, Freon 123a (a transformation product of Freon 113) and benzene. DCM has not been observed in groundwater south of North Street because it degrades both aerobically and anaerobically and is rarely transported beyond the immediate vicinity of any particular source zone. Likewise, Freon 113 and Freon 123a have not been observed as significant constituents in groundwater south of North Street. Both Freon 113 and Freon 123a have been observed at significant concentrations in extraction wells EN-89R, EN-623, and EN-624, and in nearby monitoring wells. While benzene has been observed in some monitoring wells in the Ideal Cleaners Area (OU#4), it is believed to be related to the presence of petroleum products in this area that are unrelated to source zones or transport from the Site.

4.2 Distribution of Chemical Concentrations in the Upper Aquifer

The GMP (Appendix A of the OM&M Plan, Second Update) requires isoconcentration contour maps to be included in the Annual Report for nine principal VOCs along with a map that shows data postings for total VOCs. Figure 4-1 presents the data postings for total VOCs. Isoconcentration contour maps for nine individual constituents are presented on Figures 4-2 to 4-10 and are discussed below. These isoconcentration contour maps are based on data from the August 2006 sampling event. Although data from samples collected in 2006 in OU#5 are posted on these maps, these data are not contoured because the unit they monitor is not the outwash sand and gravel that comprises the Upper Aquifer.

In the following subsections, the maps for these compounds are discussed in groups and in an order that reflects the relationship of these individual VOCs as parent or daughter products. One general observation that can be made is that the maps for constituents that are present in Off-Site Capture Zone A show the core of the plume in that area continues to be fragmented and to be drawn steadily into the extraction wells in that area.

4.2.1 Tetrachloroethene and Trichloroethene Transformation Series Compounds

Dissolved PCE degrades by reductive dechlorination to TCE and dissolved TCE, whether derived from PCE or directly from the solvent TCE, degrades by this same mechanism to either cis12-DCE (preferentially) or trans 1,2-dichloroethene (tr12-DCE). These two isomers of DCE then degrade by reductive dechlorination to VC, which ultimately degrades to ethene. As a group, these compounds are referred to as the ethene series in the text that follows. Isoconcentration contour maps for PCE, TCE, cis12-DCE, and VC are presented on Figures 4-2 to 4-5.

These four figures show that ethene series compounds occur in source areas and plumes associated primarily with the Railroad Corridor Source Area (OU#1), the North Street Area (OU#2) and the Former Ideal Cleaners Area (OU#4). They are also present in dissolved phase plumes in the Southern Area (OU#3), the Building 57 Area (OU#5) and the Northwestern Area (OU#7). For the most part, where ethene series compounds are present, one of the parent compounds predominates. However, this is not the case in the area between Buildings 18 and 41 in OU#2 and in the plume downgradient from the source area on the former Ideal Cleaners property (OU#4). In OU#4 the data show that PCE and TCE are rapidly replaced by cis12-DCE and VC due to reductive dechlorination likely caused by petroleum products sourced from the former Endicott Forging site. These transformations occur as groundwater flows downgradient in the direction of the extraction well cluster near the intersection of Monroe Street and Adams Avenue, where the plume of these constituents is captured primarily by the operation of extraction wells EN-491T, EN-492T, and EN-185. (Wells EN-195 and EN-222 have less impact because they operate at lower flow rates than the other three wells.) In OU#5, TCE and its degradation products (mostly cis12-DCE) are present in an apparent source area near the southeast corner of B057A.

In the North Street Area (OU#2), the data show a high degree of spatial variability associated with the degree to which TCE has degraded to cis12-DCE and VC. This is believed to be attributable to variable conditions that control reductive dechlorination, including the observed presence of petroleum impacts in some areas that would favor formation of the daughter products.

4.2.2 1,1,1-Trichloroethane Transformation Series Compounds

Dissolved 111-TCA degrades by reductive dechlorination to 11-DCA, which in turn degrades by this same process to chloroethane (CEA), which occurs in only limited areas at this Site. 111-TCA also degrades by an abiotic elimination reaction to 11-DCE. Even though 11-DCE is an ethene compound, this group of VOCs is referred to in the following text as the ethane series, after the parent compound 111-TCA. Isoconcentration contour maps for these three VOCs (excluding CEA) are shown on Figures 4-6 to 4-8.

As with the ethene series compounds, the ethane series VOCs occur in source areas and plumes associated primarily with the Railroad Corridor Source Area (OU#1) and the North Street Area (OU#2). However, these compounds are virtually absent from the sources and plumes in OU#4. They do occur as dilute constituents of the aqueous plume in the Northwestern Area (OU#7). 111-TCA is present in the Southern Area at low concentrations compared to TCE, although its degradation products have only been detected at concentrations equal to or less than 2 ug/l. In OU#5, 111-TCA and its degradation products are present in an apparent source area near the southeast corner of B057A.

4.2.3 Freons

Dissolved Freon 113 degrades by reductive dechlorination to Freon 123a. Isoconcentration contours for these two VOCs are shown on Figures 4-9 and 4-10. As shown on these two figures, these freons were identified at elevated concentrations only in two apparent source zones, one in the vicinity of EN-89R at B057 (OU#5) and the other in the vicinity of the EN-428 in the Railroad Corridor Source Area (OU#1). Comparatively low concentrations of freons were identified beyond these two areas.

4.3 Concentration Trends in the Upper Aquifer

The groundwater chemistry database was examined to identify apparent trends in concentration of the principal constituents at the Site. This includes the 2006 data published in Appendix E as well as the historical groundwater chemistry database. Particular attention was paid to the monitoring wells where sampling is being performed to assess concentration trends following (1) the fast-track startup of EN-284TD in late June 2004, (2) the addition of extraction operations at EN-91T and

EN-92T/92P in early 2005, and (3) implementation of extraction operations in Off-Site Capture Zone A at EN-451T, EN-215T, EN-499T, and EN-447T in 2006.

Appendix G presents time versus concentration graphs through the end of 2006 for wells that have been monitored to assess the effectiveness of extraction wells located principally within the portion of the plume that is bounded by North Street, McKinley Avenue, Monroe Street and Jefferson Avenue). By inspection of the graphs in Appendix G, the following wells were determined to exhibit decreasing concentrations of at least one principal constituent: EN-29A, EN-91, EN-91A, EN-92, EN-100, EN-133, EN-160, EN-284, EN-437, EN-450, EN-451, and EN-456. As shown on Figure 4-3, all of these wells monitor concentrations in the TCE plume within Off-Site Capture Zone A. Concentration reductions in this portion of the Upper Aquifer are attributable to (1) operation of EN-284TD to intercept flux crossing North Street, thus preventing replenishment of the VOC mass in the plume and (2) operation of extraction wells EN-133, EN-451T, EN-91T, EN-92P, EN-120, EN-160, EN-194, EN-215T, and EN-499T together with EN-284TD to remove VOC mass that was present in this portion of the plume prior to the startup of EN-284TD.

Concentrations decreased in 2006 in some wells in this same area where concentrations either were relatively constant in 2005 or were increasing in 2005 (refer to graphs in Appendix G). These include wells EN-91, EN-91A, EN-92, and EN-284 that are adjacent to extraction wells EN-284TD, EN-91T and EN-92P.

4.4 Distribution of Chemical Concentrations in the Bedrock Aquifer

As shown on Figure 3-3, the operation of extraction well EN-CAF creates a substantial capture zone within the bedrock aquifer at the Site. Figure 4-11 shows the TCE-series isoconcentration contours based on data from the bedrock monitoring wells sampled in August 2006 along with the potentiometric contours from groundwater elevation measurements for that same month. As shown on this map, it is apparent that the operation of well EN-CAF controls the plume of VOCs in bedrock groundwater. Bedrock extraction well EN-D49, which began pumping in September 2006, is expected to control the plume of VOCs in the bedrock groundwater in a similar way, as suggested by a comparison of the bedrock groundwater TCE-series chemistry data for August 2006 (when EN-CAF was pumping) and November 2006 (when EN-D49 was pumping). With the exception of wells EN-D37 and EN-D38, Table 4-1 shows that TCE-series concentrations in bedrock

groundwater for August and November 2006 are similar, without regard to which extraction well was operating at the time.

In the case EN-D37 and EN-D38, TCE-series concentrations increased by an order of magnitude from August to November 2006. These two wells are located on either side of the apparent structural discontinuity in the bedrock extending from EN-CAF to monitoring well EN-D11 and within which EN-D49 was completed. The change in pumping location from EN-CAF to EN-D49 appears to have widened the area between the 100 and 1000 ug/l concentration contours shown on Figure 4-11 to include wells EN-D37 on the east and EN-D38 on the west. This change in the configuration of the concentration contours and the related shifts in TCE-series concentration are believed to be related to the change in extraction well location. During this transition, water quality at EN-D49 and related mass removal rates are being monitored weekly to bi-weekly and the extraction rate has been doubled to accelerate the transition.

Table 4-1. Comparison of TCE-Series Concentrations in Bedrock Groundwater

5 REMEDIATION SYSTEM PERFORMANCE

This section of the Annual Report discusses the groundwater extraction and contaminant recovery achieved by extraction wells operating at the Site during 2006 and the efficiency of groundwater treatment to remove these contaminants from the groundwater prior to discharge to surface water via the storm sewer system. A summary description of significant maintenance activities conducted in 2006 for the groundwater extraction and treatment systems is included in Appendix H.

5.1 Groundwater Extraction

A tabulation of groundwater extraction volumes by well and month is provided in Appendix A. As shown in this table, the total volume of groundwater extracted at the Site in 2006 was approximately 176 million gallons (MG). A breakdown of this total by remediation area for 2006 and the increase from 2005 is as follows:

Area	2006	2005	Increase
On-Site Capture Zone (OU#1 and OU#7)	40.9 MG	37.9 MG	3.0 MG
Off-Site Capture Zone A/North Street Area (OU#2 and MA-A)	104.6 MG	72.2 MG	32.4 MG
Off-Site Capture Zone B (OU#4)	17.8 MG	13.7 MG	4.1 MG
Building 57/57A (OU#5)	1.4 MG	0.3 MG	1.1 MG
Bedrock Groundwater (OU#6)	11.3 MG	10.9 MG	0.4 MG

Additional IRM activities implemented over the past three years have most substantially influenced the comparative extraction volumes in the Building 57/57A area, in Off-Site Capture Zone A, and in Off-Site Capture Zone B. In the case of Building 57/57A, although the magnitude of the total volume pumped from the three OU#5 extraction wells is not great compared to the other areas, this extraction rate has been increased from 31,000 gallons in 2004 to 290,000 gallons in 2005 and 1.4 million gallons in 2006. This was accomplished through the installation and startup of replacement well EN-89R in 2005, resulting in nearly an order of magnitude increase in the annual extraction volume from 2004 to 2005, and through the addition of extraction wells EN-623 and EN-624 in

January 2006, resulting in a nearly four-fold increase in the annual extraction volume from 2005 to 2006.

In Off-Site Capture Zone A (including the North Street Area), the 2006 extraction volume (104.6 MG) is 45% higher than the 2005 extraction volume (72.2 MG) and 135% higher than the 2003 extraction volume (44.5 MG). These increases have been accomplished through a number of measures that began with improvements to the pumping systems in extraction wells EN-120, EN-160, EN-194 and EN-276. The first significant source of increase in extraction volume was the startup of three new extraction wells (EN-284TD, EN-91T and EN-92T/92P) in Off-Site Capture Zone A. Extraction from these wells added nearly 23 MG to the annual extraction volume in 2005. However, by far the greatest source of increase in extraction volume has been the startup in 2006 of four new extraction wells (EN-215T, EN-447T, EN-451T, and EN-499T) in Off-Site Capture Zone A. Extraction from these wells added more than 48 MG to the annual extraction volume in 2006, although this additional volume came at the expense of significantly reduced flow in Garfield Avenue extraction wells EN-120, EN-160, EN-194, and EN-92P. Pumping from these four extraction wells was discontinued with NYSDEC approval in November 2006 as a result of significant dewatering of the Upper Aquifer associated with pumping at the four new extraction wells.

In Off-Site Capture Zone B (including the OU#4 Area), the 2006 extraction volume (17.8 MG) is 30% higher than the 2005 extraction volume (13.7 MG). This increase has been accomplished by the startup of extraction wells EN-491T and EN-492T on Monroe Street in February 2006.

5.2 Mass Removal

Using chemical concentrations and monthly flows for each extraction well, the mass (in pounds) of chemicals removed from groundwater was calculated for the 12-month period from January 1, 2006 through December 31, 2006. During this period, approximately 4,050 pounds of VOCs were removed from the subsurface by extraction of 176 million gallons of groundwater. This data, including the concentration and mass removed for individual VOCs at each extraction well, is tabulated in Appendix A. The treated groundwater was discharged to storm sewers in accordance with the terms of the Order and with the Addendum to the Groundwater Remediation Systems

Operation, Maintenance, and Monitoring Plan (Second Update) approved by NYSDEC on December 20, 2006.

More than 86% of the VOC mass (nearly 3,500 pounds) was recovered by the four extraction wells in the Railroad Corridor Source Area (OU#1): EN-107, EN-219/219R, EN-253, and EN-428P. Approximately 213 pounds of VOCs (the same mass as in 2005) were recovered from the 16 Upper Aquifer extraction wells that pumped at various times throughout 2006 to the Garfield, Jefferson, and Adams Avenue Groundwater Treatment Facilities. Approximately 21 pounds were recovered from Bedrock Aquifer extraction wells EN-CAF (where pumped groundwater was treated at the B096 OTF) and EN-D49 (where pumped groundwater is treated at the Adams Avenue GTF). Of particular note is the fact that 284 pounds of VOCs were recovered from three extraction wells at Building 57 (OU#5). During the preceding year (2005), only one extraction well, EN-89R, operated at Building 57 and only 23 pounds was removed. The increase at OU#5 is due to a combination of the increased yield from the addition of new extraction wells EN-623 and EN-624 and a significant increase in concentrations in the new extraction wells. Fourteen pounds was recovered from the two wells in OU#7 (EN-154 and EN-218) and 24 pounds was recovered from the single well in OU#2 (EN-276) where pumped groundwater is treated at the B096 OTF.

Approximately 67 percent of the total VOC mass recovered consists of 111-TCA and its degradation products, 11-DCA, 11-DCE and CEA. TCE and its degradation products cis-1,2-DCE and vinyl chloride comprise approximately 28 percent of the total VOC mass recovered. The remaining 5 percent consists mostly of PCE and Freon 113.

5.3 Treatment Efficiency

Treatment efficiency was calculated for the four standalone treatment systems operated by IBM by comparing the concentration of VOCs in the influent to the concentration in the effluent. Monthly samples of the influent and weekly samples of the effluent were collected at the Garfield, Jefferson, Adams, and Hayes Avenue treatment systems in 2006. This analytical data is presented in Appendix E. The concentration of VOCs in effluent from the Garfield, Jefferson, and Adams Avenue treatment systems was within the limits allowed by the former SPDES permit, and the treatment efficiency, based on the ratio of influent to effluent concentrations at these three treatment systems, was greater than 99.9% in 2006. Effluent from the Hayes Avenue GTF exceeded the

discharge concentration limits several times between late January and mid-April 2006. During this period, new extraction wells EN-623 and EN-624 were being brought on-line and the excursions were determined to be the result of incomplete groundwater treatment caused by fouling of the low-profile tray-style air stripper system at Building 57. The fouling was caused by unexpectedly high levels of iron in the system influent. NYSDEC was notified of these discharge excursions by letter in February and May 2006, and a maintenance schedule was implemented consisting of frequent inspections of the stripper trays and cleaning when necessary. From May through December 2006, the treatment efficiency, based on the ratio of influent to effluent concentrations at the Hayes Avenue GTF, was greater than 99.9%.

6 PROGRESS OF REMEDIATION

This section of the annual report discusses the progress toward remediation of the sources and plumes of VOCs at this Site. As such, this section relates the data analysis presented in previous sections to the overall goals enumerated in the OM&M Plan.

6.1 Restatement of Site Remediation Goals

VOCs are detected in groundwater present in two geologic units beneath the Site, the bedrock and the glacial outwash, the latter containing the Upper Aquifer. The VOC plume in the bedrock is contained by the operation of a single well and the overall objective is to maintain that containment. For the Upper Aquifer, there are two principal goals of the remedial measures program. The first is the overall goal of attaining groundwater standards to the extent practicable. The second is to shrink the groundwater plumes containing VOCs, in particular TCE, to mitigate potential concentrations of TCE in soil vapor. Specifically, the objective is as follows:

Reduce groundwater concentrations south of North Street, and to the extent practicable, to within New York State 6NYCRR Part 703 groundwater standards in order to reduce potential soil vapor impacts. Such objective will be accomplished by the following actions:

- i. Continue to control the source(s) of VOCs in groundwater on the plant site and enhance this control as appropriate.
- ii. Control and/or treat the groundwater flux crossing North Street.
- iii. In conjunction with the above actions (i and ii), accelerate the rate of reduction of the plume areas south of North Street.

The overall objective of these actions is to reduce the mass of TCE in groundwater within the plumes IBM is remediating south of North Street by 50% in five years and by 80% in ten years, using the year in which a remediation system is first implemented as the base year.

6.2 Source Area Control

As described in Section 3 and shown on Figure 3-1, the operation of extraction wells EN-107, EN-219, EN-253, and EN-428/428P within the On-Site Capture Zone continues to prevent groundwater chemical flux from leaving the source areas along the railroad corridor in OU#1. Furthermore, operation of extraction wells EN-154 and EN-218 also provides hydraulic control of groundwater in OU#7, which exhibits comparatively low concentrations. Finally, the operation of EN-276 adjacent to the southwest corner of B018 in OU#2 also contributes to the control of apparent source zones in that operable unit.

Previous efforts to enhance the hydraulic control exerted by these extraction wells north of North Street have included the installation and startup of test well EN-428 which was upgraded in 2005 to a permanent, vacuum-assisted extraction well and upgrading of the pump and controls systems at EN-276. In 2006, EN-219 was replaced by EN-219R, resulting in a substantial increase in the extraction rate at this well and in the Railroad Corridor Source Area in general, substantially enhancing the hydraulic effectiveness of groundwater extraction in the RCSA.

6.3 Control of Flux Crossing North Street

Both the hydraulic effectiveness data and the chemical concentration data collected since June 2004 indicate that the fast-track startup of EN-284TD has effectively intercepted the groundwater chemical flux crossing North Street. This can be seen clearly in the groundwater elevation contours and associated capture zones shown on Figure 3-1 and in the effect that the operation of this well has had on the chemical isoconcentration contours in the vicinity of North Street as shown on Figures 4-2 to 4-8. It is clear from the pattern of chemical concentrations shown on these figures along North Street that the operation of EN-284TD has drawn into it the groundwater chemical flux crossing North Street along a line extending from the boundary of Off-Site Capture Zone A with Off-Site Capture Zone B to the intersection of Washington Avenue with North Street. Prior to the startup of EN-284TD, this flux crossing North Street was previously captured by extraction well EN-133 and the Garfield Avenue Well Cluster six hundred to one thousand feet farther downgradient.

Table 6.1 shows the recent history of annual extraction volume from wells in the vicinity of North Street that contribute to source/flux control in OU#2. As noted on this table, in 2003 groundwater was extracted from this area only at well EN-276 at an annual rate of 1.5 MG. In 2004, the annual extraction rate increased at this well to 3.0 MG following upgrades to pump and control systems. While this increase at EN-276 had some additional effect on flux crossing North Street, it is believed to have had more effect on increased mass removal from source zones in the vicinity of B018 (as discussed in Section 6.2).

Table 6.1 Control of Flux Crossing North Street - Annual Extraction Volume

Well	2003 Volume (MG)	2004 Volume (MG)	2005 Volume (MG)	2006 Volume (MG)
EN-276	1.5	3.0	3.8	3.9
EN-284TD	NA	11.4 (6 months)	15.3	12.3
Subtotal	1.5	14.4	19.1	16.2
EN-284TD (Plume Reduction)	NA	-7.6 (estimated)	-7.6 (estimated)	-4.2 (estimated)
Net Total Source/Flux Control	1.5	6.8 (estimated)	11.5 (estimated)	12.0 (estimated)

The more significant improvement in control of flux crossing North Street occurred when extraction operations were begun at EN-284TD at the end of June 2004. While much of the groundwater extracted by this well in the last six months of 2004 was derived from partial dewatering of the Upper Aquifer, groundwater elevation contours for the Upper Aquifer in December 2004 (published in the annual report for 2004) showed that by the end of 2004, extraction operations at EN-284TD were controlling flux crossing North Street from apparent source zones in OU#2.

The increases in annual extraction rates from 2004 to 2005 resulted primarily from the application of improvements and additions to the extraction system made in 2004 over a full year of operation in 2005. However, as Table 6.1 shows, the annual extraction volume from EN-284TD for 12 months in 2005 (15.3 MG) was not two times the extraction rate for six months in 2004 (11.4). This apparent discrepancy actually reflects the fact that much of the groundwater extracted by this well in 2004 came from partial dewatering of the Upper Aquifer and once removed, this source of

groundwater was no longer available for extraction at this well. Therefore, the 2005 annual extraction volume of 15.3 MG for EN-284TD is believed to be more attributable to groundwater flow from this well's capture zone resulting from recharge during the current year than from continued dewatering of the Upper Aquifer. As shown on Figure 3-1, the capture zone for EN-284TD includes apparent source areas north of North Street, to the extent they are not controlled by EN-276, and a portion of the plume area to the south in Off-Site Capture Zone A. While it is not possible based on the existing data to apportion the flow to this well between control of flux crossing North Street and plume reduction in Off-Site Capture Zone A, the pattern of groundwater flow on Figure 3-1 and the pattern of chemical isoconcentration contours on Figures 4-2 to 4-8 suggest that flow associated with these two areas may be roughly equal. Taking all of these factors into account, adjustments have been made in Table 6.1 to subtract the estimated portion of annual extraction volume at EN-284TD believed to be attributable to initial dewatering in the Upper Aquifer and flow to this well from the plume area in Off-Site Capture Zone A. With these adjustments made, Table 6.1 shows that the annual extraction volume applied to control of flux across North Street increased from 1.5 MG in 2003 to at least 11.5 MG in 2005.

This table also shows that for 2006, the total extraction rate estimated to be attributable to flux control crossing North Street has remained relatively constant (2004 annualized is 13.6 MG compared to 11.5 MG in 2005 and now 12.0 MG in 2006). The 2006 estimate is based on the assumption that the reduction in extraction volume at EN-284TD results mainly from that well deriving less flow from dewatering of the Upper Aquifer in its third year of operation. It therefore assumes that just one-third of the volume extracted by EN-284TD (4.2 MG) was derived from local dewatering of the plume and flow toward EN-284TD from the south.

Table 6.2 presents the recent history of annual mass removal for these two wells operating in the vicinity of North Street. As shown in this table, in 2003 mass removal in OU#2 was 22.6 lbs removed by EN-276. Mass removal from this well increased substantially in 2004 to 65.5 lbs due to the increased extraction rate discussed above. This higher mass removal rate was sustained in 2005 at 60.4 lbs. As noted above, this mass removal is believed to primarily reflect increased dissolution of VOCs from apparent source zones in the vicinity of B018.

Table 6.2 also shows the contribution to mass removal from the operation of EN-284TD beginning in late June 2004. The mass removed by this well in the last six months of 2004 represents both interception of mass flux crossing North Street and removal of mass dissolved in groundwater extracted from the plume in Off-Site Capture Zone A. If the annual mass removal for this well for 12 months in 2005 (110.7 lbs) is assumed to be primarily representative of intercepted flux from apparent source zones north of North Street (estimated to be 100 lbs), then the mass removed from this well in the last six months of 2004 may be roughly apportioned as 50 lbs to control of flux crossing North Street and 29.4 lbs to removal of mass dissolved in the plume within Off-Site Capture Zone A. With these adjustments made, as shown in Table 6.2, the total annual mass removal associated with source / flux control in OU#2 has increased from 22.6 lbs in 2003 to at least 160.3 lbs in 2005.

In 2006, the combined mass removal from these two wells dropped to a total of 98.2 lbs. This does not signal a reduction in control of flux crossing North Street, since, as shown in Table 6.1, there was no comparable drop in the extraction volume from these wells. Reference to the time-versus-concentration graphs for these two wells in Appendix E shows that the reduction in mass removal is directly attributable to declining concentrations in these two wells. This is consistent with the adjustments that have been occurring in the Upper Aquifer since the extraction rate was increased at EN-276 and extraction began in EN-284TD. These adjustments include dewatering of the Upper Aquifer with accompanying removal of mass in storage in addition to the active flux and the changes in flow direction and gradients in the Upper Aquifer that likely enhanced the short-term flushing of one or more sources. Since the flux across North Street in 2003 would have been controlled and extracted by five wells, EN-120, EN-133, EN-160, EN-194 and EN-276, it is notable that the total mass removed by those wells in 2003 was measured at 22.6 lbs (EN-276) plus 74.2 lbs (all others; see section 6.4.2) for a total of 96.8 lbs. As shown in Table 6.2, after subtracting 5.2 lbs attributed to plume reduction, the comparable mass removal rate for control of flux crossing North Street in 2006 has been estimated at 93.0 lbs. These two flux rates are virtually identical.

Table 6.2 Control of Flux Crossing North Street - Annual Mass Removal

Well	2003 Mass Removal (lbs)	2004 Mass Removal (lbs)	2005 Mass Removal (lbs)	2006 Mass Removal (lbs)
EN-276	22.6	65.5	60.4	24.4
EN-284TD	NA	79.3 (6 months)	110.7	73.8
Subtotal	22.6	144.8	171.1	98.2
EN-284TD (Plume reduction)	NA	-29.3 (estimated)	-10.7 (estimated)	-5.2 (estimated)
Net Total Source/Flux Control	22.6	115.5 (estimated)	160.3 (estimated)	93.0 (estimated)

6.4 Plume Reduction South of North Street

With the flux crossing North Street controlled primarily by the operation of EN-284TD, groundwater extraction from the remaining wells in Off-Site Capture Zone A has been applied to plume reduction in this area. The following subsections discuss the annual groundwater extraction volume and mass removal associated with these plume reduction measures.

6.4.1 Annual Groundwater Extraction Volume

Table 6.3 presents the recent history of extraction volumes for wells involved in this plume reduction effort. In 2003, prior to the beginning of extraction operations at EN-284TD, the combined annual extraction volume from EN-133 and the Garfield Avenue Well Cluster (EN-120, EN-160, and EN-194) (GAWC) was 43.0 MG. However, in the absence of flux control at North Street, the groundwater extracted by these wells in 2003 effectively controlled the migration of the plume to the west and south, but could not contribute to plume reduction. The same is believed to be true of groundwater extracted by these wells in the first half of 2004 prior to the startup of extraction operations at EN-284TD at the end of June. Therefore, 2004 must be viewed as a transition year during which flux control was shifted from these other wells in Off-Site Capture Zone A to EN-284TD, which permitted the groundwater extracted from EN-133 and the GAWC to contribute to plume reduction beginning in the latter part of 2004 and continuing in 2005.

Therefore, the values shown in Table 6.3 indicate that in 2003, 43.0 MG of groundwater were extracted from EN-133 and the GAWC to control flux in this plume and prevent its further migration. In 2005, Table 6.1 suggests that this same flux control function was being accomplished by EN-284TD extracting 15.3 MGY (or as little as 7.6 MGY when the plume reduction component is subtracted).

Table 6.3 Plume Reduction in Off-Site Capture Zone A - Annual Extraction Volume

Well(s)	2003 Volume (MG)	2004 Volume (MG)	2005 Volume (MG)	2006 Volume (MG)
EN-133	29.3	29.4	29.9	29.3
EN-120, EN-160 & EN-194 (GAWC)	13.7	16.1	15.6	9.4
EN-91T & EN-92T	NA	NA	7.6	1.6
EN-284TD	NA	11.4 (6 months)	15.3	12.3
EN-215T, EN-447T, EN-451T & EN-499T	NA	NA	NA	47.4
Subtotal	43.0	56.9	68.4	100.0
EN-284TD (Source/Flux Control)	NA	-3.8 (6 months) (estimated)	-7.6 (estimated)	-8.1* (estimated)
Net Total Plume Reduction	43.0	53.1	60.8	91.9
*Calculated as 12.3 MG – 4.2 MG = 8.1 MG based on Table 6.1 values				

With appropriate adjustments made to the values in Table 6.3 to reflect that component of the EN-284TD extraction volume being applied to flux control, this table shows that in 2005 at least 60.8 MG of groundwater were extracted in Off-Site Capture A to address plume reduction compared to no such benefit being derived from the 43.0 MG extracted by these wells in 2003 for plume control.

Table 6.3 further shows that in 2006 the extraction volume in this plume area increased by more than 50% to 91.9 MG due to the startup of four new extraction wells (EN-215T, EN-447T, EN-451T & EN-499T) that operated for the last half of the year. However, as previously discussed, dewatering caused by the operation of these wells caused substantial reduction of available drawdown associated with other wells (EN-91, EN-92, EN-120, EN-160, and EN-194), and the extraction volume for those wells declined. While Table 6.3 shows the extraction volume for EN-133 being sustained, near the end of 2006 the extraction rate in this well also began to decline in response to expansion of the capture zones of the new wells. For the most part this increase in extraction volume reflects dewatering of the elongated area of higher saturated thickness extending from the intersection of Garfield Avenue and Monroe Street to the intersection of Adams Avenue and Tracy Street as shown on Figure 3-3.

6.4.2 Annual Mass Removal

As in the case of the annual extraction volume, it is particularly important to examine the mass removal that is occurring in Offsite Capture Zone A, including the changes that have occurred over the past three years in response to implementation of additional remedial measures. The following table presents a summary of the annual mass removal calculated for extraction wells in this area:

Table 6.4 Plume Reduction in Off-Site Capture Zone A - Annual Mass Removal

Well(s)	2003 Mass Removal (lbs)	2004 Mass Removal (lbs)	2005 Mass Removal (lbs)	2006 Mass Removal (lbs)
EN-133	25.7	21.4	11.3	5.9
EN-120, EN-160 & EN-194	48.6	46.6	33.4	19.0
EN-284TD (Plume Reduction)	NA	29.3 (6 months) (estimated)	10.7 (estimated)	5.2 (from Table 6.2)
EN-91T & EN-92T	NA	NA	39.4	4.2
EN-215T, EN-447T, EN-451T & EN-499T	NA	NA	NA	96.7
Total	74.3	97.3	94.8	131

As shown in this table, the annual mass removal from wells in Off-Site Capture Zone A increased from 74.3 lbs in 2003 to 94.8 lbs in 2005 as a direct result of the installation and startup of the three new wells, EN-284TD, EN-91T and EN-92T. More importantly, the mass removed from the Upper Aquifer in this area beginning in the latter half of 2004 was not being replenished by continuing flux across North Street as it was prior to the startup of EN-284TD in mid-2004. Therefore, the effective increase in mass removal for plume reduction from 2003 to 2005 was equal to the full 94.8 lbs extracted in 2005.

Table 6.4 further shows that in 2006, this mass removal rate increased by nearly 40% over the 2005 rate to 131 lbs per year. This increase is directly attributable to the start-up of the four new extraction wells, which more than compensated for declining mass removal rates in other wells. Those declines were attributable to several factors, including reduced extraction rates (as described above) and reduced concentrations of VOCs in areas of the Upper Aquifer in which they operate. The increase in mass removal is primarily due to the removal of mass in storage as a consequence of the extensive dewatering that the operation of the new wells has generated.

6.5 Reduction of TCE Mass in Place

As described above, the overall objective of this enhanced remediation is to reduce the TCE mass within the plumes IBM is remediating south of North Street by 50% in the first five years of operation of the enhanced remediation systems. The analysis presented herein demonstrates positive results from the first two and one-half years of operations at EN-284TD, nearly one year of operations at EN-91T and EN-92T, and roughly six months of operation at EN-215T, EN-447T, EN-451T & EN-499T.

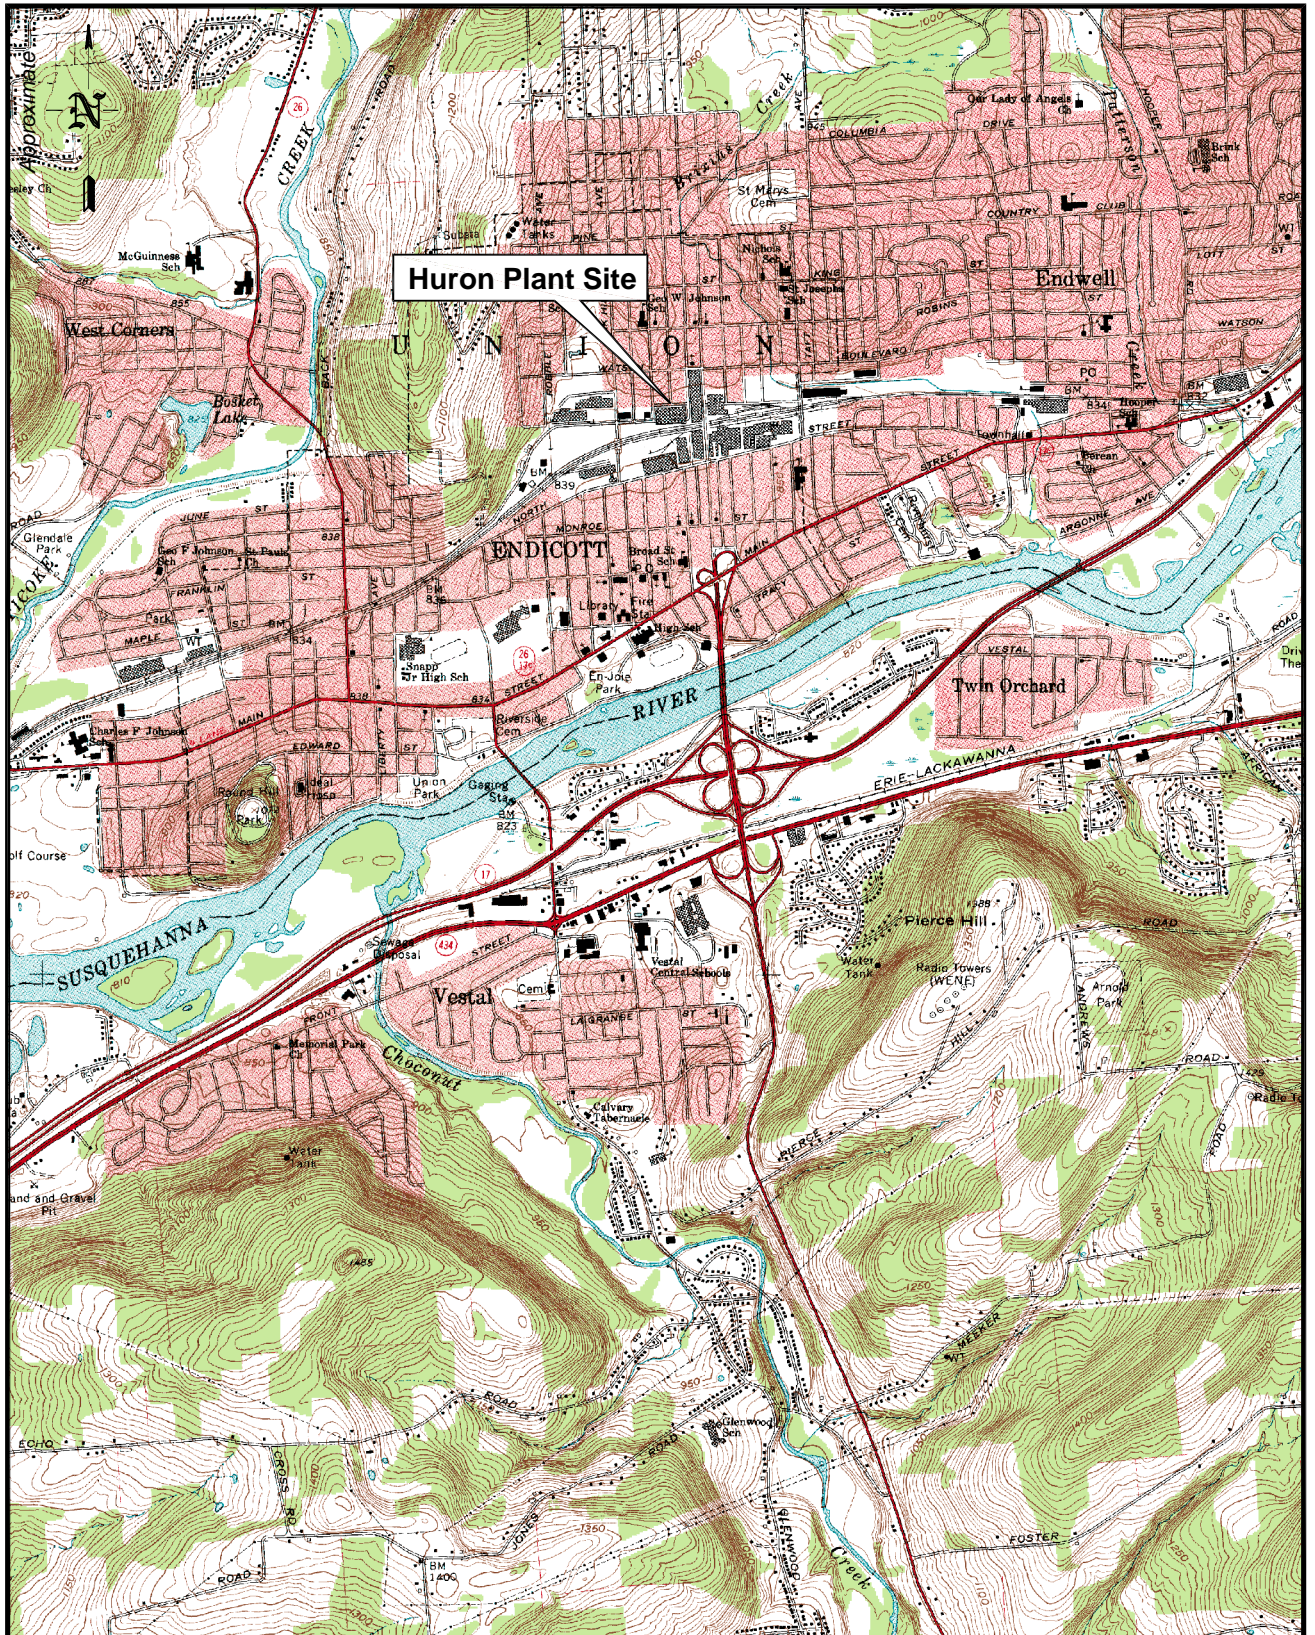

Table 6.5 shows the specific mass removal results for TCE in Off-Site Capture Zone A. This table compares the TCE mass removal rate and distribution for 2003, 2005 and 2006. The transition year 2004 is not examined. Based on this table, the total annual TCE mass removal rate has increased from 42.4 lbs in 2003 to 142.2 lbs in 2006. This is directly attributable to the TCE mass removal from the new wells that have been placed in service in Off-Site Capture Zone A since June 2004, and in particular the four new wells placed into service in 2006.

Table 6.5 Off-Site Capture Zone A - Annual TCE Mass Removal

Well(s)	2003 Mass Removal-TCE (lbs)	2005 Mass Removal-TCE (lbs)	2006 Mass Removal-TCE (lbs)
EN-133	14.1	8.0	4.5
EN-120, EN-160 & EN-194 (GAWC)	28.3 (58%)	25.3	16.3
EN-91T & EN-92T	NA	15.5	2.8
EN-215T, EN-447T, EN-451T & EN-499T	NA	NA	83.4
Subtotal	42.4	48.8	107.0
EN-284TD	NA	54.5	35.2
Total	42.4	103.3	142.2

Susquehanna River

Huron Well Field

MAP EXPLANATION

A Outwash sand and gravel, overlying lacustrine rhythmites, chiefly gray silt but interbedded with thin weak clay layers that are regularly spaced and may constitute about 5% of the thickness.

B Outwash sand and gravel, overlying lacustrine sediment described predominantly as fine or medium to fine sand to silty fine sand.

B2 Outwash sand and gravel, may grade down to a life fine sand or silt, overlying B1.

B3 Outwash sand and gravel, overlying lacustrine sediment described predominantly as medium to fine sand or silty fine sand, in part interbedded with numerous very thin, commonly discontinuous layers of weak red clay. The clay layers apparently increase in thickness and/or abundance with depth. The sand may grade down into silt interbedded with weak red clay.

C Lacustrine unit generally absent in deepest part of an ice-block depression; outwash is downwashed and generally overlain by postglacial peat and/or organic-rich silt and fine sand.

D Postglacial alluvial silt with organic matter, commonly gravely at the base, possibly deposited in a former meltwater channel.

E Organic-rich postglacial sediments overlie fine sand to silt that may also be postglacial or may be stratigraphic equivalents of the lacustrine deposits in A and B, deposited in ice-block depression.

F Valley wall, chiefly silt or colluvium derived from fill.

Volume Pumped from January 1, 2006 through December 31, 2006:

Building 096 Treatment Facility	44,725,376	Upper Aquifer Extraction Wells EN-107, EN-154/R, EN-218, EN-219/R, EN-253, EN-276, EN-428P
Bedrock Extraction Well EN-CAF	7,681,622	
Garfield Avenue GTF	44,302,286	Upper Aquifer Extraction Wells EN-120, EN-160, EN-194, EN-284TD, EN-92P, EN-215T, EN-499T
Jefferson Avenue GTF	30,940,886	Upper Aquifer Extraction Wells EN-133, EN-91T, EN-451T
Adams Avenue GTF	43,287,565	Upper Aquifer Extraction Wells EN-185, EN-195, EN-222, EN-491T, EN-492T, EN-447T
Bedrock Extraction Well EN-D49	3,593,872	
Hayes Avenue GTF (Building 057)	1,415,637	Upper Aquifer Extraction Wells EN-089R, EN-623, EN-624
Total	175,947,243	gallons (all wells)

* EN-219R replaced EN-219 on 6/15/2006. EN-154R replaced EN-154 on 7/18/2006

** Flow was treated at Building 096 OTF.

*** Annualized Rate is based on 365 days of continuous pumping. The annualized rate for wells that were not pumped for a full year is based on full months of pumping only.

TOC Elev. = Top of Casing Elevation (feet amsl)

GW Elev. = Groundwater Elevation (feet amsl)

NM = Not measured due to well conditions.

DRY = The Upper Aquifer is unsaturated at this location, although the well may have water below the top of silt elevation.

* GW Elev. not adjusted for possible floating product.

** Extraction well under vacuum.

Endicott, New York

TOC Elev. = Top of Casing Elevation (feet amsl)

GW Elev. = Groundwater Elevation (feet amsl)

NM = Not measured due to well conditions.

DRY = The Upper Aquifer is unsaturated at this location, although the well may have water below the top of silt elevation.

DECOMM = Well was recently decommissioned and could not be measured.

* GW Elev. not adjusted for possible floating product.

** Extraction well under vacuum.

TOC Elev. = Top of Casing Elevation (feet amsl)

GW Elev. = Groundwater Elevation (feet amsl)

NM = Not measured due to well conditions.

DRY = The Upper Aquifer is unsaturated at this location, although the well may have water below the top of silt elevation.

* GW Elev. not adjusted for possible floating product.

** Extraction well under vacuum. GW Elev. adjusted for vacuum.

Vacuum: 1" Hg = 1.131 feet water

Groundwater Analytical Chemistry Data
January 1, 2006 - December 31, 2006

Explanation of Reporting Conventions and Key to Comment Codes

Reporting Conventions

NA Not Analyzed
ND@X Not Detected at Detection Limit X

Code Explanation

J Estimated value - compound meets identification criteria, but result is less than the reporting limit.
R Result rejected due to analytical and quality control deficiencies. The presence or absence of the analyte cannot be verified.
X Analytical data has not been validated by a third party.

Groundwater VOC Analysis Results: OU#5/Building 57 - Endicott, New York

Notes:

1. This table represents groundwater sampling analytical results from all monitoring wells installed during this reporting period. Groundwater samples were collected by SHA personnel on January 10, 12, and 14, 2006. IBM personnel collected samples in March and April, 2006. Laboratory analyses were completed by IBM Hudson Valley Environmental Laboratory (IBM-HVAL) of Hopewell Junction, NY using method 8260B. One split sample was analyzed by Severn Trent Laboratories of Newburgh, NY using method 8260PP. Concentration units are in micrograms per liter (ug/l) which are equivalent to parts per billion (ppt). Bold values indicate the analyte was detected laboratory above reporting limits.
2. Laboratory analytical data presented here have been independently validated by New Environmental Horizons, Inc. Three samples were received at the laboratory with insufficient preservation such that the pH of each sample was greater than 2 (EN626060308, EN635060308, and EN628060308). These samples were not analyzed within 7 days of collection; therefore, all data were considered estimated (J and UJ) with possible low bias as shown in the following table.
3. "<" and "U" Indicate a non-detection at the reporting limit shown.
"J" Indicates an estimated value.
"D" Indicates result is from a dilution. Appendix C. describes the magnitude of the dilution.
"E" Indicates result is likely higher than reported. No dilution detection was reported.
"." Indicates sample was not analyzed for analyte.
5. "MWX" in a sample name indicates a duplicate sample was collected on the date indicated.
6. Monitoring wells EN-640 and EN-650 were dry in the January sampling round and were not sampled. Monitoring well EN-631 has been consistently dry through all sampling rounds.

EN-D11	8/15/2006	None detected	NA	NA	NA	NA

Absolute Difference = |S - D|

Relative Percent Difference = (|S - D| / (S + D)/2) x 100

NA = Not applicable; cannot be calculated.

* Sample contained high levels (>1000 ug/l) of trihalomethanes (THMs), which affected the reporting of VOC concentrations less than 10 ug/l. THMs detected include chloroform, bromodichloromethane (BDCM), and chlorodibromomethane.

** Duplicate sample result is not consistent with primary sample result, quarterly sample results, or isoconcentration contour maps.

Explanation of Reporting Conventions and Key to Comment Codes

Reporting Conventions

NA Not Analyzed
ND@X Not Detected at Detection Limit X

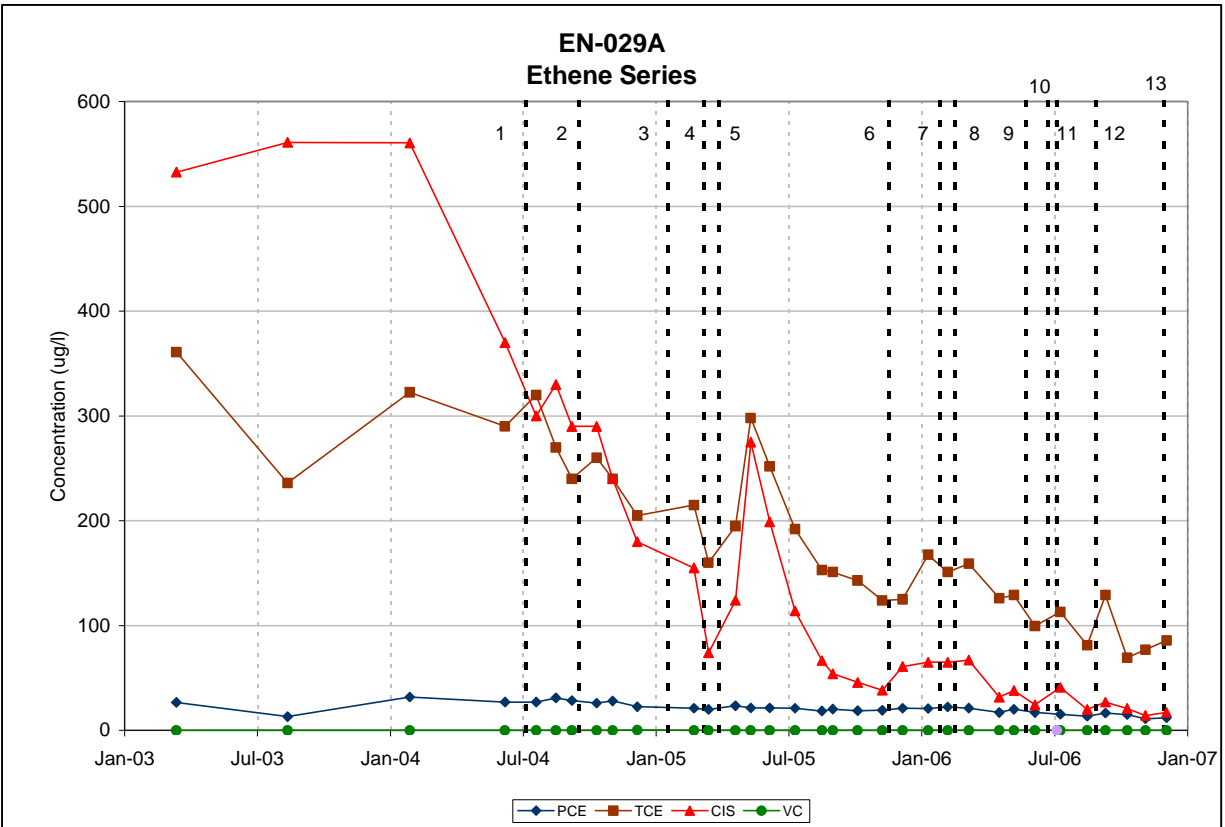

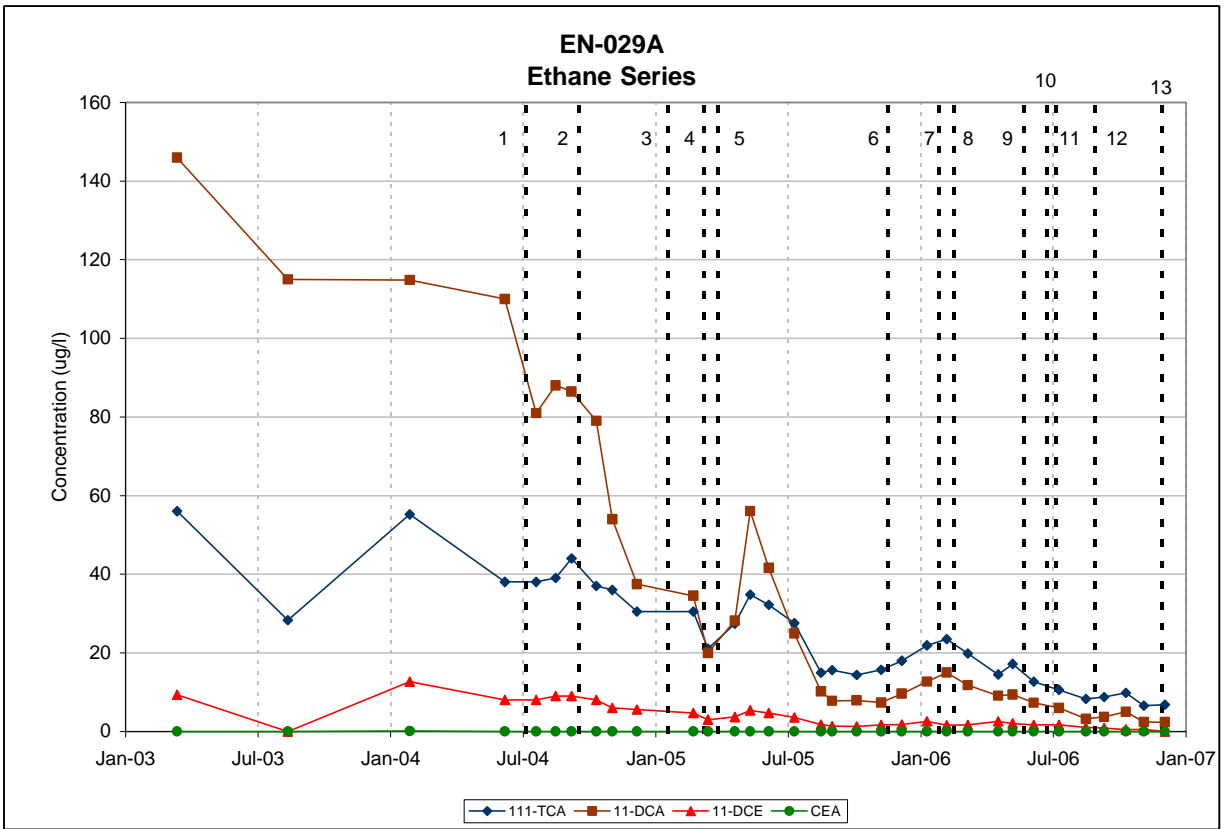

Code Explanation

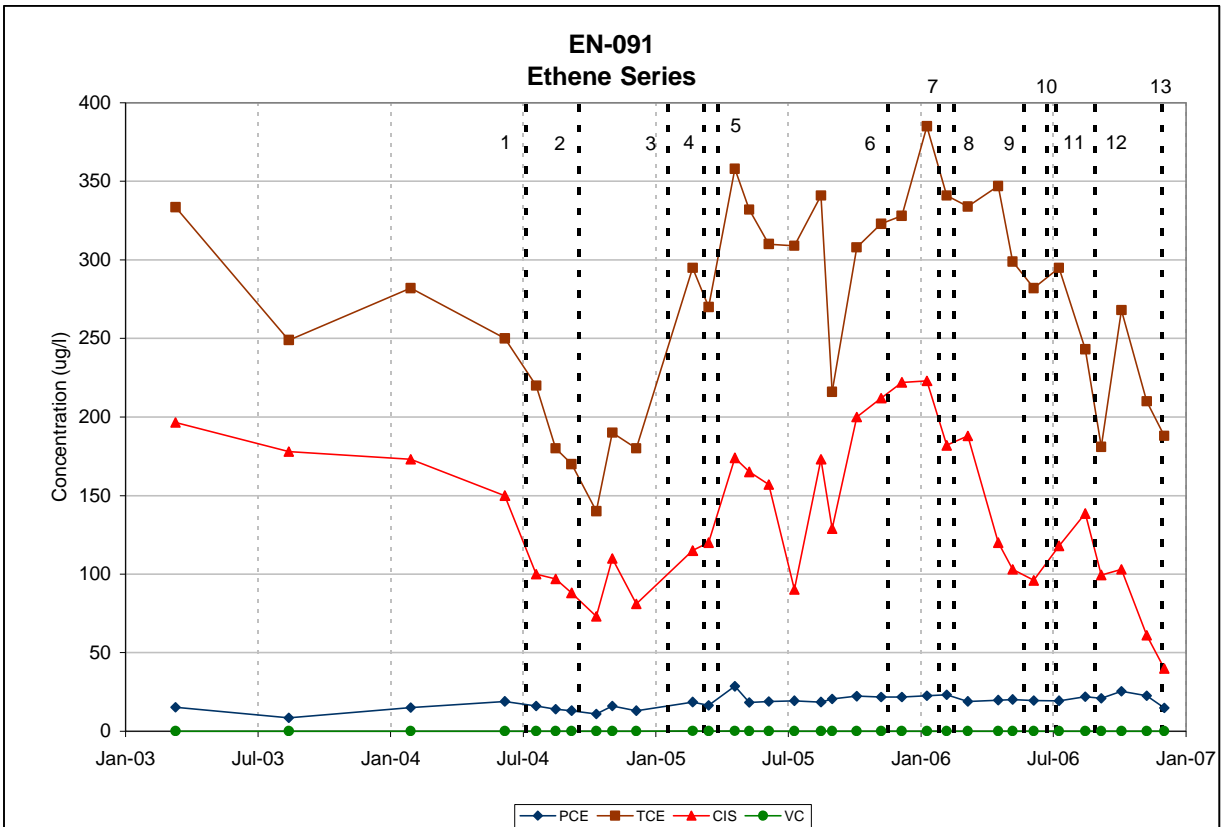

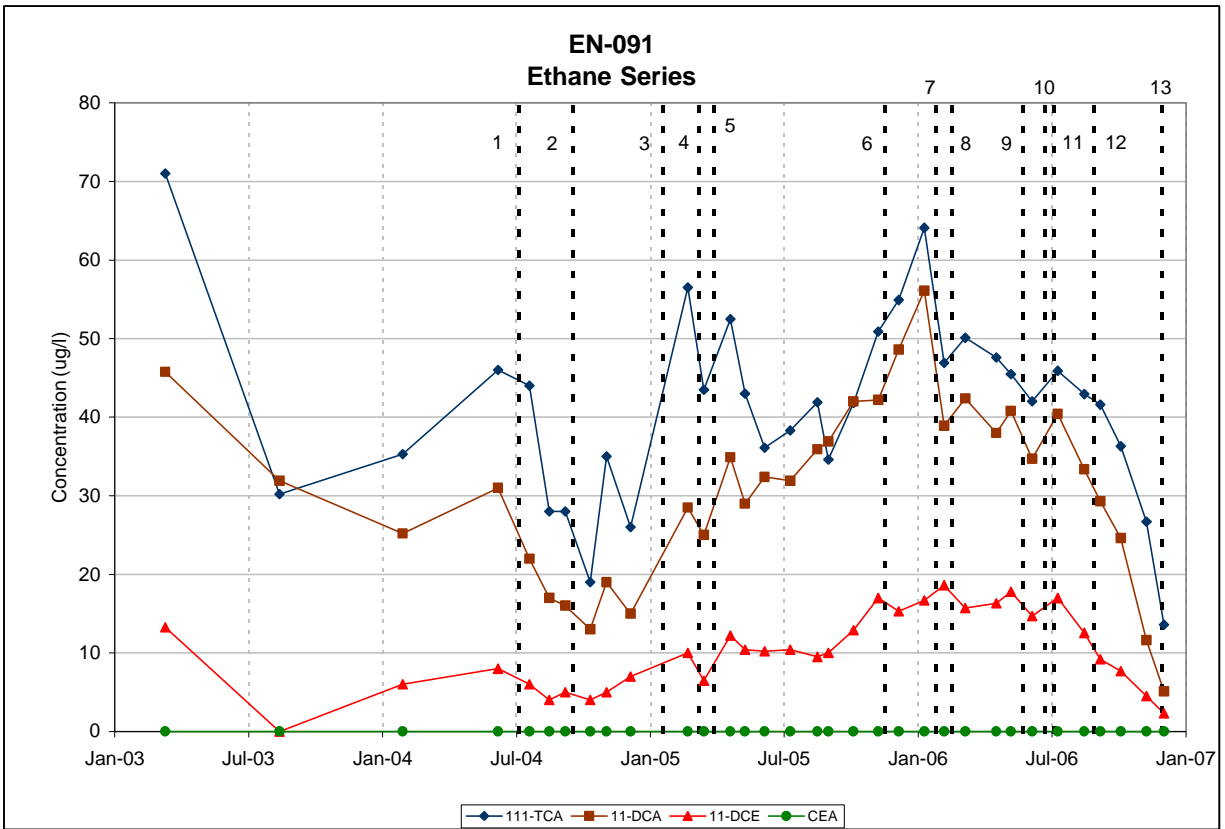

J Estimated value - compound meets identification criteria, but result is less than the reporting limit.
R Result rejected due to analytical and quality control deficiencies. The presence or absence of the analyte cannot be verified.
X Analytical data has not been validated by a third party.

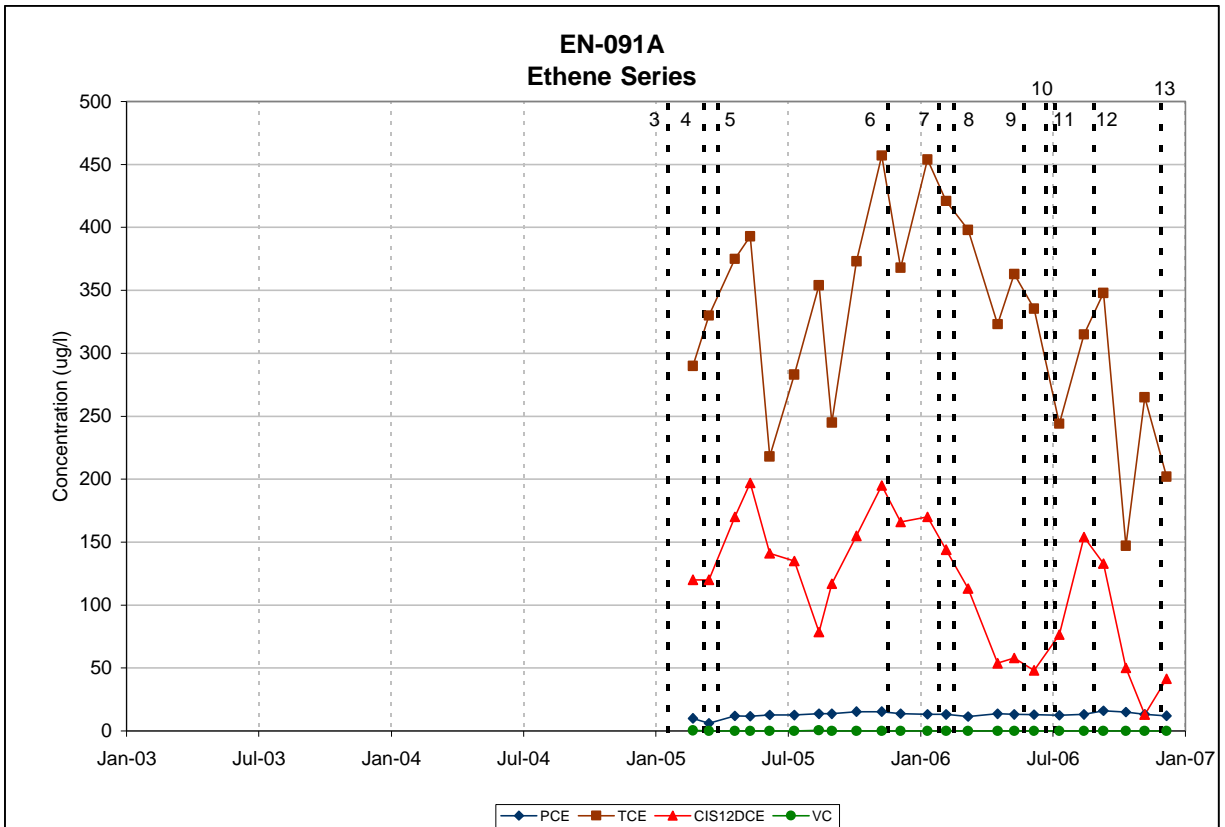

Appendix G: Time vs. Concentration Graphs

Timeline Key

- 1 Start of EN-284TD test (7/6/04)
- 2 Ivan storm event (9/17/04)

1 Groundwater Treatment Facilities

Groundwater remediation activities in 2006 included operation of four groundwater treatment facilities. The four facilities are referred to as the Jefferson Avenue Groundwater Treatment Facility (GTF), the Garfield Avenue GTF, the Adams Avenue GTF, and the Hayes Avenue GTF. In 2006, design and construction of a fifth facility, designated as the Robble Avenue GTF, was substantially completed, and design and construction of a sixth facility, designated as the Clark Street GTF, was initiated. The Robble Avenue GTF is located in Operable Unit #7 (OU#7) while the Clark Street GTF is located within OU#1.

Significant maintenance activities in 2006 for the four operating GTFs are listed below.

1. **Jefferson Avenue Groundwater Treatment Facility (GTF).** The Jefferson Avenue GTF structure was cleaned, repaired as required, and painted in 2006. The entrance drive was repaved, and an expansion parking area was added at the rear of the GTF as part of the installation of a wooden storage garage at this location. The Jefferson totalizing flow meter was cleaned, calibrated and barrel tested in December 2006. Improvements were completed on the Jefferson control system to the radio communication network and alarm software.
2. **Garfield Avenue Groundwater Treatment Facility (GTF).** Upgrade activities completed at the Garfield Avenue GTF in 2006 included improvements to the radio communication system and alarm software. Mechanical work done in 2006 included improvements to the GTF rupture disc piping in January, and work on the 1A carbon vessel piping and GTF sump in March 2006. The 1A carbon vessel was changed on June 14, 2006 at which time the carbon vessel interior was also accessed and inspected. The 1B carbon vessel was changed on December 5, 2006 and was also inspected at that time. The GTF effluent Metron flow meter was inspected, barrel tested, and calibrated in December 2006.
3. **Adams Avenue Groundwater Treatment Facility (GTF).** GTF activities and upgrades that occurred at the Adams GTF in 2006 included basic GTF maintenance and upkeep items such as painting and replacement of doors as well as electrical and mechanical improvements. Mechanical upgrades in 2006 included improvements to the internal distribution piping and nozzles in the two carbon vessels. This work was intended to help

reduce backpressure and backwashing events to maximize the dewatering potential from the extraction wells along Monroe Avenue and extraction test well EN-447T. To minimize system down time, this work was accomplished during planned carbon change events on November 28 and 29, 2006. Related pressure reduction and sediment handling modifications intended to improve the GTF hydraulic capability included further modifications to the GTF sump piping and incorporation of the third GTF vessel for use in sediment handling and separation prior to carbon treatment. The radio communication system and alarm software also was improved in 2006. The GTF effluent flow meter was calibrated and barrel tested in December 2006.

4. **Hayes Avenue Groundwater Treatment Facility (GTF).** The Hayes Avenue GTF was modified and upgraded after test wells EN-623 and EN-624 were brought online during the first quarter of 2006. After operational issues relating to system fouling occurred in March and April 2006, additional process testing and treatment-related studies were undertaken to evaluate treatment options. Test wells EN-623 and EN-624 were shut down on April 17, 2006 and remained off until May 8, 2006 when approval was obtained from NYSDEC to incorporate chemical pretreatment to limit iron and manganese fouling. The chemical pretreatment is identical to that used in other areas of the site. A larger equalization vessel and piping improvements were also installed in May 2006, and an upsized stainless steel Shallow Tray aerator was installed in August 2006. The combination of the above system modifications improved the system efficiency and reliability, and reduced the associated O&M and cleaning down-time by mid-August 2006. In addition, improvements to the radio communication and alarm system software were also implemented in 2006. The Hayes Avenue GTF flow meter was cleaned and calibrated in July and December 2006.

2 Operable Unit #1: Railroad Corridor Source Area

Extraction wells EN-428/EN428P, EN-253, EN-107 and EN-219R are located within Operable Unit #1: Railroad Corridor Source Area. Building 46S (B046S) is the transfer station adjacent to EN-428 and EN-428P. Building 46S houses meters, controls and chemical pretreatment systems for the EN-428/EN-428P and EN-253 pumps. Building 48S (B048S) is in the vicinity of well EN-107 and houses the EN-107 Transfer Tank, flow meter and controls for EN-107.

Significant maintenance activities for this area are listed below by location or extraction well.

1. **Transfer Station Building 46S.** A major upgrade to the B046S groundwater transfer station was completed during 2006. The upgrade included replacement of the existing building with a new larger concrete structure. Design of the B046S building began in January 2006. Construction of the new building began in May 2006 and was completed in September 2006. Wells EN-25 and EN-118 located in the footprint of the new building were decommissioned in May 2007. A new monitoring well, designated EN-507, was installed east of the new building footprint in June 2007 as a replacement for wells EN-25 and EN-118. The new B046S building incorporated provisions for improved control, data collection and monitoring systems, flow meters and sample ports, chemical pretreatment systems, and space for a future transfer tank system. The control and communication improvements included improvements to the radio communication network and alarm software. Control and piping provisions were also incorporated to provide a means of alternate operation of EN-428 for situations where well maintenance was required at EN-428P.
2. **Extraction well EN-428.** In 2006, EN-428 served as a monitoring well and backup extraction well to EN-428P. A new wellhead enclosure and control and piping improvements for EN-428 were completed in 2006 as part of the B046S transfer station upgrade. In December 2006, well EN-428 was inspected with a downhole camera, redeveloped, and the piping system cleaned to prepare EN-428 for use as a backup extraction well to EN-428P.
3. **Extraction well EN-428P.** Groundwater withdrawals from permanent extraction well EN-428P began in September 2005 and continued to operate with vacuum-assist technology

throughout 2006. The Metron flow meter was cleaned, checked and tested in March and August 2006, and was cleaned, barrel tested and calibrated in December 2006. Well inspections that included televising occurred in April, November and December 2006. Maintenance activities performed following these inspections included: heat treatment cleaning in April 2006; heating and water jetting in November 2006; and surge block developing in December 2006. The vacuum pump was rebuilt in April 2006. The extraction pump was pulled, inspected and replaced in April, May, October and December 2006. A new wellhead enclosure and control and piping improvements for EN-428P were completed in 2006 as part of the B046S transfer station upgrade. In October 2006, IBM received approval from NYSDEC to perform a controlled test at EN-428P to assess direct dosing of the approved pretreatment chemicals within extraction well EN-428P at the pump intake to limit fouling of the well screen and EN-428P pumping system components. In addition to this controlled test, a chemical pretreatment system was installed for the EN-428P wellhead area within the new B046S transfer station and was began to operate in November 2006. The controlled direct dosing test continued through the remainder of 2006 for evaluation of this method to reduce fouling in the well screen and transfer piping versus the use of the chemicals at the wellhead area.

4. **Extraction well EN-219.** The pump assembly for extraction well EN-219 was pulled, inspected, and replaced in April 2006 due to material buildup. The discharge lines were flushed and cleaned in May 2006. EN-219 was taken offline and transitioned into a monitoring well in June 2006 when a new vacuum-enhanced extraction well, EN-219R, was brought online as its replacement.
5. **Extraction Well EN-219R.** A design memorandum for replacement well EN-219R was submitted in January 2006. The installation and development of permanent extraction well EN-219R occurred in April 2006. Operation of replacement extraction well EN-219R began in June 2006 after wellhead piping and control connections and modifications at the EN-219 Hot Box were completed. Prior to startup of EN-219R, piping work and improvements were made at the piping connection from EN-219R to the header leading to the B047 groundwater transfer location within Building 47 to increase the flow handling capacity from EN-219R. Upgrades to the EN-219 Hot Box included piping and control

modifications such as a small wellhead Hot Box extension installed over EN-219R to include heat tracing and containment piping connecting to the EN-219 Hot Box. A chemical pretreatment system was installed within the EN-219 Hot Box enclosure and was started up in November 2006. The Metron flow meter was cleaned, checked and calibrated by barrel testing in December 2006. EN-219R continued to operate with vacuum-assist technology through December 2006.

6. **Extraction well EN-253.** The well pump assembly for extraction well EN-253 was pulled, inspected, cleaned, and replaced (when necessary) in March, July and October 2006 due to material buildup in the pump head. The Metron flow meter was replaced in October 2006 and was cleaned, checked and calibrated by barrel testing in December 2006. A chemical pretreatment system was installed for EN-253 within the new B046S transfer station and was started up in November 2006. A new Hot Box insulated wellhead enclosure and insulated and heat traced containment piping from EN-253 to B046S was installed as part of the B046S transfer station upgrade in 2006. Control and piping upgrades for EN-253 were completed within B046S as part of the transfer station upgrade.
7. **Extraction well EN-107.** The well pump for extraction well EN-107 was pulled, inspected, cleaned, and replaced (when necessary) in February, June and November 2006 due to material buildup. The Metron flow meter was cleaned, checked and calibrated by barrel testing in June and December 2006. Following inspection with a downhole camera, the well was redeveloped and the piping system was cleaned in July 2006. A chemical pretreatment system was installed for EN-107 within the EN-107 wellhead enclosure and was started up in November 2006.

3 Operable Unit #2: North Street Area

One Upper Aquifer extraction well, EN-276, is located in the vicinity of North Street between B014 and B018. Significant maintenance activities for this area are listed below.

1. Installation of the piping from Grant Avenue across North Street to a location south of EN-276 was completed in April 2006 in preparation for a future connection to the Garfield GTF. The conveyance piping installation was performed in accordance with the NYSDEC-approved IRM Groundwater Conveyance Piping Project Work Plan.
2. The pump and motor assembly, and SubGard level control device for extraction well EN-276 were pulled, inspected, cleaned and replaced as necessary in February and July 2006. The Metron flow meter was inspected in February and July 2006, and was cleaned, calibrated and barrel tested in December 2006.
3. Radio communication and alarm software improvements were initiated and completed to the EN-276 controls system during the third and fourth quarters of 2006.

4 Operable Unit #3 and Miscellaneous Activity A

During 2006, eleven extraction wells operated to remove groundwater from the Upper Aquifer in Off-Site Capture Zone A (Miscellaneous Activity A: Plume Reduction in Off-Site Capture Zone A) and Operable Unit #3: Plume Reduction in the Southern Area (OU#3). These extraction wells include: EN-284TD, EN-133, EN-451T, EN-91T, EN-92P, the Garfield Avenue Well Cluster (EN-120, EN-160, and EN-194), EN-215T, EN-499T, and EN-447T. Groundwater extraction test well EN-451T was installed in 2006. Groundwater withdrawals from the EN-451T, EN-92P, EN-215T, EN-499T, and EN-447T locations were initiated during 2006. Groundwater extracted from EN-133, EN-91T and EN-451T was treated at the Jefferson Avenue GTF. Groundwater extracted from EN-92P, the Garfield Avenue Well Cluster (EN-120, EN-160, and EN-194), EN-215T, and EN-499T was treated at the Garfield Avenue GTF. Groundwater extracted from EN-447T was treated in the Adams Avenue GTF. Significant maintenance activities relative to both operating wells and to new test wells in MAA and OU#3 are listed below.

1. **Extraction Well EN-284TD/P.** Permanent groundwater extraction well EN-284P was installed in February 2006 close to extraction test well EN-284TD. Throughout 2006, groundwater was pumped from EN-284TD while system components were constructed to allow for a switch to groundwater pumping from well EN-284P. The well pump for extraction well EN-284TD was pulled, inspected, and replaced in January, September and November 2006. At the time of each pump inspection, the well was televised. The vacuum pump was rebuilt in April 2006 and the pump was downsized during the September 2006 inspection. During the last quarter of 2006, the EN-284TD wellhead enclosure, Hot Box enclosure and surrounding piping were modified to incorporate additional piping and an additional insulated and heat traced wellhead enclosure for well EN-284P. The containment piping, well head and main Hot Box enclosures and control system were configured so that in EN-284P will serve as the extraction well at this location in 2007 and EN-284TD will serve as a backup extraction well and monitoring well. The Metron flow meter was inspected, barrel tested and calibrated in December 2006.
2. **Extraction Well EN-133.** The well pump and motor for extraction well EN-133 were replaced in September 2006 due to a pump failure. The flow meter was inspected, cleaned, calibrated and barrel tested in December 2006.

3. **Extraction Test Well EN-451T.** The installation of EN-451T began in January 2006, development occurred in February 2006, and preliminary televising and testing of the well occurred during April, May and June 2006. The installation of three associated monitoring wells (EN-502, EN-503, and EN-504) was also completed in January 2006. Groundwater withdrawals from EN-451T with treatment at the Jefferson Avenue GTF began in early July 2006. A double packer unit was fabricated and installed in September 2006; this unit is used to allow selective pumping and vacuum enhancement from the lower well screen by isolation of the upper of two well screen areas. Modifications to the conveyance piping and conduit were also completed to allow a connection from a continuous air source for maintenance of the packers from the Jefferson GTF. A provision to allow connection to a vacuum source located in the Jefferson GTF was also completed in September 2006, and the well was brought online as a vacuum-enhanced well. Groundwater withdrawals from EN-451T using the vacuum-assist technology continued through December 2006. The vacuum pump was rebuilt in October 2006. The Metron flow meter was cleaned and tested in late July 2006, and was replaced, barrel tested and calibrated in December 2006.
4. **Extraction Well EN-91T.** The well pump and motor for extraction well EN-91T were replaced in May 2006 due to failure. The pump and motor was pulled again and downsized in June 2006. The well was televised during each of the pump service events in May and June and the piping and meter were also inspected. The flow meter was inspected, cleaned and tested in July and December 2006. With NYSDEC approval, operation of EN-91T ceased on December 22, 2006 due to a lack of available groundwater.
5. **Extraction Well EN-92T / EN-92P.** Well EN-92T was taken offline and was reconstructed as permanent extraction well EN-92P between mid-November 2005 and mid-January 2006. Groundwater withdrawals from EN-92P began in late January 2006 and continued until November 30, 2006, when approval was granted by NYSDEC to cease pumping at this location due to a lack of available groundwater. The Metron flow meter was inspected, barrel tested and calibrated in December 2006.
6. **Extraction Well EN-120.** Extraction well EN-120 operated for most of 2006. Groundwater withdrawals from EN-120 ceased on November 30, 2006, when approval was granted by NYSDEC to stop pumping at this location due to a lack of available

groundwater. The Metron flow meter was inspected, barrel tested and calibrated in December 2006.

7. **Extraction Well EN-160.** Extraction well EN-160 operated for most of 2006. The well pump and motor for extraction well EN-160 were pulled and replaced in July 2006 with a downsized unit due to a decrease in the groundwater extraction rate at this location. Operation of extraction well EN-160 ceased on November 30, 2006, when approval was granted by NYSDEC to stop pumping at this location due to a lack of available groundwater. The Metron flow meter was inspected, barrel tested and calibrated in December 2006.
8. **Extraction Well EN-194.** Extraction well EN-194 operated for most of 2006. The well pump and motor for extraction well EN-194 were pulled and replaced in November 2006 with a downsized unit due to a decrease in the groundwater extraction rate at this location. Operation of extraction well EN-194 ceased on November 30, 2006, when approval was granted by NYSDEC to stop pumping at this location due to a lack of available groundwater. The Metron flow meter was inspected, barrel tested and calibrated in December 2006.
9. **Extraction Well EN-215T.** Vacuum-enhanced extraction at test well EN-215T began on August 29, 2006 to supplement groundwater withdrawals from test wells EN-499T and EN-447T. Groundwater withdrawals at this location continued for the remainder of 2006. Pumping at this location was initiated to increase dewatering in OU#3. The pump was pulled for wiring repairs in early October 2006. In mid-October 2006, the pump and motor were replaced, the well was televised, and the vacuum pump was also rebuilt. The Metron flow meter was inspected, barrel tested and calibrated in December 2006.
10. **Extraction Well EN-499T.** Vacuum-enhanced extraction at the EN-499T test well started on May 24, 2006 in conjunction with the start of pumping from test well EN-447T and continued through the end of 2006. The vacuum system was rebuilt in August 2006, and the pump and motor were pulled and upsized to increase capacity on August 30, 2006. The well was also televised at that time. The Metron flow meter was inspected, barrel tested and calibrated in December 2006.

11. **Extraction Well EN-447T.** Vacuum-enhanced extraction at test well EN-447T began on May 24, 2006 in conjunction with the start of pumping from test well EN-499T and continued through the end of 2006. In September 2006, the pump and motor were pulled and upsized from 5 to 7.5 HP and the well discharge piping was enlarged and changed to rigid 316 stainless steel to support an increase in the rate of groundwater withdrawal. The well was also televised in September 2006. The vacuum system was changed and the Metron flow meter was inspected, barrel tested and calibrated in December 2006.

5 Operable Unit #4: Ideal Cleaners Area (Off-Site Capture Zone B)

Five extraction wells operate to remove groundwater from the Upper Aquifer in Operable Unit #4 (OU#4 or Off-Site Capture Zone B). Historically, groundwater in OU#4 has been extracted from three extraction wells referred to as the Adams Avenue Well Cluster (EN-185, EN-195, and EN-222). In an effort to provide enhanced hydraulic containment in Off-site Capture Zone B, groundwater withdrawals were initiated at two additional extraction test well locations in 2006. These two test wells are designated EN-491T and EN-492T and are located along Monroe Avenue between wells EN-185 and EN-195. Groundwater extracted from all five wells is treated at the Adams Avenue GTF. Significant maintenance activities for this area are listed below.

1. **Extraction Well EN-222.** The pump and motor assembly was pulled and the discharge piping was cleaned and flushed in March and November 2006. The well was televised in November 2006. The flow meter was cleaned, inspected and barrel tested for calibration purposes in March, November and December 2006.
2. **Extraction Well EN-185.** The pump and motor assembly was pulled and the discharge piping was cleaned and flushed in July and November 2006. The well was televised and the pump/motor assembly was replaced during each cleaning event. The Metron flow meter was inspected, cleaned and calibrated in June and December 2006. The well was televised, cleaned and redeveloped using surge techniques in December 2006.
3. **Extraction Well EN-195.** The well was televised, and the pump assembly was pulled, inspected and replaced in March 2006. The Metron flow meter was inspected, cleaned and calibrated in June and December 2006.
4. **Extraction Well EN-491T.** Development of extraction test well EN-491T was completed in January 2006, at which time the installation of a nearby observation monitoring well (EN-505) also occurred. Vacuum-enhanced extraction at test well EN-491T began in February 2006 in conjunction with the start of pumping from test well EN-492T and continued through the end of 2006. The well was televised and the pump and motor were replaced in March, May and July 2006. The Metron flow meter was replaced in March 2006, inspected and cleaned in May and November 2006, and calibrated in December 2006.

5. **Extraction Well EN-492T.** An observation monitoring well (EN-506) was installed near extraction test well EN-492T in January 2006. Vacuum-enhanced extraction at test well EN-492T test well began in February 2006 in conjunction with the start of pumping from test well EN-491T and continued through the end of 2006. The well was televised and a larger vacuum pump was installed in March 2006. Extensive redevelopment activities occurred at this well between March 30, 2006 and April 24, 2006. The Metron flow meter was replaced in May 2006 and was calibrated in December 2006.

6 Operable Unit #5: Building 57 Area

During 2006, three extraction wells (EN-89R, EN-623 and EN-624) extracted groundwater from OU#5 at a rate of approximately 3 to 5 gpm. Significant maintenance activities for this area are listed below.

1. **Extraction Well EN-89R.** Groundwater withdrawals from extraction well EN-89R continued throughout 2006. The pump in EN-89R was pulled and the well was televised in June 2006. The pump assembly was pulled and a new pump and motor assembly was installed in April, June and August 2006. The flow meter was cleaned and checked in July and September 2006, and was calibrated in December 2006.
2. **Extraction Well EN-623.** Vacuum-enhanced extraction at well EN-623 resumed in February 2006 in conjunction with the restart of pumping from well EN-624 and continued through the end of 2006. The well was televised and the pump and motor were replaced in March, May and July 2006. The Metron flow meter was replaced in March 2006, inspected and cleaned in May and November 2006, and calibrated in December 2006.
3. **Extraction Well EN-624.** Vacuum enhanced extraction at test well EN-624 resumed in February 2006 in conjunction with the restart of pumping from well EN-623 and continued through the end of 2006. The well was televised and the pump and motor were replaced in March, May and July 2006. The Metron flow meter was replaced in March 2006, inspected and cleaned in May and November 2006, and calibrated in December 2006.

7 Operable Unit #6: Plume Control in Bedrock Groundwater

In 2006, bedrock groundwater withdrawals switched from bedrock extraction well EN-CAF, located inside the southern part of Building 42, to a nearby replacement bedrock extraction well EN-D49 located near the southwest corner of Building 42. An IRM Work Plan for replacement of bedrock extraction well EN-CAF was submitted on April 17, 2006 and approved by the NYSDEC on May 9, 2006. Installation of replacement bedrock well EN-D49 began in May 2006 and was completed in June 2006. Between June and September 2006, preliminary hydraulic testing of EN-D49 was completed along with installation of associated controls and conveyance equipment.

On August 31, 2006, EN-CAF was shut down and was replaced by EN-D49 on September 19, 2006. While EN-CAF was in operation, bedrock groundwater withdrawals were pumped through conveyance piping to the Building 96 OTF for treatment. Bedrock groundwater extracted from well EN-D49 is pumped through new conveyance piping to the Adams Avenue GTF for treatment. There were no significant maintenance activities at well EN-CAF from January through August 2006, or for extraction well EN-D49 from September through December 2006. A new insulated and heat traced well enclosure was constructed and installed over extraction well EN-D49, and a Hot Box enclosure with containment tray was constructed nearby for housing of the EN-D49 controls, alarm interlocks with the Adams Avenue GTF, sample ports, and flow meter. The EN-D49 flow meter was barrel tested and calibrated in December 2006.

8 Operable Unit #7: Northwestern Area

Groundwater extraction operations in Operable Unit #7 (OU#7) include groundwater withdrawals from the EN-154/EN-154R location and the EN-218 location. Groundwater extraction at these two locations is performed to control relatively low concentrations of VOCs in groundwater within this operable unit. During 2006, groundwater withdrawals were moved from extraction well EN-154 to a nearby replacement extraction well designated EN-154R. Throughout 2006, a new groundwater treatment facility with related conveyance piping and infrastructure was constructed and substantially completed in the area of extraction wells EN-154 and EN-154R. This new facility, referred to as the Robble Avenue GTF, is planned to treat groundwater extracted from the two OU#7 extraction wells. Significant maintenance activities for this area are listed below.

1. **Extraction Well EN-154/154R.** Extraction well EN-154 served as the extraction well at this location from January until July 2006. On July 18, 2006, EN-154 was shut down and groundwater withdrawals from EN-154R were initiated using vacuum enhancement. Replacement well EN-154R is located close to former extraction well EN-154. EN-154R serves as the primary extraction well with well EN-154 serving as a monitoring well and backup extraction well in the event of a major pump failure or need for maintenance on the primary well. Maintenance activities at the two well locations in 2006 included the following: EN-154 was televised in July 2006. EN-154R was developed with a surge block in March 2006, was tested under vacuum and non-vacuum conditions in March and June 2006, and was televised in April 2006. During the second, third and fourth quarters of 2006, a new concrete well building was constructed at the EN-154R wellhead location and conveyance piping and conduit for controls and power were installed leading to the Robble Avenue GTF. The EN-154R well building incorporates new controls, communication and alarm systems, a vacuum pump, and chemical feed pumps and related equipment for pretreatment of the conveyance piping (identical to the system used in the EN-154 well structure). From the start of pumping in July through the remainder of 2006, groundwater withdrawals from EN-154R were transferred through the EN-154 conveyance piping to the Huron treatment system located at Building 96. The Metron flow meter was calibrated and barrel tested in December 2006.

2. **Extraction Well EN-218.** The EN-218 flow meter was removed for cleaning and inspection in July and December 2006. The well was televised in early July 2006, and the pump was pulled and replaced in late July 2006. The EN-218 flow meter was inspected and barrel tested for calibration purposes in December 2006.
