Subject: July 2000 Post-IRM Quarterly Groundwater Monitoring
Barlow Road Air Sparging System
PIN 9803.62.301
Harza No. 8334

Ladies and Gentlemen:

This letter constitutes Harza Engineering Company's report on the July 2000 quarterly groundwater monitoring event at the Barlow Road Maintenance Facility. The site air sparging system was turned off on September 20, 1999, with NYSDEC consent following the September 14, 1999, project meeting between representatives of the NYSDOT and the NYSDEC.

The results of the repeat baseline groundwater monitoring performed in October 1999 were presented in the Harza report dated December 21, 1999. The repeat baseline monitoring report concluded that TCE concentrations in groundwater had not rebounded above the system reactivation level of 500 ppb. The report made recommendations for points to be monitored quarterly during the first year of post-IRM monitoring. The recommended monitoring network was accepted by the NYSDOT. Due to policy changes, the NYSDEC declined further involvement in this project because it is not in a formal NYSDEC program. Subsequent meetings were held with the NYSDEC in June and July 2000 to resolve the involvement issue. The DEC is currently reviewing past project reports before determining their position in this matter.

The first quarterly post-IRM groundwater monitoring event was performed in January 2000. Results of this round of sampling were presented in the Harza report of February 22, 2000. Results of the January sampling indicated that none of the monitored points had rebounded above the 500 ppb TCE system reactivation level. Continued quarterly monitoring for one full year after cessation of air sparging was recommended.

John LaBarge, P.E., Director
Harza No. 8334
August 30, 2000
Page 2

Results of the April 2000 second quarterly post-IRM monitoring event (Harza report dated May 22, 2000) indicated TCE concentrations in excess of the 500 ppb system reactivation level at SV-14 (941 ppb) and FH-X-12 (558 ppb). In accordance with the project *Environmental Monitoring Plan*, continued monitoring was recommended to see if TCE concentrations in these two wells remained above 500 ppb for two consecutive quarters, necessitating reactivation of the system.

1.0 Shallow Water Table Aquifer Quarterly Post-IRM Monitoring – July 2000 (Third Post-IRM Quarter)

The quarterly post-IRM monitoring points for the shallow water table aquifer are SS-4, SS-5, SS-8, SS-10, SS-12, FH-X-12, SV-14, and MW-13. The results of analyses performed on groundwater samples collected from the shallow water table aquifer are summarized in Table 1. Monitoring point locations are shown on Figures 1 and 2. The laboratory report for the July 2000 quarterly groundwater sampling is presented in Attachment 1.

Between the April and July 2000 quarterly sampling events, TCE concentrations in the shallow portion of the water table aquifer increased at SS-4 (66 to 185 ppb), SS-5 (39 to 218 ppb), SS-10 (81 to 91 ppb), SS-12 (84 to 134 ppb), and FH-X-12 (558 to 604 ppb). The TCE concentration detected in FH-X-12 has exceeded the 500 ppb system reactivation level for two consecutive quarters. The *Environmental Monitoring Plan* calls for reactivation of the system if TCE concentrations exceed 500 ppb at a monitoring point for two consecutive quarters.

TCE concentrations decreased or remained essentially the same at SS-8 (259 to 262 ppb), SV-14 (941 to 159 ppb), and MW-13 (2.5 to 2.7 ppb). The TCE concentration at SV-14 fell below the 500 ppb reactivation level in July 2000.

In January 2000, 6.4 ppb of TCE was detected at MW-13, located at the downgradient property line. This was the first time that a sample from this well exceeded the groundwater standard of 5 ppb for TCE. April 2000 results indicated that the TCE concentration in MW-13 (2.5 ppb) fell below the 5 ppb groundwater standard. The July 2000 TCE concentration detected at MW-13 was 2.7 ppb.

Other VOCs detected in the shallow monitoring points in July 2000 were cis-1,2-dichloroethene (SS-4, SS-5, SS-8, SS-10, SS-12, SV-14, and FH-X-12). Other chlorinated VOCs detected at SV-14 were 1,1,1-trichloroethane and vinyl chloride. Concentrations of refined petroleum product related VOCs continue to be detected at SV-14.

John LaBarge, P.E., Director
Harza No. 8334

Page 3

2.0 Deep Water Table Aquifer Quarterly Post-IRM Monitoring – July 2000 (Third Post-IRM Quarter)

The quarterly monitoring points for the deep portion of the water table aquifer are DS-2, DV-1, DV-4, DV-5, and DV-8 (Figure 1). The results of analyses performed on groundwater samples collected from the deep water table aquifer are summarized in Table 2. The laboratory report for the July 2000 quarterly groundwater sampling is presented in Attachment 1.

Between the April and July 2000 quarterly sampling events, TCE concentrations increased in all five deep monitoring points: DS-2 (101 to 119 ppb), DV-1 (75 to 139 ppb), DV-4 (71 to 97 ppb), DV-5 (10 to 13 ppb), and DV-8 (97 to 109 ppb). In no instance has the 500 ppb TCE system reactivation level been exceeded in the deep portion of the water table aquifer since cessation of sparging. Cis-1,2-dichloroethene was detected in all of the deep water table aquifer monitoring points. Benzene and toluene were detected in DV-8, on the upgradient side of the IRM area.

3.0 Recommendations

Reactivation of the sparge system may be considered based on the results of monitoring at FH-X-12. TCE concentrations measured in this well (558 ppb in April and 604 ppb in July 2000) have exceeded the 500 ppb system reactivation level for two consecutive quarters. Sparge points recommended for reactivation in the area of FH-X-12 would be SS-1, SS-2, SS-9, SS-10, SS-11, and SS-14.

Additionally, sparging near SV-14 may be advisable due to the high TCE concentration detected in April (941 ppb) and the continued presence of refined petroleum related VOCs. Given the upgradient position of SV-14, the rebound of TCE after sparging was ceased, the presence of other VOCs, and a gray color and septic odor associated with this point, it may be possible that it is located at or near a source area. It is therefore recommended that additional subsurface investigation be performed near SV-14 to assess this possibility.

The closest sparge point to SV-14 is SS-15 located approximately 20 feet south of SV-14. The next closest point is SS-16, approximately 30 feet west of SV-14. It may be necessary to install an additional sparge point (or points) to remediate the SV-14 area if investigation confirms a source.

John LaBarge, P.E., Director
Harza No. 8334
August 30, 2000
Page 4

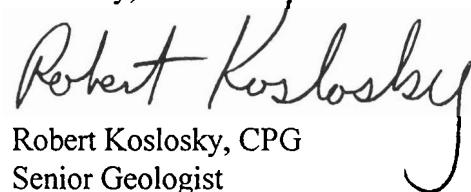

Quarterly groundwater monitoring should continue for the duration of active sparging and for one full year thereafter. The next monitoring event is scheduled for October 2000. This is the last event covered under the current project MAP.

As during the first phase of sparging, secondary sparging in the FH-X-12 and SV-14 areas should be performed until either cleanup objectives (two consecutive quarters below 100 ppb) or asymptotic conditions are achieved. During the subsequent post-sparging period, if TCE concentrations rebound above 500 ppb in any monitoring point(s) for two consecutive quarters, sparging of the area around the point(s) should be re-implemented.

In order to avoid additional sparge/rebound/sparge iterations beyond the secondary sparging, consideration may be given to modeling natural attenuation of the plume, and if modeling results are favorable (and with NYSDEC approval), decommissioning the IRM sparge system and implementing a long term scaled down monitoring program.

Harza thanks the NYSDOT for the opportunity to provide environmental services on the Barlow Road project. If you have any questions or comments, please call me at (315) 793-5000.

Sincerely,

The signature is handwritten in black ink, appearing to read "Robert Koslosky".

NOTES:

ND = Not Detected.

NYSDEC standards and guidance values from TOGS 1.1.1

Bold and shaded numbers equal or exceed standards or guidance values.

NA = Compound not analyzed for during sampling event.

NS = Well not sampled during sampling event.
