DATA ASSESSMENT

A sample delivery group containing analytical results for 14 aqueous samples was received from TestAmerica-Buffalo on 11Jul22. The samples were collected from the Cortland County Towslee Landfill site between 06Jun22 and 08Jun22, as required by 6 NYCRR Part 360 (10/94). The ASP deliverables package included formal reports, raw data, the necessary QC, and supporting information for Baseline Parameters Monitoring. CD-1, CD-1RA, DUP-CD-1RA, MW-2A, MW-6A and MW-7A were also analyzed for dissolved metals. The samples were identified by Chain of Custody documents and trackable through the work of TestAmerica-Buffalo, the laboratory contracted for analysis. Laboratory data was evaluated according to the Quality Assurance / Quality Control Requirements of the New York State Department of Environmental Conservation's Analytical Services Protocol, September 1989, Rev. 07/2005. When the required protocol was not followed, the current EPA Region II Functional Guidelines (SOP HW-33, Rev. #3, March 2013, Low/Medium Volatile Data Validation, and SOP HW-2a, Rev. 15, December 2012, ICP-AES Data Validation) were used as a technical reference.

To satisfy the requirement for 5% data validation, data calculations relating to CD-1 were examined in detail. All of the available QA/QC information was then applied to an evaluation of each program sample.

Four samples were collected on 06Jun22 and ten were collected on 08Jun22. Each group of samples was packaged with a trip blank and delivered to the Syracuse office of Eurofins on the day of collection. They were then shipped to the Buffalo laboratory, via FedEx, and were received the next day.

At the time of receipt, the sample coolers were found to be intact and properly chilled. Fourteen cooler temperatures ranging between 2.8°C and 4.0°C were recorded at that time.

Proper sample preservation was documented in the field custody records and verified in the laboratory at the time of receipt. A pH<2 was obtained from each VOC sample at the time of analysis, documenting that each VOC sample was properly stabilized.

Laboratory analyses were well organized and supported by the raw data. Each analysis incorporated the QA/QC requirements of ASP protocol. Areas where ASP requirements were not completely satisfied are addressed below. A detailed discussion of the review process follows.

LEACHATE INDICATORS

Test methods for the determination of Leachate Indicators utilize classical wet chemistry techniques. These methods were performed well and demonstrated an acceptable level of quality control. Areas of concern are addressed below.

It is noted that the laboratory instruments used for the analysis of alkalinity, TKN, sulfate and chloride were programmed to produce results in units of concentration, directly. Instrument response was not provided. This made it impossible to verify the calculations used to obtain the reported concentrations of these analytes.

HOLDING TIME

The samples from SDG 480-198813 were collected on 06Jun22 and analyzed on 22Jun22. This exceeded the program's fourteen-day holding time limitation by two days. The alkalinity results from SDG 480-198813 have been qualified as estimations due to this error.

BLANKS

Alkalinity

Although one instrument blank contained 5.31 mg/l of alkalinity, data qualifications are not required because five clean blanks separated the contaminated blank from the analysis of the first program sample.

Cyanide

A cyanide method blank that was associated with this group of samples produced a concentration of 0.010 mg/l. A similar artifact was found in MW-1B (0.011 mg/l). Cyanide should be interpreted as undetected in this sample and a detection limit equaling the reported concentration should be assumed.

CALIBRATION

Chloride

Poor performance was reported for one initial chloride calibration standard (ICV) and one low level chloride check standard (CCVL). Although these standards produced positive results, both were reported as negative. These issues are not considered significant, however, because both standards were separated from program samples by at least ten check standards (CCV) that were recovered successfully.

Total Organic Carbon (TOC)

Two low level TOC standards that were associated with this delivery group produced unacceptable recoveries of 59% and 170%. Based on this performance, the TOC results from this project have been qualified as estimations.

SPIKES

Alkalinity and Total Kjeldahl Nitrogen (TKN)

CD-1 was spiked with alkalinity and TKN was added to MW-2A. In each of these cases the concentration found in the original sample exceeded four times the level of the added spike. Based on these observations, the associated alkalinity and TKN results have been left unqualified.

Cyanide and Phenolics

CD-1 was spiked with phenolics and cyanide was added to MW-1B. Both of these spiked samples produced low recoveries. Based on

this performance, the phenolics and cyanide results from SDG 480-198720 have been qualified as estimations.

Sulfate and Chloride
MW-2S was spiked with chloride and sulfate was added to MW-6A. The chloride spike produced a recovery of 60% and sulfate produced a result of 136%. Based on these indications of bias, the chloride and sulfate results from SDG 480-198813 have been qualified as estimations.

INORGANICS

The analysis of each metal was associated with the appropriate quality control checks, as defined by ASP protocol. The QC associated with this group of samples satisfied most of these requirements. The exceptions are addressed below.

Blanks
Blanks are analyzed to evaluate various sources of sample contamination. Field blanks monitor sampling activities. Preparation blanks are carried through the digestion process with each group of samples to evaluate general laboratory technique. Calibration blanks are run periodically to verify instrument integrity. Samples are considered compromised by conditions causing contamination in any blank.

An initial blank (ICB) was analyzed following the calibration in each analytical sequence. Additional blanks were analyzed after every ten samples (CCB) and at the end of each sequence. A preparation blank was digested and analyzed with this group of samples. These blanks produced one barium result that exceeded the laboratory's reporting limit. This indication of positive bias, however, warrants no concern because the barium concentrations found in this group of samples exceeded the range requiring data qualifications.

VOLATILE ORGANIC ANALYTES

Each VOA analysis incorporates several quality assurance checks to demonstrate the precision and accuracy of laboratory measurements. These include the addition of surrogates and internal standards to every calibration standard, blank and program sample. A matrix spiked sample, a matrix spiked duplicate, and a spiked blank are also analyzed with each group of samples. ASP protocol defines acceptance criteria for each of these evaluations. Most of these requirements were satisfied. The exceptions are addressed below.

Matrix Spikes
Matrix spiking refers to the addition of known analyte concentrations to a sample, prior to analysis. Analyte recoveries provide an indication of laboratory accuracy. The analysis of a duplicate spiked aliquot provides a measurement of precision.

Although a sample from this delivery group was not selected for matrix spiking, three spiked blanks (LCS/LCSD,LCS) were analyzed with this group of samples. These spiked blanks produced high recoveries of 2-butanone (171%,170%) and vinyl acetate (143%,138%). These indications of positive bias, however, warrant no concern because 2-butanone and vinyl acetate were not detected in the samples from this project.

CORRECTNESS AND USABILITY

Data from this group of samples is felt to be technically correct and completely usable in its present form. Data presenting a usable estimation of the conditions at the time of sampling has been flagged "J" or "UJ". Estimated data should be used with caution.

Two facts should be considered by all data users. No compound concentration, even if it has passed all QC testing, can be guaranteed to be accurate. Strict QC serves to increase confidence in data, but any value potentially contains error. Secondly. DATAVAL, Inc. guarantees the quality of this data assessment. However, DATAVAL, Inc. does not warrant any interpretation or utilization of this data by a third party.

Landfill Inspection

Towslee Landfill, Cortland County

Towslee Landfill Routine Inspection

Inspection Date 8/3/22 Quarter 3 Inspected by K. McGrath

Procedures for correction of any deficiencies, if needed, are described in the Towslee Landfill Revised 2006 Monitoring Plan.

Inspection Notes - Areas examined in detail (walked) are indicated on the attached map; inspection photos follow. Most of the landfill could be observed from the areas walked. Areas inspected in detail will vary from inspection to inspection.

Site Security - Access controlled? Perimeter fencing?

Towslee Landfill is part of a much larger County property. This property is not fully enclosed with a perimeter fence. However, the only access by road is access restricted with a lockable gate that is locked except during hours of operation. Entrance to the landfill is visually monitored by staff at the weight building.

Monitoring Wells - Wells identified? Wells locked? Surface sealed?

Wells were not examined during the inspection because they are regularly observed during quarterly sampling. All wells have caps. They are not usually locked. All appear to be surface sealed with no apparent infiltration or drainage adjacent to the well casings.

Cap System - Cracking in cover soils?

No soil cracking was observed in either area walked.

Settlement in cover soils?

No settlement was observed anywhere in areas walked and observed in detail.

Erosion or loss of vegetation in the cover soils?

Small areas of bare soil were observed in each area typically associated with groundhog holes, sharp turning radius of mowers, or on steeper slopes along the edge of the cap and associated with mowing. Areas were small and shallow. In only one location was the rolled erosion product used during vegetation establishment observed. Protective cover fabric was never observed except at the landfill margin.

Mowed biannually?

It is not known whether the landfill is mowed biannually; however, the entire landfill was mowed and no woody vegetation was observed anywhere on the landfill.

<u>Drainage System</u> - Is there any erosion of the ground surface in the area of the toe of slope where water discharges from the soil drainage layer?

Very small patches of bare soil were observed on the landfill immediately above the edge. No erosion was observed below the landfill edge. All drainage areas observed were thickly vegetated with grass and brush.

Are all perimeter swales, downchutes and culverts performing properly?

The southern downchute and all swales and culverts appear to be functioning properly. No sheet erosion or rilling was observed during the inspection.

<u>Gas Venting System</u> - Is there any physical damage or plugging of the vents?

No vents observed were plugged and all vents observed were in good condition. The outlet rims of some vents were slightly damaged with edges broken off. This should not affect function. Woodchuck damage was observed adjacent to several gas vents. One T-structure on the extreme north end was disengaged from its base, tipped over and non-functional.

Has there been any settlement in the cap adjacent to the vents?

No settlement in the cap was observed adjacent to the vents.

<u>Vectors</u> - Are there any vectors present on the site?

Woodchuck damage was observed adjacent to several gas vents. They did not appear to be affecting gas flow or function of the venting system generally.

<u>Access Roads</u> - Are there any signs of erosion or excessive wear?

Access roads were in general in good condition and fully functional. In some areas significant potholes exist and/or drainage is poor. In many areas the road is on bedrock or soils are heavily compacted such that infiltration is poor.

<u>Management Recommendations</u>

None at this time.
