1991 YEARLY REPORT
GROUNDWATER MONITORING SYSTEM
NORTHEAST ENVIRONMENTAL SERVICES, INC.
TOWN OF LENOX

INTRODUCTION

The Northeast Environmental Services, Inc. (NES) T.S.D. facility on Canal Road in the Town of Lenox, New York is the site of a groundwater quality investigation. A groundwater monitoring system, comprised of twenty-four (24) two-inch diameter monitoring wells and one six-inch diameter monitoring well, has been installed at the site. Groundwater samples have been collected from monitoring wells in the groundwater monitoring system on a quarterly basis during 1991. The following report summarizes the groundwater monitoring investigation results for 1991.

INTEX has developed a Groundwater Monitoring Plan for the NES site. The Groundwater Monitoring Plan will be implemented at the site beginning with the first quarter of 1992. All sampling and reporting of results as of that date will be in accordance with the provisions of the plan.

This report will serve as a supplement to other hydrogeologic reports that have recently been submitted to the NYSDEC for the NES facility (Groundwater Monitoring Plan, RFI Report: Groundwater). It is intended to serve as a transitional document between quarterly reports that have previously been forwarded to NYSDEC and more formal future reports which will follow the guidelines of the Groundwater Monitoring Plan.

During the first three sampling events (1st, 2nd and 3rd quarters) in 1991, groundwater samples were collected from the following monitoring wells: WP2S, WP2D, WP3S, WP3D, WP4S, WP4D, WP8S, WP8D, WP11S and Test Well D-T-1. The groundwater samples were analyzed at a New York State approved laboratory for Aromatic Volatile Organic Compounds (EPA 8020), Chlorinated Volatile Organic Compounds (EPA 8010), Total Metals (Arsenic, Barium, Chromium, Lead, Mercury and Nickel) and Soluble Metals (Arsenic, Barium, Chromium, Lead, Mercury and Nickel). Upon the effective date of the facilities Part 373 permit, groundwater monitoring samples were collected from Monitoring Wells WP5S, WP5D, WP8S, WP8D, WP9S and WP9D in accordance with the required quarterly monitoring during the December (4th quarter) 1991 sampling event. The December 1991 samples were collected in an identical manner as the samples collected during the previous three sampling events.

After the collection of the June 1991 groundwater monitoring samples, NES, Inc. reached an agreement with FLI Environmental Services to perform the analysis of the groundwater samples collected from the groundwater monitoring system.

DEPTH TO GROUNDWATER AND HYDRAULIC GRADIENT

COLLECTION OF GROUNDWATER ELEVATION DATA

During the March 1991, June 1991 and September 1991 groundwater sampling events at the NES, Inc. facility, depth to water data was collected from Monitoring Wells WP11S, WP2S, WP2D, WP3S, WP3D, WP4S, WP4D, WP8S, WP8D and Test Well D-T-1. The depth to water table level measurements were collected using the following procedure:

1. The monitoring well was unlocked and inspected for tampering or vandalism.
2. A calibrated HnU photoionizing detector was used to measure the levels of Volatile Organic Compounds inside the well casing and in the work space.
3. An electronic water level indicator probe was lowered into the monitoring well until contact with the water table's upper surface was indicated.
4. The depth to water was measured to the nearest 1/100th of a foot from the pre-labeled well measuring point.
5. The water level indicator probe and cord were decontaminated to prevent the transfer of contamination between walls using an alconox wash, tap water rinse and a distilled water rinse.

Note: All water and sediment generated during decontamination of the water level indicator was contained on site for proper treatment and/or disposal.

Depth to water table level data was collected from each monitoring well in the groundwater monitoring system during the December 1991 sampling event. The depth to water data was collected in an identical manner as described above.

DEPTH TO WATER DATA/WATER TABLE ELEVATION

The depth to water measurements for the March 1991, June 1991, September 1991 and December 1991 sampling events were recorded in Table 1 (March 1991), Table 2 (June 1991), Table 3 (September 1991) and Table 4 (December 1991). The monitoring well measuring point survey elevation, and depth to water measurements were used to calculate the water table elevation for each monitoring well. The water level elevations for each monitoring well are included in each table listed above.

GROUNDWATER CONTOUR MAPS

Groundwater contour maps were prepared from the water table elevations obtained from the December 1991 depth to water table measurements. Separate groundwater contour maps were prepared to diagram the water level elevations for the monitoring wells installed with shallow screening and for the monitoring wells

installed with deeper screening. The groundwater contour maps are included in Appendix I. The maps included in this report were prepared using the data from December of 1991. This was the only sampling event in 1991 when water levels were collected from all of the monitoring points.

The contour maps for both the shallow and deep zones beneath the site indicate a hydraulic gradient that generally trends to the north, tending to the northeast toward Dutch Settlement Creek, near the northern property boundary.

Both maps indicate the existence of a groundwater divide in the center of the site. The divide is more pronounced in the shallow zone than the deeper zone. This is an unusual hydraulic feature on such a small scale. It may be related to the drainage swales on the property acting as groundwater sumps.

GROUNDWATER QUALITY**SAMPLING PROCEDURE**

Groundwater monitoring samples were collected from the groundwater monitoring system installed at the NES facility. The samples were collected according to the following procedure:

- 1) A HnU Photo-Ionizing Detector was checked for calibration accuracy using a standard isobutylene gas.
- 2) The well was unlocked and inspected for vandalism and/or tampering.
- 3) The HnU Photo-ionizing Detector (PID) was used to measure background levels of Volatile Organic Compounds.

- 4) The well was opened and the PID used to measure Volatile Organic Compound levels inside the well riser casing and in the work space.
- 5) The depth to the groundwater level was measured from a pre-labeled location on the well casing. This was accomplished using a water level indicator.
- 6) The total well depth was measured from the pre-labeled location on the well casing.

Note: The water level indicator was decontaminated between well locations to prevent the transfer of contaminants between wells.

- 7) The volume of water contained in each well was calculated.
- 8) Each monitoring well was bailed prior to sampling using a decontaminated disposable bailer so that at least three times the well's calculated volume was removed.

Note: During the bailing of each well care was taken to avoid excessive draw down and any splashing of the bailer that might cause the release of Volatile Organic Compounds.

Note: All waste water generated as a result of bailing the monitoring wells was containerized on site. Each drum was labeled as to its contents.

- 9) The well was allowed to recover after bailing for a period not exceeding two (2) hours.
- 10) The depth to water was measured prior to sampling after the well was allowed to recover. A water level indicator was used to measure the depth to water from a pre-labeled location on the well casing. The water level indicator was decontaminated between uses to prevent the transfer of contaminants between wells.
- 11) Two additional bailer volumes were removed prior to sampling.
- 12) The samples were collected in the following order: 1) Volatile Organic Compounds and 2) Total and/or Soluble Metals.
- 13) The samples were collected in laboratory supplied decontaminated sample containers. The containers had been labeled immediately prior to sampling.
- 14) The samples were placed, along with the completed Chain of Custody Form, in the cooler provided for storage and transport.
- 15) The samples were delivered to a New York State approved laboratory for analysis.

- 16) A trip blank, prepared by the laboratory, accompanied the samples.
- 17) All sampling and measurement equipment was decontaminated after completing the sampling of each well or at any time where the equipment may have been contaminated. The decontamination procedure used is as follows:
 - a) The equipment was rinsed with tap water so that all sediment and debris was removed.
 - b) The equipment was brush washed using an Alconox detergent solution.
Note: An Alconox saturated paper towel was used to wash the water level indicator cord.
 - c) The equipment was rinsed with tap water.
Note: A saturated paper towel was used to rinse the water level indicator cord.
 - d) The equipment was rinsed with distilled water.
Note: A saturated paper towel was used to rinse the water level indicator cord.
 - e) The equipment was set in a non-contaminated location to air dry. All bailers were wrapped in aluminum foil after decontamination.
Note: All liquids and sediments generated during the decontamination of equipment was containerized on site in drums. Each drum was labeled as to its contents.
- 18) The wells were closed and locked.
- 19) Monitoring Well Sampling Data Sheets (MWSDS) were completed to document the procedures used and observations during the bailing and sampling of the monitoring wells.

LABORATORY ANALYTICAL RESULTS

The laboratory analytical results report forms for the groundwater samples collected from the groundwater monitoring system at the NES facility were previously forwarded to the New York State Department of Environmental Conservation (NYSDEC) on the following dates:

1st Quarter (March 18-20, 1991) - April 29, 1991
2nd Quarter (June 24-26, 1991) - August 6, 1991
3rd Quarter (September 19, 1991) - November 6, 1991
4th Quarter (December 19, 1991) - February 13, 1992

Copies of the Laboratory Analysis Results Reports are included in Appendix 2 (March 1991), Appendix 3 (June 1991), Appendix 4 (September 1991) and Appendix 5 (December 1991).

The laboratory analysis results for each sampling event are summarized in the following tables in this report.

Table 5: March 1991 Analytical Results Summary

Table 6: June 1991 Analytical Results Summary

Table 7: September 1991 Analytical Results Summary

Table 8: December 1991 Analytical Results Summary

The laboratory analytical results for each monitoring well are tabulated in Appendix 6. Each table in Appendix 6 includes all of the 1991 analytical data for each compound detected.

The analytical data is arranged by sampling event to assist in identifying trends that may be occurring in the results. The groundwater protection concentrations established for the site for each listed compound are included in each table to assist in comparing the observed levels to the groundwater protection concentration.

DISCUSSION OF LABORATORY ANALYTICAL RESULTS

The 1991 analytical results have been reviewed to identify trends in the results. Large fluctuations in the levels of organic compounds were observed in the analytical results for each monitoring well. Further investigation and review of analytical data will be required to identify specific trends in the data.

ISOCONCENTRATION MAPS

Isoconcentration maps and cross-sections were constructed to illustrate the distribution of total volatile organics in the groundwater at NES. Data from the sampling event of September 1991 were used to construct these maps, since it was during this event that wells were sampled which typically contain the highest concentrations of volatiles. Isoconcentration maps and cross-sections are contained in Appendix I.

The isoconcentration maps and cross-sections indicate the highest concentrations of volatiles are present in the shallow zone in the vicinity of the well 4 pair. Concentrations decrease significantly in the deep zone and in the downgradient direction. The furthest downgradient well that was sampled was the well 8 pair. Concentrations of volatiles in these wells were 80 ug/l as compared to 50,501 ug/l at well 4.

GROUNDWATER PROTECTION CONCENTRATIONS

The most recent groundwater quality monitoring data collected from each monitoring well was compared to the groundwater protection concentrations established in the Part 373 permit issued to NES, Inc. Table 9 lists the groundwater protection concentrations applicable to the site. The groundwater protection concentrations are included on the Monitoring Well Sample Analysis Results Summaries located in Appendix 6

Monitoring Well WP2S

The most recent groundwater quality monitoring data available for Monitoring Well WP2S was collected during the September 1991 sampling event. The laboratory analysis results indicate that the groundwater collected from Monitoring Well WP2S exceeded the groundwater protection concentrations for the following compounds: Total Arsenic, Total and Dissolved Barium, Total and Dissolved Lead, Benzene and Toluene.

Monitoring Well WP2D

The most recent groundwater quality monitoring data available for Monitoring Well WP2D was collected during the September 1991 sampling event. The laboratory analysis results indicate that the groundwater collected from Monitoring Well WP2D exceeded the groundwater protection concentrations for the following compounds: Benzene, Toluene, Ethylbenzene, Xylenes, Vinyl Chloride, Cis-1,2-dichloroethene and 1,1-dichloroethene.

Monitoring Well WP3S

The most recent groundwater quality monitoring data available for Monitoring Well WP3S was collected during the September 1991 sampling event. The laboratory analysis results indicate that the groundwater collected from Monitoring Well WP3S exceeded the groundwater protection concentrations for the following compounds: Total and Dissolved Barium, Vinyl Chloride, Trans-1,2-dichloroethane, 1,1-dichloroethane and Cis-1,2-dichloroethene.

* Applies to sum of para (1,4-) and ortho (1,2-) isomers only.

*** Total includes all species in the groundwater that contain this element.

Monitoring Well WP3D

The most recent groundwater quality monitoring data available for Monitoring Well WP3D was collected during the September 1991 sampling event. The laboratory analysis results indicate that the groundwater collected from Monitoring Well WP3D exceeded the groundwater protection concentrations for the following compounds: Toluene, Xylenes, Vinyl Chloride, cis-1,2-dichloroethene and 1,1-dichloroethene.

Monitoring Well WP4S

The most recent groundwater quality monitoring data available for Monitoring Well WP4S was collected during the September 1991 sampling event. The laboratory analysis results indicate that the groundwater collected from Monitoring Well WP4S exceeded the groundwater protection concentrations for the following compounds: Total and Dissolved Barium, Benzene, Toluene, Ethylbenzene, Xylenes, Vinyl Chloride, Trans-1,2-dichloroethane, 1,1-dichloroethane, Cis-1,2-dichloroethene, Chloroform, 1,1,1-trichloroethane, 1,2-dichloroethane, 1,1,2-trichloroethane, 1,1-dichloroethene, Dichlorodifluoro Methane and Tetrachloroethene.

Monitoring Well WP4D

The most recent groundwater quality monitoring data available for Monitoring Well WP4D was collected during the September 1991 sampling event. The laboratory analysis results indicate that the groundwater collected from Monitoring Well WP4D exceeded the groundwater protection concentrations for the following compounds: Total and Dissolved Barium, Toluene, Xylenes, Cis-1,2-dichloroethene and 1,1-dichloroethene.

Monitoring Well WP5S

Laboratory analysis results from the most recent (December 1991) sampling event indicate that the groundwater collected from Monitoring Well WP5S was in compliance with the groundwater protection concentrations established for the site.

Monitoring Well WP5D

The most recent (December 1991) laboratory analysis results indicate that the groundwater protection concentrations for Total and Dissolved Barium were exceeded in the groundwater sample collected from Monitoring Well WP5S.

Monitoring Well WP8S

The most recent (December 1991) analysis results indicate that the groundwater protection concentration for Total Lead was exceeded in the groundwater analyzed from Monitoring Well WP8S. Previous results (September 1991) have indicated that Total and Dissolved Lead were detected in groundwater collected from Monitoring Well WP8S at levels above the groundwater protection concentrations.

Monitoring Well WP8D

The December 1991 laboratory analysis results for groundwater samples collected from Monitoring Well WP8D indicate that the groundwater protection concentrations for Total and Dissolved Barium were exceeded. Previous samples (March 1991 and June 1991) detected the presence of Chloroethane at levels above the groundwater protection concentrations for that compound. The September 1991 analysis results detected the presence of Bromomethane (not Chloroethane) at levels similar to those observed previously for Chloroethane. Bromomethane had not been detected in any of the monitoring wells prior to the September 1991 sampling event and was

not detected in the December 1991 laboratory results. The levels of Chloroethane, previously detected, exceeded the groundwater protection concentrations.

Monitoring Well WP9S

The most recent (December 1991) laboratory analysis results indicate that the groundwater collected from Monitoring Well WP9S was in compliance with the groundwater protection concentrations established for the site.

Monitoring Well WP9D

The most recent (December 1991) laboratory analysis results indicate that the groundwater protection concentration for Total Lead was exceeded in the groundwater sample collected from Monitoring Well WP9D.

Monitoring Well WP11S

Monitoring Well WP11S is an upgradient monitoring well. The levels of Volatile Organic Compounds and metals observed in samples collected from Monitoring Well WP11S during 1991 were in compliance with the groundwater protection concentrations established for the site.

Test Well D-T-1

The most recent (September 1991) laboratory analytical results indicate that the following compounds were present at levels that exceeded the groundwater protection concentrations established for the site: Total and Dissolved Barium, Total and Dissolved Lead, Benzene, Toluene, Ethylbenzene, Xylenes, Vinyl Chloride, Chloroethane, 1,1-dichloroethane, cis-1,2-dichloroethene, 1,2-dichloroethane, 1,1-dichloroethene and Dichlorodifluoro Methane.

SUMMARY AND CONCLUSIONS

- 1) Hydraulic gradients in the deep and shallow zones trend north and northwest, which is consistent with past calculations. There appears to be a groundwater divide in the center of the site. This divide is probably not a continuously occurring feature. It may be caused by the drainage ditches at the perimeter of the property acting as sumps or low head zones.
- 2) High concentrations of volatile organics continue to exist in the shallow zone of the water table int he vicinity of well 4s. Concentrations of volatiles are significantly lower in the deeper zone and in the downgradient direction.
