**NYSDEC Spill No. 01-60024/PIN No. H-0529**  
SEM File: 3003.050.05.03

Dear Mr. DiGiulio:

The following provides a summary of operation, monitoring, and maintenance activities conducted by our firm in connection with the above-referenced project since our last monthly summary report dated May 7, 2003. This also serves to present the results of effluent monitoring conducted at Outfall 001A, pursuant to the requirements of the existing State Pollutant Discharge Elimination System (SPDES) Permit.

## Maintenance and Repairs

In general, the maintenance activities that have been conducted by SEM since the issuance of the last monthly summary report have included weekly system inspection and backflushing of the four carbon filters.

The air stripper unit was also dismantled on April 4, 2003, and the trays were manually scraped to remove mineral deposits. Additionally, the air exchange perforations in each tray bottom were reamed to clear deposits and restore proper air flow, thus allowing efficient stripping of VOCs from the influent water. The air stripper sump was cleaned of all residual mineral deposits and accumulated fine sand, and re-assembled. The system was restarted and observed to operate within normal parameters.

The carbon within the four carbon filters was also backflushed during each site visit by SEM personnel to remove accumulated mineral deposits. The backflushed water and mineral deposits were placed in six 55-gallon settling drums. The deposits were allowed to settle out of suspension and the clear liquid was transferred to the air stripper via a portable submersible pump at the outset of the subsequent weekly site visit.

A log of magnehelic readings for the air stripper that have been recorded since the cleaning event of April 4, 2003 is presented below. The magnehelic measures the air pressure in the air stripper sump where the fresh influent air is introduced. As the trays become fouled with mineral deposits the air pressure has been observed to rise due to the restricted air flow through the diffusion trays. Upon start-up of the system after the cleaning, the sump pressure was 11.5 inches of water column (w.c.). As of the May 28 site visit, the pressure had increased to 15 inches w.c. Prior to the April 4 cleaning, the air pressure had been observed to be 15.5 in. w.c. and represented a reading associated with heavy fouling of the trays.

**Tabulation of Magnehelic Readings**

Date	Magnehelic Reading (" w.c.)
4/3/03	11.5
5/7/03	14.5
5/13/03	14.75
5/20/03	14.75
5/28/03	15.0

Based on the above data, it is recommended that the trays be pressure washed in the near future in an attempt to reduce the fouling before it becomes necessary to disassemble the unit to clear the individual perforations of the trays.

As previously discussed with you, water has been observed on the floor of the remediation building during the recent site visits. This condition appears to have resulted from leakage from a number of leaking ball valves, and from the flanges (i.e., lids) of the carbon filters. Some improvement of this condition has been realized through re-tightening of bolts that secure the carbon flanges; however, leakage continues to occur from the ball valves, and, to a lesser degree, through the filter flanges. Based on these factors, SEM has developed plans for repair and minor modification of the GAC filter system. These modifications include the replacement of leaking ball valves with new valves with compatible seal components and the incorporation of vinyl nitrile hose assembly with Cam-and-Groove fittings to facilitate the backflushing procedure. The use of hose assemblies will reduce the number of ball valves required in the backflush operation and thus reduce future maintenance issues as well as the additional backpressure associated with ball valves. SEM plans to modify the plumbing configuration during the week of June 2<sup>nd</sup>. At that time, SEM plans to also commence the pilot study for iron precipitate control methods to prevent scale build-up and fouling of the stripper trays. SEM will make the required plumbing modifications in the air stripper discharge line to allow recirculation of the Super-Iron Out cleaning solution. Recirculation of the cleaning solution will coincide with the disassembly and modification of the GAC filter system to reduce downtime of the groundwater recovery treatment system.

**Sampling and Analysis/Operational Monitoring**

Weekly monitoring samples are collected from several points of the groundwater recovery and treatment system. Discrete samples are collected from each of the two influent sources (RW-1 and WP5D), post-air stripper/pre-GAC filter, and the treatment system effluent (Outfall 001A).

The samples are submitted to Life Science Laboratories, of East Syracuse, New York, for analysis via EPA 601/602 methodology for volatile organic compounds (VOC). The data generated from these analyses are used to assess the contaminant level of the influent waters, the operational efficiency of the air stripper, and the VOC removal capacity of the GAC filter backup system.

The sampling was conducted on the following dates:

- Week of April 28, 2003 (April 30)
- Week of May 5 (May 7)
- Week of May 12 (May 13)
- Week of May 19 (May 20)
- Week of May 26 (May 28)-Results Pending

The results of the analyses are summarized in the table included on the following page.

June 2, 2003

**Tabulation of Detected Compounds vs. SPDES Discharge Limitations**  
**System O&M Sampling**

Sampling Date	Detected Compound	RW-1 Influent	WP-5D Influent	Air Stripper Discharge	Final System Discharge (Outfall 01A)	SPDES Discharge Limit
4/30/03	Ethyl Benzene	14	ND	ND	ND	10
	Toluene	250	ND	ND	ND	10

June 2, 2003

Re: Groundwater Recovery and Treatment System O, M & M Summary-May 2003

Former Northeast Environmental Services, Inc. Site

A log of operational parameters and maintenance activities (ATTACHMENT A), and a tabulation of flow volumes vs. analysis results (ATTACHMENT B) are attached to allow convenient reference. Copies of the laboratory analysis results and sample custody documentation associated with the various sampling events are also attached.

The detection of VOC in both the air stripper discharge sample and the final effluent (Outfall 001A) are consistent with the magnehelic observations discussed above, indicating that the air stripper should be cleaned in the immediate future. As such, we will attempt to schedule this work to be conducted by Op-Tech prior to the initiation of the pilot study employing the Super Iron-Out product.

The next monthly summary of operation, monitoring and maintenance activities will be submitted in early June. Please feel free to contact our office if you have any questions or concerns in the interim.

Respectfully,

STRATEGIC ENVIRONMENTAL MANAGEMENT, Inc.

Date	Time	RW-1 Flow Totalizer (GPM)	WP-5D Flow Totalizer (GPM)	Activities/Comments
<b>June 2002</b>				
June 6	0845	5	12.5	194430      8 New flow meter/totalizer installed on RW-1; Carbon filters 3 and 4 back flushed.
June 11	1330	49090	11.5	227910      8 Carbon filters 1, 2, 3 and 4 back flushed; flow from recovery wells
June 13	1130	69830	11.2	241720      7.5 intermittent-air stripper discharge pump unable to handle flow from both wells. High water level interlock of air stripper shuts down operation of recovery wells periodically while water is transferred from lower tray of air stripper to carbon filters.
June 25	0830	198030	None	323710      None Groundwater recovery and treatment system operation discontinued to allow pipe from well WP-5D to be buried.
June 26	-	198030	None	323710      None Continuation of water line installation activities; system not operational.
June 27+	-	198030	None	323710      None Water line installation finalized by Op-Tech; determination that carbon in carbon filters requires change due to breakthrough detected at Outfall 001; Carbon ordered by Op-Tech, system no operational.
<b>July 2002</b>				
July 18	-	198030	None	323710      None Carbon in carbon filters 1,2,3 and 4 replaced by Op-Tech; system not operational.
July 19	1810	198030	11.5	323710      None Connected new water line that had been installed from WP-5D, attempts to prime water line from WP-5D and re-start system operation unsuccessful; system operation with RW-1 only resumed in pm.
July 21	1335	210220	11	323710      None System check, electrical line installed from remediation building to Outfall 001 area for flow meter that is positioned within V-notch weir.
July 22	--	--	--	-- Trouble shooting water pipe from well WP-5D to groundwater treatment system; WP-5D not operational; air pressure-test of line.
July 23	0910	-	11.5	323710      None Re- Excavation and replacement of buried water line from WP-5D to groundwater treatment system; priming new line; startup of system with WP-5D operational.
July 26	1130	236900	11.5	331160      7.0 System operation intermittent, as air stripper outlet pump is unable to handle volume from RW-1 and WP-5D; significant fouling of interior of stripper trays; new flow meter delivered to site for WP-5D.
July 31	1515	252830	11.0	342370      None Air Stripper cleaned by Op-Tech; only RW-1 turned back on-Pump of WP-5D not operational; troubleshooting revealed blown fuses-need to purchase new fuses for pump.

Notes: \* Influent piping equipped with digital flow meters not capable of totalizing flow until May 15 (WP-5D) and June 6 (RW-1).

<b>August 2002 (cont.)</b>						
August 28	1520	374270	None	366200	None	System not operational upon arrival, as air stripper discharge pump had been removed and cleaned/repaired by HOW Pumps of Liverpool, NY. Pump re-installed, and system placed into operation. System in full operation at 1555; pump for WP-5D was primed. Air stripper discharge pump now maintaining adequate drawdown in lower tray of stripper so that inflow from wells RW-1 and WP-5D is not interrupted due to high water level. Carbon filters 1 and 2 backflushed-very turbid; recommend backflush again on 8/29. Carbon filters 1 and 2 placed in operation; filters 3 and 4 not in operation at this time-may need to open all four at once if sediment buildup occurs too quickly to maintain adequate flow. Samples of influent from RW-1 and WP-5D; air stripper effluent (pre-carbon); and final system discharge (Outfall 001A) collected and submitted to Life Science Laboratories for analysis by EPA Methods 601 + 602.
	1603	374630	10.7	366250	6.6	
	1702	375260	10.0	366640	6.7	
	1720	375440	11.38	366760	7.4	
	1840	376350	Ave. = 10.96 GPM	367350	Ave. = 7.0 GPM	
August 29	1228	386320	11 GPM	373800	6.8 GPM	System operating properly upon arrival. Transferred water from 8/28 carbon backflush event to air stripper, and backflushed carbon filters 1 and 2. Influent flow discontinued from 1230 to 1304 for backflush procedure. Carbon filters 3 and 4 remain closed. System operation fine upon departure.
	1412	387110		374310		
<b>September 2002</b>						
Sept. 3		Not Recorded		Not Recorded		Carbon filters 1 and 2 backflushed; filters 3 and 4 remain closed.
Sept. 6		Not Recorded		Not Recorded		Carbon filters 1 and 2 backflushed; filters 3 and 4 remain closed.
Sept. 9	1451	501830	11.5 GPM	438660	5.5 GPM	Carbon filters 1 and 2 backflushed; filters 3 and 4 remain closed.
Sept. 12	1423	528940	12 GPM	451930	5.5 GPM	Carbon filters 1 and 2 backflushed; filters 3 and 4 remain closed.
Sept. 17	1231	576220	11 GPM	475670	6 GPM	Carbon filters 1 and 2 backflushed; filters 3 and 4 opened.
Sept. 21	1427	613330	11 GPM	494800	5.5 GPM	Upon arrival, air stripper discharge pump operating, but influent pumps from RW-1 and WP-5D not, due to high water level in air stripper. Carbon filter backpressure at 66 PSI prior to backflush event. Carbon filters 1, 2, 3, and 4 backflushed. Filters 3 and 4 most turbid; recommend backflush again on 9/23 or 9/24, as flow through filters 3 and 4 remained turbid. System operating without intermittent shutdown of influent pumps upon departure. Pressure reduced to 16 PSI following backflushing.

Notes: \* Influent piping equipped with digital flow meters not capable of totalizing flow until May 15 (WP-5D) and June 6 (RW-1).

Date	Time	Flow Totalizer (GPM)	RW-1 Flow Rate (GPM)	Flow Totalizer (GPM)	WP-5D Flow Rate (GPM)	Activities/Comments
<b>January 2003</b>						
January 3	PM	NA	NA	NA	NA	Visited site to check on GWT system operation and to collect samples for laboratory analysis. Could not access site or safely pull off road anywhere remotely near the site to walk to treatment building due to high volume of snow received during storm on this date. System inspection and sampling to occur after site access has been plowed.
January 7	0905	1297680	10 GPM	983460	6.1 GPM	GWT system operating upon arrival. Water from prior carbon backflushing event transferred to air stripper and carbon filters 1 through 4 backflushed. Rate of flow from air stripper discharge pump suggests that flow may be reduced somewhat, possibly due to iron/mineral buildup. Pump to be dismantled and inspected, and cleaned if necessary at time of next site visit. Operational monitoring and SPDES discharge samples collected.
January 14	1647	1363910	10.6 GPM	1026750	7 GPM	GWT system operating upon arrival-system operation slightly intermittent, due to high water level in air stripper sump, resulting in influent flow being occasionally interrupted for a short time. This may be indicative of decreased efficiency of air stripper discharge pump as a result of iron buildup, as encountered previously with this system. Water from prior backflush event transferred to air stripper; all four carbon filters backflushed. Filters 3 and 4 were most turbid.
January 22	1410	1427180	10 GPM	1068380	6.8 GPM	System operating intermittently upon arrival, due to buildup of water within air stripper sump-believed to be result of fouling of air stripper discharge pump and resultant reduced efficiency of pump operation. Air stripper discharge pump should be dismantled and cleaned to improve efficiency-to-be scheduled. Water from prior carbon backflush event transferred to air stripper; all four carbon filters backflushed. pH of system discharge measured at 8.8 s.u.
January 27	1615	1462600	10.1 GPM	1091610	7 GPM	System operating intermittently upon arrival, due to water buildup in air stripper sump. Air stripper discharge pump disassembled-impellers and pump head components placed in "CLR" iron/mineral removal product (commercially available); pump re-assembled and re-installed following cleaning. Used "CLR" solution remains in 5-gallon pail pending arrangements for disposal. Water from prior carbon backflushing transferred to air stripper; all four carbon filters backflushed. System operating okay upon departure.

Notes: \* Influent piping equipped with digital flow meters not capable of totalizing flow until May 15 (WP-5D) and June 6 (RW-1).

		Flow Totalizer	Flow Rate (GPM)	Flow Totalizer	Flow Rate (GPM)	
<b>February 2003</b>						
02/03/03	NA	NA	NA	NA	NA	Air stripper disassembled and cleaned by high-pressure water, and carbon within carbon filters replaced by Op-Tech.
02/04/03	1707	1511070	10 GPM	1123840	7 GPM	System operating fine upon arrival. pH of final discharge = 8.6 s.u.
02/11/03	1525	1543920	10.2 GPM	1147150	6.8 GPM	System operating intermittently upon arrival due to buildup of water within the air stripper sump. Combined influent flow continues to exceed rate of transfer from air stripper to carbon filters by the discharge pump. Pump rate of air stripper transfer pump is very slow. approx. 5.5 to 6 GPM. Piping between pump and carbon filters contains some iron buildup, but remains relatively open. Water from prior carbon backflush event transferred to air stripper; all four carbon filters backflushed.
02/20/03	1550	1607960	10 GPM	1190810	6.5 GPM	System operating intermittently upon arrival due to buildup of water within the air stripper sump. Combined influent flow continues to exceed rate of transfer from air stripper to carbon filters by the discharge pump. Pump rate of air stripper transfer pump is very slow. Water from prior carbon backflush event transferred to air stripper; all four carbon filters backflushed. pH of final discharge = 8.0 s.u.
02/27/03	0842	1653430	10 GPM	1222500	6.5 GPM	System operating intermittently upon arrival due to buildup of water within the air stripper sump. Combined influent flow continues to exceed rate of transfer from air stripper to carbon filters by the discharge pump. Pump rate of air stripper transfer pump is very slow. Water from prior carbon backflush event transferred to air stripper; all four carbon filters backflushed.
<b>March 2003</b>						
3/7/03	0807	1697690	10 GPM	1256640	6.5	System operating intermittently upon arrival due to buildup of water in air stripper sump. Water from prior backflush event transferred from settling drums to air stripper. All four carbon filters backflushed. Collected monitoring samples.
3/13/03	1150	1697710 0(new flowmeter)	11 GPM	1279290	6.5	Replaced RW-1 flow totalizer; Air stripper discharge pump disassembled and cleaned; carbon filters backflushed; collected monitoring samples. Ordered replacement pump impellers.
3/19/03	0937	72244	11 GPM	1321946	6.6	System operating upon arrival. Backflushed all four carbon filters, collected monitoring samples.

Notes: \* Influent piping equipped with digital flow meters not capable of totalizing flow until May 15 (WP-5D) and June 6 (RW-1).

Date	Time	RW-1 Flow Totalizer (GPM)	WP-5D Flow Totalizer (GPM)	Activities/Comments
3/31/03	NR	NR	NR	SEM personnel on site to inspect air stripper; observed obstruction of air exchange perforations, scheduled Op-Tech for more aggressive cleaning, system not restarted due to high operating pressures.
4/4/03	1512	148120	11 GPM	April 2003 Disassembled air stripper and manually scrapped trays, reamed out air perforation holes, and removed residue from stripper sump. Cleaned residue from floor sump, backflushed all four carbon filters, collected weekly monitoring samples. Magnehelic gauge=11.5 in. WC. upon restart of system.
4/10/03	1104	236050	11 GPM	System operating upon arrival, pumped settling drums to air stripper, backflushed all 4 carbon filters.
4/15/03	1105	313060	11 GPM	System operating upon arrival; floor wet; carbon drums dripping. Shut off ball valve from backflush hose of drum #2 overflowing settling drum. Collected monitoring samples including pH (from 001A). Magnehelic gauge=12 in. WC. Flow meter for WP-5D was not functioning.
4/23/03	1000	430810	10.5 GPM	Two to three inches of water on floor of shed upon arrival, two valves leaking in first set of carbon drums and drums leaking at flanges. Flow meter for WP-5D was not functioning, tapped on meter to clear sediment. Magnehelic gauge=13.5 in. WC.
4/30/03	1030	531876	10 GPM	System operating upon arrival, significant water accumulation (2 in.) on floor-cleaned up with sump pump-due to leak from ball valve on drum #1 back flow valve (1 1/2") Pumped out settling drums; collected monitoring data, samples and backflushed carbon filters. Magnehelic gauge=14 in. WC. Flow meter WP-5D functioning.
5/7/03	1055	631080	9.7 GPM	May 2003 1480660 6.2 GPM Two (2) inches of water accumulated on floor of treatment shed due to overflow of settling drums-leakage through backflush BV of drum #1 3/8 inch hose. Collected all data/samples; pumped out settling drums; backflushed carbon filters. Magnehelic gauge=14.5 in. WC.
5/13/03	937	711960	10.0 GPM	1533430 5.5 GPM Pumped out settling drums and floor sump; backflushed all four carbon filters, recorded system data (O&M); Recorded carbon filter layout for schematic; system monitoring samples collected by C. Bradford while doing quarterly sampling of monitoring wells. Magnehelic gauge=14.75 in. WC.

Notes: \* Influent piping equipped with digital flow meters not capable of totalizing flow until May 15 (WP-5D) and June 6 (RW-1).

NOTES: -Δ indicates number of gallons recovered from respective well since the air stripper was last cleaned.

-NR=Not Recorded

-ND=None Detected

NA=Not Applicable

ppb=Pars per billion (ug/L)

Cumulative gallons column reflects sum total of water volumes recovered from both wells since the prior air stripper cleaning.

\* Flow meter/totalizer for RW-1 was clogged and not recording flow-discovered and remedied on 11/18/02;actual flow for this period unknown. Subsequent total flows between this period and the December 20 air stripper cleaning may not be representative.

\* Sample of influent from RW-1 not available on September 24, 2002 due to broken sampling port-port subsequently replaced.

\*\* Flow meter/totalizer for RW-1 was not operating during the March 13, 2003 visit, the flow meter/totalizer was replaced; actual flow for this period is unknown. Subsequent total flows between this period and the March 31, 2003 air stripper cleaning may not be representative.

# Laboratory Analysis Report for the New York State Department of Environmental Conservation

## Contract Number: C200209

NYS DEC Spill #: 01-60024

NYS DEC Pin #: H-0529

LSL Project ID: 0306797

Receive Date/Time: 05/13/03 16:29 by: GS

"I certify that this laboratory has current ELAP certification to provide the analytical results in this report and that the data package is in compliance with the terms and conditions of the contract."

Life Science Laboratories, Inc. warrants, to the best of its knowledge and belief, the accuracy of the analytical test results contained in this report, but makes no other warranty, expressed or implied, especially no warranties of merchantability or fitness for a particular purpose. By the Client's acceptance and/or use of this report, the Client agrees that LSL is hereby released from any and all liabilities, claims, damages or causes of action affecting or which may affect the Client as regards to the results contained in this report. The Client further agrees that the only remedy available to the Client in the event of proven non-conformity with the above warranty shall be for LSL to re-perform the analytical test(s) at no charge to the Client. The data contained in this report are for the exclusive use of the Client to whom it is addressed, and the release of these data to any other party, or the use of the name, trademark or service mark of Life Science Laboratories, Inc. especially for the use of advertising to the general public, is strictly prohibited without express prior written consent of Life Science Laboratories, Inc. This report may only be reproduced in its entirety. No partial duplication is allowed. The Chain of Custody document submitted with these samples is considered by LSL to be an appendix of this report and may contain specific information that pertains to the samples included in this report. The analytical result(s) in this report are only representative of the sample(s) submitted for analysis. LSL makes no claim of a sample's representativeness, or integrity, if sampling was not performed by LSL personnel.
