DATA REVIEW FOR MCKESSON - BEAR STREET SITE

SDG# BEL0414

VOLATILE AND SEMIVOLATILE ANALYSES

Analyses performed by:

Buck Environmental Laboratories Cortland, New York

Review performed by:

Blasland, Bouck & Lee, Inc. Syracuse, New York

Summary

The following is an assessment of the data package for SDG # BEL0414 for sampling at the McKesson - Bear Street Site. Included with this assessment are the data review check sheets used in the review of the package and corrected sample results. Analyses were performed on the following samples:

Sample ID	LabID	Matrix.	Sample Date	Aı	nalysis Method	
				8260¹	8015²	8270 ³
DUP-1	0406218-06A	water	6/16/04	x	x	x_
MW-1	0406176-01 A	water	6/14/04	x	x	_x
MW-3S	0406176-02 A	water	6/14/04	x	_x	x
MW-8S	0406218-02A	water	6/16/04	x	x	x
MW-9S	0406195-02A	water	6/15/04	x	x	x
MW-274	0406218-03A	water	6/16/04	x	x	x
MW-29	0406218-09A	water	6/16/04	×	x	x

VOC Trip Blank-5	0406195-08A	water	6/15/04	_ x		
VOC Trip Blank-6	040621 8 -07A	water	6/16/04	x		
Alcohol Trip Blank-4	0406176-04A	water	6/14/04		x	
Alcohol Trip Blank-5	0406195-09A	water	6/15/04		x	

¹ VOC analyses for: methylene chloride, acetone, trichloroethene, benzene, toluene, ethylbenzene, and xylenes

² Alcohol analyses for: methanol

³ compounds include: aniline and N,N'-dimethylaniline

⁴ MS/MSD analyses performed on sample

VOLATILE ANALYSES
METHOD 8260

Introduction

Analyses were performed according to USEPA method 8260 as referenced in the NYSDEC ASP.

The data review process is an evaluation of data on a technical basis rather than a determination of contract compliance. As such, the standards against which the data are being weighed may differ from those specified in the analytical method. It is assumed that the data package represents the best efforts of the laboratory and had already been subjected to adequate and sufficient quality review prior to submission.

During the review process, laboratory qualified and unqualified data are verified against the supporting documentation. Based on this evaluation, qualifier codes may be added, deleted, or modified by the data reviewer. Results are qualified with the following codes in accordance with National Functional Guidelines:

- U The compound was analyzed for but not detected. The associated value is the compound quantitation limit.
- J The compound was positively identified; however, the associated numerical value is an estimated concentration only.
- B The compound has been found in the sample as well as its associated blank, its presence in the sample may be suspect.
- N The analysis indicates the presence of a compound for which there is presumptive evidence to make a tentative identification.
- JN The analysis indicates the presence of a compound for which there is presumptive evidence to make a tentative identification. The associated numerical value is an estimated concentration only.
- E The compound was quantitated above the calibration range.
- D Concentration is based on a diluted sample analysis.
- UJ The compound was not detected above the reported sample quantitation limit. However, the reported limit is approximate and may or may not represent the actual limit of quantitation.
- R The sample results are rejected.

Two facts should be noted by all data users. First, the "R" flag means that the associated value is unusable. In other words, due to significant QC problems, the analysis is invalid and provides no information as to whether the compound is present or not. "R" values should not appear on data tables because they cannot be relied upon, even as a last resort. The second fact to keep in mind is that no compound concentration, even if it has passed all QC test, is guaranteed to be accurate. Strict QC serves to increase confidence in data but any value potentially contains error.

Data Assessment

1. Holding Time

The specified holding time for volatile analyses under the Quality Assurance Project Plan (QAPP) is 7 days from sample receipt, the technical holding time is 14 days.

All samples were analyzed within the technical holding time.

2. Blank Contamination

Quality assurance blanks (i.e., method, trip, field, or rinse blanks) are prepared to identify any contamination which may have been introduced into the samples during sample preparation or field activity. Method blanks measure laboratory contamination. Trip blanks measure contamination of samples during shipment. Field and rinse blanks measure contamination of samples during field operations.

No target compounds were detected in the method or trip blanks.

3. Mass Spectrometer Tuning

Mass spectrometer performance was acceptable.

4. Calibration

Satisfactory instrument calibration is established to insure that the instrument is capable of producing acceptable quantitative data. An initial calibration demonstrates that the instrument is capable of acceptable performance at the beginning of an experimental sequence. The continuing calibration verifies that the instrument daily performance is satisfactory.

4.1 Initial Calibration

The method specifies various percent relative standard deviation (%RSD) limits for select compounds and allows two outliers. A technical review of the data applies a RSD limit of 30% to all compounds with no exceptions.

The %RSD were less than 30% and the response factors were greater than 0.05 for all compounds.

4.2 Continuing Calibration

All continuing calibration standards were within 25% difference (%D) of the initial calibration.

5. Surrogates / System Monitoring Compounds

All samples to be analyzed for organic compounds are spiked with surrogate compounds prior to sample preparation to evaluate overall laboratory performance and efficiency of the analytical technique.

Recovery for one surrogate was below control limits in samples MW-33, TW-02R and MW-36. Data in the listed samples have been qualified as estimated based on the deviations. All other surrogate recoveries were within control limits.

6. Internal Standard Performance

Internal standard performance criteria insure that the GC/MS sensitivity and response are stable during every experimental run.

All internal standard areas and retention times were within established limits.

7. Compound Identification

Target compounds are identified on the GC/MS by using the analyte's relative retention time and ion spectra.

Methylene chloride, toluene and trichloroethene in sample MW-8S and methylene chloride in sample MW-8S DL were detected above the linear range. Data for trichloroethene in sample MW-8S have been replaced with data from dilution analyses, MW-8S DL, and data for methylene chloride have been replaced with data from the second dilution analyses, MW-8S DL2. All other identified compounds met the specified criteria.

8. Matrix Spike/Matrix Spike Duplicate/Matrix Spike Blank

Matrix and matrix spike duplicate (MS/MSD) data are used to assess the precision and accuracy of the analytical method relative to the sample matrix. Matrix spike blank (MSB) data is used to assess the precision and accuracy of the analytical method independent of matrix interferences.

All matrix spike and matrix spike duplicate recoveries and relative percent differences between recoveries were within control limits. All matrix spike blank recoveries were also within control limits.

9. Field Duplicates

Results for duplicate samples are summarized as follows:

Sample ID/ Duplicate ID	Analyte	Sample Result	Duplicate Result	RPD
MW-27 / DUP-1	acetone	23J	21J	<crdl< td=""></crdl<>

Sample ID/ Duplicate ID	Analyte	Sample Result	Duplicate Result	RPD
	benzene	5J	5J	<crdl< td=""></crdl<>
	ethylbenzene	2J	3J	<crdl< td=""></crdl<>
MW-27 / DUP-1	toluene	4J	8J	<crdl< td=""></crdl<>
	m,p-xylene	31	5J	<crdl< td=""></crdl<>
	o-xylene	3J	4J	<crdl< td=""></crdl<>

The duplicate results are acceptable.

10. System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines listed in the analytical method.

Volatile Organics Data Validation Checklist YES NO NΑ Data Completeness and Deliverables Have any missing deliverables been received and added to the data package? X Is there a narrative or cover letter present? Х Are the sample numbers included in the narrative? Χ Are the sample chain-of-custodies present? Х Do the chain-of-custodies indicate any problems with sample receipt or sample condition? Holding Times Have any holding times been exceeded? Χ Surrogate Recovery Are surrogate recovery forms present? Are all the samples listed on the appropriate surrogate recovery form? Was one or more surrogate recoveries outside of specified limits for any sample or blank? Χ If yes, were the samples reanalyzed? Matrix Spikes Is there a matrix spike recovery form present? Χ Were matrix spikes analyzed at the required frequency? Х How many spike recoveries were outside of QC limits? 0 out of 6 How many RPDs for matrix spike and matrix spike duplicate were outside of QC limits? __0_ out of __3__ Blanks Is the method blank summary form present? Χ Has a method blank been analyzed for each set of samples or for each 20 samples, whichever is more frequent? X Has a blank been analyzed at least once every twelve hours for each system used? Do any method/reagent/instrument blanks have positive results? Are there trip/field/rinse/equipment blanks associated with every sample? Do any trip/field/rinse blanks have positive results? Χ

Volatile Organics Data Validation Checklist - Page 2 YES NO NA Tuning and Mass Calibration Are the GC/MS tuning forms present for BFB? Х Are the bar graph spectrum and mass/charge listing provided for each BFB? Χ Has a BFB been analyzed for each twelve hours of analysis per instrument? Х Have the ion abundance criteria been met for each instrument used? Target Analytes Is an organics analysis data sheet present for each of the following: Samples X Matrix spikes X Blanks Are the reconstructed ion chromatograms present for each of the following: Samples Χ Χ ____ Matrix spikes X Blanks X Is the chromatographic performance acceptable? Are the mass spectra of the identified compounds present? Х Is the RRT of each reported compound within 0.06 RRT units of the continuing calibration standard? Χ Are all ions present in the standard mass spectrum at a relative intensity of 10% or greater also present in the sample spectrum? Х Do the samples and standard relative ion intensities agree within 20%? Tentatively Identified Compounds Are all the TIC summary forms present? Are the mass spectra for the tentatively identified compounds and there associated "best match" spectra present? Are any target compounds listed as TICs?

Are all ion present in the reference mass spectrum with a relative intensity greater than 10% also present in the

sample mass spectrum?

Volatile Organics Data Validation Checklist - Page 3 YES NO NΑ Do the TIC and "best match" spectrum agree within 20%? Χ Quantitation and Detection Limits Are there any transcription/calculation errors in the Form 1 results? Are the reporting limits adjusted to reflect sample dilutions, and for soils, sample moisture? Χ Standard Data Are the quantitation reports and reconstructed ion chromatograms present for the initial and continuing calibration standards? Initial Calibration Are the initial calibration forms present for each instrument used? Χ Are the response factor RSDs within specified limits? Are the average RRF equal to or greater than minimum requirements? Are there any transcription/calculation errors in reporting the RRF or RSD? Continuing Calibration Are the continuing calibration forms present for each day and each instrument? Χ Has a continuing calibration standard been analyzed for each twelve hours of analysis per instrument? All %D within acceptable limits? Χ Are all RF equal to or greater than minimum requirements? Χ Are there any transcription/calculation errors in reporting of RF or %D? Internal Standards Are internal standard areas of every sample and blank within the upper and lower limits for each continuing calibration? Χ Are the retention times of the internal standards within 30 seconds of the associated calibration standard? Field Duplicates Were field duplicates submitted with the samples?

VOLATILE ANALYSES METHOD 8015

Introduction

Analyses were performed according to USEPA method 8015 as referenced in the NYSDEC ASP.

The data review process is an evaluation of data on a technical basis rather than a determination of contract compliance. As such, the standards against which the data are being weighed may differ from those specified in the analytical method. It is assumed that the data package represents the best efforts of the laboratory and had already been subjected to adequate and sufficient quality review prior to submission.

During the review process, laboratory qualified and unqualified data are verified against the supporting documentation. Based on this evaluation, qualifier codes may be added, deleted, or modified by the data reviewer. Results are qualified with the following codes in accordance with National Functional Guidelines:

- U The compound was analyzed for but not detected. The associated value is the compound quantitation limit.
- J The compound was positively identified; however, the associated numerical value is an estimated concentration only.
- B The compound has been found in the sample as well as its associated blank, its presence in the sample may be suspect.
- N The analysis indicates the presence of a compound for which there is presumptive evidence to make a tentative identification.
- JN The analysis indicates the presence of a compound for which there is presumptive evidence to make a tentative identification. The associated numerical value is an estimated concentration only.
- E The compound was quantitated above the calibration range.
- D Concentration is based on a diluted sample analysis.
- UJ The compound was not detected above the reported sample quantitation limit. However, the reported limit is approximate and may or may not represent the actual limit of quantitation.
- R The sample results are rejected.

Two facts should be noted by all data users. First, the "R" flag means that the associated value is unusable. In other words, due to significant QC problems, the analysis is invalid and provides no information as to whether the compound is present or not. "R" values should not appear on data tables because they cannot be relied upon, even as a last resort. The second fact to keep in mind is that no compound concentration, even if it has passed all QC test, is guaranteed to be accurate. Strict QC serves to increase confidence in data but any value potentially contains error.

Data Assessment

1. Holding Time

The specified holding time for volatile analyses under the Quality Assurance Project Plan (QAPP) is 7 days from sample receipt. The technical holding time is 14 days from sample collection to analysis.

All samples were analyzed within the specified holding time.

2. Blank Contamination

Quality assurance blanks (i.e., method, trip, field, or rinse blanks) are prepared to identify any contamination which may have been introduced into the samples during sample preparation or field activity. Method blanks measure laboratory contamination. Trip blanks measure contamination of samples during shipment.

No target compounds were detected in the method or trip blanks.

3. Calibration

Satisfactory instrument calibration is established to insure that the instrument is capable of producing acceptable quantitative data. An initial calibration demonstrates that the instrument is capable of acceptable performance at the beginning of an experimental sequence. The continuing calibration verifies that the instrument daily performance is satisfactory.

3.1 Initial Calibration

The method specifies a percent relative standard deviation (%RSD) limit of 20% or, alternately, a correlation coefficient of 0.99 or greater.

The initial calibration was acceptable.

3.2 Continuing Calibration

All continuing calibration standards were within 15%D of the initial calibration.

4. Compound Identification

Target compounds are identified by using the analyte's retention time.

No target compounds were identified in the samples.

5. Matrix Spike/Matrix Spike Duplicate/Matrix Spike Blank

Matrix and matrix spike duplicate (MS/MSD) data are used to assess the precision and accuracy of the analytical method relative to the sample matrix.

Matrix spike blank (MSB) data is used to assess the precision and accuracy of the analytical method independent of matrix interferences.

All matrix spike and matrix spike duplicate recoveries and the relative percent difference between recoveries were within control limits.

6. Field Duplicates

Results for duplicate samples are summarized below:

Sample ID/ Duplicate ID	Analyte	Sample Result	Duplicate Result	RPD
MW-27 / DUP-1	methanol	ND	ND	NA

ND Not detected

NA Analyte not detected in sample and/or duplicate. RPD not applicable.

The duplicate results are acceptable.

7. System Performance and Overall Assessment

Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines listed in the analytical method.

Data Validation Checklist

Organic Data Validation Checklist YES NO NΑ Data Completeness and Deliverables Have any missing deliverables been received and added to the data package? X Is there a narrative or cover letter present? Are the sample numbers included in the narrative? Χ X Are the sample chain-of-custodies present? Do the chain-of-custodies indicate any problems with sample receipt or sample condition? Holding Times Have any holding times been exceeded? Х Matrix Spikes Is there a matrix spike recovery form present? Χ Χ Were matrix spikes analyzed at the required frequency? How many spike recoveries were outside of QC limits? <u>0</u> out of <u>2</u> How many RPDs for matrix spike and matrix spike duplicate were outside of QC limits? __0_ out of __1__ Blanks Is the method blank summary form present? Has a method blank been analyzed for each set of samples or for each 20 samples, whichever is more frequent? Has a blank been analyzed at least once every twelve hours for each system used? Χ Do any method/reagent/instrument blanks have positive results? Are there trip/field/rinse/equipment blanks associated with Х every sample? Do any trip/field/rinse blanks have positive results? Χ Target Analytes Is an organics analysis data sheet present for each of the following: Samples Matrix spikes Χ Blanks

SEMIVOLATILE ANALYSES METHOD 8270

Introduction

Analyses were performed according to USEPA SW-846 Method 8270 as referenced in NYSDEC ASP.

The data review process is an evaluation of data on a technical basis rather than a determination of contract compliance. As such, the standards against which the data are being weighed may differ from those specified in the analytical method. It is assumed that the data package represents the best efforts of the laboratory and had already been subjected to adequate and sufficient quality review prior to submission.

During the review process, laboratory qualified and unqualified data are verified against the supporting documentation. Based on this evaluation, qualifier codes may be added, deleted, or modified by the data reviewer. Results are qualified with the following codes in accordance with National Functional Guidelines:

- U The compound was analyzed for but not detected. The associated value is the compound quantitation limit.
- J The compound was positively identified; however, the associated numerical value is an estimated concentration only.
- B The compound has been found in the sample as well as its associated blank, its presence in the sample may be suspect.
- N The analysis indicates the presence of a compound for which there is presumptive evidence to make a tentative identification.
- JN The analysis indicates the presence of a compound for which there is presumptive evidence to make a tentative identification. The associated numerical value is an estimated concentration only.
- E The compound was quantitated above the calibration range.
- D Concentration is based on a diluted sample analysis.
- UJ The compound was not detected above the reported sample quantitation limit. However, the reported limit is approximate and may or may not represent the actual limit of quantitation.
- R The sample results are rejected.

Two facts should be noted by all data users. First, the "R" flag means that the associated value is unusable. In other words, due to significant QC problems, the analysis is invalid and provides no information as to whether the compound is present or not. "R" values should not appear on data tables because they cannot be relied upon, even as a last resort. The second fact to keep in mind is that no compound concentration, even if it has passed all QC test, is guaranteed to be accurate. Strict QC serves to increase confidence in data but any value potentially contains error.

Data Assessment

1. Holding Time

The specified holding times for semi-volatile analyses under the Quality Assurance Project Plan (QAPP) are 5 days from sample receipt to extraction and 40 days to analysis. The technical holding times are 7 days from sample collection to extraction and 40 days to analysis.

All samples were extracted and analyzed within the specified holding times.

2. Blank Contamination

Quality assurance blanks (i.e., method, field, or rinse blanks) are prepared to identify any contamination which may have been introduced into the samples during sample preparation or field activity. Method blanks measure laboratory contamination. Field and rinse blanks measure contamination of samples during field operations.

No target compounds were detected in the method blanks.

3. Mass Spectrometer Tuning

Mass spectrometer performance was acceptable.

4. Calibration

Satisfactory instrument calibration is established to insure that the instrument is capable of producing acceptable quantitative data. An initial calibration demonstrates that the instrument is capable of acceptable performance at the beginning of an experimental sequence. The continuing calibration verifies that the instrument daily performance is satisfactory.

4.1 Initial Calibration

The method specifies various percent relative standard deviation (%RSD) limits for select compounds and allows two outliers. A technical review of the data applies a RSD limit of 30% to all compounds with no exceptions.

The %RSD was less than 30% for all compounds.

4.2 Continuing Calibration

All continuing calibration standards were within 25% difference (%D) of the initial calibration.

5. Surrogates / System Monitoring Compounds

All samples to be analyzed for organic compounds are spiked with surrogate compounds prior to sample preparation to evaluate overall laboratory performance and efficiency of the analytical technique.

Surrogate recoveries were below control limits for one compound in samples MW-1, MW-3S, TW-01, MW-9S, MW-31, MW-32, MW-33, MW-34 and MW-29. Since all other surrogate recoveries were within control limits, no data have been qualified based on the deviations. Surrogates were diluted in samples TW-02R, MW-8S and DUP-1. No data have been qualified based on the diluted surrogates.

6. Internal Standard Performance

Internal standard performance criteria insure that the GC/MS sensitivity and response are stable during every experimental run.

All internal standard areas and retention times were within established limits.

7. Compound Identification

Target compounds are identified on the GC/MS by using the analyte's relative retention time and ion spectra.

Aniline was detected above the linear range in samples MW-27 and MW-33. Data for aniline have been replaced with data from the dilution analyses in the listed samples. All other identified compounds met the specified criteria.

8. Matrix Spike/Matrix Spike Duplicate/Matrix Spike Blank

Matrix and matrix spike duplicate (MS/MSD) data are used to assess the precision and accuracy of the analytical method relative to the sample matrix. Matrix spike blank (MSB) data is used to assess the precision and accuracy of the analytical method independent of matrix interferences.

The MS/MSD recoveries for N,N-dimethylaniline were below control limits. Data for the listed compound have been qualified as estimated in sample MW-27 based on the deviation. The MS/MSD recoveries for aniline were above control limits. Since the sample concentration was greater than four times the spike concentration for aniline, no data have been qualified based on the deviation. The MSB recoveries were within control limits.

9. Field Duplicates

Results for duplicate samples are summarized as follows:

Sample ID/ Duplicate ID	Analyte	Sample Result	Duplicate Result	RPD
	aniline	3700	4200	12.7%
MW-27 / DUP-1	N.N-dimethylaniline	20	ND	NA

ND Not detected.

NA Analyte not detected in sample and/or duplicate. RPD not applicable.

The duplicate results are acceptable.

10. System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines listed in the analytical method.

Semivolatile Organics Data Validation Checklist YES NO NA Data Completeness and Deliverables Have any missing deliverables been received and added to the data package? Is there a narrative or cover letter present? X Are the sample numbers included in the narrative? Χ Х Are the sample chain-of-custodies present? Do the chain-of-custodies indicate any problems with sample receipt or sample condition? Χ **Holding Times** Have any holding times been exceeded? Х Surrogate Recovery Are the surrogate recovery forms present? Χ Are all the samples listed on the appropriate surrogate recovery form? Χ Were two or more surrogate recoveries outside of specified limits for any sample or blank? Х If yes, were the samples reanalyzed? Х Matrix Spikes Is there a matrix spike recovery form present? Х Were matrix spikes analyzed at the required frequency Х How many spike recoveries were outside of QC limits? <u>4</u> out of <u>4</u> How many RPDs for matrix spike and matrix spike duplicate were outside of QC limits? <u>1</u> out of 2 Blanks Is the method blank summary form present? Has a method blank been analyzed for each set of samples or for each 20 samples, whichever is more frequent? Х Has a blank been analyzed for each GC/MS system used? Do any method/reagent/instrument blanks have positive results? Are there field/rinse/equipment blanks associated with every sample?

Semivolatile Organics Data Validation Checklist - Page 2

	YES	NO	NA
Do any field/rinse blanks have positive results?			X
Tuning and Mass Calibration			
Are the GC/MS tuning forms present for DFTPP?	X		
Are the bar graph spectrum and mass/charge listing provided for each DFTPP?	X		
Has a DFTPP been analyzed for each twelve hours of analysis per instrument?	X		
Have the ion abundance criteria been met for each instrument used?	X		
Target Analytes			
Is an organics analysis data sheet present for each of the following:			
Samples	X		
Matrix spikes	X		
Blanks	X		
Has GPC cleanup been performed on all soil/sediment sample extracts?			X
Are the reconstructed ion chromatograms present for each of the following:			
Samples	X		
Matrix spikes	X		
Blanks	X		
Is the chromatographic performance acceptable?	X	-	
Are the mass spectra of the identified compounds present?	X		
Are all ions present in the standard mass spectrum at a relative intensity of 10% or greater also present in the sample spectrum?	X		
Do the samples and standard relative ion intensities agree within 20%?	X		
Tentatively Identified Compounds			
Are all the TIC summary forms present?		X	
Are the mass spectra for the tentatively identified compounds and their associated "best match" spectra			
present?			X
Are any target compounds listed as TICs?			X

Semivolatile Organics Data Validation Checklist - Page 3 YES NO NΑ Are all ions present in the reference mass spectrum with a relative intensity greater than 10% also present in the sample mass spectrum? Do the TIC and "best match" spectrum agree within 20%? Quantitation and Detection Limits Are there any transcription/calculation errors in the Form 1 results? Are the reporting limits adjusted to reflect sample dilutions, and for soils, sample moisture? Х Standard Data Are the quantitation reports and reconstructed ion chromatograms present for the initial and continuing calibration standards? X Initial Calibration Are the initial calibration forms present for each instrument used? X Χ Are the response factor RSDs within acceptable limits? Are the average RRF equal to or greater than minimum requirements? Χ Are there any transcription/calculation errors in reporting the RRF or RSD? Continuing Calibration Are the continuing calibration forms present for each day and each instrument? Χ Has a continuing calibration standard been analyzed for each twelve hours of analysis per instrument? All %D within acceptable limits? Х Are all RF equal to or greater than minimum requirements? Are there any transcription/calculation errors in reporting of RF or %D? Internal Standards Are internal standard areas of the samples and blanks within the upper and lower limits for each continuing calibration? Χ Are the retention times of the internal standards within 30 seconds of the associated calibration standard?
