1. Introduction

This Periodic Review Report (PRR) summarizes monitoring activities for the period 2018 through 2023 conducted by Conklin Limited associated with the Containment Structure Site #734048 (Site). In accordance with the NYSDEC approved Operation and Maintenance (O&M) Manual (O'Brien & Gere (OBG) 1994), annual monitoring and reporting associated with the Containment Structure Site ended in 2017 and is now on a 5-year frequency. 2023 represents the 30th year of the 30-year post-closure monitoring and the first 5-year Periodic Review reporting period (January 7, 2018 to December 1, 2023). Consistent with previously submitted PRRs, this PRR includes data collected since 1994. Water elevation and quality monitoring was conducted in November 2023. An Institutional and Engineering Controls (IC/EC) Certification Form associated with this PRR is provided in **Appendix A**.

Based on review of the 2023 monitoring data, the Containment Structure appears to be functioning appropriately and in accordance with elements provided in the Response Action Plan (RAP) (OBG 1998) except for the leachate collection system as monitored by the leachate collection sumps (LCSs). The November 2023 data indicated that leachate levels in leachate collection sumps were above the corrective action level specified in the RAP. The leachate collection pumps have not been operated since 2017.

Analytical results for samples collected during November 2023 from the LCSs, leachate detection sumps (LDSs), and monitoring wells indicate that detected constituents are consistent with historic data and the detected concentrations are among the lowest to date. The pavement surface above the Containment Structure is intact showing small cracks but overall appears structurally sound. Some asphalt resurfacing in areas of the Containment Structure was completed.

2. Site Overview

The Containment Structure Site #734048, constructed in 1990, is located in the western portion of the Carousel Center, now branded as DestiNY USA, in the City of Syracuse, Onondaga County, New York, below a bituminous concrete parking area. A Site Location map is provided as **Figure 1**. Carousel Center is generally bounded by Hiawatha Boulevard to the south, Onondaga Lake to the north, Interstate Route 81 to the east, and the New York State Barge Canal to the west.

2.1 Site History

The local area that contains the Site was originally a salt marsh. Saline groundwater reportedly discharged to the marsh and formed salt springs. This natural feature was exploited for salt production as early as the mid-1600's. Salt production became Syracuse's largest industry in the early 1800's, although salt production had declined dramatically by the end of the 19th century. Maps dated 1892 and 1908 show that the area including the Site was being used for salt production until it was discontinued circa 1910.

Around the turn of the 20th century, disposal of inert fill such as construction debris was initiated at the Site. According to historical maps, the Allied Corporation disposed of Solvay Process Company materials on the Site from 1907 to 1910. Solvay Process materials are a mixture of calcium carbonate, calcium chloride, and calcium oxide. The Site was gradually reclaimed by fill operations to the grade that existed prior to salt production operations.

2.2 Remedial History

Conklin Limited acquired property located at West Hiawatha Boulevard, Syracuse, New York that was owned by Clark Concrete Co., Inc. (i.e., the "Clark Site"). Environmental sampling and analysis of soils and groundwater, connected with the development of Carousel Center, identified elevated concentrations of VOCs at the Clark Site. Conklin Limited voluntarily undertook to investigate and remediate the Clark Site, and an Approved Interim Remedial Plan (IRP) was completed in March of 1990. The IRP included dewatering, excavation and removal of VOC contaminated soils from the Clark Site, and placement of the material in a Containment Structure to be located beneath the parking lot for the shopping center.

The Containment Structure received nearly 60,000 cubic yards of VOC-impacted soils excavated from the Clark Site and portions of the Hess-1 and Buckeye properties.

An Operations and Maintenance (O&M) Manual was prepared for the Clark Site in accordance with Agreement and Determination No. A7-0163-88-12 and Agreement and Determination No. A7-0224-90-02 between Conklin Limited and the NYSDEC for remediation of the Inactive Hazardous Waste Site No. 734048 (Clark Site). These agreements required Conklin Limited to perform a Remedial Investigation/Feasibility Study (RI/FS) and an Interim Remedial Measure (IRM), respectively, at the Clark Site. The IRM was performed during the spring and summer of 1990, and on December 3, 1990, an IRM report and Supplemental Remedial Investigation Study Report were submitted to the NYSDEC. The Supplemental Remedial Investigation was accepted and approved by the NYSDEC on January 14, 1991. The IRM Report was accepted and approved by the NYSDEC on March 14, 1991. The Feasibility Study was submitted to the NYSDEC in April 1991. The Feasibility Study was performed in a manner consistent with the National Contingency

Plan and concluded that the preferred remediation alternative was Alternative No. 2 – Groundwater Management/Leachate Site Monitoring with completed Interim Remedial Measures. The NYSDEC adopted the Final Record of Decision (ROD) approving Alternative No. 2 on or about March 24, 1994. The O&M Manual, as approved by the NYSDEC, was implemented as part of Alternative No. 2.

The O&M Manual is a post-closure document that provides guidelines and procedures for operation and maintenance of Containment Structure #734048. Work tasks for the 30-year closure period described in the O&M Manual were commenced in 1994. The Containment Structure continues to be operated in accordance with the approved O&M Manual.

2.3 Containment Structure

The Containment Structure was constructed of an earthen berm ranging from approximately 16.5 to 21.0 feet in height. The bottom and sides of the interior of the berm were double-lined with 60 mil high density polyethylene (HDPE) liners.

The primary liner was overlain with a combination of sand, crushed stone and geotextile filter fabric layers to facilitate leachate collection and management of the leachate generated from the soils impacted by VOCs. The secondary cover consisted of an HDPE liner underlain with stone dust and covered by stone dust, sand, gravel, and a bituminous concrete surface. An intermediate layer of geonet was installed as the drainage layer for the leak detection system between the liners.

Additional information regarding Site remedial work, Containment Structure construction, and project implementation is provided in the Interim Remedial Measure Report Site #734048 (Volumes 1 through 5) dated November 1990 that was approved by the NYSDEC on March 14, 1991.

Perforated pipes within the Containment Structure direct leachate by gravity towards five LCSs. Leak detection sumps (LDSs) are located adjacent to each of the LCSs. Originally there were four groundwater MWs installed around the perimeter of the Containment Structure to evaluate groundwater level and quality outside the limits of the Containment Structure. An additional MW (MW-5) was installed during the 1997 reporting period at the request of the NYSDEC to better evaluate system performance. A Site Plan that includes the locations of the Containment Structure, LCSs, LDSs, and groundwater monitoring wells is provided as **Figure 2**.

As shown on **Figure 2**, the Containment Structure was constructed in two sections separated by an interior berm. Three of the five LCSs (LCS 1, 2 and 3) collect leachate from the western cell and the other two LCSs (LCS 4 and 5) collect leachate from the eastern cell.

2.3.1 Leachate Collection System

The five LCSs located within the interior of the Containment Structure are equipped with sumps that include the following features:

- concrete manholes that extend vertically from approximately 4-feet below the Containment Structure bottom to finished grade
- standard manhole steps
- solid 24-inch diameter cast iron covers

The grading of the Containment Structure bottom and the 6-inch diameter perforated drain piping installed at the interior perimeter of the Containment Structure direct leachate to the LCSs. Leachate entering the LCSs is removed automatically by a submersible pump located within each sump. The pumps discharge leachate to a holding tank via two networks of 2-inch HDPE piping. The holding tank is emptied by Site personnel when observed full. The contents are disposed of at a licensed hazardous waste disposal facility.

2.3.2 Leak Detection System

An LDS consisting of a perforated concrete vault is located adjacent to each LCS to receive leachate that penetrates the primary liner or water that enters from external sources. Drainage net between the primary and secondary 60 mil HDPE liners provides the medium through which water is conveyed to LDSs.

A 2-inch diameter pipe that extends from the pavement surface down to each sump allows access for gauging and water removal. Upon detection during monitoring, water is pumped and metered to the adjacent LCS and then automatically pumped to the holding tank for storage and disposal.

2.3.3 Groundwater Monitoring System

As illustrated on **Figure 2**, five groundwater monitoring wells are located outside of the Containment Structure: MW-1, MW-2, MW-3, and MW-5 on the Onondaga Lake side of the structure, and MW-4 on the Carousel Center side.

The monitoring wells are constructed of 2-inch diameter PVC piping. Rim elevations of MW-1 through MW-4 were surveyed in 1994 at the time of installation. The rim elevation of MW-5 was surveyed in 1997 and rim elevations of MW-1 through MW-4 were also re-surveyed. Rim elevations of MW-1 through MW-5 were re-surveyed in 2004 and in 2011.

The O&M Manual specifies re-surveying of LCSs, LDSs, and monitoring wells on a recurring 5-year basis. The most recent survey was performed in 2011.

3. Evaluate Remedy Performance, Effectiveness and Protectiveness

The O&M Manual establishes appropriate procedures for data and sample collection, compilation of results (**Tables 6-1** and **6-2** in Section 6, **Tables B-1 through B-5** in **Appendix B**, and **Tables C-1 through C-6** of **Appendix C**), and analysis of results. Sampling results are compared to corrective action criteria provided in the RAP.

3.1 Observations

- VOCs were not detected in water samples collected from leachate collection sumps LCS-1, LCS-2, and LCS-5 during November 2023. 1,1-Dichloroethane (1,1-DCA) was the only VOC constituent detected in LCS-3 and LCS-4. 1,1-DCA concentrations detected in LCS-3 and LCS-4 were 2.1 µg/L and 7.4 µg/L, respectively. As shown on the tables in Appendix C, these concentrations are the lowest detected to date.
- Water samples were collected from leak detection system wells LDS-2, LDS-3, and LDS-5 during November 2023. LDS-1 and LDS-4 were dry at the time of sampling. VOCs were not detected in water samples collected from LDS-3 or LDS-5 during November 2023. Chloroethane and 1,1-DCA were detected in the water sample collected from LDS-2 at concentrations of 15 µg/L and 5.5 µg/L, respectively. As shown on the tables in **Appendix C**, the chloroethane concentration is within the range of concentrations detected historically and the 1,1-DCA concentration is the lowest detected to date.
- Consistent with groundwater sample analytical data dating from circa 2006 to November 2023, VOCs were not detected in groundwater samples collected from perimeter monitoring wells MW-2, MW-3, MW-4, or MW-5. Consistent with groundwater analytical data collected since August 2005, trichloroethene (TCE) was the only VOC constituent detected in MW-1. TCE was detected at a concentration of 7.2 µg/L at MW-1, which is relatively consistent with concentrations dating back to 2005.
- Samples from the LCSs and LDSs continue to contain different constituents compared to samples from groundwater monitoring wells, indicating that there does not appear to be a hydrologic connection between Containment Structure and local groundwater. Based on data collected to date, the Containment Structure continues to function as designed.
- Leachate continues to enter the leachate collection system. The height of leachate in the LCSs were above the action level established in the RAP.
- Water continues to drain to the LDSs where it is removed during the monitoring events. The continued presence of water in this layer may be due to water between the liners during Containment Structure construction, seepage, and/or minor breaks in the primary liner. The secondary liner appears to be performing its design function of containing water and directing it to the LDSs. The measured water levels from the LDSs do not prompt corrective action per the RAP.
- Some minor cracks in the pavement have been observed over the Containment Structure during the 2023 site observation and some asphalt resurfacing and pothole repair has been performed. An approximate 100-ft by 30-ft section of roadway over a portion of the containment cell has been repaved. The bituminous concrete surface cap over the Containment Structure continues to promote runoff and minimize infiltration of rainfall. The landscaped areas were observed to be maintained with new mulch and plantings.

- Air quality, measured in terms of Lower Explosive Limit (LEL), hydrogen sulfide (H_2S), and oxygen content (O_2), has been within acceptable levels within the LCS and LDS access points.

3.2 Recommendations

Monitoring and inspection operations at the Site should continue.

4. IC/EC Plan Compliance Report

Not applicable. The substantive components of the same are incorporated in other sections of this report.

5. Monitoring Plan Compliance Report

Not applicable. The substantive components of the same are incorporated in other sections of this report.

6. Operation & Maintenance (O&M) Plan Compliance Report

This section summarizes monitoring activities associated with the Containment Structure Site #734048 conducted from 1994 through 2023. Annual Reports have been submitted to the NYSDEC since 1994. Five Year Review Reports were submitted in May 1999, April 2004, March 2009. The first annual PRR summarizing the monitoring activities from 2009 was submitted to the NYSDEC in March 2010. Annual PRRs summarizing monitoring activities from 2010 through 2017 were also submitted to the NYSDEC. Information provided within the Annual Reports, Five Year Review Reports, and PRRs includes the following:

- water surface elevations within the LCSs
- quantity of leachate removed from the LCSs
- quality of water from the LCSs based on laboratory analysis
- water surface elevations within the LDSs
- quantity of water collected from the LDSs
- quality of water from the LDSs based on laboratory analysis
- groundwater elevations
- quality of water within the groundwater MWs based on laboratory analysis
- general Site observations including visual assessment of the final bituminous concrete cover
- surface water drainage system inspection
- hazardous waste manifests
- air quality records

Information contained in these reports was provided by the Owner's Site monitors. The Site monitors have completed the 40-hour Occupational Safety and Health Administration (OSHA) Course in Hazardous Waste Site Operation Safety training and annual 8-hour refresher courses. Documentation of their Health and Safety at Hazardous Waste Operations Course is provided in **Appendix D**.

Data summaries from the 30-year monitoring period are provided in **Tables 6-1 and 6-2**, **Tables B-1 through B-5** in **Appendix B**, and **Tables C-1 through C-6** in **Appendix C**. Monitoring results are compared to criteria in the RAP that were established as action levels indicative of potential failure(s) of the Containment Structure systems. Specifically, the RAP established the following:

- water levels that represent indicators of potential system malfunction
- protocols to identify and abate potential malfunctions
- procedures to be taken to minimize environmental impacts and human health risks.

6.1 Leachate Collection System

6.1.1 LCS Monitoring and Sampling

Between 1994 through 2017, the five LCSs had been monitored on an annual frequency and subsequently on a 5-year frequency beginning in 2023. Monitoring activities include:

- measurements from finished grade to water surface using a water level indicator
- collection and laboratory analysis of leachate samples
- notation of field observations.

The LCS Field Logs for the 2023 monitoring year are provided as **Appendix E**.

6.1.2 LCS Water Measurements

The rim and invert elevations of the LCSs are provided in **Table B-1** of **Appendix B**. For the years 1999 through 2010, rim and invert elevations reflect information obtained by surveys performed by C.T. Male on July 21, 1997 and April 1, 2004. Rim and invert elevations for 2011 through 2017 reflect the August 29, 2011 C.T. Male survey information.

Rim and invert elevations are used to calculate water elevation and depth of water (water level) within the LCSs that are provided in **Tables B-2** and **B-3** in **Appendix B**, respectively, for each year since 1994. Leachate has been observed within the LCSs throughout the monitoring period. When the system is operating, leachate is automatically removed from the individual LCSs by pumps equipped with float switches. As shown in **Table B-3**, the height of leachate recorded in November 2023 in the LCSs were above the corrective action level of 1.5 ft.

6.1.3 LCS Air Quality

Air quality measurements have been conducted on an instantaneous basis during monitoring events for LEL, H2S and O2 for health and safety and reporting purposes. Measurements near the access cover to the sump have consistently been as follows since 1994:

- LEL readings of 0%
- H2S readings of 0%
- O2 levels at or near 20.5%

6.1.4 LCS Sampling and Laboratory Analysis

Since 1994, samples have been collected pursuant to the O&M Manual from each of the five LCSs. Samples have been delivered to Certified Environmental Services, Inc. (CES) for analysis of VOC content using United States Environmental Protection Agency (USEPA) Method 601/602 (updated to 624/625). The samples were ultimately analyzed by Life Science Laboratories, Inc. (LSL) due to CES's instrumentation being down at the time of sample receipt.

Compounds detected above the laboratory detection limits within the individual LCS samples since 1994 are summarized in **Tables C-1** through **C-5** in **Appendix C**. Laboratory reports from 1994 through 2017 have been submitted in past years in accordance with the O&M Manual. Laboratory reports for the 2023 sampling event are provided in **Appendix F**. VOCs were not detected in water samples collected from leachate collection sumps LCS-1, LCS-2, and LCS-5 during November 2023. 1,1-Dichloroethane (1,1-DCA) was the only VOC constituent detected in

LCS-3 and LCS-4. 1,1-DCA concentrations detected in LCS-3 and LCS-4 were 2.1 µg/L and 7.4 µg/L, respectively. As shown on the tables in Appendix C, these concentrations are the lowest detected to date.

6.1.5 Leachate Removal Quantities

Automatic submersible pumps installed within the five LCSs transfer leachate through two piping networks to a holding tank located on-Site. **Table 6-1** indicates the volume of leachate collected annually between 1994 and 2017, as well as the estimated volume prior to automatic pump operation.

Table 6-1. Quantity of leachate collected from leachate collection sumps

Dates	Leachate Collected (Gallons)	Annual Recovery (year) (gallons)
10/90 to 1/94	171,000[1]	
Period 2/94 to 6/94[2]	20,000	
Period 7/94 to 9/94	23,903	
Period 10/94 to 12/94	10,000	53,900 (1994)
Period 1/95	1,601	
Period 2/95 - 12/95	10,050	11,651 (1995)
Period 1/96 - 12/96	14, 508	14,508 (1996)
Period 1/97 - 12/97	5,055	5,055 (1997)
Period 1/98 - 12/98	11,957	11,957 (1998)
Period 1/99 – 12/99	20,250	20,250 (1999)
Period 1/00 - 12/00	15,270	15,270 (2000)
Period 1/01 - 12/01	12,910	12,910 (2001)
Period 1/02 - 12/02	12,495	12,495 (2002)
Period 1/03 - 12/03	17,020	17,020 (2003)
Period 1/04 – 12/04	16,850	16,850 (2004)
Period 1/05 – 12/05	14,700	14,700 (2005)
Period 1/06 – 12/06	15,350	15,350 (2006)
Period 1/07 – 12/07	16,458	16,458 (2007)
Period 1/08 – 12/08	10,394	10,394 (2008)
Period 1/09 – 12/09	10,406	10,406 (2009)
Period 1/10 – 12/10	11,440	11,440 (2010)

Dates	Leachate Collected (Gallons)	Annual Recovery (year) (gallons)
Period 1/11 – 12/11	18,846	18,846 (2011)
Period 1/12 – 12/12	13,183	13,183 (2012)
Period 1/13 – 12/13	18,542	18,542 (2013)
Period 1/14 – 12/14	12,110	12,110 (2014)
Period 1/15 – 12/15	15,950	15,950 (2015)
Period 1/16 – 12/16	12,767	12,767 (2016)
Period 1/17 – 12/17[3]	13,184	13,184 (2017)

(1) Estimated based on review of available records

(2) Automatic pumping initiated

(3) Leachate collection pumps have not operated since 2017

The leachate collection pumps are not individually metered. Therefore, leachate collected during the annual reporting periods was metered when removed from the temporary storage tank. As shown in **Table 6-1**, the annual recovery quantities between 1995 and 2017 were less than the response action volume of 20,800 gallons specified in the RAP.

6.2 Leak Detection System

6.2.1 LDS Monitoring and Sampling

The five LDSs have been monitored on an annual basis since 1994. Specific activities include:

- measurements from finished grade to water surface using a water level indicator
- monitoring of air quality with a Drager MultiPac, Industrial Science M40, or MultiRae Plus air monitoring device
- collection and laboratory analysis of LDS water samples
- recording of quantities of water pumped to adjacent LCSs
- notation of field observations

LDS Field Logs from 1994 through 2017 have been submitted in past years in accordance with the O&M Manual. The LDS Field Logs for the 2023 monitoring year are provided as **Appendix G**.

6.2.2 LDS Water Measurements

The rim and invert elevations of the LDSs are provided in **Table B-1** in **Appendix B**. For the years 1999 through 2010, rim and invert elevations reflect information obtained by surveys performed by C.T. Male on July 21, 1997 and April 1, 2004. Rim and invert elevations for 2011 through 2022 reflect the August 29, 2011 C.T. Male survey information.

Depths to water within the individual LDSs were measured each year since 1994 and are indicated in **Table B-2** in **Appendix B**. Calculated water elevations also appear in **Table B-2**. **Table B-2** indicates that, based on information provided by the Site monitor, water levels in 2023 were below corrective action levels identified in the RAP in each LDS. This indicates that the leak detection system continues to function as designed.

6.2.3 LDS Air Quality

Air quality measurements were conducted on an instantaneous basis during monitoring events for LEL, H_2S and O_2 for health and safety and reporting purposes. From 1994 through 2022, measurements near the access cover to the sump have consistently been as follows:

- LEL readings of 0%
- H_2S readings of 0%
- O_2 levels at or near 20.3%

6.2.4 LDS Sampling and Laboratory Analysis

Samples were collected pursuant to the O&M Manual from each of the LDSs where water was present since 1994. Samples were collected from LDS-2, LDS-3, and LDS-5 during November 2023. LDS-1 and LDS-4 were dry at the time of sampling. Samples collected from LDS-2, LDS-3, and LDS-4 were delivered to CES for analysis of VOC content using USEPA Method 601/602 (updated to 624/625). The samples were ultimately analyzed by LSL due to CES's instrumentation being down at the time of sample receipt.

Compounds detected above the laboratory detection limits within the individual LDS samples since 1994 are summarized in **Appendix C**. VOCs were not detected in water samples collected from leak detection wells LDS-3 or LDS-5 during November 2023. Chloroethane and 1,1-DCA were detected in the water sample collected from LDS-2 at concentrations of 15 µg/L and 5.5 µg/L, respectively. As shown on the tables in **Appendix C**, the chloroethane concentration is within the range of concentrations detected historically and the 1,1-DCA concentration is the lowest detected to date.

Laboratory reports from the 1994 through 2017 sampling events have been submitted in past years in accordance with the O&M Manual. Laboratory reports for the 2023 sampling event are provided in **Appendix F**.

6.2.5 Water Removal Quantities

Water was removed by pumping water from each of the LDSs to the respective LCSs during inspections. Metered flow quantities from the LDSs from 1994 through 2017 are indicated in **Table 6-2**.

Table 6-2. Leak detection sump water removal (gals)

Date (Month/Year)	LDS-1	LDS-2	LDS-3	LDS-4	LDS-5	TOTAL
4/94	610	1240	720	1575	1670	6815
5/94	1290	930	265	1075	295	3855
6/94	600	575	85	800	160	2220
7/94	600	750	200	500	645	2695

6.3 Groundwater Monitoring System

6.3.1 Groundwater Monitoring

For the years 1999 through 2010, rim and invert elevations reflect information obtained by surveys performed by C.T. Male on July 21, 1997 and April 1, 2004. Rim and invert elevations for 2011 through 2022 reflect the August 29, 2011 C.T. Male survey information and are provided in **Table B-4** provided in **Appendix B**. Depth to water in the five groundwater MWs were gauged during monitoring events using a water level indicator. Results for 2023 are provided on Groundwater Monitoring Field Logs provided in **Appendix H**. Depth to water measurements and water level calculations since 1994 are summarized in **Table B-5** provided in **Appendix B**.

Based on data from past monitoring events, groundwater flow direction generally occurs in a westerly direction towards Onondaga Lake and the Barge Canal. The groundwater elevations fluctuate year-to-year, and the 2023 groundwater elevations are within the historical range (**Figure 3**).

6.3.2 Groundwater Sampling and Laboratory Analysis

Groundwater samples were collected pursuant to the O&M Manual from MW-1 through MW-4 since 1994 and from MW-5 since 1997. Samples were delivered to CES for analysis of VOC content using USEPA Method 601/602 (updated to 624/625). The samples were ultimately analyzed by LSL due to CES's instrumentation being down at the time of sample receipt.

Compounds detected above laboratory detection limits within the individual MWs since 1994 are summarized in **Table C-6** provided in **Appendix C**. In 2023, no constituents were detected in MW-2, MW-3, MW-4, or MW-5. No constituents have been detected in MW-2, MW-3, MW-4, and MW-5 since 2006, 1996, 2006, and 2008, respectively. Consistent with groundwater analytical data collected since August 2005, trichloroethene (TCE) was the only VOC constituent detected in MW-1. TCE was detected at a concentration of 7.2 µg/L at MW-1, which is relatively consistent with concentrations dating back to 2005.

Laboratory reports from the 1994 through 2017 sampling events have been submitted in past years in accordance with the O&M Manual. Laboratory reports for 2023 are provided in **Appendix F**.

6.4 Site Observations

6.4.1 Site Conditions

Visual observations of the bituminous concrete pavement and landscaped areas over and adjacent to the Containment Structure have been performed since 1994. The Site Observation Form (Form 4) for the 2023 monitoring and inspection event is provided in **Appendix I**. The inspection conducted in 2023 indicates that the pavement surface above the Containment Structure overall appears to be structurally sound and intact but is showing some small cracks. Some asphalt resurfacing in areas of the Containment Structure was completed. Landscaped areas were intact with no observed sink holes.

6.4.2 Surface Water Drainage

Surface cover over the Containment Structure is bituminous concrete pavement. Rainfall and snow melt runoff are directed overland via positive grading to a separate stormwater drainage system consisting of catch basins and underground storm drains. The locations of these catch basins and storm drains are illustrated in the O&M Manual.

Dry weather inspection of the storm drainage facilities has been performed since 1994. The purpose of the inspections is to document the presence or absence of flow and the need for system cleaning. Copies of the Storm Drainage Facilities Reports from the 1994 through 2017 have been submitted in past years in accordance with the O&M Manual. A copy of the Storm Drainage Facilities Report for 2023 is provided in **Appendix J**.

In 2023, minor accumulations of water and sediment deposits were recorded in the catch basin sumps during the inspection; however, no impacts to the Containment Structure or operation of the storm drainage facility were identified.

6.5 O&M Conclusions

The following summarize results and observations based on the O&M activities for the period 2019 to 2023:

- The height of leachate in the LCSs were above the corrective action level of 1.5 ft.
- Consistent with historic data, water elevations were below corrective action levels identified in the RAP in the LDSs, indicating that the leak detection system continues to function as designed.
- Analytical results for samples collected during November 2023 from the LCSs, leachate detection sumps (LDSs), and monitoring wells continue to indicate that few VOC constituents are detected, and when detected, concentrations are relatively low.
- Based on the monitoring data, 1,1-DCA continues to be the predominant constituent detected in the LCSs and/or LDSs and at some of the lowest concentrations to date. No constituents have been detected in groundwater monitoring wells MW-2, MW-3, MW-4, and MW-5 since 2006, 1996, 2006, and 2008, respectively. Consistent with groundwater analytical data collected since August 2005, trichloroethene (TCE) was the only VOC constituent detected in MW-1 and its concentration has been relatively consistent with concentrations dating back to 2005.
- Consistent with historic data, sample analytical data from the LCSs and LDSs continue to contain different constituents, at variable concentrations compared to sample analytical data

from the groundwater monitoring wells. As such, there does not appear to be a hydrologic connection between the containment system and local groundwater.

- No major pavement disturbances have been reported over the Containment Structure although some small cracking has been observed. Overall, the surface cap appears intact and structurally sound and continues to promote runoff and minimize infiltration of rainfall to the Containment Structure.
- Air quality, measured in terms of LEL, O_2, and H_2S, has been within acceptable levels within the LCSs and LDS access points.

6.6 O&M Recommendations

As indicated previously, 2023 represents the final year of the established 30-year monitoring period for the Containment Structure Site. As such, Conklin Limited is proposing that future monitoring requirements be conducted in accordance with a newly developed Site Management Plan (SMP) to replace the current O&M Plan and RAP. It is proposed that the SMP be submitted to NYSDEC by March 31, 2024. Current requirements under the existing O&M Plan to be retained in the newly developed SMP will include the following:

- Water level monitoring of the LCSs, LDSs, and monitoring wells
- Collection and analysis of samples collected from the LCSs, LDSs, and monitoring wells
- Inspections of general site conditions and surface water drainage facilities
- Re-surveying of LCS and LDS rims and inverts every five years beginning in 2024.
- Preparation and submittal of PRRs

Institutional and Engineering Controls Certification Form

Enclosure 2

NEW YORK STATE DEPARTMENT OF ENVIRONMENTAL CONSERVATION
Site Management Periodic Review Report Notice
Institutional and Engineering Controls Certification Form

Site Details **Box 1**

Site No. **734048**

Site Name Clark Property

Site Address: 372 West Hiawatha Boulevard Zip Code: 13208
City/Town: Syracuse
County: Onondaga
Site Acreage: 5.360

Reporting Period: January 07, 2018 to December 1, 2023

	YES	NO
1. Is the information above correct?	X	☐
If NO, include handwritten above or on a separate sheet.		
2. Has some or all of the site property been sold, subdivided, merged, or undergone a tax map amendment during this Reporting Period?	☐	X
3. Has there been any change of use at the site during this Reporting Period (see 6NYCRR 375-1.11(d))?	☐	X
4. Have any federal, state, and/or local permits (e.g., building, discharge) been issued for or at the property during this Reporting Period?	☐	X
If you answered YES to questions 2 thru 4, include documentation or evidence that documentation has been previously submitted with this certification form.		
5. Is the site currently undergoing development?	☐	X

Box 2

	YES	NO
6. Is the current site use consistent with the use(s) listed below? Commercial and Industrial	X	☐
7. Are all ICs in place and functioning as designed?	X	☐

IF THE ANSWER TO EITHER QUESTION 6 OR 7 IS NO, sign and date below and DO NOT COMPLETE THE REST OF THIS FORM. Otherwise continue.

A Corrective Measures Work Plan must be submitted along with this form to address these issues.

Periodic Review Report (PRR) Certification Statements

1. I certify by checking "YES" below that:

   a) the Periodic Review report and all attachments were prepared under the direction of, and reviewed by, the party making the Engineering Control certification;

   b) to the best of my knowledge and belief, the work and conclusions described in this certification are in accordance with the requirements of the site remedial program, and generally accepted engineering practices; and the information presented is accurate and compete.

YES	NO
X	☐

2. For each Engineering control listed in Box 4, I certify by checking "YES" below that all of the following statements are true:

   (a) The Engineering Control(s) employed at this site is unchanged since the date that the Control was put in-place, or was last approved by the Department;

   (b) nothing has occurred that would impair the ability of such Control, to protect public health and the environment;

   (c) access to the site will continue to be provided to the Department, to evaluate the remedy, including access to evaluate the continued maintenance of this Control;

   (d) nothing has occurred that would constitute a violation or failure to comply with the Site Management Plan for this Control; and

   (e) if a financial assurance mechanism is required by the oversight document for the site, the mechanism remains valid and sufficient for its intended purpose established in the document.

YES	NO
☐	X

IF THE ANSWER TO QUESTION 2 IS NO, sign and date below and DO NOT COMPLETE THE REST OF THIS FORM. Otherwise continue.

Notes:
NM = not measured on that date.
1. Date of leachate collection sump monitoring.
2. Depth to water in feet.
3. Elevations refer to Syracuse City Datum.
4. Elevation data collected from 1997 through December 2002 reflect the 1997 survey information.
5. Elevation data collected in 2003 through 2010 inclusive reflect the 2004 survey information.
6. Elevation data collected in 2011 through 2017 inclusive reflect the 2011 survey information.

Notes:
NM = not measured on that date.
1. Date of monitoring well monitoring.
2. Depth to water in feet.
3. Elevations refer to Syracuse City Datum.
4. Elevation data collected from 1997 through December 2002 reflect the 1997 survey information.
5. Elevation data collected from 2003 through 2010 inclusive reflect the 2004 survey information.
6. Elevation data collected from 2011 through 2017 inclusive reflect the 2011 survey information.

APPENDIX C

Laboratory Analytical Results

C-1 LCS-1 and LDS-1 Water Quality Data

C-2 LCS-2 and LDS-2 Water Quality Data

C-3 LCS-3 and LDS-3 Water Quality Data

C-4 LCS-4 and LDS-4 Water Quality Data

C-5 LCS-5 and LDS-5 Water Quality Data

C-6 MW-1 through MW-5 Water Quality Data

LCS Field Logs

GROUND WATER SAMPLING FIELD LOG

Sample Location: LCS Well No. : 1

Sampled By: BOB KENNEDY Date: 11/2/23 Time: 0730

Weather: CLEAR 36° Sampled with Bailer: ✓ Pump: ____

A. WATER TABLE:
Well Depth (below top of casing): 17.25 ft.
Well Elevation (below top of casing): ____ ft.
Depth to Water Table (below top of casing): 11'7" ft.
Water Table Elevation: ____
Length of Water Column: ____ ft.
Volume of water in well:
2" diameter wells = 0.163 x (LWC) = ____ gallons x3
4" diameter wells = 0.653 x (LWC) = ____ gallons
6" diameter wells = 1.469 x (LWC) = ____

B. PHYSICAL APPERANCE AT START
Color: GREY Odor: SLIGHT Turbidity: MED
Was an oil film or layer apparent? NO

C. PREPARATION OF WELL FOR SAMPLING
Amount of water removed before sampling: 50 GALLONS
Did the Well go dry: NO

D. PHYSICAL APPEARANCE DURING SAMPLING SAME
Color: ____ Odor: ____ Turbidity: ____
Was an oil film or layer apparent? ____

E. CONDUCTIVITY ____

F. PH 7.50

G. TEMPERATURE 12.9°C

H. WELL SAMPLING NOTES:

GROUND WATER SAMPLING FIELD LOG

Sample Location: LCS 2 Well No. : 2

Sampled By: BOB K. Date: 11/2 Time: 0:730

Weather: CLEAR 30° Sampled with Bailer: ✓ Pump: ____

A. WATER TABLE:

Well Depth (below top of casing): 19.92 ft.

Well Elevation (below top of casing): ____ ft.

Depth to Water Table (below top of casing): 14.5 ft.

Water Table Elevation: ____

Length of Water Column: ____ ft.

~~Volume of water in well~~:

2" diameter wells = 0.163 x (LWC) = ____ gallons x3

4" diameter wells = 0.653 x (LWC) = ____ gallons

6" diameter wells = 1.469 x (LWC) = ____

B. PHYSICAL APPERANCE AT START

Color: CLEAR Odor: SOME Turbidity: CLEAR

Was an oil film or layer apparent? ____

C. PREPARATION OF WELL FOR SAMPLING

Amount of water removed before sampling: 50 GAL.

Did the Well go dry: NO

D. PHYSICAL APPEARANCE DURING SAMPLING SAME

Color: ____ Odor: ____ Turbidity: ____

Was an oil film or layer apparent? ____

E. CONDUCTIVITY ____

F. PH 6.98

Subject: RE: URGENT Well Samples

Hi Barb

There seems to be a discrepancy on the LDS paperwork. On the chain of custody, we mistakenly listed LDS #4 instead of #3. Wells sampled were #'s 2,3 and 5, same as the samples taken on 6/1/23.
Can you please resubmit the paperwork to reflect this error on my part.

Thank you
