RE: Former GE Farrell Road, NYSDEC Site No. 734055
Response to Submittal of the 2016-2018 Vapor Intrusion Activities Report
FILE: 5851/64466

Dear **Mr. Cook**:

On behalf of Lockheed Martin Corporation (LMC), O'Brien & Gere (OBG) is re-submitting the enclosed *2016-2018 Vapor Intrusion Activities Report (Report)*. The Report has been revised to address comments received from the New York State Department of Environmental Conservation (NYSDEC) on January 8, 2019 regarding the initial Report that was provided to NYSDEC on November 15, 2018.

NYSDEC comments received in the January 8, 2018 letter have been addressed in the revised Report, except where noted below:

Comment 8: It is unclear what NYSDEC is requesting to be added to the Report. However, the following sentence was added to footnote 3 in Section 3.2: "It should be noted that there are other factors specifically NYSDOH's air guideline values and its Decision Matrices, that are also used in guiding decisions to reduce exposure to a chemical."

Comment 10: In general, sub-slab ventilation (SSV) is not always measurable via differential pressure measurements. According to the United States Environmental Protection Agency (EPA)[1], sub-slab ventilation (SSV) operates by creating adequate advective flow under the slab to dilute volatile organic compounds (VOCs). SSV is confirmed via smoke testing where the differential pressure was not measurable. The following revision to Footnote 6 was made: "… inches of water and an induced airflow beneath the slab as observed by smoke tests (…)".

Comment 11: Please note that nine new sub-slab soil vapor (SSSV) sampling locations were proposed at the time of that referenced conclusion. Section 7.1 identifies that two additional SSSV sample locations (totaling 11 new SSSV sample locations) were sampled during the July 2017 sampling event. Therefore, we did not revise the attached as suggested in this comment

[1] *EPA Engineering Issue: Indoor Air Vapor Intrusion Mitigation Approaches,* EPA/600/R-08-115, October 2008.

because the original text is accurate as written and the suggested comment was captured later in the text.

Comment 17: It is unclear what of the information provided is expected to be in the report given that the information will be added to the future OMM Plan and is not currently in the SMP. However, in our attempt to clarify our understanding, we have revised the last paragraph of Section 9.3 to read as follows:

> "In addition, an operating, maintenance, and monitoring plan (OMM Plan) will be submitted along with the design, and will describe activities associated with the operating and maintenance of the SSDS as well as indoor air monitoring of the areas not depressurized. The OMM Plan will also describe monitoring activities and pro-active mitigation measures that will be conducted when changes to the building occupancy, build-outs, and HVAC occur to demonstrate that building occupant's health is protected. Following approval from NYSDEC and NYSDOH, the OMM Plan will be included in the site's Site Management Plan (SMP)."

Comment 18: LMC believes that the facts presented in this sentence of Section 10 are important to state as they are relevant to previous and existing conditions from within Building 2. However, we added more specifics to these facts so there is a clearer tie back to the specifics cited in the report.

Comment 24: Please note that the referenced table for Figure 10 reports tetrachloroethene as 1.36 U. Figure 10 shows tetrachloroethene as 1.4 U, which drops one significant figure. Given that the values are the same, there were no changes made to either.

If you have and additional questions or comments regarding the revised Report, please feel free to contact Eric Alongi at (315) 956-6674.

Very truly yours,
O'BRIEN & GERE ENGINEERS, INC.

Re: Former GE Farrell Road, Site ID No. 734055
Town of Geddes, Onondaga County
ISCO Summary and Baseline Groundwater Report

Dear Ms. Fonte:

The New York State Department of Environmental Conservation (Department) and the New York State Department of Health (NYSDOH) have reviewed the *2016-2018 Vapor Intrusion Activities Report* (report) for the Former GE Farrell Road site (site), dated November 15, 2018, which was prepared by O'Brien and Gere Engineers, Inc. (OBG) on behalf of the Lockheed Martin Corporation (LMC). The report must be modified as set forth below.

1. Include a certification consistent with Section 1.5 of the Department's guidance document *DER-10: Technical Guidance for Site Investigation and Remediation* dated May 2010, as updated by its Errata Sheet (DER-10).

2. Section 2.1, 3rd Paragraph – Area of Concern 3 (Trichloroethene Tanks) is also pertinent.

3. Section 2.2 – To supplement the details of this section, please append to the report the referenced Technical Memorandums that summarize air sampling events completed at the site prior to 2016 (*e.g.*, February/December 2007, December 2008, September 2015, etc.).

4. Section 2.2, Final Paragraph – "Widewaters Group, Inc." should be "Widewaters Farrell Road II Company, LLC".

5. Section 2.2, Final Paragraph, 1st Sentence – It is worth noting that the proposed occupancy would have included a build-out of the space and installation and operation of a heating, ventilation and air condition (HVAC) system or systems.

6. Section 2.3, 2nd Paragraph, 5th Sentence – It was stated it was possible air conditioners were present in the storage boxes; not "likely".

7. Section 2.3, 3rd Paragraph – It is worth noting that, in general, the indoor air concentrations of petroleum-related compounds were greater during sampling events conducted when vehicles were being stored in the building (*i.e.*, winter events vs. summer/fall events).

8. Section 3.2, Sample Results and Data Evaluation – Please note that the reference in footnote 3 and Table 1 to Appendix C.2 (EPA 2001: Building Assessment and Survey Evaluation (BASE) Database) of the NYSDOH's *Guidance for Evaluating Soil Vapor Intrusion in the State of New York* dated October 2006, as updated (NYSDOH SVI guidance) is only one of the factors considered when evaluating air sampling results at a site. It should not be assumed the referenced database (and 90th percentile measurement for TCE) is the sole mechanism for determining actions to address exposures related to soil vapor intrusion. The various background databases in the State's Guidance are used for comparing air data at a site to help understand whether a detection of a chemical in the indoor air at a site may be expected if not affected by soil vapor intrusion. In addition to using background databases, Table 1 should also reference the NYSDOH air guideline values (where available) and the May 2017 Decision Matrices as additional tools used to guide decisions to reduce exposure to a chemical.

9. Section 4, 5th Paragraph – Add to the end of this paragraph, "Additional details regarding the SSDS are included in the Interim Site Management Plan, dated July 2017."

10. Section 4, Footnote 6 – Revise to read, "…pulled into the CTP) or by measuring the pressure differential."

11. Section 5.3, Bullet 3 – There were 11 new sub-slab vapor sampling locations in that round.

12. Section 6, 3rd Paragraph, 2nd Sentence – It is recommended this be revised to read, "…into the slab, then swept, mopped and allowed to dry to apply polyurethane caulk."

13. Section 7, 4th Paragraph, 4th Sentence – It is recommended this be revised to read, "…in the tenant space (referred to as the Joy Carpet room) within Building 2 by OBG…"

14. Section 7, 4th Paragraph, Final Sentence – This should be revised to clarify the trailer was moved into the main area of Building 2. It is suggested it be revised to read, "…placed inside the trailer that was placed inside the main, open area of the building. The location of the trailer and its sample is shown on Figures 7 and 9 as sample IA-XX."

15. Section 7.2, 3rd Paragraph, 2nd Sentence – Revise to read, "…trailer contents were likely a source of TCA, 11DCE and TCE found in indoor air…"

16. Section 8.3, 3rd Paragraph, 2nd Sentence – Revise to read, "No mitigation of the high-bay area was proposed."

17. Section 9.3, Conclusions and Recommendations – Please indicate that the site's Site Management Plan (SMP) will include a requirement for indoor air monitoring of areas not depressurized to verify that the partial depressurization of the building slab (as currently proposed) remains adequate and that additional actions are not needed to address any potential indoor air impacts resulting from soil vapor intrusion. Any changes needed to the SMP plan should be made in consultation with both the NYSDEC and the NYSDOH prior to any proposed changes in use (e.g., any proposed physical or mechanical changes to the building; changes in building occupancy are anticipated, etc.) so that the intended use or uses of a building remain protective for all occupants.

18. Section 10, 3rd Sentence – Delete this sentence.

19. Table 2 – The indoor air background levels for the following compounds should be as listed below.

    a. isopropanol – 250 (listed in guidance as 2-proponal)
    b. 2-butanone – 12
    c. 2,2,4-trimethylpentane – It is not clear why this was listed as 9.5. An appropriate value could be 5.0 with a note that that is the upper fence value for the NYSDOH study of volatile organic chemicals in air of fuel oil heated homes.

20. Figure 2 and 5, SS-09, Feb 2016, 1,1-dichloroethane – This should be 4.53.

21. Figure 6 – The photoionization detector (PID) readings listed are in parts per billion (ppb).

22. Figure 7 - The table below lists necessary corrections for trichlorofluoromethane in July 2017:

IA-04	IA-10	SS-15	SS-06	IA-06
166	347	309	262	369

23. Figure 10 - The table below lists necessary corrections for trichlorofluoromethane in October 2017:

SS-28	SS-29	SS-30	SS-26
76.4	128	134	172

24. Figure 10, SS-23, tetrachloroethene – The tables report this result as 1.4 U. Please rectify.

Please make the necessary modifications and submit the revised report within 30 days of the date of this letter.

Please note, as additional structure data (sub-slab vapor, indoor/outdoor air) are collected, the results must be reported periodically. It is noted that results of sampling must be provided to owners, tenants, etc. as required by the New York State Environmental Conservation Law. It is recommended this report be made available as a reference to current and/or prospective tenants of the site building.

If you have any questions, please do not hesitate to contact me at 315-426-7411 or joshua.cook@dec.ny.gov.

Sincerely,

Joshua P. Cook, P.E.

1. INTRODUCTION

This Report describes and presents the results of vapor intrusion (VI) activities conducted by O'Brien & Gere Engineers, Inc. on behalf of the Lockheed Martin Corporation at the former GE Farrell Road Site (Site) between February 2016 and June 2018, inclusive of the following sampling events and mitigation activities:

- Sub-slab soil vapor (SSSV) and indoor air sampling completed in February 2016
- Installation of sub-slab depressurization systems (SSDSs) completed in October 2016
- Post-mitigation indoor air (PMIA) sampling completed in January 2017
- Slab inspection, survey and sealing completed in July 2017
- SSSV and indoor air sampling completed in July 2017
- SSSV and indoor air sampling completed in October 2017
- SSSV screening and sampling conducted in June 2018

The scope of each of the VI activities was developed in concert with, and with the approval of, the New York State Departments of Environmental Conservation and of Health (NYSDEC and NYSDOH). Sample results and documentation of the completed activities were provided to NYSDEC, NYSDOH and the property owner following each activity completion.

This Report concludes with a discussion of NYSDEC-approved VI activities to be conducted in 2019.

2. BACKGROUND

2.1 SITE BACKGROUND

The Site consists of 16.6 acres in an industrial zone setting located on Farrell Road and John Glenn Boulevard in the Town of Geddes, northeast of Routes 690 and 90 and south of the Seneca River. The site includes an industrial building (Building 2) that is approximately 310,500 square feet (sq. ft.) in size, a garage that is approximately 8,000 sq. ft. in size and Class I wetlands on the north side of the site (**Figure 1**). Further north of the site, the Class I wetland area continues north to the Seneca River. Currently, the site is classified as Class 4 on NYSDEC's Registry of Inactive Hazardous Waste Disposal Sites (Site #734055). This report pertains to Building 2 and the maintenance garage.

Building 2 has a slab-on-grade foundation with a footprint of approximately 300,000 sq. ft. It is divided into two areas by a dividing wall: high-bay area on its north end and a low-bay area on its south end. Except for a few small enclosed rooms (boiler room, bathrooms, storage room), the building's interior space is ~90% open in the low-bay area and 100% open in the high-bay area. The dividing wall between the two areas is not air-tight such that indoor air transfers between the two areas. The building is not ventilated except for natural ventilation through exterior doors and minor openings in the high-bay walls. The building is not generally heated except for on-demand space heaters and is not air conditioned.

There are three primary historic source areas relevant to vapor intrusion potential at the Site, referred to as areas of concern (AOC), where interim remedial measures (IRMs) were implemented.[1] The following identifies the location (also shown on **Figure 1**) and gives a description of each AOC:

- AOC 5, located along the west side of Building 2, was an area where nine underground storage tanks (USTs), which reportedly contained both chlorinated and non-chlorinated solvents, and a paint drippings dry well were removed.
- AOC 7, located along the east side of Building 2, was an area of a former fuel oil UST and where drums containing Freon were rinsed.
- AOC 16, located adjacent to the maintenance garage, was an area of a former gasoline UST.

2.2 VAPOR INTRUSION SAMPLING BACKGROUND

In response to a request by NYSDEC in August 2006, Lockheed Martin Corporation (LMC) conducted sampling at Building 2 to assess the potential for VI. LMC retained OBG to conduct the VI sampling, which was performed in February 2007, representing the 2006-2007 heating season. In January 2007, NYSDEC approved the scope of the sampling specified in a work plan and work plan addendum, which included indoor air and sub-slab sampling at five locations (four in the high bay area and one in the low bay area). The results of the sampling were summarized in a Technical Memorandum (TM) dated May 24, 2007, in which additional sampling at locations in the high-bay area was recommended. A copy of the May 24, 2007 TM can be found in **Appendix A.**

In November 2007, NYSDEC approved the additional sampling scope that included repeat sampling at two of the locations in the high bay area. The sampling was conducted in December 2007, representing the 2007-2008 heating season, and the results of which were reported by OBG in a TM, dated February 21, 2008 (see **Appendix A**). Repeat sampling at the same two locations (also referred to as monitoring) was recommended to monitor for changes in indoor air SSSV levels for two compounds, as an alternative to mitigation given that indoor air levels were below background levels and applicable NYSDOH air guideline values.

In May 2008, NYSDEC approved the recommended monitoring scope. The monitoring was conducted in December 2008, representing the 2008-2009 heating season and results were summarized in a TM, dated March

[1] Note that there were other AOCs at the Site where some remedial work was completed, but they are not considered relevant to this investigation. AOC 3 was an area where TCE was used; however, no further action or remediation was required after its investigation (characterization and extent).

12, 2009 (see **Appendix A**). Based on the sample results, OBG, on behalf of LMC, recommended that, in lieu of annual sampling, annual inspections be conducted to identify slab breaches and building modifications that could increase the potential for sub-slab vapors to intrude. NYSDEC approved the annual inspection approach in a December 9, 2009 letter from Javier Perez of NYSDEC to Myron Parkolap of LMC. NYSDEC also informed LMC that additional investigation may be necessary when the building's occupancy changes. At that time, a portion of Building 2 was being used for warehousing with limited occupancy during normal business hours and no occupancy outside of normal business hours. Since 2009, OBG conducted and reported annual slab inspections to NYSDEC. From 2007 to present, the light warehousing use of Building 2 has not changed. In addition, there has been no interior space build-outs (*i.e.,* no enclosing areas, such as new rooms) and no changes were made to the building's HVAC system (*i.e.,* no creation of negative indoor air pressure).

The current owner of the property, Widewaters Farrell Road II Company, LLC (Widewaters) tentatively contracted with two separate tenants to occupy Building 2, with occupancy to begin in the fourth quarter of 2015 or first quarter of 2016. The proposed occupancy planned to include a build-out of the space and installation and operation of heating, ventilating, and air conditioning (HVAC) system(s). As a result of the site's anticipated change of use and at the request of NYSDEC to LMC, OBG conducted sampling within Building 2 and the maintenance garage in September 2015 to acquire updated soil vapor data for the site. In September 2015, NYSDEC approved the scope of the sampling to include eight indoor air and SSSV samples within Building 2 (two locations in the high bay area that had been sampled previously and six in the low bay area that had not been sampled previously), as well as two locations in the maintenance garage. The full list of USEPA Method TO-15 compounds were analyzed for this sampling event. The results of the sampling were summarized in a TM dated December 11, 2015, in which LMC and OBG recommended additional sampling during the 2015-2016 heating season to assess seasonal variability of SSSV and indoor air. Installation of SSDSs at two locations was also recommended pending the additional sampling. A work plan to design and install the SSDSs was submitted to NYSDEC on December 28, 2015 and approved by NYSDEC on January 19, 2016 with modifications.

2.3 SCOPE OF DOCUMENT

The remainder of this report describes VI sampling and mitigation activities that have followed the September 2015 sampling event to date. The discussion of sampling results that follows is primarily limited to the following chlorinated compounds that are known to be related to historic site contamination and have been found to be present in soil vapor under Building 2 fairly consistently and above levels of other chlorinated compounds:

- 1,1,1-Trichloroethane (TCA)
- 1,1-Dichloroethene (11DCE)
- 1,1-Dichloroethane (11DCA)
- Tetrachloroethane (PCE)
- Trichloroethane (TCE)
- Trichlorofluoromethane (Freon 11)

These compounds are considered site-related but the detection of them in indoor air may not always be attributable to historic site contamination. As discussed below, there were indoor sources (owned by the building's tenants) of some of these compounds found to have impacted indoor air. In particular, the discussion of Freon 11 detections is limited because indoor air concentrations were often found above SSSV concentrations, suggesting the presence of indoor sources. Given the large quantity of large wooden crated boxes stored in the building, a complete chemical inventory was never completed. When asked if any tenant could be storing air conditioners, the property owner received a reply that it was "possible." Therefore, this report has limited discussion of Freon 11 results because of its relatively low SSSV concentrations and that indoor air levels appear to be primarily due to indoor sources.

Although petroleum-related compounds, such as benzene, ethylbenzene, toluene and xylene, are known to be related to historic site contamination, they have not been found at appreciable levels in SSSV, and in most cases, have been found at higher levels in indoor air, more often during sampling events conducted when gasoline-powered vehicles were stored in the building. Therefore, there is no discussion about petroleum-related compounds except with respect to the former maintenance garage. However, the data for all compounds included in the analytical method are presented in the attached tables.

3. FEBRUARY 2016 SAMPLING

3.1 OVERVIEW

VI sampling was conducted on February 19, 2016 in accordance with a NYSDEC-approved work plan prepared by OBG, dated December 28, 2015. The purpose of the sampling was to check for temporal variability in relation to the September 2015 sampling results prior to designing two SSDSs. The same sample locations used in September 2015 were re-sampled in February 2016. An additional (third) sample location was added in the former maintenance garage. There were eight locations in Building 2 and three locations in the former maintenance garage, as shown in **Figure 2**. OBG collected a total of 11 sets of samples (each set consisting of one sub-slab sample and one indoor air sample) from within Building 2 and the former maintenance garage. One ambient air sample was collected upwind of both buildings, simultaneously with the sub-slab/indoor air samples.

Samples were collected and analyzed in accordance with the NYSDEC-approved protocols. One duplicate sample of SSSV was collected to assess overall precision. Data were validated and a data usability summary report (DUSR) was prepared and included in this report in **Appendix B**.

3.2 SAMPLE RESULTS AND DATA EVALUATION

Sample results were delivered via email to NYSDEC on March 9, 2016, and are presented in **Table 1**, in units of micrograms per cubic meter (µg/m^3). Laboratory data reports are provided as **Appendix C** and copies of completed field forms are provided as **Appendix D**.

Figure 2 compares the SSSV and indoor air results of six site-related chlorinated compounds from the September 2015 sample event with the results of the February 2016 sample event.

3.2.1 Maintenance Garage

As shown in **Figure 2**, the highest SSSV concentration was 19 µg/m^3 for TCE at location -02. The corresponding indoor air concentration of TCE at location -02 was not detected above the analytical reporting limit of 0.11 µg/m^3.

The second highest SSSV compound was TCA at 3.9 µg/m^3 at location -01. The corresponding indoor air concentration of TCA at location -01 was not detected above the analytical reporting limit of 0.11 µg/m^3. TCA was also detected at a lower concentration in SSSV at location -11 (2.3 µg/m^3), and the corresponding indoor air concentration at location -11 was not detected above the analytical reporting limit of 0.11 µg/m^3.

As shown in Table 1, there were indoor air detections for benzene, toluene, ethylbenzene, and xylene; however, corresponding SSSV concentrations were lower than respective indoor air concentrations or were slightly higher such that the indoor air concentrations could not be primarily due to vapor intrusion. Therefore, indoor air concentrations of these petroleum-related compounds are likely attributable to indoor air sources within the garage[2], and thus not attributable to VI.

Comparison of detected chlorinated compounds from the September 2015 results to the February 2016 results indicate lower SSSV concentrations ranging from 77% (TCA at location -01) to 94% (TCE at location -02). Therefore, there appears to be a temporal variability of SSSV levels with lower levels observed during the heating season than prior to the heating season.

Indoor air TCE concentration at location -02 remained below NYSDOH's air guideline value for TCE of 2.0 µg/m^3, and below typical indoor air background levels[3] of 4.2 µg/m^3. The February 2016 sample results confirm

[2] Tenants within the garage repair/modify automobiles, maintain commercial lawn equipment, and clean-out semi-trailers utilizing numerous solvents, aerosol cleaners and oils.

[3] Defined by the NYSDOH SVI guidance document as the 90th percentile for office and commercial buildings database provided in Appendix C.2 of the guidance document. It should be noted that there are other factors, specially

conclusions established following the September 2015 sample event that VI does not appear to be occurring nor has a potential to occur in the maintenance garage.

3.2.2 Building 2

As shown in **Table 1** and **Figure 2**, the highest SSSV concentrations were in the low-bay area, particularly at locations -06 and -08. Similar to the September results, the primary compounds in SSSV were TCA and 11DCE, with the highest concentrations of these compounds found at locations -08 and -06, respectively. TCE was the third highest compound in SSSV[4], found at its highest concentration at location -06 at two orders of magnitude below 11DCE.

It appears that the September 2015 sample IDs for locations -05 and -06 were inadvertently swapped in the field, as was evidenced in succeeding sampling events. However, at the time of the February 2016 sampling, OBG believed that the sample IDs were not swapped since location-specific details on field forms indicated that sample IDs were accurately matched. The attached appendices and figures showing September 2015 data have not been corrected since they were delivered to NYSDEC as such.

Assuming the September 2015 results for location -05 apply to location -06 and visa-versa, SSSV concentrations for the six chlorinated compounds were lower in February 2016 compared to the September 2015 concentrations. Therefore, the same temporal variability that was found in the former maintenance garage was also observed in Building 2.

The chlorinated compounds with the highest indoor air concentrations were TCA and 11DCE. The other chlorinated compounds were found at approximately an order of magnitude less. In particular, TCE, with the third highest SSSV concentration, was consistently less than 0.18 µg/m^3, which was well below the NYSDOH air guideline value and typical background level defined above. Given that TCA and 11DCE were also the primary SSSV constituents and that indoor sources of these two compounds were not identified, the results confirmed the previous assumption that their indoor air concentrations were likely attributable to VI. The following summarizes the indoor air concentrations of the three compounds, found at the highest concentrations in sub-slab for the three different areas in the building:

		Indoor Air Range (µg/m^3)		
Area	**Sample Location Nos.**	**TCA**	**11DCE**	**TCE**
High-Bay	3, 4	0.72-1.2	2.4-4.6	<0.11-0.15
Low-Bay	6-10	1.5-4.3	4.6-12	<0.11-0.17
Boiler Room	5	0.15	0.31	<0.11
Typical Background*		20.6	<1.4	4.2
***NYSDOH guidance, Appendix C-2, 90th percentile**				

Boiler room and high-bay area indoor air concentrations were less than those found in the low-bay area, which suggests that vapor intrusion was occurring in low-bay area, with some communication of its indoor air to the high-bay area and limited communication to the boiler room.

NYSDOH's air guideline values and its Decision Matrices, that are also used in guiding decisions to reduce exposure to a chemical.

[4] Excluding Freon-11 for the reason discussed in Section 2.3.

3.3 CONCLUSIONS & RECOMMENDATIONS

3.3.1 Maintenance Garage

Temporal variation of SSSV concentrations was evident in comparison to the September 2015 results. The February 2016 sampling confirmed the September 2015 sampling that VI did not appear to be occurring in the garage, that indoor air levels are still below NYSDOH air guideline values, and that the slab is in good condition. OBG, on behalf of LMC, recommended that annual slab inspections be conducted to monitor for slab condition changes in the future, and conduct slab sealing and/or sampling if changes are found that cause a VI pathway. The initial slab inspection was conducted during the 2016/2017 heating season and findings were summarized in a TM dated February 13, 2017. Annual slab inspections have occurred each heating season since then and there have been no changes that required additional sampling or slab sealing.

3.3.2 Building 2

Temporal variation of SSSV concentrations was also evident. VI appears to be occurring for TCA and 11DCE in the low-bay area, which may be communicating into the high-bay area and to a more limited extent into the boiler room. Indoor air concentrations of 11DCE are above typical background levels, defined by NYSDOH.

At the time, it appeared from both the September 2015 and February 2016 results that the highest SSSV locations, -05, -06 and -08, may be the source locations of VI. Therefore, OBG, on behalf of LMC, added a third SSDS to its December 2015 recommendation of mitigation. The purpose of the mitigation systems was to protect against possible future increased VI if slab conditions were to change. NYSDEC verbally approved this recommendation during a conference call on March 21, 2016.

4. INSTALLATION OF SUB-SLAB DEPRESSURIZATION SYSTEMS

Following the February 2016 sampling event, OBG conducted a preliminary SSDS design for three systems within Building 2 at locations -05, -08, and -06. During pre-design testing conducted on February 22, 2016, pressure field extension tests (also referred to as communication tests) were performed to assess if sub-slab conditions were conducive to sub-slab depressurization. Using the communication test results, the location of one vertical system suction point (SSP) was proposed for each system.

OBG prepared a design drawing to show the layout of system components, including proposed SSP locations, interior pipe routes and fan and exhaust locations. The design drawing also showed the location of communication test points (CTPs) used for communication testing and differential pressure measurements recorded at the CTPs during the preliminary design visit. OBG provided the design drawing to Widewaters for its approval of the locations of system components.

Widewaters expressed some concerns regarding the location of system components with respect to future tenant build-outs. Therefore, OBG proposed installation of horizontal sub-slab piping at locations -08 and -06. Through multiple rounds of revisions to the preliminary SSDS design, Widewaters provided approval of the final SSDS design layout (as shown on **Figure 3**), which was submitted to Mr. Joshua Cook of NYSDEC, who provided agency approval of the SSDS design in an email dated June 15, 2016.

OBG began installation of the three SSDSs in July 2016. As a result of scheduling conflicts with the roofing contractor, installation was temporarily postponed until September, when the contractor was available. The installation of the three SSDSs was completed in September 2016.

Following SSDS installation, OBG commissioned the SSDSs on September 20, 2016. SSP vacuum measurements were made and post-mitigation communication testing was performed to identify the area of depressurization[5] induced by each SSDS. The commissioning documented that system operating conditions and the area of depressurization, as well as ventilation,[6] under the intended slab areas. The commissioned communication test results and final system layout are provided on **Figure 4**. The commissioning documentation is provided in **Appendix E**. Additional details regarding the SSDS are included in the Interim Site Management Plan (ISMP) dated July 2017 and revised November 2018. Based on commissioning testing, the systems were depressurizing the following approximate slab areas:[7]

- SSDS-05 (single SSP): 1,900 square feet (ft2)
- SSDS-06 (105-foot trench): 13,700 ft2
- SSDS-08 (25-foot trench): 2,400 ft2

According to the December 2015 mitigation system design and installation work plan, post-mitigation indoor air (PMIA) samples were to be collected from within Building 2 following at least 30 days of continuous SSDS operation. Given that NYSDOH recommends collection of PMIA samples during the heating season (defined by NYSDOH as the period between November 15 and March 31), PMIA sampling was scheduled for December 6, 2016.

[5] Slab areas where the induced differential pressure (above and below the slab) is at least 0.004 inches of water.
[6] In addition to depressurization, sub-slab ventilation (SSV) was also identified. SSV exists when the differential pressure is <0.004 inches of water and an induced airflow beneath the slab as observed by smoke tests (*i.e.,* test smoke released at the CTP is pulled into the CTP).
[7] Subsequent communication testing using additional CTPs was conducted to monitor the depressurization areas, which vary temporally, likely due to variation in the sub-slab soil moisture content.

Prior to PMIA sampling, inspection of the SSDSs on December 6, 2016 found that additional sealing was required along the sub-slab trench associated with SSDS-06. As a result, PMIA sampling was postponed one week to allow the sealant to cure. OBG attempted to collect PMIA samples thereafter; however, OBG found that the fan for SSDS-06 was inadvertently shut down. Given that the SSDSs were not in continuous operation for at least 30 days, the PMIA sampling was again postponed until January 2017.

5. JANUARY 2017 PMIA SAMPLING

5.1 OVERVIEW

The purpose of the January sampling was to assess the effectiveness of the SSDSs in regards to decreasing indoor air concentrations, primarily with respect to TCA and 11DCE as discussed in Section 3. PMIA sampling was conducted on January 17, 2017 in accordance with the NYSDEC-approved December 2015 mitigation system work plan. Immediately prior to collecting the PMIA samples, OBG inspected the SSDSs to verify that they were still operating as commissioned and conducted communication testing to verify that the portions of the slab were still depressurized as commissioned.

Eight PMIA samples were collected at the same indoor air sample locations used during the September 2015 and February 2016 sampling events. One upwind ambient air sample was collected simultaneously with the indoor air samples. Sub-slab sampling was not conducted during the PMIA sampling event. One duplicate sample of indoor air was collected to assess overall precision. Data were validated and a data usability summary report (DUSR) was prepared and included in this report in **Appendix B**.

5.2 RESULTS AND DATA EVALUATION

Sample results were delivered to NYSDEC via email on March 6, 2017 and are presented in **Table 2**. Laboratory data reports are provided in **Appendix C** and copies of completed field forms are provided in **Appendix D**.

Figure 5 shows the results of the January 2017 indoor air samples along with the September 2015 and February 2016 SSSV and indoor air results of the site-related chlorinated compounds. To assess the effectiveness of the SSDSs, the sampling results were compared to the indoor air results obtained in February 2016, which were collected prior to the mitigation system installation and during the prior heating season. As shown in **Figure 5**, there was a mix of no change, decreases and increases of TCA and TCE across the eight locations. 11DCE decreased in seven of the locations but increased in the boiler room location. Given that there were not reductions at all locations in both compounds constituting most of the SSSV (TCA and 11DCE, as discussed in Section 3.2), it appeared that the SSDSs did not effectively reduce VI for one or more of the following potential reasons:

1. SSSV concentrations may have been higher compared to the February 2016 sampling (given the temporal variation discussed in Section 3.3).
2. Indoor air sources of some of the chlorinated compounds are present in portions of the building that could not be inspected during the PMIA sample event.
3. Vapor intrusion may be occurring through one or more of the five possible slab areas found during the 2015 and 2016 slab inspections for Building 2.
4. The SSDSs may not be influencing enough of the slab area to capture enough SSSV.

5.3 CONCLUSIONS AND RECOMMENDATIONS

The SSDSs did not appear to effectively reduce indoor air concentrations for the two primary SSSV compounds at all locations. Based upon the PMIA sample results and discussions during a May 12, 2017 meeting with NYSDEC, LMC, and Widewaters, the following recommendations were developed and outlined in a Vapor Intrusion Investigation Work Plan dated May 23, 2017, and Plan addendum dated June 12, 2017:

1. Seal the five previously identified and documented slab areas that contain potential breaches (*e.g.,* cracks, expansion joints between concrete sections, floor and wall/column intersections, drains, grates, and sump pits). At the same time, conduct another slab inspection using a real-time total volatile organic compound (VOC) analyzer that uses a photoionization detector (PID) to identify if the breaches are potential soil vapor pathways, and seal upon discovery.

2. Conduct indoor air sampling to assess effectiveness of the sealing. Immediately following the indoor air sampling, the SSDSs would be turned off for a 48-hour period in preparation of additional SSSV sampling.
3. Conduct additional SSSV sampling to evaluate SSSV variability at previously sampled locations, and to identify whether SSSV was present at nine new sampling locations.

6. JUNE/JULY 2017 SLAB INSPECTION, SURVEY AND SEALING

The slab inspection and survey was conducted on June 26 and June 27, 2017. Accessible areas of the slab were visually inspected for new or changed potential slab breaches, and surveyed for total VOCs using a PID to identify if the breaches were potentially soil vapor pathways. As part of the inspection, the following potential breaches were surveyed:

- Previously identified potential slab breaches identified during the 2015 and 2016 slab inspections
- Other potential slab breaches not identified during previous slab inspections
- Expansion joints
- Floor drains
- Grates
- Sump pits
- Floor/column intersections
- Floor/wall intersections

The survey identified potential vapor pathways that were expansion joints (between concrete sections), narrow gaps where the floor intersects with some of the columns, and small holes. As can be seen in **Figure 6**, the identified potential soil vapor pathways were centrally located within the low-bay area. The PID survey showed elevated levels of total VOC, when measured within an inch of the slab, ranging between 54 parts per billion (ppb) and 2,600 ppb. There were no potential soil vapor pathways identified in the high-bay area.

The identified potential soil vapor pathways were sealed on July 5 and July 6, 2017 using concrete or polyurethane caulk, as appropriate. For expansion joints, the entire length of the joint between columns were saw-cut approximately 3/8" deep into the slab, then swept, mopped and allowed to dry before applying polyurethane caulk. The gaps at the floor/column intersections were cleaned with a wire brush and sealed with polyurethane caulk. The previously identified potential slab breaches (identified during the 2015 and 2016 slab inspections) did not indicate elevated total VOC concentrations; however, they were sealed with concrete or polyurethane caulk regardless.

7. JULY 2017 SAMPLING

7.1 OVERVIEW

SSSV and indoor air sampling was conducted on July 27, July 31, and August 1, 2017. As discussed in Section 5.3, the purpose for the sampling was as follows:

Assess indoor air concentration changes as a result of the slab sealing

- Assess temporal variations in SSSV concentrations at the previously sampled locations
- Evaluate SSSV concentrations in areas of potential tenant office spaces, as was proposed by the property owner at that time
- Evaluate SSSV concentrations at locations areas not previously sampled, particularly nearest to the former AOC-5 and AOC-8

The July 2017 sampling was approved by NYSDEC in a letter dated June 20, 2017, which referenced the Soil Vapor Investigation Work Plan, dated May 23, 2017, and work plan addendum dated June 12, 2017.

Eight indoor air samples were collected at the same indoor air sample locations used during the September 2015, February 2016, and January 2017 sample events. One upwind ambient air sample was collected simultaneously with the indoor air samples. Immediately prior to collecting the PMIA samples, OBG inspected the SSDSs to verify that they were still operating as commissioned and conducted communication testing at CTPs used during SSDS commissioning to verify that the intended areas of the slab were still depressurized.

At the time of sampling (approximately 3 hours into the 8-hour sampling event and while OBG was conducting a building survey), elevated total VOC concentrations (measured by a PID) were detected near a cargo/work trailer parked within Building 2. Total VOC readings in excess of 4,000 ppb were detected at vents located on the sides of the trailer. When the trailer was opened by the property owner, containers of chemicals (including cleaners and degreasers), three air conditioners, and a lawn mower were found inside. The items inside the trailer were previously identified in the tenant space (referred to as the Joy Carpet room) within Building 2 by OBG in June 2017 during the slab inspection. At that time, the property owner instructed the tenant to remove them from the building before the July sampling event. Instead of removing the items, it appears they were placed inside the trailer that was placed inside the main, open area of the building. The location of the trailer and its sample is shown on **Figures 7** and **9** as sample IA-XX.

OBG notified the property owner about the total VOC readings of the trailer vents. The property owner contacted the trailer owner (Joy Carpet) to immediately remove the contents of the trailer. OBG requested to inventory the chemicals but the property owner declined the request and insisted that they be removed immediately. Given the potential impact of the trailer's contents on indoor air concentrations, an additional indoor air sample was collected from within the trailer, immediately prior to and during the content removal, to characterize the VOCs that could be coming from the trailer into the building. The sample was a grab sample (not integrated over an 8-hour period as the other samples).

Following collection of the indoor air samples, the SSDSs were shut-down to minimize any impact that the sub-slab depressurization may have on SSSV samples. After the SSDSs were shut-down for approximately three days, SSSV samples were then collected at 15 locations (four at previously sampled locations (-04, -05, -06, -08) and 11 at new locations) over a two-day period. When the SSSV sampling was completed, the SSDSs were turned back on.

Samples were collected and analyzed in accordance with the NYSDEC-approved work plan. One duplicate sample of SSSV was collected to assess overall precision. Data were validated and a data usability summary report (DUSR) was prepared and included in **Appendix B**.

7.2 RESULTS AND DATA EVALUATION

Sample results were delivered via email to NYSDEC on August 18, 2017 and are presented in **Tables 3** and **4** for each sample location. Laboratory data reports are provided in **Appendix C** and copies of completed field forms are provided in **Appendix D**.

Figure 7 shows the location of the samples and recent historical SSSV and indoor air results of the six site-related chlorinated compounds. The results of the air sample collected from within the trailer (shown as sample IA-XX) showed concentrations of TCA, 11DCE and TCE higher than the eight indoor air locations, as summarized below:

		Indoor Air Range (µg/m^3)		
Area	**Sample Location Nos.**	**TCA**	**11DCE**	**TCE**
High-Bay	3, 4	0.54-0.57	1.1-1.2	0.24-0.32
Low-Bay	6-10	2.1-3.6	3.4-6.0	0.21-0.37
Boiler Room	5	1.2	2.1	0.14
Trailer	XX	38	6.2	0.67

Given that the trailer air sample was collected after the trailer was opened and while the contents were being removed from the building, the trailer air results likely would have been even higher if the trailer was not opened up before the sample was collected. These results indicated that the trailer contents were likely a source of TCA, 11DCE, and TCE found in indoor air throughout the building. The existence of these indoor sources during previous sampling events is unknown. It is suspected that the sources were contained in a locked room, called the Joy Carpet room, which may have been contributing to indoor air levels for some or all of the previous sampling events.

To evaluate the effectiveness of slab sealing, a comparison of the indoor air results obtained in January 2017 (pre-sealing) and the July 2017 indoor air results should indicate a reduction, primarily for TCA and 11DCE, for locations that were previously sampled within the low-bay area where the sealing occurred (-06 and -08). As shown in **Figure 7**, there was relatively no change in TCA levels and an increase in 11DCE levels. Also worth noting is an increase in PCE and Freon 11 levels and no change in TCE and 11DCA levels. It is possible that the effect of the indoor source (trailer contents) may have masked the effectiveness of the sealing, in that the emissions from the indoor source and its resulting contribution to indoor air may not have been the same in January and July 2017. Therefore, the sampling event was inconclusive with respect to showing the effectiveness of the slab sealing.

Sub-slab sampling locations SS-17 and SS-18 were located within or near the proposed potential tenant office space. The sample results showed no elevated site-related chlorinated compounds, similar to previous sampling events at SS-10.

Of the 11 new SSSV sampling locations, elevated SSSV concentrations of site-related chlorinated compounds were detected just outside the area of depressurization of SSDS-08, specifically at SS-14, SS-15, and SS-16. TCA was found at its highest concentration in SSSV (490,000 µg/m^3) at SS-16, and at an order of magnitude higher than 11DCE at that location. At locations SS-14 and SS-15, 11DCE was higher than TCA, and was found at its highest SSSV concentration (53,300 µg/m^3) at SS-15. These results confirm the previous findings that TCA and 11DCE are the primary SSSV components, and thus the compounds with the highest potential for VI.

7.3 CONCLUSIONS AND RECOMMENDATIONS

The assessment of the effect of the slab sealing was inconclusive. An indoor source of the two primary SSSV compounds was found, which appear to have biased high the indoor air sampling results, and likely previous

sampling results as well. Other slab areas were found with TCA and 11DCE SSSV concentrations higher than those found thus far and were outside the depressurization areas.

The low SSSV results in the proposed potential tenant office space (SS-17 and SS-18) suggested that mitigation in that area (building's south corner) was not warranted at that time. The high SSSV concentrations found in the low-bay area, in comparison to those in the areas of depressurization, indicate that the existing SSDSs were not capturing elevated SSSV beyond the depressurization area of SSDS-08 and SSDS-06.

In its submittal of the sampling results to NYSDEC on August 18, 2017, OBG, on behalf of LMC, OBG proposed re-sampling indoor air at the eight locations following a period of building ventilation after the trailer and its contents were removed from the building, for the purpose of assessing the effect the indoor air source had on the indoor air sample results. In its response on September 7, 2017, NYSDEC approved the resampling and requested that SSSV samples be collected at five new locations to further delineate the extent of elevated SSSV concentrations beyond the areas of depressurization.

To identify the locations of the five additional SSSV sample locations, OBG conducted communication testing surrounding the three SSDSs to reaffirm the areas of depressurization and ventilation induced by each system. New communication test points were installed in the high bay area (north and northeast of SSDS-06) to delineate the area of depressurization induced in this area. The communication testing was conducted between September 20 and September 22, 2017. Following the communication testing, the SSDSs were shut-down.

With the SSDSs shut-down for approximately two days, OBG conducted another PID survey of the building to identify potential indoor air sources or soil vapor pathways. OBG did not identify new sources or pathways during this survey.

Following the survey, OBG began drilling holes through the slab in areas where new SSSV samples were proposed. The holes were screened with a PID and the total VOC concentrations were recorded to identify the extent of sub-slab concentration areas. The sub-slab holes were located either between previous SSSV sample locations, or stepped away from previous SSSV sample locations. As a result, on October 2, 2017 OBG proposed to collect eight additional SSSV samples (three more than requested by NYSDEC). **Figure 8** was sent on October 2, 2017 showing the proposed sampling locations and the screening results.

8. OCTOBER 2017 SAMPLING

8.1 OVERVIEW

The indoor air re-sampling was conducted on October 10, 2017. The purpose of the re-sampling was to assess indoor air concentrations without the indoor source found during the July 2017 sampling.

In addition, eight SSSV samples were then collected on October 13, 2017. The purpose of the sampling was to further delineate the extent of elevated SSSV concentrations beyond the areas of depressurization. Approval for re-sampling of the indoor air and locations of the SSSV samples was received via email from Mr. Joshua Cook of NYSDEC on October 10 and October 11, 2017.

Eight indoor air samples were collected at the same indoor air sample locations used during the September 2015, February 2016, January 2017, and July 2017 sampling events. One upwind ambient air sample was collected simultaneously with the indoor air samples. Immediately prior to collecting the PMIA samples, OBG inspected the SSDSs to verify that they were still operating as commissioned and conducted communication testing at CTPs used during SSDS commissioning to verify that the portions of the slab were still depressurized.

At the time of sampling, the tenant trailer was not in the building but elevated VOC concentrations (measured by a PID) were detected at the bottom of a locked door to the Joy Carpet room. Therefore, an additional indoor air sample was collected from the room by extending sampling tubing under the door.

Following collection of the indoor air samples, the SSDSs were shut-down to minimize any impact that the sub-slab depressurization may have on SSSV samples. After the SSDSs were shut-down for approximately three days, eight SSSV samples were then collected. When the SSSV sampling was completed, the SSDSs were turned back on.

Samples were collected in accordance with NYSDEC-approved protocols. One duplicate sample of SSSV was collected to assess overall precision. Data were validated and a data usability summary report (DUSR) was prepared and included in this report in **Appendix B.**

8.2 RESULTS AND DATA EVALUATION

Sample results were delivered to NYSDEC on November 6, 2017 and are presented in **Tables 5** and **6**. Laboratory data reports are provided in **Appendix C** and copies of completed field forms are provided in **Appendix D**. **Figures 9** and **10** show the location of the samples and recent historical SSSV and indoor air results of the six site-related chlorinated compounds.

To assess indoor air concentrations without the indoor source found during the July 2017 sampling, the October 2017 results were compared to the July 2017 sample results, which are summarized as follows:

			Indoor Air Range (µg/m^3)		
Area	Sample Location Nos.	Sample Event	TCA	11DCE	TCE
High-Bay	3, 4	July 2017	0.54-0.57	1.1-1.2	0.24-0.32
		October 2017	0.33-0.34	0.43-0.48	0.16-0.26
Low-Bay	6-10	July 2017	2.1-3.6	3.4-6.0	0.21-0.37
		October 2017	1.4-2.4	1.4-2.1	0.15-0.46
Boiler Room	5	July 2017	1.2	2.1	0.14
		October 2017	1.6	2.1	0.17

			Indoor Air Range (µg/m^3)		
Area	Sample Location Nos.	Sample Event	TCA	11DCE	TCE
Joy Carpet Trailer	XX	July 2017	38	6.2	0.67
Joy Carpet Room	JY	October 2017	3.7	1.4	0.89

The indoor air results in the high-bay area and low-bay area show an obvious reduction in the two primary SSSV compounds (TCA and 11DCE) after removal of the indoor source. The results also continue to show limited indoor air communication between the low-bay area and the boiler room. It also appears that the Joy Carpet room could still be contributing to TCA levels in the low-bay area since it showed a TCA concentration higher than all other samples. Finally, the results of other compounds from the room show elevated levels of petroleum (likely gasoline) compounds and solvent compounds (acetone and alcohols), which suggest the room may be one of, if not the primary, source of these compounds in indoor air.

As shown in **Figure 10**, elevated SSSV concentrations for the chlorinated compounds were detected in the low-bay area at new sampling locations -24, -25, -26, and -27, which are in the same general area of the other elevated levels found during the July 2017 sampling event (see Section 7.2). Although an order of magnitude lower, elevated concentrations of SSSV were found at new sampling locations in the high-bay area (-29 and -30).

8.3 CONCLUSIONS AND RECOMMENDATIONS

The indoor air source found during the July 2017 sampling event appeared to contribute to TCA and 11DCE concentrations, as well as other compounds, in the low-bay area that communicated to the indoor air in the high-bay area. The tenant responsible for the source may still be contributing to indoor air levels via their locked storage room.

In its November 6, 2017 results submittal to NYSDEC, OBG, on behalf of LMC, indicated its intention to add a fourth SSDS to depressurize the area between SSDS-6 and SSDS-8. The specific new area of depressurization was submitted to Mr. Joshua Cook of NYSDEC in an email on November 13, 2017. OBG indicated that it would submit a pre-design investigation (PDI) work plan for NYSDEC review.

While elevated SSSV concentrations for some chlorinated compounds were detected in the high-bay area, the estimated total mass of sub-slab vapors (based on the sum of the six chlorinated compounds weighted by the slab area) in the high-bay area is <5 percent of the total mass in the existing and proposed depressurization areas. Therefore, no mitigation of the high-bay area was proposed.

9. JUNE 2018 SCREENING AND SAMPLING

9.1 OVERVIEW

After receipt of input from the property owner and discussion with all interested parties regarding the proposed additional mitigation area, a PDI work plan was submitted to NYSDEC on April 5, 2018 that outlined the following investigation activities:

- SSSV screening – To aid in finalizing the specific slab area to be mitigated
- SSSV sampling – To confirm the previously developed correlation between screening levels and speciated compound concentrations
- Communication testing – To estimate the extent of depressurization/ventilation that can be induced by applied vacuum to the sub-slab
- Sub-slab obstruction survey – To assess possible obstructions (e.g., pipes, conduits) that could inhibit pressure field extension of induced sub-slab vacuum

The PDI work plan was approved by NYSDEC on May 18, 2018.

With the existing SSDSs shutdown, OBG began installation and screening of approximately 42 temporary sub-slab screening points and eight SSSV sample points on June 4, 2018. The points were screened for total VOCs utilizing two different PIDs with 10.6 eV and 11.7 eV lamps. The screening took place over a three-day period. Multiple screening measurements were collected at the points to assess bias due to humidity and/or heat generated from drilling.

On June 7, 2018, OBG, NYSDEC, and the property owner and its consultant (CHA Consulting, Inc.) met on-site to discuss the screening results and select SSSV sampling locations, at which OBG proposed to collect 14 samples. Mr. Joshua Cook of NYSDEC verbally accepted the SSSV sampling approach at the on-site meeting.

Beginning June 18, 2018, OBG collected 14 SSSV samples at locations shown on **Figure 11**. Samples were collected and analyzed in accordance with the NYSDEC-approved protocols. One duplicate sample of SSSV was collected to assess overall precision. Data were validated and a data usability summary report (DUSR) was prepared and included in this report in **Appendix B**.

9.2 RESULTS AND DATA EVALUATION

Sample results were delivered to NYSDEC on July 12, 2018 and are presented in **Table 7** for each sample location. Laboratory data reports are provided in **Appendix C** and copies of completed field forms are provided in **Appendix D**.

Figure 11 presents the SSSV results for all samples collected in June 2018. **Figure 12** presents the historical SSSV results for locations sampled in June 2018. As shown in **Figure 11**, there were no locations with detections of site-related compounds similar to those found previously. The highest new SSSV sampling point outside of the existing and proposed areas of depressurization/mitigation is -M2 with a SSSV concentration of 11DCE at 11,500 µg/m^3. When compared to the total chlorinated compound SSSV concentrations, -M2 represents 1% of the mass of SSSV beneath the building. Additional mitigation near -M2, encompassing -29 and -30 as well, would mitigate approximately 2% of the total mass.

Figure 13 is a heat map of interpolated SSSV concentrations of total chlorinated compounds inclusive of the June 2018 sample event. As shown in **Figure 13**, the primary mass of SSSV is located around locations -14, -15, -16, -24, -25, and -27. Beyond these locations, SSSV concentrations decrease significantly to the four corners of the building.

A comparison of **Figure 11** (showing the proposed and existing areas of depressurization/ventilation) and **Figure 13** (showing where the primary mass of SSSV is located), the June 2018 sample results suggest that the proposed and existing areas of depressurization/ventilation will encompass approximately 95% of the total mass of SSSV beneath the building.

9.3 CONCLUSIONS AND RECOMMENDATIONS

The June 2018 SSSV sampling further delineated the extent of the SSSV but did not reveal SSSV locations near the same magnitude of concentrations found previously. The results confirmed that the proposed area for the new mitigation system when combined with the existing systems would depressurized areas of the slab where SSSV concentrations have the greatest potential to create indoor air concentrations greater than the typical indoor air background concentrations.

As of the date of this report, the design approach to mitigate the proposed area on **Figure 11** has been proposed to NYSDEC in an email dated November 13, 2017, and discussed during meetings with NYSDEC and NYSDOH on March 2, 2018 and September 11, 2018. NYSDEC provided approval of this approach in a letter dated September 12, 2018. Communication testing and the sub-slab obstruction survey within the proposed area of depressurization/ventilation have been completed, and an SSDS design is being prepared for NYSDEC review.

In addition, an operating, maintenance, and monitoring plan (OMM Plan) will be submitted along with the design, and will describe activities associated with the operating and maintenance of the SSDS as well as indoor air monitoring of the areas not depressurized. The OMM Plan will also describe monitoring activities and pro-active mitigation measures that will be conducted when changes to the building occupancy, build-outs, and HVAC occur to demonstrate that building occupant's health is protected. Following approval from NYSDEC and NYSDOH, the OMM Plan will be included in the site's Site Management Plan (SMP).

10. SUMMARY

LMC is committed to the protection of the environment and human health at the former GE Farrell Road site. This report documents LMC's efforts to investigate soil vapor and indoor air. It also documents that indoor air quality has been, before and after mitigation, below NYSDOH air guideline values for two of the six site-related compounds that have air guideline values. Indoor air levels are now (after removal of a tenant's indoor air source) documented to be below indoor air background levels of commercial buildings (as defined by NYSDOH) for four of the six site-related compounds. Indoor air levels for Freon 11, as described in this TM, is assumed to be related to indoor sources. 11DCE is the only other site-related compound that appears to be related to VI, and is present below background levels in high bay area and ranges at and slightly above background levels in the low bay area. One of the objectives of the additional mitigation area is to reduce 11DCE levels in the low bay area. The objective of the upcoming OMM Plan is to monitor indoor air levels in the future to assess the need for future mitigation. Therefore, LMC has shown its commitment to characterize and address VI at this site, and will demonstrate with the forthcoming OMM Plan its commitment to continue to protect human health in the future, if and when building conditions change.

Notes:

[a] Indoor air concentrations measured in commercial and public buildings that do not have vapor intrusion. The values are the 90th percentile values taken from the EPA 2001

6.8 - Bold value indicates indoor air concentration is above typical background levels

U - indicates compound was not detected (ND) above reporting limit. Reporting limit reported.

Notes:

[a]Indoor air concentrations measured in commercial and public buildinngs that do not have vapor intrusion. The values are the 90th percentile values taken from the EPA 2001.

6.8 - Bold value indicates indoor air concentration is above typical background levels.

<6.8 - Indicates compound was not detected (ND) above reporting limit. Reporting limit reported.

[a]Indoor air measured in commercial and public buildings that do not have vapor intrusion. The values are the 90th percentile values taken from the EPA 2001.

6.8 - Bold value indicates indoor air concentration is above typical background levels.

<6.8 - Indicates compound was not detected (ND) above reporting limit. Reporting limit reported.

Submitted Technical Memorandums

To:	Myron Parkolap	*cc:*	Heather Daniels, LMC
From:	Mark Distler		Phil Talucci, LMC
Re:	Vapor Intrusion Sampling Results, Former GE Farrell Road Site		Virginia Robbins, BS&K
File:	5851/40162.100.100		
Date:	May 24, 2007		

This Technical Memorandum (TM) presents the results of the sampling conducted at the former GE Farrell Road Site (Site) on February 20, 2007. The sampling was performed in accordance with a Work Plan, dated September 19, 2006, and a Work Plan Addendum, dated January 9, 2007. The New York State Department of Environmental Conservation (NYSDEC) in a letter dated January 19, 2007 approved the Work Plan and Work Plan Addendum. This TM also evaluates the data with respect to the potential for vapor intrusion, and provides recommendations.

1. Site Background

The Site consists of 156 acres in an industrial zone setting located on Farrell Road and John Glenn Boulevard in the Town of Geddes, northeast of Routes 690 and 90 and south of the Seneca River. Nearly half of the Site (81 acres) is classified as a Class I wetlands. Ground water flows in a north/northwest direction across the Site toward Seneca River. Depth to ground water in the developed portion of the Site is approximately ten feet below ground surface (bgs). The developed portion of the Site is paved and contains four on-Site buildings; Buildings 1 and 2, former test building, and maintenance garage. Figure 1 shows Buildings 1 and 2.

There are three primary historic source areas relevant to vapor intrusion potential at the Site, referred to as areas of concern (AOC), where interim remedial measures (IRMs) were implemented.[1] The following identifies the location (also shown on Figure 1) and gives a description of each AOC:

- AOC 5, located along the west side of Building 2, was an area where nine underground storage tanks (USTs) and a dry well were removed.
- AOC 7, located along the east side of Building 2, was an area of a former fuel oil UST and where drums containing Freon were rinsed.
- AOC 16, located adjacent to the maintenance garage, was an areas of a former gasoline UST.

Currently, the Site is classified as Class 4 on the New York State Registry of Inactive Hazardous Waste Disposal Sites, based on the effectiveness of the IRMs. A ground water extraction and treatment system at the Site has been deemed effective at controlling off-site migration of shallow contaminated ground water. Concentrations of VOCs in ground water are periodically measured from samples collected from monitoring wells located at the Site. Building 2 is currently operated by Rite Aid Corporation who uses it as warehouse space for product inventory for its retail outlets.

[1] Note that there were other AOCs at the Site where some remedial work was completed, but they are not considered relevant to this investigation.

2. Vapor Intrusion Sampling

Vapor intrusion sampling was conducted on February 20, 2007. Samples of sub-slab vapor, indoor air, and ambient air were collected simultaneously over an 8-hour period. Samples were collected in accordance with the approved Work Plan. Javier Perez of the NYSDEC was present during a portion of the on-Site activities.

2.1 Sampling Locations and Methods

Paired sub-slab vapor and indoor air sample sets were collected at five locations at the northern portion of Building 2, as shown in Figure 1. Sample sets were collected at the following locations:

Sample IDs	Location
SS-1-FR, IA-1-FR	Northwest corner of building
SS-2-FR, IA-2-FR	Middle of northern side of building
SS-3-FR, IA-3-FR	Northeast corner of building
SS-4-FR, IA-4-FR	Northeastern area of building, down gradient of AOC#7
SS-5-FR, IA-5-FR	Loading dock office

In addition to and concurrent with the sub-slab and indoor air sampling, an ambient air sample was collected immediate to and upwind of the building to assess the potential of impacts from upwind air sources on indoor air concentrations. The ambient air sample was located along a fence northwest of the building, as shown on Figure 1.

Air samples were collected using 6-liter pre-evacuated Summa® canisters. Sample collection rates were maintained by laboratory-calibrated constant-differential low volume flow controllers. Vacuum readings of the canisters were obtained and documented prior to sample collection and upon completion of sampling. Sample identifications, vacuum readings, flow controller identification numbers, and other relevant information were recorded on field forms provided in Attachment 1 of this document.

Sub-slab soil vapor samples were collected by drilling a 3/8-inch diameter hole in the building's slab, inserting inert food-grade tubing, sealing the tubing to the slab with beeswax, purging the tubing of indoor air, and slowly pulling (<15 cc/min) sub-slab vapor into a canister. The ambient and indoor air samples were collected by slowly pulling air into the canisters, which were situated at a height of 3 to 5 feet above the ground or slab. Samples were collected over an 8-hour period, utilizing batch certified-clean canisters for sub-slab samples and canisters that were individually certified-clean for low level analysis for indoor and ambient air samples. After sample collection, the canisters were shipped under routine chain-of-custody to a subcontracted laboratory, Air Toxics, Ltd. (Air Toxics) of Folsom, CA, where they were analyzed by USEPA Method TO-15. Air Toxics is certified under the Environmental Laboratory Approval Program (ELAP) and by NYSDOH for TO-15 analyses. Canister certifications and Chain-of-Custody forms can be found with the analytical results in Attachment 2.

2.2 Quality Control

In accordance with the Work Plan, one duplicate sub-slab sample (duplicate to SS-2-FR) was collected as part of this sampling program. The sub-slab sample and duplicate sample were collected by installing a stainless steel "tee" to the sample tubing from which each canister pulled sub-slab vapor. The combined sampling rate of sub-slab vapor from the duplicate sample location was less than 0.03 liters per minute.

Additionally, a Data Usability Summary Report (DUSR) was prepared for this sampling program to compare sample data with validation criteria prescribed by the United States Environmental Protection Agency's (USEPA) data validation guidance[2]. The DUSR, provided as Attachment 3, concludes that the overall data usability with respect to completeness is 100 percent. There were some minor excursions with regards to analytical calibration, analytical blank, and recovery. There were also some results reported above the analytical calibration range without dilution analyses performed. These data are flagged as estimated values.

3. Building Survey and Chemical Inventory

During sampling, a building survey was conducted to inventory VOC-containing materials (such as aerosols, cleaners) in the building and to document building characteristics that may influence indoor air conditions. The completed survey form is provided as Attachment 4.

Building 2's concrete floor (slab) is located on-grade. Except for some narrow cracks in the slab's surface, it is in excellent condition. Multiple floor drains as well as roof drains penetrate the floor throughout the building. The building is used as a warehouse, with few partitioning walls and separate rooms. The building is primarily heated by hot water radiators, located around the perimeter of the building. There is a loading dock area with three overhead doors located along the northern end of the building's west side, where two trucks were being loaded during the sampling. Two fan-operated hot water heating units were located above the dock area. There is a boiler room located near AOC 7, on the eastern side of the building. This room was found to be under neutral pressure with respect to outdoor pressure during boiler operation. There is an office, which is occasionally occupied, located near the loading docks. The office door is normally left open.

A few VOC-containing products were found within the warehouse and office area. Most of the building contents were boxed consumer products stored in the building as inventory for Rite Aid's retail stores. Most of the boxes did not have descriptive information on the boxes, and therefore, identification of VOC-containing materials was not possible. In the office area, a case of aerosol air fresheners was found and then moved at the start of the sampling to an outside hallway that was separate from the office and warehouse areas. Frequent traffic of propane-powered forklift trucks was observed near the loading dock area and throughout the building. The primary sources of VOCs present during the sampling were diesel-powered vehicles at the loading docks and workers smoking cigarettes in the office area and immediately outside the loading dock doors. Details including names and approximate quantities of the individual product containers were recorded on building survey forms provided in Attachment 4.

4. Sampling Results and Data Evaluation

4.1. Sub-Slab and Indoor Air Sampling Results

Sample results for each set of samples (sub-slab and indoor air) are presented together in Table 1 for each sampling location. Results are presented in units of micrograms per cubic meter ($\mu g/m^3$). Only compounds that were detected in samples above their respective reporting limits are included on the table. Compounds that were included in the analysis but not detected are presented in the laboratory data reports, which are provided as

[2] United States Environmental Protection Agency (USEPA). 1994. *Region II Validating Canisters of Volatile Organics in Ambient Air,* HW-18, Revision 0. New York, New York.

Attachment 3. The ratio of sub-slab to indoor air concentrations, referred to as an attenuation factor (AF), is also presented in Table 1 for each compound in the third column for each set of samples.

4.2. Quality Assurance and Quality Control

The duplicate sub-slab sample collected at sampling location 2 revealed excellent overall precision for all compounds. Laboratory analytical results were subjected to data validation requirements in accordance with the USEPA procedures, referenced above. Quality assurance/quality control (QA/QC) samples included laboratory blanks, field duplicates, and matrix spike / matrix spike duplicates (MS/MSD).

4.3. Data Evaluation

The sample results were evaluated to assess if:

- indoor air concentrations were attributable to vapor intrusion,
- indoor air concentrations are above typical background levels for commercial buildings, and
- sub-slab and indoor air concentrations require any follow-on actions as recommended by NYSDOH's two soil vapor / indoor air matrices.

4.3.1. Vapor Intrusion Evaluation

An attenuation factor was calculated for each sample set, as shown on Table 1. The attenuation factor is the ratio of the sub-slab vapor concentration to the indoor air concentration. Attenuation factors are useful in estimating which indoor air concentrations may be attributable solely to vapor intrusion and which are likely attributable to indoor air sources. Attenuation factors greater than 1 (indoor air concentrations are greater than the sub-slab concentrations) indicate that the indoor air concentration is likely attributable primarily to indoor air sources.

Some aromatic compounds (such as, ethylbenzene, toluene, and styrene) have attenuation factors greater than 1 and appear to be present primarily due to indoor air sources. Ethylbenzene and toluene are typically related to petroleum (such as, gasoline and diesel). Therefore, indoor sources of these compounds may include the truck traffic at the loading docks. Styrene is commonly used in foam packing materials that may be used in some of the boxed consumer products stored in the building.

Other aromatic compounds commonly related to petroleum (benzene, xylenes) are also present in indoor air, as well as sub-slab vapor. As noted above in Section 1, the Site was impacted by petroleum compounds at AOC 7 (near sampling location 4). However, the petroleum-related compounds in the sub-slab are present at relatively equivalent concentrations. It is our experience to find a general background level of petroleum compounds of equivalent concentrations in soil vapor near highly trafficked roads, such as Farrell Road and John Glen Boluevard. Therefore, the source of these compounds in sub-slab vapor can be from any one or a combination of three sources: AOC 7, loading dock traffic, and/or nearby roadways. Typically, however, if soil vapor is attributable to a local impact such as AOC 7, then there will be elevated levels of soil vapor in proximity to the impact. Since the concentration of soil vapor at sampling location 4 is essentially equivalent to the other four sampling locations, the petroleum compounds present in the sub-slab samples are more likely due to the general background concentrations of these compounds typically found near roadways. For the samples containing benzene and xylenes where the attenuation factor is less than 1[3] , it is possible that a portion of the indoor air concentrations of these compounds is due to vapor intrusion with the balance due to indoor sources (loading dock

[3] Note that one of the five sampling locations has a benzene attenuation factor less than 1.

truck emissions). The estimated portion of indoor air concentrations attributable to vapor intrusion is discussed in Section 4.3.2.

There were several chlorinated compounds identified that have attenuation factors greater than 1 including:

- Chloromethane
- 1,2-Dichloroethane (1,2-DCA)
- 1,1-Dichloroethene (1,1-DCE)
- 1,2-Dichloropropane
- cis-1,3-Dichloropropene
- Trichlorofluoromethane (Freon 11)
- Ethanol
- 1,3-Butadiene

Sub-slab levels for all of these compounds, except for 1,1-DCE and Freon 11, are less than the indoor air concentrations at all five sampling locations. Therefore, the primary sources for the indoor air concentrations for these compounds are indoor sources. Ethanol and 1,3-butadiene are likely attributable to emissions of cigarette smoke, which was evident in the building.

1,1-DCE and Freon 11 are known Site contaminants. 1,1-DCE is not a common indoor air contaminant and its indoor air concentrations are relatively low compared to the sub-slab concentrations at sampling location 2. Therefore, the unusually high sub-slab concentration at sampling location 2 may be contributing to the indoor air concentrations found at all sampling locations. Freon 11 is a common indoor contaminant and its indoor air concentrations are relatively high compared to its highest sub-slab concentrations found at sampling location 2. This information along with the presence of dichlorodifluoromethane (Freon 12) in the sub-slab at sampling location 3 indicates that a portion of the Freon 11 and Freon 12 indoor air concentrations are attributable to vapor intrusion. The estimated portion of indoor air concentrations attributable to vapor intrusion is discussed in Section 4.3.2.

For compounds having attenuation factors less than 1, all or a portion of their indoor air concentrations may be attributable to vapor intrusion. Compounds having the highest sub-slab concentrations and attenuation factors less than 1 include:

- Trichloroethene (TCE)
- 1,1,1-Trichloroethane (1,1,1-TCA)
- Acetone
- Dichlorodifluoromethane (Freon 12)
- n-Heptane
- 1,4-Dichlorobenzene
- Xylenes

In general, sub-slab concentrations at the Site are relatively low (all compounds at all locations were detected at concentrations less than 340 $\mu g/m^3$) when compared to other sites where we have seen evidence of vapor intrusion and where sub-slab concentrations are above 1,000 $\mu g/m^3$ by orders of magnitude. With proximity to historically impacted areas, such as AOCs 5, 7 and 16, it is more typical to see increased concentrations in the sub-slab closer to the impacted areas. However, the sampling results at this Site show a relatively low level of

concentrations spread across the entire slab, indicating no particular highly impacted areas. This observation supports our analysis of the sampling results, as discussed in the next section.

4.3.2 Estimated Vapor Intrusion

To help assess the portion of indoor air concentrations attributable to vapor intrusion, we look for an "indicator attenuation factor", that is a compound with a high sub-slab concentration and without any known indoor source. Since the sub-slab concentration of TCE at sampling location 3 was the highest of any compound, and we did not find an indoor air source of TCE, we propose that the attenuation factor for TCE at sample location 3 of 0.001 indicates a true attenuation due to vapor intrusion for the building. A review of Table 1 reveals that there is just one other attenuation factor near the proposed indicator attenuation factor, n-heptane at sampling location 1. Therefore, the attenuation factors suggest that there are only two detected indoor air concentrations attributable solely to vapor intrusion: TCE and n-heptane.

We also propose that the portion of each indoor air concentration attributable to vapor intrusion is equivalent to the associated sub-slab vapor concentration multiplied by the indicator attenuation factor of 0.001. Table 2 presents estimated indoor air concentrations attributable to vapor intrusion derived as proposed. The highest estimated indoor air concentrations attributable to vapor intrusion is 0.3 $\mu g/m^3$ of TCE at sampling location 3, 0.3 $\mu g/m^3$ of 1,1-DCE at sampling location 2, and 0.3 $\mu g/m^3$ of acetone at sampling location 1.

4.3.3 Indoor Air Background Levels

Tables 1 and 2 include indoor air background levels measured by the US Environmental Protection Agency (USEPA) in commercial and public buildings that do not have vapor intrusion[4]. These levels are referenced by NYSDOH and suggested for data evaluation in NYSDOH's vapor intrusion guidance[5]. As can be observed in Table 2, all of the estimated indoor air concentrations attributable to vapor intrusion are well below the indoor air background levels. Therefore, we conclude that vapor intrusion is not occurring, or if it is occurring, it is having minimal impact on indoor air quality.

4.3.4. NYSDOH Matrices

The NYSDOH guidance document has soil vapor / indoor air matrices for TCE, carbon tetrachloride, 1,1,1-TCA, and tetrachloroethene (PCE). Using the sub-slab and indoor concentrations, the matrices suggest the next step in managing potential vapor intrusion. Table 2 includes a column for each sampling location that presents the recommended next step suggested by the matrices, using the indoor air concentrations attributable to vapor intrusion and the sub-slab vapor results.

For TCE at sample location 3, the matrix suggests that mitigation be performed because the sub-slab vapor concentration is high enough that it may potentially cause future indoor air exposure if the slab or building conditions were to change. For TCE at sample locations 1 and 2, the matrix suggests periodic monitoring be performed to identify any future increase in sub-slab vapor and indoor air concentrations if site or building conditions were to change. The matrix suggests that due to TCE results at sample location 5, the property owner should take reasonable action to identify indoor sources and reduce exposure, but since the indoor air concentrations are significantly below typical background levels, this action is not warranted.

[4] USEPA. 2001. "Building Assessment and Survey Evaluation (BASE) Database".
[5] NYSDOH, 2006. "Guidance for Evaluating Soil Vapor Intrusion in the State of New York".

Indoor air concentrations of carbon tetrachloride are equivalent to the ambient air concentration, and therefore, are attributable to outdoor air sources. The NYSDOH matrix would not apply to such a situation, and therefore, we conclude that there is no further action necessary for this compound.

The matrix for 1,1,1-TCA and PCE suggests no further action is recommended for these compounds.

5. Summary and Recommendations for Next Steps

Indoor air concentrations of several compounds were found above sub-slab concentrations and are the result of indoor air sources such as vehicular emissions and cigarette smoking.

In using TCE as an indicator for the vapor intrusion potential, the estimated portion of all reported indoor air concentrations attributable to vapor intrusion (shown in Table 2) are well below background levels. Therefore, we do not recommend any follow-on activity to address current exposures.

However, due to the sub-slab concentration of TCE at sampling location 3, the NYSDOH matrix for TCE suggests that mitigation should be considered to prevent future potential vapor intrusion. Since the other four sampling locations had TCE sub-slab concentrations considerably less than sample location 3, we recommend that TCE at location 3 be re-sampled to confirm the sample result. We suggest collecting three sub-slab samples for the purposes of understanding the variability of sub-slab TCE vapor in the vicinity of sampling location 3: one at the original sampling location 3 and two others on opposite sides of and approximately 20 feet from the original location. We do not recommend collection of additional indoor air or ambient samples. The samples should be collected following the same sampling procedures described in the Work Plan.

Note: Results are reported in units of micrograms per cubic meter (ug/m^3).

[a] Indoor air concentrations measured in commercial and public buildings that do not have vapor intrusion. The values are the 90th percentile values taken from the EPA 2001 BASE Database, as reported in the NYSDOH vapor intrusion guidance (October 2006).

[b] Indoor air concentrations attributable to vapor intrusion. Determined by multiplying the sub-slab concentration by an attenuation factor of 0.001.

[c] NYSDOH vapor intrusion guidance (Oct 2006) recommends actions based on the combination of sub-slab and indoor air concentrations (available for TCE, 111-TCA, Carbon Tetrachloride, and PCE only).

[d] Due to apparent outdoor air sources of this compound, the action presented assumes the indoor air result is not due to vapor intrusion or indoor air sources.

<## - Compound not detected above the reporting limit (##).

NA - Not available

J - Results reported as estimated values reported from the laboratory or assigned by the data validator. Reasons include (1) minor calibration excursion, (2) minor blank excursion, and/or (3) reported results exceeding the upper calibration range and dilution analyses were not performed.

NFA - No further action, as recommended by NYSDOH guidance.

IRE - Property owner should take reasonable and practical actions to identify indoor source(s) and reduce exposures, as recommended by NYSDOH guidance.

Monitor - Per the NYSDOH guidance, monitoring is recommended to assess changes in sub-slab and indoor air concentrations and/or building conditions.

Mitigate - Per the NYSDOH guidance, mitigation is recommended to minimize the current or potential exposures associated with vapor intrusion.

Air Toxics LTD.

AN ENVIRONMENTAL ANALYTICAL LABORATORY

Air Toxics Ltd. Introduces the Electronic Report

Thank you for choosing Air Toxics Ltd. To better serve our customers, we are providing your report by e-mail. This document is provided in Portable Document Format which can be viewed with Acrobat Reader by Adobe.

This electronic report includes the following:

- Work order Summary;
- Laboratory Narrative;
- Results; and
- Chain of Custody (copy).

180 BLUE RAVINE ROAD, SUITE B FOLSOM, CA - 95630

(916) 985-1000 .FAX (916) 985-1020

LABORATORY NARRATIVE
Modified TO-15
OBrien & Gere
Workorder# 0702505BR1

Six 6 Liter Summa Canister samples were received on February 23, 2007. The laboratory performed analysis via modified EPA Method TO-15 using GC/MS in the full scan mode. The method involves concentrating up to 1.0 liter of air. The concentrated aliquot is then flash vaporized and swept through a water management system to remove water vapor. Following dehumidification, the sample passes directly into the GC/MS for analysis.

Method modifications taken to run these samples are summarized in the below table. Specific project requirements may over-ride the ATL modifications.

Requirement	*TO-15*	*ATL Modifications*
ICAL %RSD acceptance criteria	+- 30% RSD with 2 compounds allowed out to < 40% RSD	30% RSD with 4 compounds allowed out to < 40% RSD
Daily Calibration	+- 30% Difference	</= 30% Difference with four allowed out up to </=40%.; flag and narrate outliers
Blank and standards	Zero air	Nitrogen
Method Detection Limit	Follow 40CFR Pt.136 App. B	The MDL met all relevant requirements in Method TO-15 (statistical MDL less than the LOQ). The concentration of the spiked replicate may have exceeded 10X the calculated MDL in some cases
Sample collection media	Summa canister	ATL recommends use of summa canisters to insure data defensibility, but will report results from Tedlar bags at client request

Receiving Notes

There were no receiving discrepancies.

Analytical Notes

All Quality Control Limit failures and affected sample results are noted by flags. Each flag is defined at the bottom of this Case Narrative and on each Sample Result Summary page. Target compound non-detects in the samples that are associated with high bias in QC analyses have not been flagged.

Due to instrument performance, the reporting limit for MTBE was raised from 0.10 ppbv to 0.50 ppbv in this work order.

THE WORKORDER WAS REISSUED ON 3/27/07 TO REPORT THE RESULT FOR NAPHTHALENE FOR EACH SAMPLE.

Definition of Data Qualifying Flags

Eight qualifiers may have been used on the data analysis sheets and indicates as follows:

B - Compound present in laboratory blank greater than reporting limit (background subtraction not

performed).

J - Estimated value.
E - Exceeds instrument calibration range.
S - Saturated peak.
Q - Exceeds quality control limits.
U - Compound analyzed for but not detected above the reporting limit.
UJ- Non-detected compound associated with low bias in the CCV
N - The identification is based on presumptive evidence.

File extensions may have been used on the data analysis sheets and indicates as follows:
a-File was requantified
b-File was quantified by a second column and detector
r1-File was requantified for the purpose of reissue

Air Toxics Ltd. Introduces the Electronic Report

Thank you for choosing Air Toxics Ltd. To better serve our customers, we are providing your report by e-mail. This document is provided in Portable Document Format which can be viewed with Acrobat Reader by Adobe.

This electronic report includes the following:

- Work order Summary;
- Laboratory Narrative;
- Results; and
- Chain of Custody (copy).

LABORATORY NARRATIVE
Modified TO-15 Full Scan/SIM
OBrien & Gere
Workorder# 0702505A

Six 6 Liter Summa Special (100% Certified) samples were received on February 23, 2007. The laboratory performed analysis via modified EPA Method TO-15 using GC/MS in the Full Scan and SIM acquisition modes. The method involves concentrating up to 1.0 liters of air. The concentrated aliquot is then flash vaporized and swept through a water management system to remove water vapor. Following dehumidification, the sample passes directly into the GC/MS for analysis.

Method modifications taken to run these samples are summarized in the below table. Specific project requirements may over-ride the ATL modifications.

Requirement	*TO-15*	*ATL Modifications*
ICAL %RSD acceptance criteria	</=30% RSD with 2 compounds allowed out to < 40% RSD	For Full Scan: 30% RSD with 4 compounds allowed out to < 40% RSD For SIM: Project specific; default criteria is </=30% RSD with 10% of compounds allowed out to < 40% RSD
Daily Calibration	+- 30% Difference	For Full Scan: </= 30% Difference with four allowed out up to </=40%.; flag and narrate outliers For SIM: Project specific; default criteria is </= 30% Difference with 10% of compounds allowed out up to </=40%.; flag and narrate outliers
Blank and standards	Zero air	Nitrogen
Method Detection Limit	Follow 40CFR Pt.136 App. B	The MDL met all relevant requirements in Method TO-15 (statistical MDL less than the LOQ). The concentration of the spiked replicate may have exceeded 10X the calculated MDL in some cases

Receiving Notes

There were no receiving discrepancies.

Analytical Notes

The results for each sample in this report were acquired from two separate data files originating from the same analytical run. The two data files have the same base file name and are differentiated with a "sim" extension on the SIM data file.

All Quality Control Limit failures and affected sample results are noted by flags. Each flag is defined at the bottom of this Case Narrative and on each Sample Result Summary page. Target compound non-detects in the samples that are associated with high bias in QC analyses have not been flagged.

Acetone was detected in the laboratory blank analyzed on March 9, 2007 at less than 5X the reporting limit. Associated samples that contained Acetone were flagged as indicated.

Definition of Data Qualifying Flags

Eight qualifiers may have been used on the data analysis sheets and indicates as follows:

B - Compound present in laboratory blank greater than reporting limit (background subtraction not performed).

J - Estimated value.

E - Exceeds instrument calibration range.

S - Saturated peak.

Q - Exceeds quality control limits.

U - Compound analyzed for but not detected above the reporting limit.

UJ- Non-detected compound associated with low bias in the CCV

N - The identification is based on presumptive evidence.

File extensions may have been used on the data analysis sheets and indicates as follows:

a-File was requantified

b-File was quantified by a second column and detector

r1-File was requantified for the purpose of reissue

Attachment 3
Data Usability Summary Report

To: Mark Distler *cc:* SJ Spiegel
From: Karen A. Storne
Re: Review of Data for the Vapor Intrusion Sampling, Former GE Farrell Road Site, Performed February 2007
File: 5851/40162.100.100
Date: April 11, 2007

This report addresses the review of the sub-slab and indoor air samples collected for the Former GE Farrell Road Site in Geddes, New York. Sample collection activities were conducted by O'Brien & Gere on February 20, 2007.

The following table summarizes the analysis performed for this sampling event.

Table 1-1. *Analytical methods and references*

Parameter	Method	Reference
VOCs	USEPA Method TO-15, Including Modified SIM for Carbon Tetrachloride and Trichloroethene	1

Note:
1. United States Environmental Protection Agency (USEPA). 1999. *Compendium of Methods for the Determination of Toxic Organic Compounds in Ambient Air.* Cincinnati, Ohio.

VOCs indicates volatile organic compounds.
SIM indicates selective ion monitoring.

Air Toxics LTD. of Folsom, California (Air Toxics) performed the analyses.

The laboratory packages generated by Air Toxics contained quality control analysis and supportive raw data.

Full validation was performed on the samples collected for this sampling event.

The analytical data generated for this investigation were evaluated by O'Brien & Gere using the quality assurance/quality control (QA/QC) information presented in the following documents:

- United States Environmental Protection Agency (USEPA). 1999. *Compendium of Methods for the Determination of Toxic Organic Compounds in Ambient Air.* Cincinnati, Ohio.
- O'Brien & Gere. 2006. *Vapor Intrusion Sampling Work Plan Addendum, Former GE Farrell Road. Site # 7-34-055. Geddes, New York.* Syracuse, New York.

Data affected by excursions from the previously mentioned QA/QC criteria were qualified using the following USEPA data validation guidance and professional judgment:

- United States Environmental Protection Agency (USEPA). 1994. *Region II Validating Canisters of Volatile Organics in Ambient Air,* HW-18, Revision 0. New York, New York.

USEPA data validation guidelines have been modified to reflect the requirements of the method used in the analysis of samples collected for this sampling event. Qualifiers were applied to data that failed to meet the quality control criteria presented in the USEPA method.

In accordance with the USEPA guidance, and utilizing professional judgment, the following qualifiers are used in this type of data validation:

"U" Indicates that the analyte was analyzed for, but was not detected. The associated value indicates the approximate sample concentration necessary to be detected.

"J" Indicates that the detected analyte is present but the reported value may not be accurate or precise. The result should be considered approximate based on excursions from QA/QC criteria.

"UJ" Indicates that the analyte was not detected and the quantitation limit may be inaccurate or imprecise. The result should be considered approximate based on excursions from QA/QC criteria.

"R" Indicates that the detection limit or sample result is unreliable and has been rejected due to a major excursion from QA/QC criteria. The analyte may or may not be present in the sample. The data should not be used for qualitative or quantitative purposes.

The validation included checking the following parameters:

- Work plan compliance
- Chain-of-custody records
- Sample collection
- Holding times
- Calibrations
- Blank analysis
- Laboratory control sample (LCS)/Laboratory control sample duplicate (LCSD) analysis
- Field duplicate analysis
- Internal standards performance
- Gas chromatography/mass spectrometry (GC/MS) instrument performance check
- Target analyte quantitation, identification, and reported detection limits
- Documentation completeness.

The samples that were submitted for data validation are listed in Table 1-2 presented in Attachment A.

The following sections of this memorandum present the results of the comparison of the analytical data to the QA/QC criteria specified above. Based on the QA/QC information review, an overall evaluation of the data's usability is also presented in the final section.

VALIDATION APPROACH

O'Brien & Gere applies the following general approach for application of data validation qualifiers when control limits are exceeded:

- If percent recoveries are less than laboratory control limits but greater than ten percent, non-detected and detected results are qualified as approximate (J, UJ).

- If percent recoveries are greater than laboratory control limits, detected results are qualified as approximate (J).

- If percent recoveries are less than ten percent, detected results are qualified as approximate (J) and non-detected results are qualified as rejected (R).

- If RPDs for field duplicates are outside of validation criteria, detected and non-detected results are qualified as approximate (UJ, J).

The calibration criteria used to evaluate the data generated for this investigation were based on the method criteria.

Laboratory established control limits were used to assess LCS data.

The cumulative effect of the various QA/QC excursions is employed in assigning the final data qualifiers. For example, if a sample result is affected by low LCS recovery for which the "J" qualifier is applied, but severely low internal standard recoveries result in the rejection of the sample result (R), the final qualifier is "R".

Qualification of data associated with field duplicate excursions is limited to the field duplicate pair.

Field duplicate data were evaluated against relative percent difference (RPD) criteria of less than 25 percent for air samples when results were greater than five times the reporting limit. When sample results for field duplicate pairs were less than five times the reporting limit, the data were evaluated using control limits of plus or minus two times the reporting limit.

SAMPLE COLLECTION

Canister blanks were not collected as part of this sampling event.

WORK PLAN COMPLIANCE

Although included in the target analyte list provided to the laboratory in the Work Plan, the target analyte 3-chloropropene was not reported by the laboratory for the samples analyzed for this investigation. In addition, target analytes were reported by the laboratory that were not included on the Work Plan target analyte list.

The Project Manager was informed of this compliance issue.

VOLATILE ORGANIC COMPOUND IN AIR DATA EVALUATION SUMMARY

The following QA/QC parameters were found to meet method and validation criteria or did not result in additional qualification of sample results:

- Chain-of-custody records
- Holding times
- Internal standards performance
- GC/MS instrument performance check
- Field duplicate analysis
- Target analyte quantitation, identification and reported detection limits
- Documentation completeness.

Excursions from method or validation criteria are described in the following section along with additional observations made during the validation process.

I. Calibrations

As a result of an initial calibration excursion, the results for ethanol in samples SS-1-FR, SS-2-FR, SS-3-FR, SS-4-FR and SS-DUP-FR [SS-2-FR], associated with the calibration of 3/7/07 on instrument MSD-Z, were qualified as approximate (J) to indicate a minor compromise in calibration linearity.

As a result of a calibration verification excursion, the results for 2-butanone in samples AA-FR and IA-1-FR, associated with the calibration of 3/7/07 (11:14) on instrument MSD-Y, were qualified as approximate (J) to indicate a minor compromise in calibration linearity.

As a result of a calibration verification excursion, the results for ethanol and 1,2-dibromoethane in samples IA-2-FR, IA-4-FR, IA-3-FR and IA-5-FR, associated with the calibration of 3/9/07 (08:36) on instrument MSD-Y, were qualified as approximate (UJ, J) to indicate minor compromises in calibration linearity.

As a result of a calibration verification excursion, the results for bromomethane and chloroethane in samples SS-1-FR, SS-2-FR, SS-3-FR, SS-4-FR, SS-5-FR, and SS-DUP-FR [SS-2-FR], associated with the calibration of 3/8/07 (09:14) on instrument MSD-Z, were qualified as approximate (UJ, J) to indicate minor compromises in calibration linearity.

II. Blank analysis

As a result of blank contamination, the results for acetone in samples IA-5-FR, IA-4-FR, IA-3-FR and IA-2-FR, associated with the method blank of 3/9/07, were qualified as non-detected (U).

III. LCS analysis

The recovery for 1,2,4-trichlorobenzene in the LCS result of 3/7/07 was less than the lower laboratory control limit. As a result, the results for 1,2,4-trichlorobenzene in samples AA-FR and 1A-1-FR were qualified as approximate (UJ) to indicate a minor accuracy excursion.

The recovery for naphthalene in the LCS result of 3/7/07 was less than the lower laboratory control limit. As a result, the results for naphthalene in samples AA-FR and 1A-1-FR were qualified as approximate (UJ) to indicate a minor accuracy excursion.

DATA USABILITY

Overall data usability with respect to completeness for the final sample results reported is 100 percent for the VOC air data. The VOC air data were determined to be usable for qualitative and quantitative purposes. Based on the validation performed, the typical completeness goal of 95 percent was met for these analyses.

Owner ☐ Renter ☐ Other ☐ Access Agreement Signed ____

Date built 21950
Yrs. of residence Since '93
No. of occupants 25-30 people

Building type:
Residential ☐ Commercial ☑ School ☐ Church ☐ Industrial ☐ Other ____

Check all that apply:

Ranch ☐ Cape ☐ 3-Family ☐ Raised Ranch ☐ Colonial ☐ Mobile Home ☐ 2-Family ☐ Duplex ☐ Other (specify) warehouse Apartments ☐ Condominium ☐

Above grade building construction

Wood frame ☐ Brick ☐ Poured concrete ☑ Concrete block ☑ Stone ☐ Other ____

Foundation construction

Fieldstone ☐ Poured concrete ☐ Solid top concrete block ☐ Open top concrete block ☐ Slab on grade ☑ Other ____

Is the owner aware of any additions made to the original design of the structure? (please specify)
Dock area office added in '99

Utilities

Sewer: Public ☑ Private ☐ Other ____
Water: Public ☑ Private ☐ Other ____ Spring ☐ Well ☐
Hot water heater type: Gas ☐ Oil ☐ Electric ☐ Other ____

Heating, ventilation, and air conditioning systems

Primary heat type: Hot air ☐ Hot water ☑ Steam radiator ☐ Electric ☐ Solar ☐ Other Boiler NE Docks
- From boiler in boiler room - Boiler room is near SE corner of building, room is not air tight - NO negative pressure

Fuel type (heat): Natural gas ☑ Fuel oil ☐ Electric ☐ Wood ☐ Other ____

Secondary heat type: Kerosene ☐ Wood stove ☐ Electric ☐ Propane ☐ Other —

Ventilation types: Attic fan ☐ Kitchen hood ☐ Bathroom fan ☐ Other Ventilation system appears inactive - many cold air returns
Ceiling fan ☐ Air filtration ☐ Induced fireplace ☐ Other ____

Air conditioning: Window units ☐ Furnance unit ☐ Electric ☐ Other —

- Outside air vent along wall near A25. ventilation fan along outside wall SE of stairway.

Basement type

None ☐ Half ☐ Vented crawlspace ☐ Other _____
Full ☐ Slab on grade ☑ Unvented crawlspace ☐ _____

If slab on grade, is there a garage with occupied space above? _____

Basement depth below grade (feet)

Front — Rear — Side 1 — Side 2 —

Basement characteristics

General:		Floor:		Walls:			
No. of rooms		Earth		Finished	✓	Paneling	
Bathroom	3	Concrete	✓	Unfinished		Tile	
Basement use	~~1~~ ②	Tile		Painted		Insulated	
		Carpet		Sheetrock		Uninsulated	
		Other		Other			

Check if present:

Fireplace		Elevator		French drain	
Sump pump		Ash cleanout		Floor cracks	✓
Floor drains	✓	Water damage		Wall cracks	
Interior walls	✓	Jacuzzi/hot tub		Other	

Does the basement have a moisture problem? NO

Does the basement ever flood? (specify frequency) - Mens bathroom (outside) ~~pipe~~ appears to be leaking onto the floor.

Does the basement have a radon system installed? _____

Has there been recent purchases of furnishings (carpets, rugs, linoleum, tile, or funiture) or remodeling (new construction,roofing, or floor stripping? (please specify) NO

Chemical usage, exposure and storage

Identify occupant hobbies:

Painting		Electronics		Model making	
Stained glass		Woodworking		Auto repair	
Jewelry making		Furniture refinishing		Other	

Where in the structure are these hobbies conducted? NA

Does the occupants' job require chemical exposure? No

If so, where are the occupants clothes cleaned? NA

Has the structure been fumigated in the last year? NO

If so, is fumigation regularly performed? (how often) NA

Are pesticides frequently applied to lawn or garden? No

If so, are they stored on the property? NO

Identify chemicals stored in the basement/1st floor living space, or garage if structure is slab on grade (include fuels, solvents, cleaners, etc.) Use separate inventory sheet for each area surveyed

Brand	Product	Amount stored
Aerosol Fragrence was found under cabinet in office area ~ 638ppb Moved entire case outside office into hallway (seperate from shop area)		
1 Tw Dymon Do it All Plus	Cleaner —	1 Qt
Krylon Mark-It	-	1 Can

Comments

Is there any other information about the structural features of this building, the habits of its occupants or potential sources for chemical contaminents to the indoor air that may be of importance in facilitating the evaluation of the indoor air quality of the building?

- Shop area has high traffic from fork lift trucks which operate on propane.
- Additives from hot water heat
- Truck traffic @ bay doors exists (near IA-1)

Identify photographs taken as additional documentation of existing conditions.

Photo ID	Description of photo
	Photos were taken of the chemical inventory and sampling locations. Photos are stored on the I: drive (obg-syracuse)

Sketch lot and sample location layout (if applicable)

Re:	Preliminary Vapor Intrusion Sampling Results, Former GE Farrell Road Site, Site # 7-34-055		Virginia Robbins, BS&K
File:	5851/41510		
Date:	February 21, 2008		

This Technical Memorandum (TM) presents the results of additional sampling conducted at the former GE Farrell Road Site (Site) on December 17, 2007. The additional sampling was performed in accordance with a work plan, dated October 12, 2007, and a response letter to the New York State Department of Environmental Conservation (NYSDEC), dated November 13, 2007, which addressed comments in the NYSDEC's work plan approval letter, dated November 6, 2007.

The additional sampling was performed in response to O'Brien & Gere's May 24, 2007 technical memorandum (Memorandum) to Lockheed Martin Corporation (LMC), which reported results of vapor intrusion sampling performed in February 2007 and recommended additional sampling. The additional sampling was performed to confirm trichloroethene (TCE) and 1,1-dichloroethene (1,1-DCE) concentrations at previous sampling Locations 2 and 3. This Draft TM evaluates the additional sampling data with respect to the potential for vapor intrusion, and provides recommendations for next steps.

1. Site Background

The Site consists of 156 acres in an industrial zone setting located on Farrell Road and John Glenn Boulevard in the Town of Geddes, northeast of Routes 690 and 90 and south of the Seneca River. Nearly half of the Site (81 acres) is classified as a Class I wetlands. Ground water flows in a north/northwest direction across the Site toward Seneca River. Depth to ground water in the developed portion of the Site is approximately ten feet below ground surface (bgs). The developed portion of the Site is paved and contains four on-Site buildings; Buildings 1 and 2, former test building, and maintenance garage. Figure 1 shows Buildings 1 and 2.

There are three primary historic source areas relevant to vapor intrusion potential at the Site, referred to as areas of concern (AOC), where interim remedial measures (IRMs) were implemented.[1] The following identifies the locations (also shown on Figure 1) and gives a description of each AOC:

- AOC 5, located along the west side of Building 2, was an area where nine underground storage tanks (USTs) and a dry well were removed.
- AOC 7, located along the east side of Building 2, was an area of a former fuel oil UST and where drums containing Freon were rinsed.
- AOC 16, located adjacent to the maintenance garage, was an area of a former gasoline UST.

Currently, the Site is classified as Class 4 on the New York State Registry of Inactive Hazardous Waste Disposal Sites, based on the effectiveness of the IRMs. A ground water extraction and treatment system at the Site has been deemed effective at controlling off-site migration of shallow contaminated ground water. Concentrations of VOCs in ground water are periodically measured from samples collected from monitoring wells located at the Site. Building 2 is currently operated by Rite Aid Corporation who uses it as warehouse space for product inventory for its retail outlets.

[1] Note that there were other AOCs at the Site where some remedial work was completed, but they are not considered relevant to this investigation.

2. Vapor Intrusion Sampling

The additional vapor intrusion sampling was conducted on December 17, 2007. Samples of sub-slab vapor, indoor air, and ambient air were collected simultaneously over a 24-hour period. Samples were collected in accordance with the approved Work Plan, with the exception of the duration of sampling. Twenty four-hour constant differential low volume flow controllers were sent by the laboratory instead of the 8-hour constant differential low volume flow controllers, due to equipment availability, that were specified in the approved Work Plan. The NYSDEC was notified of the change and approved the use of the 24-hour flow controllers provided that the detection limits specified in the Work Plan were achieved. .

2.1 Sampling Locations and Methods

Paired sub-slab vapor and indoor air sample sets were collected at two locations at the northern portion of Building 2, as shown in Figure 1. The sampling locations were re-installed within approximately one-foot of the sampling locations sampled in February 2007. Sample sets were collected at the following locations:

Sample IDs	Location
SS-2-FR, IA-2-FR	Location 2, Middle of northern side of building
SS-3-FR, IA-3-FR	Location 3, Northeast corner of building

In addition to and concurrent with the sub-slab and indoor air sampling, an ambient air sample was collected immediate to and upwind of the building to assess the potential of impacts from upwind air sources on indoor air concentrations. The ambient air sample was located along a fence northwest of the building, as shown on Figure 1.

Air samples were collected using 6-liter pre-evacuated Summa® canisters. Sample collection rates were maintained by laboratory-calibrated constant-differential low volume flow controllers. Vacuum readings of the canisters were obtained and documented prior to sample collection and upon completion of sampling. Sample identifications, vacuum readings, flow controller identification numbers, and other relevant information were recorded on field forms provided in Attachment 1 of this document.

Sub-slab soil vapor samples were collected by drilling a 3/8-inch diameter hole in the building's slab near the locations of the previous sub-slab sampling, inserting inert food-grade tubing, sealing the tubing to the slab with beeswax, purging the tubing of indoor air, and slowly pulling (<15 cc/min) sub-slab vapor into a canister. The ambient and indoor air samples were collected by slowly pulling air into the canisters, which were situated at a height of 3 to 5 feet above the ground or slab. Samples were collected over a 24-hour period, utilizing batch certified-clean canisters for sub-slab samples and canisters that were individually certified-clean for low level analysis for indoor and ambient air samples. After sample collection, the canisters were shipped under routine chain-of-custody to a subcontracted laboratory, Air Toxics, Ltd. (Air Toxics) of Folsom, CA, where they were analyzed by USEPA Method TO-15. Air Toxics is certified under the Environmental Laboratory Approval Program (ELAP) and by NYSDOH for TO-15 analyses. Canister certifications and Chain-of-Custody forms can be found with the analytical results in Attachment 2.

2.2 Quality Control

In accordance with the Work Plan, one duplicate sub-slab sample (duplicate to SS-3-FR) and one duplicate indoor air sample (duplicate to IA-2-FR) were collected as part of this sampling program. Each set of duplicate samples were collected by installing a stainless steel "tee" to the sample tubing from which each canister pulled sub-slab or indoor air vapor. The combined sampling rate of sub-slab vapor from the duplicate sample locations was less than 0.01 liters per minute.

Additionally, a DUSR was prepared for this sampling program to compare sample data with validation criteria prescribed by the United States Environmental Protection Agency's (USEPA) data validation guidance[2]. The DUSR is attached as Attachment 3.

3. Building Survey and Chemical Inventory

Prior to sampling, the building tenant (Rite Aid) was requested to provide an inventory of the building's contents, so that an inventory of VOC-containing materials (such as aerosols, cleaners) could be documented (nearly all of building contents are warehoused in cardboard boxes without labels describing their contents). This inventory is provided in Attachment 4. Although the inventory is not detailed, it generally contains products such as paper tableware, gift bags/cards, holiday decorations, candles (no oils), and miscellaneous items. It does not appear that chlorinated solvents are included in the building's inventory.

O'Brien & Gere confirmed that the building survey information (e.g., building foundation, utilities, heating and ventilation systems, slab conditions and penetrations) collected during the initial sampling had not changed. Therefore a building survey form is not included in Attachment 4, but the following information is provided as an overview. Building 2's concrete floor (slab) is located on-grade. Except for some narrow cracks in the slab's surface, it is in excellent condition. Multiple floor drains as well as roof drains penetrate the floor throughout the building. The building is used as a warehouse, with few partitioning walls and separate rooms. The building is primarily heated by hot water radiators, located around the perimeter of the building. There is a loading dock area with three overhead doors located along the northern end of the building's west side, where two trucks were being loaded during the sampling. Two fan-operated hot water heating units were located above the dock area. There is a boiler room located near AOC 7, on the eastern side of the building. This room was found to be under neutral pressure with respect to outdoor pressure during boiler operation. There is an office, which is occasionally occupied, located near the loading docks. The office door is normally left open.

4. Sampling Results and Data Evaluation

4.1. Sub-Slab and Indoor Air Sampling Results

Sample results for each set of samples (sub-slab and indoor air) are presented together in Table 1 for each sampling location. Results are presented in units of micrograms per cubic meter ($\mu g/m^3$). The laboratory reports are provided as Attachment 2.

[2] USEPA 2006. "Validating Volatile Organic Analysis of Ambient Air in Canister by Method TO-15. SOP HW-31, Revision 4."

4.2. Quality Assurance and Quality Control

The duplicate sub-slab sample collected at Location 3 and the duplicate indoor air sample collected at Location 2 revealed excellent overall precision for both compounds. Laboratory analytical results were subjected to data validation requirements in accordance with the USEPA procedures, referenced above. Quality assurance/quality control (QA/QC) samples included laboratory blanks, field duplicates, and matrix spike / matrix spike duplicates (MS/MSD).

The DUSR (Attachment 3) reports that there were no excursions from method or validation criteria and therefore the data were not qualified. The DUSR concludes that the 100 percent of the data are usable for qualitative and quantitative purposes.

4.3. Data Evaluation

The sample results were evaluated to assess if:

- indoor air concentrations were attributable to vapor intrusion,
- sub-slab and indoor air concentrations changed significantly since the previous sampling,
- indoor air concentrations are above typical background levels for commercial buildings, and
- sub-slab and indoor air concentrations require any follow-on actions as recommended by NYSDOH's two soil vapor / indoor air matrices.

4.3.1. Vapor Intrusion Evaluation

The highest sub-slab concentration of the compounds sampled was for TCE. Sub-slab concentrations of 500 $\mu g/m^3$ in both the sub-slab and sub-slab duplicate samples were collected at Location 3. Considerably less TCE (3.4 $\mu g/m^3$) was found in the sub-slab sample at Location 2. TCE was not detected in the indoor air.

1,1-DCE was found at a low level (1 $\mu g/m^3$) in the indoor air sample collected at Location 3 but was not found above its reporting limit (0.65 $\mu g/m^3$) at Location 2. Sub-slab concentrations of 1,1-DCE for both locations were below the reporting limits of the samples.

Since no detectable levels of TCE was found in the indoor air at both locations and 1,1-DCE was found at a very low level at one indoor location (without a detectable level in either sub-slab sample), we conclude that vapor intrusion is not occurring at detectable levels. However, the TCE concentration in the sub-slab at Location 3 has the potential to intrude at detectable levels in the future if slab conditions change.

4.3.2 Comparison of Results to Previous Sampling

Table 2 provides a side-by-side comparison of the December 2007 and February 2007 sampling results. The comparison shows that there were some changes in the sub-slab concentrations for TCE (60% decrease at Location 2 and 50% increase at Location 3), however TCE concentrations were on the same order of magnitude between the two sampling events. The indoor air TCE concentrations were consistent between the December 2007 and February 2007 sampling results.

The sub-slab concentration for 1,1-DCE at Location 2 during the December 2007 sampling event was significantly lower than the February 2007 concentration. Similarly, indoor air concentrations for 1,1-DCE at Location 2 were also significantly lower. The indoor air concentration for 1,1-DCE at Location 3 also decreased since February 2007.

4.3.3 Indoor Air Background Levels

Table 1 includes indoor air background levels measured by the US Environmental Protection Agency (USEPA) in commercial and public buildings that do not have vapor intrusion[3]. These levels are referenced by NYSDOH and suggested for data evaluation in NYSDOH's vapor intrusion guidance[4]. As can be observed in Table 1, all of the measured indoor air concentrations are below the indoor air background levels. Therefore, we conclude that if vapor intrusion is occurring, it is not having an impact on indoor air quality above indoor air background levels.

4.3.4. NYSDOH Matrices

The NYSDOH guidance document has soil vapor / indoor air matrices for a few compounds including TCE and 1,1-DCE. Using the sub-slab and indoor concentrations, the matrices suggest the next step in managing potential vapor intrusion. Table 1 includes a column for each sampling location and each compound that presents the recommended next step suggested by the matrices, using the indoor air and sub-slab vapor results.

For TCE at Location 3, the matrix suggests that mitigation be performed because the sub-slab vapor concentration is high enough that it may potentially cause future indoor air exposure if the slab or building conditions were to change. For TCE at Location 2, the matrix suggests that no further action is necessary. For 1,1-DCE, the matrix suggests that no further action is necessary for both locations

5. Summary and Recommendations for Next Steps

As discussed above, vapor intrusion is not occurring at a rate that is detectable or resulting in indoor concentrations above background levels. In addition, TCE is the only compound that has the potential for vapor intrusion due to the elevated sub-slab concentrations at Location 3. TCE sub-slab and indoor air concentrations are relatively unchanged from previous sampling conducted in February 2007. 1,1-DCE has decreased significantly in both sub-slab vapor and indoor air.

NYSDOH guidance suggests that no further action is necessary for 1,1-DCE and TCE at Location 2. Due to the sub-slab concentration of TCE at Location 3, the NYSDOH guidance suggests that mitigation should be considered to prevent future potential vapor intrusion. However, the guidance also states that its recommended actions are generic and can be modified to accommodate building-specific conditions. Therefore we recommend monitoring of TCE at Location 3 as an alternative to mitigation for the following reasons:

1. The indoor air concentrations for TCE were well below the indoor air background levels and health risk levels (air guideline values) suggested by NYSDOH. Therefore, there is no immediate health risk concern.
2. The building slab is in very good condition.

[3] USEPA 2001. "Building Assessment and Survey Evaluation (BASE) Database".
[4] NYSDOH 2006. "Guidance for Evaluating Soil Vapor Intrusion in the State of New York".

3. The building is entirely unoccupied during weekends and most of each workday. During the 8 to 10 hours per workday that it is occupied, the few building occupants rarely spend any time in the Location 3 area. Therefore, the amount of potential future exposure would be significantly less than the assumptions used by NYSDOH in developing its air guideline value.
4. Annual monitoring (re-sampling) will detect vapor intrusion, and corrective action can be implemented well before any long-term exposure is experienced.

In addition to monitoring of TCE at Location 3, we recommend re-sampling at Location 2 for 1,1-DCE in late 2008 to confirm the apparent decrease of 1,1-DCE sub-slab concentrations.

AN ENVIRONMENTAL ANALYTICAL LABORATORY

Air Toxics Ltd. Introduces the Electronic Report

Thank you for choosing Air Toxics Ltd. To better serve our customers, we are providing your report by e-mail. This document is provided in Portable Document Format which can be viewed with Acrobat Reader by Adobe.

This electronic report includes the following:

- Work order Summary;
- Laboratory Narrative;
- Results; and
- Chain of Custody (copy).

180 BLUE RAVINE ROAD, SUITE B FOLSOM, CA - 95630

(916) 985-1000 .FAX (916) 985-1020

LABORATORY NARRATIVE
Modified TO-15
OBrien & Gere
Workorder# 0712393

Five 6 Liter Summa Special (100% Certified) and two 6 Liter Summa Special samples were received on December 19, 2007. The laboratory performed analysis via modified EPA Method TO-15 using GC/MS in the full scan mode. The method involves concentrating up to 1.0 liter of air. The concentrated aliquot is then flash vaporized and swept through a water management system to remove water vapor. Following dehumidification, the sample passes directly into the GC/MS for analysis.

This workorder was independently validated prior to submittal using 'USEPA National Functional Guidelines' as generally applied to the analysis of volatile organic compounds in air. A rules-based, logic driven, independent validation engine was employed to assess completeness, evaluate pass/fail of relevant project quality control requirements and verification of all quantified amounts.

Method modifications taken to run these samples are summarized in the table below. Specific project requirements may over-ride the ATL modifications.

Requirement	***TO-15***	***ATL Modifications***
ICAL %RSD acceptance criteria	+- 30% RSD with 2 compounds allowed out to < 40% RSD	30% RSD with 4 compounds allowed out to < 40% RSD
Daily Calibration	+- 30% Difference	</= 30% Difference with four allowed out up to </=40%.; flag and narrate outliers
Blank and standards	Zero air	Nitrogen
Method Detection Limit	Follow 40CFR Pt.136 App. B	The MDL met all relevant requirements in Method TO-15 (statistical MDL less than the LOQ). The concentration of the spiked replicate may have exceeded 10X the calculated MDL in some cases
Sample collection media	Summa canister	ATL recommends use of summa canisters to insure data defensibility, but will report results from Tedlar bags at client request

Receiving Notes

There were no receiving discrepancies.

Analytical Notes

There were no analytical discrepancies.

Definition of Data Qualifying Flags

Eight qualifiers may have been used on the data analysis sheets and indicates as follows:

B - Compound present in laboratory blank greater than reporting limit (background subtraction not performed).

J - Estimated value.

E - Exceeds instrument calibration range.
S - Saturated peak.
Q - Exceeds quality control limits.
U - Compound analyzed for but not detected above the reporting limit.
UJ- Non-detected compound associated with low bias in the CCV
N - The identification is based on presumptive evidence.

File extensions may have been used on the data analysis sheets and indicates as follows:
a-File was requantified
b-File was quantified by a second column and detector
r1-File was requantified for the purpose of reissue

Data Usability Summary Report

To:	Mark Distler	*cc:*
From:	Karen A. Storne	
Re:	Review of Data for the Vapor Intrusion Sampling, Former GE Farrell Road Site, Performed December 2007	
File:	5851/41510.100.100	
Date:	February 19, 2008	

This report addresses the review of the sub-slab and indoor air samples collected for the Former GE Farrell Road Site in Geddes, New York. Sample collection activities were conducted by O'Brien & Gere on December 18, 2007.

The following table summarizes the analysis performed for this sampling event.

Table 1-1. *Analytical methods and references*

Parameter	Method	Reference
VOCs	USEPA Method TO-15 Modified SIM	1

Note:
1. United States Environmental Protection Agency (USEPA). 1999. *Compendium of Methods for the Determination of Toxic Organic Compounds in Ambient Air.* Cincinnati, Ohio.

VOCs indicates volatile organic compounds.
SIM indicates selective ion monitoring.

Air Toxics LTD. of Folsom, California (Air Toxics) performed the analyses.

The laboratory packages generated by Air Toxics contained quality control analysis and supportive raw data.

Full validation was performed on the samples collected for this sampling event.

The analytical data generated for this investigation were evaluated by O'Brien & Gere using the quality assurance/quality control (QA/QC) information presented in the following documents:

- United States Environmental Protection Agency (USEPA). 1999. *Compendium of Methods for the Determination of Toxic Organic Compounds in Ambient Air.* Cincinnati, Ohio.

- O'Brien & Gere. 2006. *Vapor Intrusion Sampling Work Plan Addendum, Former GE Farrell Road. Site # 7-34-055. Geddes, New York.* Syracuse, New York.

Data affected by excursions from the previously mentioned QA/QC criteria were qualified using the following USEPA data validation guidance and professional judgment:

- United States Environmental Protection Agency (USEPA). 2006. *Validating Volatile Organic Analysis of Ambient Air in canister by Method TO-15. SOP HW-31, Revision 4.* Albany, New York

USEPA data validation guidelines have been modified to reflect the requirements of the method used in the analysis of samples collected for this sampling event. Qualifiers were applied to data that failed to meet the quality control criteria presented in the USEPA method.

In accordance with the USEPA guidance, and utilizing professional judgment, the following qualifiers are used in this type of data validation:

"U" Indicates that the analyte was analyzed for, but was not detected. The associated value indicates the approximate sample concentration necessary to be detected.

"J" Indicates that the detected analyte is present but the reported value may not be accurate or precise. The result should be considered approximate based on excursions from QA/QC criteria.

"UJ" Indicates that the analyte was not detected and the quantitation limit (QL) may be inaccurate or imprecise. The result should be considered approximate based on excursions from QA/QC criteria.

"R" Indicates that the QL or sample result is unreliable and has been rejected due to a major excursion from QA/QC criteria. The analyte may or may not be present in the sample. The data should not be used for qualitative or quantitative purposes.

The validation included checking the following parameters:

- Work plan compliance
- Chain-of-custody records
- Sample collection
- Holding times
- Calibrations
- Blank analysis
- Laboratory control sample (LCS)/Laboratory control sample duplicate (LCSD) analysis
- Field duplicate analysis
- Internal standards performance
- Gas chromatography/mass spectrometry (GC/MS) instrument performance check
- Target analyte quantitation, identification, and QLs
- Documentation completeness.

The samples that were submitted for data validation are listed in Table 1-2 presented in Attachment A.

The following sections of this memorandum present the results of the comparison of the analytical data to the QA/QC criteria specified above. Based on the QA/QC information review, an overall evaluation of data usability is also presented in the final section.

VALIDATION APPROACH

O'Brien & Gere applies the following general approach for application of data validation qualifiers when control limits are exceeded:

- If percent recoveries are less than laboratory control limits but greater than ten percent, non-detected and detected results are qualified as approximate (J, UJ).

- If percent recoveries are greater than laboratory control limits, detected results are qualified as approximate (J).

- If percent recoveries are less than ten percent, detected results are qualified as approximate (J) and non-detected results are qualified as rejected (R).

- If RPDs for field duplicates are outside of validation criteria, detected and non-detected results are qualified as approximate (UJ, J).

The calibration criteria used to evaluate the data generated for this investigation were based on the method criteria.

Laboratory established control limits were used to assess LCS data.

The cumulative effect of the various QA/QC excursions is employed in assigning the final data qualifiers. For example, if a sample result is affected by low LCS recovery for which the "J" qualifier is applied, but severely low internal standard recoveries result in the rejection of the sample result (R), the final qualifier is "R".

Qualification of data associated with field duplicate excursions is limited to the field duplicate pair.

Field duplicate data were evaluated against relative percent difference (RPD) criteria of less than 25 percent for air samples when results were greater than five times the QL. When sample results for field duplicate pairs were less than five times the QL, the data were evaluated using control limits of plus or minus two times the QL.

SAMPLE COLLECTION

Canister blanks were not collected as part of this sampling event.

VOLATILE ORGANIC COMPOUND IN AIR DATA EVALUATION SUMMARY

The following QA/QC parameters were found to meet method and validation criteria or did not result in additional qualification of sample results:

- Work plan compliance
- Chain-of-custody records
- Sample collection
- Holding times
- Calibrations
- Blank analysis
- LCS/LCSD analysis
- Field duplicate analysis
- Internal standards performance
- GC/MS instrument performance check
- Target analyte quantitation and identification
- Documentation completeness.

Excursions from method or validation criteria were not detected during the validation process. Therefore data were not qualified during the validation process. Additional observations are presented in the following section.

I. Target analyte quantitation limits.

As part of laboratory policy in analyzing this type of air sample, Air Toxics routinely pressurizes samples at the time of receipt at the laboratory. This pressurization step allows sufficient sample volume to be available in the case that multiple analyses are necessary. This step dilutes the sample within the canister, which results in an increase in the QLs.

The results for samples SS-3-FR-121707 and SS-DUP-FR-121707 [SS-3-FR-121707] were analyzed at an additional dilution of 1:2 due to elevated concentrations of trichloroethene in the samples.

DATA USABILITY

Overall data usability with respect to completeness for the final sample results reported is 100 percent for the VOC air data. The VOC air data were identified as usable for qualitative and quantitative purposes. Based on the validation performed, the typical completeness goal of 95 percent was met for these analyses.

TECHNICAL MEMORANDUM

TO:	Jill Fonte, Lockheed Martin	cc:	Myron Parkolap – Lockheed Martin Ginny Robbins – BSK Mark Distler – OBG
FROM:	Eric Alongi, OBG		
RE:	September 2015 VI Results Former GE Farrell Road Site		
FILE:	5851/50238		
DATE:	December 11, 2015		

This Technical Memorandum (TM) presents the results of sampling conducted at the former GE Farrell Road Site (Site) on September 23, 2015. The sampling was performed in accordance with a Vapor Intrusion (VI) Sampling Work Plan (WP), dated August 20, 2015. The New York State Department of Environmental Conservation (NYSDEC) approved the WP, with modifications, in a letter dated September 3, 2015. A letter from O'Brien & Gere (OBG), dated September 9, accepted the NYSDEC modifications and provided a revised proposed sampling location map. This TM also evaluates the data with respect to the potential for VI, and provides recommendations for follow-on actions.

1. BACKGROUND

1.1 SITE BACKGROUND

The Site consists of 156 acres in an industrial zone setting located on Farrell Road and John Glenn Boulevard in the Town of Geddes, northeast of Routes 690 and 90 and south of the Seneca River. Nearly half of the Site (81 acres) is classified as a Class I wetlands. Ground water flows in a north/northwest direction across the Site toward Seneca River. Depth to ground water in the developed portion of the Site is approximately ten feet below ground surface (bgs). The developed portion of the Site is paved and contains four on-Site buildings; Buildings 1 and 2, former test building, and maintenance garage. Figure 1 shows Buildings 1 and 2.

There are three primary historic source areas relevant to vapor intrusion potential at the Site, referred to as areas of concern (AOC), where interim remedial measures (IRMs) were implemented.[1] The following identifies the location (also shown on **Figure 1**) and gives a description of each AOC:

- AOC 5, located along the west side of Building 2, was an area where nine underground storage tanks (USTs) and a dry well were removed.
- AOC 7, located along the east side of Building 2, was an area of a former fuel oil UST and where drums containing Freon were rinsed.
- AOC 16, located adjacent to the maintenance garage, was an area of a former gasoline UST.

Currently the Site is classified as Class 4 on the New York State Registry of Inactive Hazardous Waste Disposal Sites, based on the effectiveness of the IRMs. A ground water extraction and treatment system (currently shut down) at the Site has been deemed effective at controlling off-site migration of shallow contaminated ground water. Concentrations of VOCs in ground water are periodically measured from samples collected from monitoring wells located at the Site.

1.2 VAPOR INTRUSION SAMPLING BACKGROUND

In response to a request by the NYSDEC in August 2006, Lockheed Martin Corporation (LMC) conducted sampling at Building 2 to assess the potential for vapor intrusion. LMC retained OBG to conduct the vapor intrusion sampling, which was performed in February 2007 for the 2006-2007 heating season. The results of the sampling were summarized in a technical memorandum in May 2007, in which further monitoring for TCE and

[1] Note that there were other AOCs at the Site where some remedial work was completed, but they are not considered relevant to this investigation.

1,1-DCE was recommended for two of the five sampling locations. Further monitoring was conducted in December 2007 for the 2007-2008 heating season, the results of which were reported by OBG in a technical memorandum in February 2008. Additional sampling was recommended at two locations to confirm the results.

The recommended additional sampling was conducted in December 2008 for the 2008-2009 heating season and results were summarized in a technical memorandum in March 2009. Based on the sample results, and in conformance with NYSDOH's two soil vapor / indoor air matrices, OBG recommended that annual inspections be conducted to identify slab breaches and building modifications that could increase the potential for sub-slab vapors to intrude. NYSDEC approved the annual inspection approach in a December 9, 2009 letter from Javier Perez of NYSDEC to Myron Parkolap of LMC. NYSDEC also informed LMC that additional investigation may be necessary when the building's occupancy changes. Since 2009, OBG has conducted and reported annual slab inspections and findings to NYSDEC. From 2007 to present, the light warehousing use of Building 2 has not changed.

The current owner of the property (Widewaters Group, Inc.) tentatively contracted with two separate tenants to occupy Building 2, with occupancy to begin in the fourth quarter of 2015, or first quarter of 2016. Specific activities to be conducted in the tenant spaces for Building 2 were not provided; however, warehousing and light to moderate manufacturing was anticipated. The layout of the proposed tenant spaces are illustrated in **Figure 2**.

The property owner has also contracted with tenants to occupy the former maintenance garage. Two of the three tenant spaces in the garage have already been occupied by a lawn care/snow removal business and a trailer washing and brake repair business that sublets a portion of its space to car enthusiasts and hobbyists that maintain their vehicles in their spare time.

As a result of the sites' anticipated change of use and at the request of NYSDEC to LMC, OBG conducted vapor intrusion sampling within Building 2 and the maintenance garage to acquire updated soil vapor data for the site. The following describes the sampling.

2. VAPOR INTRUSION SAMPLING

Vapor intrusion sampling was conducted on September 23, 2015. Samples of sub-slab vapor, indoor air, and ambient air were collected over an 8-hour period. Samples were collected in accordance with the NYSDEC approved WP, and Mr. Joshua Cook of NYSDEC was present during a portion of the on-Site activities.

2.1 SAMPLING LOCATIONS

The number of samples was selected to assess spatial variability of sub-slab soil vapor across the slabs of Building 2 and the former maintenance garage. In NYSDEC's September 3, 2015 approval letter they referenced use of the New Jersey Department of Environmental Protection VI guidance that recommends the number of samples based on the area of the slab. Given that Building 2's slab area is ~300,000 square feet and the former garage is ~8,000 square feet, the guidance recommends 10 sub-slab soil vapor samples be collected in Building 2, and four be collected in the former garage, depending on several factors. One of the factors pertinent to Building 2 is the presence of enclosed areas within the larger manufacturing and storage areas of both proposed tenant spaces. **Figure 2** shows the anticipated enclosed areas as identified by the current property owner.

Figure 3 shows the number and locations of the sampling. Building 2 samples were collected in the four largest enclosed areas, along the north end of the building where soil vapor has been found to be highest, and other locations to provide spatial representation. The total number of sample locations, included previously sampled ones, is 11.

There are three separate areas within the former garage (as shown on **Figure 3**). The north end area was vacant during the time of sampling. Therefore, samples were collected in the two occupied areas. Although the total number of sample locations (2) is less than recommended, sampling in the former garage was expected to be

significantly impacted by indoor air sources of the same petroleum related compounds that could possibly be found in soil vapor.

In summary, OBG collected a total of 10 sets of samples (each set consisting of one sub-slab sample and one indoor air sample) from within Building 2 and the former maintenance garage, at locations shown in **Figure 3**. One ambient air sample was collected upwind of both buildings, simultaneously with the sub-slab/indoor air samples.

2.2 SAMPLE COLLECTION METHODOLOGY

Samples were collected in accordance with the NYSDEC-approved WP. Sub-slab samples were collected through temporary or permanent sampling points in the concrete floor and in batch-certified clean 6-liter pre-evacuated canisters.

The indoor air and ambient air samples were collected in individually-certified clean 6-liter pre-evacuated canisters. All samples were collected over an 8-hr period.

Sample Analysis

Samples (canisters) were delivered to a laboratory that is certified by the Environmental Laboratory Approval Program (ELAP) and certified by New York State Department of Health (NYSDOH) for USEPA Method TO-15 under routine Chain-of-Custody protocols. The samples were analyzed for standard compounds via USEPA Method TO-15.

Quality Assurance/Quality Control

One duplicate sample of sub-slab vapor was collected to assess overall precision. No trip or equipment blanks were collected. Prior to and following collection of sub-slab samples, a helium tracer gas was used to verify the integrity of the seal between the sample tubing and concrete floor. Analytical QA/QC requirements of USEPA Method TO-15 were followed by the laboratory. Data was validated and a data usability summary report (DUSR) was prepared and included in this TM in **Attachment 1**.

3. SAMPLING RESULTS AND DATA EVALUATION

Sample results for each set of samples (sub-slab and indoor air) are presented in **Table 1** for each sample location. Results are presented in units of micrograms per cubic meter ($\mu g/m^3$). Only compounds that were detected in samples above their respective reporting limits are included in **Table 1**. Laboratory data reports are provided as **Attachment 2** and copies of completed field forms are provided as **Attachment 3**.

Figure 4 shows the sub-slab soil vapor and indoor air results of the seven NYSDOH Matrix compounds and their location within the buildings. The NYSDOH matrix compounds are presented below:

- 1,1-dichloroethene (1,1-DCE)
- carbon tetrachloride (CT)
- 1,1,1-trichloroethane (1,1,1-TCA)
- cis-1,2-dichloroethane (cis-1,2-DCA)
- trichloroethene (TCE)
- tetrachloroethene (PCE)
- vinyl chloride (VC)

3.1 DATA EVALUATION

The sample results were evaluated to assess:

- spatial variability of sub-slab soil vapor across the slab,

- if there have been changes to indoor air quality related to VI since previous sampling events,
- if indoor air concentrations were attributable to vapor intrusion,
- if indoor air concentrations are above typical background levels for commercial buildings; and
- if sub-slab and indoor air concentrations require any follow-on actions as recommended by NYSDOH's two soil vapor/indoor air matrices.

Maintenance Garage

Two sub-slab soil vapor/indoor air sample pairs were collected in the occupied spaces of the maintenance garage. As can be seen in **Figure 4**, 1,1,1-TCA, TCE and PCE were detected in both sub-slab soil vapor samples. The highest sub-slab soil vapor concentration for a NYSDOH matrix compound was 340 µg/m^3 for TCE at location -02. The corresponding indoor air concentration of TCE at location -02 was 0.23 µg/m^3.

The second highest NYSDOH matrix compound detected in sub-slab soil vapor was 1,1,1-TCA at 17 µg/m^3 at location -01. The corresponding indoor air concentration of 1,1,1-TCA at location -01 was found below the analytical detection limit of 1.1 µg/m^3. PCE was detected in sub-slab soil vapor at location -01 at 15 µg/m^3 and the corresponding PCE indoor air concentration at location -01 was 0.5 µg/m^3.

CT was detected in both indoor air samples at 0.59 µg/m^3 (location -01) and 0.47 µg/m^3 (location -02). CT was not detected in the sub-slab soil vapor samples above their respective reporting limits. The indoor air concentrations of CT are attributable to ambient air concentrations; the ambient air concentration for CT was 0.50 µg/m^3. 1,1-DCE, cis-1,2-DCE and VC were not detected above respective detection limits in sub-slab soil vapor or indoor air samples collected at either location.

There were indoor air detections for benzene, toluene, ethylbenzene, and xylene; however, corresponding sub-slab soil vapor concentrations were lower than respective indoor air concentrations. Indoor air concentrations of these petroleum related compounds are impacted by indoor air sources within the garage and do not appear to be attributable to VI.

Strict interpretation of NYSDOH matrices would recommend mitigation because the sub-slab soil vapor concentration for TCE at location -02 is above 250 µg/m^3. If VI were occurring, the indoor air level of 0.23 µg/m^3 would suggest an attenuation factor across the slab in the order of 10^{-3}, which is more indicative of a slab with some cracks or other breaches that allow soil vapor to intrude. The attenuation factor would also indicate the presence of negative indoor air pressure, often caused by exhausting indoor air to the outdoors that can pull soil vapor across a competent slab. However, neither condition exists in the garage; the slab has no breaches and the space is not under negative pressure. Therefore, the one detection of TCE in indoor air is not likely attributable to VI and is more likely attributable to indoor sources associated with vehicle maintenance. Nonetheless, the indoor air TCE concentration at location -02 is below NYSDOH's newly revised air guideline value for TCE of 2.0 µg/m^3, and below typical indoor air background levels[2] of 4.2 µg/m^3.

Building 2

Eight sub-slab soil vapor /indoor air samples pairs were collected in Building 2. As can be seen in **Figure 4**, there were detections of matrix compounds in the northeast portion of Tenant space 1 at locations -03, -06, and -07; however, comparison of the sub-slab soil vapor/indoor air concentrations with respect to NYSDOH matrices would recommend that no further action is necessary at these sample locations.[3]

---

[2] Defined by the NYSDOH SVI guidance document as the 90th percentile for office and commercial buildings database, provided in Appendix C.2.

[3] Carbon tetrachloride was detected in all indoor air samples and the ambient air sample at the same level, and therefore all carbon tetrachloride indoor air detections are assumed to be attributable to outdoor (background) sources and not from vapor intrusion.

There were low detections of some matrix compounds in sub-slab soil vapor and indoor air at location -10. Comparison of the results with the NYSDOH matrices would recommend no further action for all matrix compounds except for 1,1-DCE and 1,1,1-TCA, for which the matrices recommend identification and removal of the indoor sources. However, there are no indoor sources of 1,1-DCE or 1,1,1-TCA within Building 2. Vapor intrusion of these compounds appears to be occurring at other locations in Tenant space 2 (as discussed below), which is likely contributing to the indoor air detections at location -10.

Location -04 (easternmost portion of Tenant space 1) coincides with a sample location sampled during previous sample events in February 2007, December 2007, and December 2008. During these previous sample events, indoor air concentrations of TCE and 1,1-DCE ranged from 0.32 µg/m^3 to <0.90 µg/m^3 and 1.0 µg/m^3 to 3.6 µg/m^3, respectively. The 2015 sample results indicate no change to indoor air concentrations of TCE or 1,1-DCE, despite the increased TCE sub-slab soil vapor concentration from 550 µg/m^3 in December 2008 to 1,100 µg/m^3 in 2015. Strict interpretation of the 2015 results with the NYSDOH matrices suggest that monitoring or mitigation are warranted for location -04, however the detections of 1,1-DCE and 1,1,1-TCA in the indoor air are not likely associated with soil vapor intrusion from this location but from other locations in the building, as discussed below.

Elevated sub-slab soil vapor concentrations were found at locations -05 and -08. The highest sub-slab and indoor air concentrations of TCE and 1,1-DCE were found at location -05. The highest sub-slab concentration of 1,1,1-TCA was found at location -08 but did not correspond with the highest indoor air level of 1,1,1-TCA, which was found at location -09.

Strict interpretation of the NYSDOH matrices would recommend monitoring or mitigation due to sampling results at locations -05, -08, and -09 for at least two of three compounds: 1,1-DCE, 1,1,1-TCA, and TCE. A brief summary of these detections and calculated attenuation factors are presented below:

Summary of Select Matrix Compounds and Attenuation Factors for Locations -05, -08, and -09

	Location -05			Location -08			Location -09		
Analyte	**Sub-Slab**	**Indoor Air**	**AF**	**Sub-Slab**	**Indoor Air**	**AF**	**Sub-Slab**	**Indoor Air**	**AF**
1,1-DCE	76,000	6.8	8.9×10^{-5}	17,000	2.7	1.6×10^{-4}	1.1	4.6	4.2
1,1,1-TCA	190	4.2	2.2×10^{-2}	20,000	2.6	1.3×10^{-4}	280	5.8	2.1×10^{-2}
TCE	2,400	0.26	1.1×10^{-4}	68	0.22	3.2×10^{-3}	55	0.25	4.5×10^{-3}

Results reported are in units of µg/m^3
AF – Attenuation Factor = (indoor air concentration / sub-slab soil vapor concentration)

The lowest attenuation factors shown above are on the order of 10^{-4}, which is typical for slabs in good condition. Therefore, it is possible that vapor intrusion is primarily occurring for 1,1-DCE at locations -05 and -08, for 1,1,1-TCA at location -08, and for TCE at location -05. The somewhat elevated indoor air levels of these compounds at location -09 without corresponding elevated sub-slab levels is attributable to vapor intrusion occurring at locations -05 and -08 and to the lower natural ventilation that likely occurs at the south end of Building 2 which is further away from building openings in the north end (gaps in the walls and loading dock doors).

The significant differences in sub-slab levels at locations -05 and -08 compared to the nearest other sampling locations, approximately 200 feet away, suggest the sources of soil vapor are small in size and do not represent a typical groundwater plume. Each location -05 and -08 are proximate to former AOCs where impacted soil was removed from the site. It is likely that the presence of soil vapor under Building 2 are small areas of impacted soil that could not be excavated during the AOC remediation.

Although sample results suggest that vapor intrusion is occurring, the slab is in overall good shape and the impact to indoor air concentrations is below levels of health concern. Indoor air concentrations of 1,1-DCE, 1,1,1-TCA, and TCE are below their respective guidance concentrations or matrix action levels (100 µg/m^3 for

1,1-DCE and 1,1,1-TCA and 2.0 µg/m^3 for TCE), and are below USEPA Regional Screening Levels for commercial inhalation (880 µg/m^3 for 1,1-DCE, 22,000 µg/m^3 for 1,1,1-TCA, and 3 µg/m^3 for TCE). Therefore, immediate action to mitigate the indoor air levels is not warranted.

4. RECOMMENDATIONS AND FURTHER ACTIONS

The following provides recommendations for further actions based upon the September 2015 sample results evaluations presented above.

4.1 MAINTENANCE GARAGE

Given that vapor intrusion does not appear to be occurring in the garage, that indoor air levels are below levels of health concern, and that the slab is in good condition, we do not recommend mitigation but rather annual slab inspections. If slab conditions change in the future then additional indoor air sampling and/or slab sealing may be warranted. The initial slab inspection can be conducted in the heating season of 2016/2017.

We also recommend one more round of sampling in the heating season to discern if there is a seasonal variability in soil vapor levels, as has been studied and shown in many other cases. We recommend another sub-slab and indoor sample pair at location -02 and another pair in the previously vacant space on the north end of the garage where we recently learned that it is now being occupied, primarily for storage.

4.2 BUILDING 2

Given that vapor intrusion appears to be occurring for three compounds, that the sources of the soil vapor appear to be small in size and located near locations -05 and -08, and that measured indoor air levels are below levels of health concern, mitigation of the sources may be warranted as a means to protect against possible future increased vapor intrusion if slab conditions were to change. Mitigation is most effectively achieved via sub-slab depressurization (SSD), where practical. A single suction point and single fan system would be practical if installed at each location -05 and -08 (one system per location). After operation of each system for approximately four weeks, indoor air sampling should be conducted to assess if the indoor air concentrations are reduced. If reduced, then the systems would appear to be effective and that the systems should continue to operate as protection against future vapor intrusion. If not reduced, then additional investigation for other soil vapor sources may be warranted.

We also recommend one more round of sampling in the heating season (before mitigation installation) to discern if there is a seasonal variability in soil vapor levels, as well as in indoor air levels since their variability is important to understand because of their use in evaluating mitigation system effectiveness. We recommend another sub-slab and indoor sample pair at locations -04, -05, -08, -09, and -10 (each location where the NYSDOH matrices recommended some follow-on action).

Notes:
U - indicates compound was not detected (ND) above reporting limit. Reporting limit reported.
J - indicates result is less than the reporting limit, but greater than or equal to the minimum detection limit and the concentration is an approximate value.
D - Sample results are obtained from a dilution; the surrogate or matrix spike recoveries reported are calculated from diluted samples.

Data Usability Summary Report

DATA VALIDATION MEMORANDUM

TO:	MA Distler	cc:	EM Alongi – OBG
FROM:	KA Storne		
RE:	Data Usability Summary Report for the Former GE Farrell Road Site VI Sampling – Performed September 2015		
FILE:	5851/50238.002.100		
DATE:	November 6, 2015		

This Data Usability Summary Report (DUSR) presents the data validation results for indoor air, sub-slab soil gas and ambient air samples collected by O'Brien & Gere in September 2015 for the Lockheed Martin Corporation (LMC) at the Former GE Farrell Road Site.

TestAmerica Burlington (TA Burlington) of Burlington, Vermont performed the laboratory analyses for the sampling event. The laboratory package generated by TA Burlington contained summary forms for quality control analysis and supportive raw data.

The analysis performed for this sampling event is summarized in Table 1 below.

Table 1. ***Analytical Methods and References***

Parameter	Method	Reference
Volatile Organic Compounds (VOCs)	USEPA Method TO-15	1

Note:
1. United States Environmental Protection Agency. 1999. Compendium of Methods for the Determination of Toxic Organic Compounds in Ambient Air. Cincinnati, Ohio.

VOCs indicates volatile organic compounds.

The samples submitted for review are summarized in the attached Table 2. Table 3 presents the specific data validation approach applied to data generated for this investigation. Table 4 presents the Laboratory QA/QC analyses definitions.

Full validation was performed on the samples collected for this sampling event.

The analytical data generated for this investigation were evaluated by O'Brien & Gere using the quality assurance/quality control (QA/QC) information presented in the following documents:

- United States Environmental Protection Agency (USEPA), 1999. *Compendium of Methods for the Determination of Toxic Organic Compounds in Ambient Air*. Cincinnati, Ohio.
- O'Brien & Gere. 2007. Vapor Intrusion Sampling Work Plan, Former GE Farrell Road Site. Site # 7-34-055. Geddes, New York. Syracuse, New York.

Data affected by excursions from the previously mentioned QA/QC criteria were qualified using the following USEPA data validation guidance and professional judgment:

- USEPA. 2014. *Analysis of Volatile Organic Compounds in Air Contained in Canisters by Method TO-15. SOP HW-31, Revision 6*. Albany, New York

USEPA data validation guidelines have been modified to reflect the requirements of the methods used in the analysis of samples collected for this sampling event. Qualifiers were applied to data that failed to meet the quality control criteria presented in the USEPA methods.

In accordance with the USEPA guidance, and utilizing professional judgment, the following qualifiers are used in data validation:

"U" Indicates that the analyte was analyzed for, but was not detected. The associated value indicates the approximate sample concentration necessary to be detected.

"J" Indicates that the detected analyte is present but the reported value may not be accurate or precise. The result should be considered approximate based on excursions from QA/QC criteria.

"UJ" Indicates that the analyte was not detected and the quantitation limit (QL) may be inaccurate or imprecise. The result should be considered approximate based on excursions from QA/QC criteria.

"R" Indicates that the QL or sample result is unreliable and has been rejected due to a major excursion from QA/QC criteria. The analyte may or may not be present in the sample. The data should not be used for qualitative or quantitative purposes.

The validation included checking the following parameters:

- Chain-of-custody records;
- Sample collection;
- Canister filling evaluation;
- Holding times;
- Calibrations;
- Blank analysis;
- Laboratory control sample (LCS) analysis;
- Internal standards performance;
- Field duplicate analysis;
- Gas chromatography/mass spectrometry (GC/MS) instrument performance check;
- Target analyte quantitation, identification, and quanitation limits (QLs); and
- Documentation completeness.

The following sections of this memorandum present the results of the comparison of the analytical data to the QA/QC criteria specified above. Based on the QA/QC information review, an overall evaluation of data usability is also presented in the final section.

VOLATILE ORGANIC COMPOUND DATA EVALUATION SUMMARY

The following QA/QC parameters were found to meet method and validation criteria or did not result in additional qualification of sample results:

- Sample collection;
- Canister filling evaluation
- Holding times;
- Blank analysis
- LCS analysis;
- Internal standards performance;
- GC/MS instrument performance check;
- Documentation completeness.

Excursions from method or validation criteria and additional observations are described below.

I. CHAIN-OF-CUSTODY RECORDS

For the samples collected 9/23/15, the Federal Express tracking numbers for the sample containers were only listed on page 4 of the record.

II. FIELD DUPLICATE ANALYSIS

Results in the following samples were qualified as approximate (J) due to a minor field duplicate precision excursion:

- Carbon disulfide in samples FR-SS09-092315 and FR-SSDUP-092315 [FR-SS09-092315].

III. CALIBRATIONS

Results in the following samples were qualified as approximate (UJ) due to a minor calibration accuracy excursion:

- Bromoform in samples FR-SS01-092315, FR-SS02-092315, FR-SS03-092315, FR-SS06-092315, FR-SS07-092315, FR-SS09-092315, FR-SSDUP-092315 [FR-SS09-092315] and FR-SS10-0923152-IA-021915.

IV. TARGET ANALYTE QUANTITATION, IDENTIFICATION AND QLS

Dilutions were performed for samples FR-IA01-092315, FR-SS02-092315, FR-IA02-092315, FR-SS04-092315, FR-SS05-092315, FR-IA05-092315, FR-IA06-092315, FR-SS07-092315, FR-IA07-092315, FR-SS08-092315, FR-IA08-092315, FR-SS09-092315, FR-IA09-092315, FR-SSDUP-092315 [FR-SS09-092315], FR-SS10-092315 and FR-IA10-092315 due to high concentrations of target analytes. As a result of the dilutions, reported detection limits were elevated.

The initial detected result for cyclohexane in sample FR-SS09-092315 was revised to non-detected (U) as a result of the laboratory re-evaluating the target analyte identification as requested during data validation.

For samples FR-IA01-092315, FR-IA02-092315, FR-SS05-092315, FR-IA05-092315, FR-IA06-092315, FR-IA07-092315, FR-SS08-092315, FR-IA08-092315, FR-IA09-092315 and FR-IA10-092315 two analyses were reported by the laboratory. The analytes with concentrations that were greater than the upper calibration limit were reported from the higher dilution analysis and the concentrations for the remaining analytes were reported from the less diluted or undiluted analysis.

DATA USABILITY

Overall data usability with respect to completeness for the sample results reported is 100 percent for the VOC air data. The VOC air data were identified as usable for qualitative and quantitative purposes. Based on the validation performed, the typical completeness goal of 95 percent was met for these analyses.

Table 2. *Sample Cross Reference Table*

TA Burlington indicates TestAmerica of Burlington, Vermont.

SDG Indicates sample delivery group.

VOCs indicates volatile organic compounds.

Table 3. *Specific Data Validation Approach Applied*

O'Brien & Gere Data validation approach using USEPA Region II Data validation guidelines for VOCs by USEPA Method TO-15	
Laboratory Methods and Data Validation Approach	The O'Brien & Gere data validation approach utilizes the methods applied by the laboratory to evaluate data. The USEPA Region II validation guidelines and professional judgment are then utilized to apply qualifiers to data if excursions from the method quality control requirements are identified.
General Validation Approach	For certain parameters, USEPA guidance for data validation indicates that professional judgment is to be utilized to identify the appropriate validation action. In these situations, the validation approach taken by O'Brien & Gere is a conservative one; qualifiers are applied to sample data to indicate both major and minor excursions. In this way, data associated with any type of excursion are identified to the data user. Major excursions will result in data being rejected, indicating that the data are considered unusable for either quantitative or qualitative purposes. Minor excursions will result in sample data being qualified as approximate that are otherwise usable for quantitative or qualitative purposes.
	Excursions are subdivided into excursions that are within the laboratory's control and those that are out of the laboratory's control. Excursions involving laboratory control sample recovery, calibration response, method blank excursions, low or high spike recovery due to inaccurate spiking solutions or poor instrument response, holding times, interpretation errors, and quantitation errors are within the control of the laboratory. An excursion resulting from internal standard performance due to matrix interference is an example of an excursion that is not within the laboratory's control if the laboratory has followed proper method control procedures.
	The data quality evaluation results in only one type of qualifier ("U", "J", "UJ" or "R") for each analyte; in a case when several qualifiers are applicable to the same analyte, the cumulative effect of the various QA/QC excursions is employed in assigning the final data qualifiers. For example, if a sample result is affected by low LCS recovery for which the "J" qualifier is applied to indicate a biased low result, but a major response factor excursion results in the rejection of the sample results (application of the "R" qualifier), the final data qualifier is the "R" qualifier, considering the overall impact of the two excursions.
Validation Guidelines	Validation qualifiers will be applied based on professional judgment and the guidance in USEPA. 2014. Analysis of Volatile Organic Compounds in Air Contained in Canisters by Method TO-15. SOP HW-31, Revision 6. New York, New York.
Validation Qualifiers	U - The analyte was analyzed for, but was not detected at a level greater than or equal to the level of the quantitation limit (QL). J - The analyte was positively identified and the associated numerical value is the approximate concentration of the analyte in the sample (due either to the quality of the data generated because certain quality control criteria were not met, or the concentration of the analyte was below the QL). J+ The result is an approximated quantity, but the result may be biased high. J- The result is an approximated quantity, but the result may be biased low. NJ - The analysis indicates the presence of an analyte that has been "tentatively identified" and the associated numerical value represents its approximate concentration. UJ - The analyte was not detected at a level greater than or equal to the QL. However, the QL is approximate and may be inaccurate or imprecise. R - The sample results are unusable due to the quality of the data generated because certain criteria were not met. The analyte may or may not be present in the sample.
Canister Pressure Excursions	The laboratory should evacuate the canister to approximately - 30 inches of mercury (" Hg) prior to shipping the canister to the sampling location.
	The difference between the initial canister pressure recorded at the laboratory and the pressure measured prior to sample collection must not be greater than 5" Hg.
	Difference between the canister pressure measured in the field after sample collection and the pressure measured upon receipt at laboratory must not be greater than 5" Hg.
	The canisters must be filled to a minimum of -15 in Hg. But the sample canister should be filled to approximately -5" Hg to -2" Hg when collection of the sample is completed. A canister with any negative pressure upon receipt at the laboratory is acceptable for analysis.

O'Brien & Gere Data validation approach using USEPA Region II Data validation guidelines for VOCs by USEPA Method TO-15

Canister Pressure Excursions	For samples impacted by pressure excursions, results are qualified as approximate (UJ, J).
Canister Leak Check	Hold vacuum/pressure within ±2psi for 24 hours before sampling. Difference in initial and 24 hour pressure greater than 5 is qualified approximate (J), UJ).
Evaluation of Holding Times	A holding time of 30 days from sample collection to analysis is used to evaluate holding times. Canisters should be returned to the laboratory within 15 days of shipment to the field location but are not qualified for this excursion. Results outside of holding time are qualified approximate (UJ, J).
Evaluation of Calibration Data	VOC target analytes are evaluated using the criteria of either 30 percent relative standard deviation (%RSD) for initial calibrations or calibration coefficient of greater than 0.990 for initial calibration curves. The calibration verifications are evaluated using the criteria of 30 percent difference (%D). Initial calibrations and calibration verifications are also evaluated using the response factor (RF) criteria of 0.05 for the target analytes. The second-source standard or low standard is evaluated using a 30% recovery or the laboratory control limits. The IC verification (ICV) are evaluated using the criteria of 30% D or 70 to 130%R. For Initial Calibration: Detected results for target analytes associated with RFs of less than 0.05 are qualified as approximate (J) and non-detected results are rejected (R). Detected results for target analytes associated with RSD greater than 30.0% are qualified as approximate (J). Non-detected results are qualified as approximate (UJ). Detected results for target analytes associated with RSD greater than 90% are qualified as approximate (J) and non-detected results are rejected (R). For Calibration Verifications: Detected and non-detected results for target analytes associated with %D greater than 30.0% are qualified as approximate (J) and non-detected results are qualified as approximate (UJ). Detected results for target analytes associated with RSD greater than 90% are qualified as approximate (J) and non-detected results are rejected (R). For Initial Calibration Verifications: Detected and non-detected results for target analytes associated outside of 30%D or 70 to 130 %R are qualified as approximate (J) and non-detected results are qualified as approximate (UJ).

O'Brien & Gere Data validation approach using USEPA Region II Data validation guidelines for VOCs by USEPA Method TO-15

Evaluation and Actions for Blank	Blanks are not qualified due to contamination of another blank. Sample results qualified as non-detected (U) are treated as hits when qualifying for calibration excursions. 1. For blank results less than the QL, samples with concentrations less than the QL are reported at the QL and qualified as non-detected (U). Samples with concentrations less than two times the QL are reported at the sample concentration as non-detected (U). 2. For blank results greater than the QL, samples with concentrations less than the QL are reported at the QL and qualified as non-detected (U). Samples with concentrations greater than or equal to the QL and less than the blank contamination level are reported and qualified as non-detected (U 3. For blank results equal to the QL, sample concentrations less than the QL are reported at the QL value and qualified as non-detected (U). 4. For gross contamination in blanks (saturated peaks, interference peaks, poor baselines), all associated sample detected results are qualified as non-detected (U) using professional judgment. Allowance for twice the methylene chloride, 2-butanone and acetone.
Actions for Canister Blank	1. For results less than canister results or greater than canister result and less than twice the canister result, are qualified as non-detected (U).
Evaluation of LCS Data	Detected result associated with LCS recovery outside the control limit is qualified as approximate (J). Non-detected result associated with LCS recovery greater than the upper control limit is not qualified. Non-detected result associated with LCS recovery less than the lower control limit but greater than10% is qualified as approximate (UJ). Non-detected result associated with LCS recovery less than 10% is rejected (R). [Region II - non-detected result less than 50% is rejected (R).]
Evaluation of LCS/LCSD Data	Detected and non-detected result associated with LCS/LCSD precision outside the control limit is qualified as approximate (UJ, J).
Evaluation of Multi-results	When two results are reported, due to re-preparation or for dilution analyses, both sets of results are evaluated during the validation process. Based on the evaluation of the associated quality control data, the results reflecting the higher quality data are reported.
General Evaluation of Data	Laboratory established control limits are used to assess data.
	In the case that excursions are identified in more than one quality control sample of the same matrix within one sample delivery group, samples are batched according to sample analysis date and qualified accordingly.
	If percent recoveries are less than laboratory control limits but greater than ten percent, non-detected and detected results are qualified as approximate (UJ, J) to indicate minor excursions.
	If percent recoveries are greater than laboratory control limits, detected results are qualified as approximate, biased high (J) to indicate minor excursions.
	If percent recoveries are less than ten percent, detected results are qualified as approximate (J) and non-detected results are qualified as rejected (R) to indicate major excursions.
	If RPDs are outside of laboratory control limits, detected and non-detected results are qualified as approximate (J) to indicate minor excursions.
Evaluation of Field Duplicate Data	Field duplicate data are evaluated against relative percent difference (RPD) criteria of less than 25 percent for air when results are greater than five times the QL. When sample results for field duplicate pairs are less than five times the QL, the data are evaluated using control limits of plus or minus two times the QL. If RPDs for field duplicates are outside of laboratory control limits, detected and non-detected results are qualified as approximate (UJ, J) to indicate minor excursions.

O'Brien & Gere Data validation approach using USEPA Region II Data validation guidelines for VOCs by USEPA Method TO-15	
Evaluation of Internal Standards	Internal standard recoveries are evaluated using control limits of from 60% of the lower standard area to 140% of the upper standard area of the associated calibration verification standard. The results associated with internal standard area recoveries less than 60%, detected results are qualified as approximate biased high (J+) and non-detected results are rejected (R). The results associated with internal standard area recoveries greater than 140%, detected results are qualified as approximate biased low (J-). Retention time difference of greater than 20 seconds between CCV -samples results are rejected (R).
Applying "J" qualifier	The "J" qualifier applied by the laboratory to organic results that are greater than the MDL but less than the QL is retained during the validation process.

Table 4. *Laboratory QA/QC Analysis Definitions*

QA/QC Term	Definition
Accuracy	The closeness or agreement of the observed value or test response to the true or acceptable reference value or the test response from a reference method. It is influenced by both random error (precision) and systematic error (bias). The terms "bias" and "precision" are often used in lieu of "accuracy".
Precision	A measure of mutual agreement between two or more individual measurements of the same property, obtained under similar conditions.
Representativeness	A measure of the degree to which data accurately and precisely characterize a population; the correspondence between the analytical result and the actual quality or condition experienced by a contaminant receptor.
Sensitivity	The capability of a method or instrument to discriminate between measurement responses representing different levels of a variable of interest.
Completeness	A measure of the amount of valid data obtained from a measurement system as compared to the planned amount, usually expressed as a percentage; also a measure of the degree to which the sampling scheme represents the available range in something, regardless of what was planned.
Detection limit	The lowest concentration or amount of the target analyte that can be determined to be different from zero by a single measurement at a stated level of probability.
Quantitation limit	The level above which numerical results may be obtained with a specified degree of confidence; the minimum concentration of an analyte in a specific matrix that can be identified and quantified above the method detection limit and within specified limits of precision and bias during routine analytical operating conditions.
Method detection limit	The minimum concentration of an analyte that undergoes preparation similar to the environmental samples and can be reported with a stated level of confidence that the analyte concentration is greater than zero.
Instrument detection limit	The lowest concentration of a metal target analyte that, when directly inputted and processed on a specific analytical instrument, produces a signal/response that is statistically distinct from the signal/response arising from equipment "noise" alone.
Gas chromatography/mass spectrometry (GC/MS) instrument performance check	Performed to verify mass resolution, identification, and to some degree, instrument sensitivity. These criteria are not sample specific; conformance is determined using standard materials.
Control limits	The variation in a process data set expressed as plus/minus standard deviations from the mean, generally placed on a chart to indicate the upper and lower acceptable ranges of process data and to judge whether the process is in or out of statistical limitations.
Calibration	Compliance requirements for satisfactory instrument calibration are established to verify that the instrument is capable of producing acceptable quantitative data. Initial calibration demonstrates that the instrument is capable of acceptable performance at the beginning of analysis and calibration verifications document satisfactory maintenance and adjustment of the instrument on a day-to-day basis.
Relative Response Factor	A measure of the relative mass spectral response of an analyte compared to its internal standard. Relative Response Factors are determined by analysis of standards and are used in the calculation of concentrations of analytes in samples.
Relative standard deviation	The standard deviation divided by the mean; a unit-free measure of variability.
Correlation coefficient	A measure of the strength of the relationship between two variables.
Relative Percent Difference	Used to compare two values; the relative percent difference is based on the mean of the two values, and is reported as an absolute value, i.e., always expressed as a positive number or zero.

QA/QC Term	Definition
Percent Difference	Used to compare two values; the percent difference indicates both the direction and the magnitude of the comparison, i.e., the percent difference may be either negative, positive, or zero.
Drift	The deviation in instrument response from its set or reference value over a period of time.
Percent Recovery	The act of determining whether or not the methodology measures all of the target analytes contained in a sample.
Blanks	Several types of blanks are analyzed by the laboratory. Corrective action procedures are implemented for blank analyses if target compounds are detected at concentrations greater than the method criteria. The criteria for evaluation of blanks apply to any blank associated with a group of samples. If problems with a blank exist, data associated with the project are evaluated to determine whether or not there is an inherent variability in the data for the project or if the problem is an isolated occurrence not affecting other data.
Reagent blank	Consists of laboratory target analyte-free water and any reagents added to a sample during analysis. This type of blank is analyzed to evaluate whether contamination occurred during the analysis of the sample due to reagent contamination. A reagent blank is usually analyzed following highly contaminated samples to assess the potential for cross-contamination during analysis.
Instrument blank	Consists of clean solvent spiked with the surrogates and analyzed on each GC column and instrument used for sample analysis by GC. This type of blank is analyzed to evaluate whether contamination occurred during the analysis of the sample due to instrument contamination.
Calibration blank	Consists of acids and reagent water used to prepare metal samples for analysis. This type of blank is analyzed to evaluate whether contamination is occurring during the preparation and analysis of the sample.
Method blank	A water or soil blank that undergoes the preparation procedures applied to a sample (i.e., extraction, digestion, clean-up). These samples are analyzed to examine whether sample preparation, clean-up, and analysis techniques result in sample contamination.
Field/equipment	Collected and submitted for laboratory analysis, where appropriate. Field/equipment blanks are handled in the same manner as environmental samples. Equipment/field blanks are analyzed to assess contamination introduced during field sampling procedures.
Trip blank	Consist of samples of analyte-free water that have undergone shipment from the sampling site to the laboratory in coolers with the environmental samples submitted for volatile organic compound (VOC) analysis. Trip blanks will be analyzed for VOCs to determine if contamination has taken place during sample handling and/or shipment. Trip blanks will be utilized at a frequency of one each per cooler sent to the laboratory for VOC analysis.
Storage blank	Consists of sample vials filled with laboratory analyte-free water. The vials are stored at the laboratory with the samples collected for VOC analysis, under the same conditions as the samples. The storage blank is analyzed with the VOC samples to evaluate for contamination due to sample storage.
Internal standards performance	Compounds not found in environmental samples which are spiked into samples and quality control samples at the time of sample preparation for organic analyses. Internal standards must meet retention time and recovery criteria specified in the analytical method. Internal standards are used as the basis for quantitation of the target analytes.
Surrogate recovery	Compounds similar in nature to the target analytes but not expected to be detected in the environmental media which are spiked into environmental samples, blanks, and quality control samples prior to sample preparation for organic analyses. Surrogates are used to evaluate analytical efficiency by measuring recovery.
Laboratory control sample	Standard solutions that consist of known concentrations of the target analytes spiked into laboratory analyte-free water or sand. They are prepared or purchased from a certified

QA/QC Term	Definition
Matrix spike blank analyses	manufacturer from a source independent from the calibration standards to provide an independent verification of the calibration procedure. They are prepared and analyzed following the same procedures employed for environmental sample analysis to assess method accuracy independently of sample matrix effects.
Laboratory duplicate	Two or more representative portions taken from one homogeneous sample by the analyst and analyzed in the same laboratory.
Matrix	The material of which the sample is composed or the substrate containing the analyte of interest, such as drinking water, waste water, air, soil/sediment, biological material.
Matrix Spike (MS)	An aliquot of a matrix (water or soil) fortified (spiked) with known quantities of specific target analytes and subjected to the entire analytical procedure in order to indicate the appropriateness of the method for the matrix by measuring recovery.
Matrix spike duplicate (MSD)	A second aliquot of the same matrix as the matrix spike that is spiked in order to determine the precision of the method.
Retention time	The time a target analyte is retained on a GC column before elution. The identification of a target analyte is dependent on a target compound's retention time falling within the specified retention time window established for that compound.
Relative retention time	The ratio of the retention time of a compound to that of a standard.
Resolution	The separation between peaks on a chromatogram.
Interference	An element, compound, or other matrix effect present in a sample which disturbs the detection of a target analyte leading to inaccurate concentration results for the target analyte.
Percent Moisture	An approximation of the amount of water in a soil/sediment sample made by drying an aliquot of the sample.
Raw data	The documentation generated during sampling and analysis which includes, but is not limited to, field notes, hardcopies of electronic data, disks, un-tabulated sample results, QC sample results, printouts of chromatograms, instrument outputs, and handwritten notes.

CASE NARRATIVE

Client: O'Brien & Gere Inc of North America

Project: LMCO Farrell Rd.

Report Number: 200-29972-1

With the exceptions noted as flags or footnotes, standard analytical protocols were followed in the analysis of the samples and no problems were encountered or anomalies observed. In addition all laboratory quality control samples were within established control limits, with any exceptions noted below. Each sample was analyzed to achieve the lowest possible reporting limit within the constraints of the method. In some cases, due to interference or analytes present at high concentrations, samples were diluted. For diluted samples, the reporting limits are adjusted relative to the dilution required.

Calculations are performed before rounding to avoid round-off errors in calculated results.

All holding times were met and proper preservation noted for the methods performed on these samples, unless otherwise detailed in the individual sections below.

RECEIPT
The samples were received on 09/25/2015; the samples arrived in good condition.

VOLATILE ORGANIC COMPOUNDS
Samples FR-SS01-092315, FR-IA01-092315, FR-SS02-092315, FR-IA02-092315, FR-SS03-092315, FR-IA03-092315, FR-SS04-092315, FR-IA04-092315, FR-SS05-092315, FR-IA05-092315, FR-SS06-092315, FR-IA06-092315, FR-SS07-092315, FR-IA07-092315, FR-SS08-092315, FR-IA08-092315, FR-SS09-092315, FR-IA09-092315, FR-SSDUP-092315, FR-SS10-092315, FR-IA10-092315 and FR-AA-092315 were analyzed for Volatile Organic Compounds in accordance with EPA Method TO-15. The samples were analyzed on 09/29/2015, 09/30/2015, 10/05/2015 and 10/06/2015.

Samples FR-IA01-092315[2.99X], FR-SS02-092315[4X], FR-IA02-092315[5X], FR-SS04-092315[10X], FR-SS05-092315[176X], FR-SS05-092315[927X], FR-IA05-092315[2.99X], FR-IA06-092315[2X], FR-SS07-092315[5X], FR-IA07-092315[2X], FR-SS08-092315[180X], FR-SS08-092315[39.5X], FR-IA08-092315[2.99X], FR-SS09-092315[2X], FR-IA09-092315[4X], FR-SSDUP-092315[3X], FR-SS10-092315[2X] and FR-IA10-092315[2.5X] required dilution prior to analysis. The reporting limits have been adjusted accordingly.

The original analyses for the majority of the samples in this delivery group yielded concentrations of target analytes that exceeded the range of calibrated instrument response. These samples were diluted and re-analyzed yielding acceptable results. The results from both analyses for each sample have been formally presented. Samples FR-SS02-092315, FR-SS04-092315, FR-SS07-092315, FR-SS09-092315, FR-SSDUP-092315, and FR-SS10-092315 were analyzed at dilution only.

No analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

REVISION SUMMARY
The enclosed submittal has been revised to provide for the removal of the detected value for Cyclohexane for sample FR-SS09-092315 based on additional review of the spectra.

DATA REPORTING QUALIFIERS

Client: O'Brien & Gere Inc of North America Job Number: 200-29972-1

Lab Section	Qualifier	Description
Air - GC/MS VOA		
	U	Indicates the analyte was analyzed for but not detected.
	E	Result exceeded calibration range.
	J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.
	D	Sample results are obtained from a dilution; the surrogate or matrix spike recoveries reported are calculated from diluted samples.

94 sec-Butylbenzene, CAS: 135-98-8

Processing Integration Results

RT: 23.81
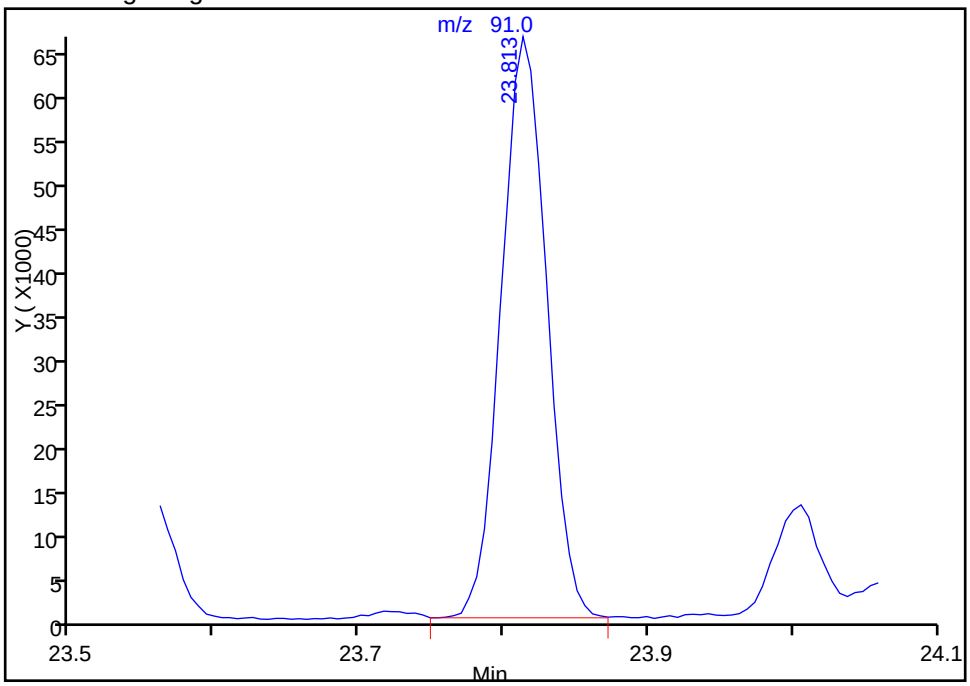
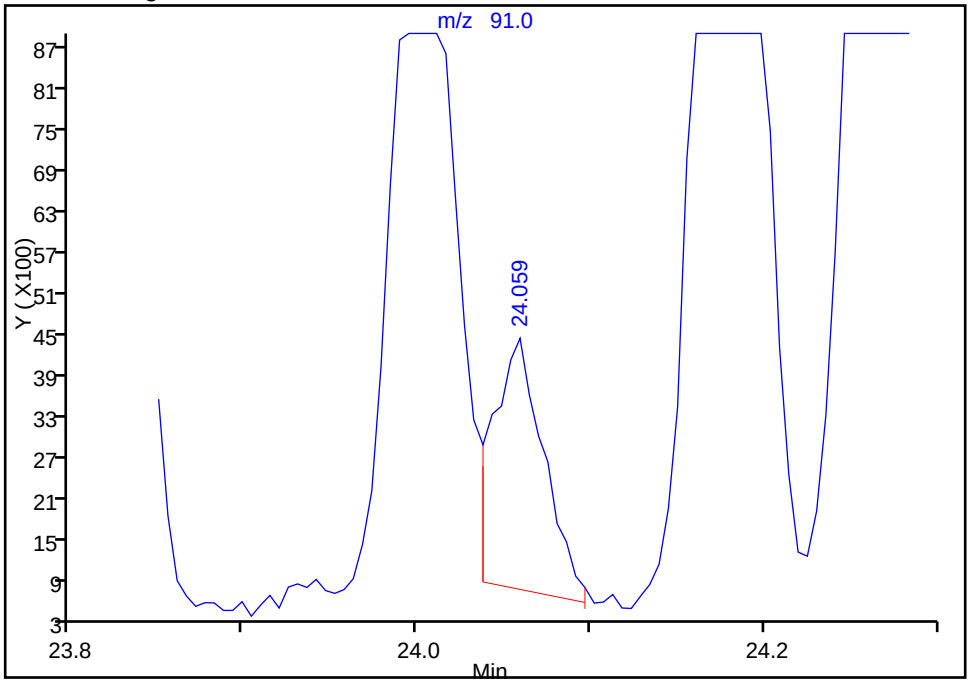
Area: 144504
Amount: 8.123797
Amount Units: ppb v/v



Manual Integration Results

RT: 24.06
Area: 7559
Amount: 0.265720
Amount Units: ppb v/v



Reviewer: daiglep, 30-Sep-2015 12:40:37
Audit Action: Manually Integrated
Audit Reason: Missed Peak
