Appendix F6 – Pro UCL Version 4.0 – Output Summary

Electronic Appendix F6, Table 1
Honeywell - Wastebeds 1-8 Site
Baseline Ecological Risk Assessment
Pro-UCL version 4.0 Output - Terrestrial Surface Soil

General UCL Statistics for Data Sets with Non-Detects

User Selected Options	
From File	I:\Honeywell.1163\39642.Wastebeds-1-8-R\WasteBeds1-8\BERA\BERA 2010\July 2010 Revision\Tables\Tables\Terrestrial SurfSoil ProUCL Input.wst
Full Precision	OFF
Confidence Coefficient	95%
Number of Bootstrap Operations	2000

1,2,4-Trichlorobenzene

General Statistics

Number of Valid Data	149	Number of Detected Data	1
Number of Distinct Detected Data	1	Number of Non-Detect Data	148
		Percent Non-Detects	99.33%

Warning: Only one distinct data value was detected! ProUCL (or any other software) should not be used on such a data set!
It is suggested to use alternative site specific values determined by the Project Team to estimate environmental parameters (e.g., EPC, BTV).

The data set for variable 1,2,4-Trichlorobenzene was not processed!

1,2,4-Trimethylbenzene

General Statistics

Number of Valid Data	2	Number of Detected Data	1
Number of Distinct Detected Data	1	Number of Non-Detect Data	1
		Percent Non-Detects	50.00%

Warning: This data set only has 2 observations!
Data set is too small to compute reliable and meaningful statistics and estimates!
The data set for variable 1,2,4-Trimethylbenzene was not processed!

It is suggested to collect at least 8 to 10 observations before using these statistical methods!
If possible, compute and collect Data Quality Objectives (DQO) based sample size and analytical results.

1,2-Dichlorobenzene

General Statistics

Number of Valid Data	146	Number of Detected Data	2
Number of Distinct Detected Data	2	Number of Non-Detect Data	144
		Percent Non-Detects	98.63%

Raw Statistics		Log-transformed Statistics	
Minimum Detected	0.067	Minimum Detected	-2.703
Maximum Detected	0.073	Maximum Detected	-2.617
Mean of Detected	0.07	Mean of Detected	-2.66
SD of Detected	0.00424	SD of Detected	0.0606
Minimum Non-Detect	0.0056	Minimum Non-Detect	-5.185
Maximum Non-Detect	7.4	Maximum Non-Detect	2.001

Note: Data have multiple DLs - Use of KM Method is recommended	Number treated as Non-Detect	146
For all methods (except KM, DL/2, and ROS Methods),	Number treated as Detected	0
Observations < Largest ND are treated as NDs	Single DL Non-Detect Percentage	100.00%

Warning: Data set has only 2 Distinct Detected Values.
This may not be adequate enough to compute meaningful and reliable test statistics and estimates.
The Project Team may decide to use alternative site specific values to estimate environmental parameters (e.g., EPC, BTV).

Unless Data Quality Objectives (DQOs) have been met, it is suggested to collect additional observations.

The number of detected data may not be adequate enough to perform GOF tests, bootstrap, and ROS methods.
Those methods will return a 'N/A' value on your output display!

It is necessary to have 4 or more Distinct Values for bootstrap methods.
However, results obtained using 4 to 9 distinct values may not be reliable.
It is recommended to have 10 to 15 or more observations for accurate and meaningful results and estimates.

UCL Statistics

Normal Distribution Test with Detected Values Only		Lognormal Distribution Test with Detected Values Only	
Shapiro Wilk Test Statistic	N/A	Shapiro Wilk Test Statistic	N/A
5% Shapiro Wilk Critical Value	N/A	5% Shapiro Wilk Critical Value	N/A
Data not Normal at 5% Significance Level		Data not Lognormal at 5% Significance Level	

Assuming Normal Distribution	Assuming Lognormal Distribution
DL/2 Substitution Method	DL/2 Substitution Method

1,3,5-Trimethylbenzene

General Statistics			
Number of Valid Data	2	Number of Detected Data	1
Number of Distinct Detected Data	1	Number of Non-Detect Data	1
		Percent Non-Detects	50.00%

Warning: This data set only has 2 observations!
Data set is too small to compute reliable and meaningful statistics and estimates!
The data set for variable 1,3,5-Trimethylbenzene was not processed!

It is suggested to collect at least 8 to 10 observations before using these statistical methods!
If possible, compute and collect Data Quality Objectives (DQO) based sample size and analytical results.

		Percent Non-Detects	92.11%

Raw Statistics		Log-transformed Statistics	
Minimum Detected	0.008	Minimum Detected	-4.828
Maximum Detected	0.39	Maximum Detected	-0.942
Mean of Detected	0.154	Mean of Detected	-2.84
SD of Detected	0.206	SD of Detected	1.945
Minimum Non-Detect	0.026	Minimum Non-Detect	-3.65
Maximum Non-Detect	12	Maximum Non-Detect	2.485

Note: Data have multiple DLs - Use of KM Method is recommended		Number treated as Non-Detect	38
For all methods (except KM, DL/2, and ROS Methods),		Number treated as Detected	0
Observations < Largest ND are treated as NDs		Single DL Non-Detect Percentage	100.00%

Warning: There are only 3 Distinct Detected Values in this data set
The number of detected data may not be adequate enough to perform GOF tests, bootstrap, and ROS methods.
Those methods will return a 'N/A' value on your output display!

It is necessary to have 4 or more Distinct Values for bootstrap methods.
However, results obtained using 4 to 9 distinct values may not be reliable.
It is recommended to have 10 to 15 or more observations for accurate and meaningful results and estimates.

alpha-BHC

General Statistics

Number of Valid Data	132	Number of Detected Data	1
Number of Distinct Detected Data	1	Number of Non-Detect Data	131
		Percent Non-Detects	99.24%

Warning: Only one distinct data value was detected! ProUCL (or any other software) should not be used on such a data set!
It is suggested to use alternative site specific values determined by the Project Team to estimate environmental parameters (e.g., EPC, BTV).

The data set for variable alpha-BHC was not processed!

For all methods (except KM, DL/2, and ROS Methods),		Number treated as Detected	0
Observations < Largest ND are treated as NDs		Single DL Non-Detect Percentage	100.00%

Warning: Data set has only 2 Distinct Detected Values.
This may not be adequate enough to compute meaningful and reliable test statistics and estimates.
The Project Team may decide to use alternative site specific values to estimate environmental parameters (e.g., EPC, BTV).

Unless Data Quality Objectives (DQOs) have been met, it is suggested to collect additional observations.

The number of detected data may not be adequate enough to perform GOF tests, bootstrap, and ROS methods.
Those methods will return a 'N/A' value on your output display!

It is necessary to have 4 or more Distinct Values for bootstrap methods.
However, results obtained using 4 to 9 distinct values may not be reliable.
It is recommended to have 10 to 15 or more observations for accurate and meaningful results and estimates.

General Statistics			
Number of Valid Data	148	Number of Detected Data	5
Number of Distinct Detected Data	5	Number of Non-Detect Data	143
		Percent Non-Detects	96.62%
Raw Statistics		Log-transformed Statistics	
Minimum Detected	0.51	Minimum Detected	-0.673
Maximum Detected	2.7	Maximum Detected	0.993
Mean of Detected	1.562	Mean of Detected	0.286
SD of Detected	0.907	SD of Detected	0.665
Minimum Non-Detect	0.0053	Minimum Non-Detect	-5.24
Maximum Non-Detect	11	Maximum Non-Detect	2.398
Note: Data have multiple DLs - Use of KM Method is recommended		Number treated as Non-Detect	148
For all methods (except KM, DL/2, and ROS Methods),		Number treated as Detected	0
Observations < Largest ND are treated as NDs		Single DL Non-Detect Percentage	100.00%

Warning: There are only 5 Detected Values in this data
Note: It should be noted that even though bootstrap may be performed on this data set
the resulting calculations may not be reliable enough to draw conclusions

It is recommended to have 10-15 or more distinct observations for accurate and meaningful results.

n-Butylbenzene

General Statistics			
Number of Valid Data	2	Number of Detected Data	1
Number of Distinct Detected Data	1	Number of Non-Detect Data	1
		Percent Non-Detects	50.00%

Warning: This data set only has 2 observations!
Data set is too small to compute reliable and meaningful statistics and estimates!
The data set for variable n-Butylbenzene was not processed!

It is suggested to collect at least 8 to 10 observations before using these statistical methods!
If possible, compute and collect Data Quality Objectives (DQO) based sample size and analytical results.

Nickel

Phenol

General Statistics			
Number of Valid Data	148	Number of Detected Data	4
Number of Distinct Detected Data	4	Number of Non-Detect Data	144
		Percent Non-Detects	97.30%
Raw Statistics		Log-transformed Statistics	
Minimum Detected	0.059	Minimum Detected	-2.83
Maximum Detected	0.12	Maximum Detected	-2.12
Mean of Detected	0.0843	Mean of Detected	-2.511
SD of Detected	0.0269	SD of Detected	0.311
Minimum Non-Detect	0.0053	Minimum Non-Detect	-5.24
Maximum Non-Detect	12	Maximum Non-Detect	2.485
Note: Data have multiple DLs - Use of KM Method is recommended		Number treated as Non-Detect	148
For all methods (except KM, DL/2, and ROS Methods),		Number treated as Detected	0
Observations < Largest ND are treated as NDs		Single DL Non-Detect Percentage	100.00%

Warning: There are only 4 Distinct Detected Values in this data
Note: It should be noted that even though bootstrap may be performed on this data set
the resulting calculations may not be reliable enough to draw conclusions

It is recommended to have 10-15 or more distinct observations for accurate and meaningful results.

1,2,4-Trichlorobenzene

General Statistics			
Number of Valid Data	202	Number of Detected Data	1
Number of Distinct Detected Data	1	Number of Non-Detect Data	201
		Percent Non-Detects	99.50%

Warning: Only one distinct data value was detected! ProUCL (or any other software) should not be used on such a data set!
It is suggested to use alternative site specific values determined by the Project Team to estimate environmental parameters (e.g., EPC, BTV).

The data set for variable 1,2,4-Trichlorobenzene was not processed!

1,2-Dichlorobenzene

General Statistics			
Number of Valid Data	203	Number of Detected Data	2
Number of Distinct Detected Data	2	Number of Non-Detect Data	201
		Percent Non-Detects	99.01%

Raw Statistics		Log-transformed Statistics	
Minimum Detected	0.067	Minimum Detected	-2.703
Maximum Detected	1.5	Maximum Detected	0.405
Mean of Detected	0.784	Mean of Detected	-1.149
SD of Detected	1.013	SD of Detected	2.198
Minimum Non-Detect	0.0056	Minimum Non-Detect	-5.185
Maximum Non-Detect	9.1	Maximum Non-Detect	2.208

Note: Data have multiple DLs - Use of KM Method is recommended		Number treated as Non-Detect	203
For all methods (except KM, DL/2, and ROS Methods),		Number treated as Detected	0
Observations < Largest ND are treated as NDs		Single DL Non-Detect Percentage	100.00%

Warning: Data set has only 2 Distinct Detected Values.
This may not be adequate enough to compute meaningful and reliable test statistics and estimates.
The Project Team may decide to use alternative site specific values to estimate environmental parameters (e.g., EPC, BTV).

Unless Data Quality Objectives (DQOs) have been met, it is suggested to collect additional observations.

The number of detected data may not be adequate enough to perform GOF tests, bootstrap, and ROS methods.
Those methods will return a 'N/A' value on your output display!

It is necessary to have 4 or more Distinct Values for bootstrap methods.
However, results obtained using 4 to 9 distinct values may not be reliable.
It is recommended to have 10 to 15 or more observations for accurate and meaningful results and estimates.

General Statistics			
Number of Valid Data	203	Number of Detected Data	2
Number of Distinct Detected Data	2	Number of Non-Detect Data	201
		Percent Non-Detects	99.01%
Raw Statistics		Log-transformed Statistics	
Minimum Detected	0.12	Minimum Detected	-2.12
Maximum Detected	1.4	Maximum Detected	0.336
Mean of Detected	0.76	Mean of Detected	-0.892
SD of Detected	0.905	SD of Detected	1.737
Minimum Non-Detect	0.0056	Minimum Non-Detect	-5.185
Maximum Non-Detect	9.1	Maximum Non-Detect	2.208
Note: Data have multiple DLs - Use of KM Method is recommended		Number treated as Non-Detect	203
For all methods (except KM, DL/2, and ROS Methods),		Number treated as Detected	0
Observations < Largest ND are treated as NDs		Single DL Non-Detect Percentage	100.00%

Warning: Data set has only 2 Distinct Detected Values.
This may not be adequate enough to compute meaningful and reliable test statistics and estimates.
The Project Team may decide to use alternative site specific values to estimate environmental parameters (e.g., EPC, BTV).

Unless Data Quality Objectives (DQOs) have been met, it is suggested to collect additional observations.

The number of detected data may not be adequate enough to perform GOF tests, bootstrap, and ROS methods.
Those methods will return a 'N/A' value on your output display!

It is necessary to have 4 or more Distinct Values for bootstrap methods.
However, results obtained using 4 to 9 distinct values may not be reliable.
It is recommended to have 10 to 15 or more observations for accurate and meaningful results and estimates.

Number of Bootstrap Operations	2000

Maximum Detected	0.16	Maximum Detected	-1.833
Mean of Detected	0.0576	Mean of Detected	-3.976
SD of Detected	0.0887	SD of Detected	1.858
Minimum Non-Detect	0.0034	Minimum Non-Detect	-5.684
Maximum Non-Detect	0.37	Maximum Non-Detect	-0.994

Note: Data have multiple DLs - Use of KM Method is recommended	Number treated as Non-Detect	148
For all methods (except KM, DL/2, and ROS Methods),	Number treated as Detected	0
Observations < Largest ND are treated as NDs	Single DL Non-Detect Percentage	100.00%

Warning: There are only 3 Distinct Detected Values in this data set
The number of detected data may not be adequate enough to perform GOF tests, bootstrap, and ROS methods.
Those methods will return a 'N/A' value on your output display!

It is necessary to have 4 or more Distinct Values for bootstrap methods.
However, results obtained using 4 to 9 distinct values may not be reliable.
It is recommended to have 10 to 15 or more observations for accurate and meaningful results and estimates.

General Statistics

Number of Valid Data	148	Number of Detected Data	2
Number of Distinct Detected Data	2	Number of Non-Detect Data	146
		Percent Non-Detects	98.65%

Raw Statistics		Log-transformed Statistics	
Minimum Detected	0.0018	Minimum Detected	-6.32
Maximum Detected	0.0033	Maximum Detected	-5.714
Mean of Detected	0.00255	Mean of Detected	-6.017
SD of Detected	0.00106	SD of Detected	0.429
Minimum Non-Detect	0.0017	Minimum Non-Detect	-6.377
Maximum Non-Detect	0.19	Maximum Non-Detect	-1.661

Note: Data have multiple DLs - Use of KM Method is recommended		Number treated as Non-Detect	148
For all methods (except KM, DL/2, and ROS Methods),		Number treated as Detected	0
Observations < Largest ND are treated as NDs		Single DL Non-Detect Percentage	100.00%

Warning: Data set has only 2 Distinct Detected Values.
This may not be adequate enough to compute meaningful and reliable test statistics and estimates.
The Project Team may decide to use alternative site specific values to estimate environmental parameters (e.g., EPC, BTV).

Unless Data Quality Objectives (DQOs) have been met, it is suggested to collect additional observations.

The number of detected data may not be adequate enough to perform GOF tests, bootstrap, and ROS methods.
Those methods will return a 'N/A' value on your output display!

It is necessary to have 4 or more Distinct Values for bootstrap methods.
However, results obtained using 4 to 9 distinct values may not be reliable.
It is recommended to have 10 to 15 or more observations for accurate and meaningful results and estimates.

Number of Distinct Detected Data	1	Number of Non-Detect Data	147
		Percent Non-Detects	99.32%

Warning: Only one distinct data value was detected! ProUCL (or any other software) should not be used on such a data set!
It is suggested to use alternative site specific values determined by the Project Team to estimate environmental parameters (e.g., EPC, BTV).

The data set for variable beta-BHC was not processed!

Constituents of Chlordane

General Statistics			
Number of Valid Data	1	Number of Detected Data	0
Number of Distinct Detected Data	0	Number of Non-Detect Data	1
		Percent Non-Detects	100.00%

Warning: This data set only has 1 observations!
Data set is too small to compute reliable and meaningful statistics and estimates!
The data set for variable Constituents of Chlordane was not processed!

It is suggested to collect at least 8 to 10 observations before using these statistical methods!
If possible, compute and collect Data Quality Objectives (DQO) based sample size and analytical results.

Number of Bootstrap Operations	2000

Warning: Data set has only 2 Distinct Detected Values.
This may not be adequate enough to compute meaningful and reliable test statistics and estimates.
The Project Team may decide to use alternative site specific values to estimate environmental parameters (e.g., EPC, BTV).

Unless Data Quality Objectives (DQOs) have been met, it is suggested to collect additional observations.

The number of detected data may not be adequate enough to perform GOF tests, bootstrap, and ROS methods.
Those methods will return a 'N/A' value on your output display!

It is necessary to have 4 or more Distinct Values for bootstrap methods.
However, results obtained using 4 to 9 distinct values may not be reliable.
It is recommended to have 10 to 15 or more observations for accurate and meaningful results and estimates.

Methoxychlor

General Statistics			
Number of Valid Data	148	Number of Detected Data	3
Number of Distinct Detected Data	3	Number of Non-Detect Data	145
		Percent Non-Detects	97.97%

Raw Statistics		Log-transformed Statistics	
Minimum Detected	0.0059	Minimum Detected	-5.133
Maximum Detected	0.076	Maximum Detected	-2.577
Mean of Detected	0.0302	Mean of Detected	-4.148
SD of Detected	0.0397	SD of Detected	1.375
Minimum Non-Detect	0.0086	Minimum Non-Detect	-4.756
Maximum Non-Detect	1.9	Maximum Non-Detect	0.642

Note: Data have multiple DLs - Use of KM Method is recommended		Number treated as Non-Detect	148
For all methods (except KM, DL/2, and ROS Methods),		Number treated as Detected	0
Observations < Largest ND are treated as NDs		Single DL Non-Detect Percentage	100.00%

Warning: There are only 3 Distinct Detected Values in this data set
The number of detected data may not be adequate enough to perform GOF tests, bootstrap, and ROS methods.
Those methods will return a 'N/A' value on your output display!

It is necessary to have 4 or more Distinct Values for bootstrap methods.

Methyl Mercury (Derived)

General Statistics

Number of Valid Data	206	Number of Detected Data	0
Number of Distinct Detected Data	0	Number of Non-Detect Data	206
		Percent Non-Detects	100.00%

Warning: All observations are Non-Detects (NDs), therefore all statistics and estimates should also be NDs!
Specifically, sample mean, UCLs, UPLs, and other statistics are also NDs lying below the largest detection limit!
The Project Team may decide to use alternative site specific values to estimate environmental parameters (e.g., EPC, BTV).

The data set for variable Methyl Mercury (Derived) was not processed!

1-Phenyl-1-(2,4-Dimethylphenyl)ethane

General Statistics

Number of Valid Observations	2	Number of Distinct Observations	2

Warning: This data set only has 2 observations!
Data set is too small to compute reliable and meaningful statistics and estimates!
The data set for variable 1-Phenyl-1-(2,4-Dimethylphenyl)ethane was not processed!

It is suggested to collect at least 8 to 10 observations before using these statistical methods!
If possible, compute and collect Data Quality Objectives (DQO) based sample size and analytical results.

2-Hexanone

General Statistics

Number of Valid Data	8	Number of Detected Data	1
Number of Distinct Detected Data	1	Number of Non-Detect Data	7
		Percent Non-Detects	87.50%

Warning: Only one distinct data value was detected! ProUCL (or any other software) should not be used on such a data set!
It is suggested to use alternative site specific values determined by the Project Team to estimate environmental parameters (e.g., EPC, BTV).

The data set for variable 2-Hexanone was not processed!

4-Methylphenol

General Statistics

Number of Valid Data	8	Number of Detected Data	1
Number of Distinct Detected Data	1	Number of Non-Detect Data	7
		Percent Non-Detects	87.50%

Warning: Only one distinct data value was detected! ProUCL (or any other software) should not be used on such a data set!
It is suggested to use alternative site specific values determined by the Project Team to estimate environmental parameters (e.g., EPC, BTV).

The data set for variable 4-Methylphenol was not processed!

4,4'-DDT

General Statistics

Number of Valid Data	8	Number of Detected Data	1
Number of Distinct Detected Data	1	Number of Non-Detect Data	7
		Percent Non-Detects	87.50%

Warning: Only one distinct data value was detected! ProUCL (or any other software) should not be used on such a data set!
It is suggested to use alternative site specific values determined by the Project Team to estimate environmental parameters (e.g., EPC, BTV).

The data set for variable 4,4'-DDT was not processed!

From File I:\Honeywell.1163\39642.Wastebeds-1-8-R\WasteBeds1-8\BERA\BERA 2010\July 2010 Revision\Tables\Tables\Habitat Sediment ProUCL Input.wst
Full Precision OFF
Confidence Coefficient 95%
Number of Bootstrap Operations 2000

Note: Data have multiple DLs - Use of KM Method is recommended
For all methods (except KM, DL/2, and ROS Methods),
Observations < Largest ND are treated as NDs

Number treated as Non-Detect	8
Number treated as Detected	0
Single DL Non-Detect Percentage	100.00%

Warning: There are only 3 Distinct Detected Values in this data set
The number of detected data may not be adequate enough to perform GOF tests, bootstrap, and ROS methods.
Those methods will return a 'N/A' value on your output display!

It is necessary to have 4 or more Distinct Values for bootstrap methods.
However, results obtained using 4 to 9 distinct values may not be reliable.
It is recommended to have 10 to 15 or more observations for accurate and meaningful results and estimates.

This may not be adequate enough to compute meaningful and reliable test statistics and estimates.
The Project Team may decide to use alternative site specific values to estimate environmental parameters (e.g., EPC, BTV).

Unless Data Quality Objectives (DQOs) have been met, it is suggested to collect additional observations.

The number of detected data may not be adequate enough to perform GOF tests, bootstrap, and ROS methods.
Those methods will return a 'N/A' value on your output display!

It is necessary to have 4 or more Distinct Values for bootstrap methods.
However, results obtained using 4 to 9 distinct values may not be reliable.
It is recommended to have 10 to 15 or more observations for accurate and meaningful results and estimates.

Methylcyclohexane

General Statistics			
Number of Valid Observations	2	Number of Distinct Observations	2

Warning: This data set only has 2 observations!
Data set is too small to compute reliable and meaningful statistics and estimates!
The data set for variable a was not processed!

It is suggested to collect at least 8 to 10 observations before using these statistical methods!
If possible, compute and collect Data Quality Objectives (DQO) based sample size and analytical results.

Methylene chloride

General Statistics			
Number of Valid Data	8	Number of Detected Data	2
Number of Distinct Detected Data	2	Number of Non-Detect Data	6
		Percent Non-Detects	75.00%

Raw Statistics		Log-transformed Statistics	
Minimum Detected	6.60E-04	Minimum Detected	-7.323
Maximum Detected	6.90E-04	Maximum Detected	-7.279
Mean of Detected	6.75E-04	Mean of Detected	-7.301
SD of Detected	2.12E-05	SD of Detected	0.0314
Minimum Non-Detect	0.0063	Minimum Non-Detect	-5.067
Maximum Non-Detect	0.011	Maximum Non-Detect	-4.51

Note: Data have multiple DLs - Use of KM Method is recommended		Number treated as Non-Detect	8
For all methods (except KM, DL/2, and ROS Methods),		Number treated as Detected	0
Observations < Largest ND are treated as NDs		Single DL Non-Detect Percentage	100.00%

Warning: Data set has only 2 Distinct Detected Values.
This may not be adequate enough to compute meaningful and reliable test statistics and estimates.
The Project Team may decide to use alternative site specific values to estimate environmental parameters (e.g., EPC, BTV).

Unless Data Quality Objectives (DQOs) have been met, it is suggested to collect additional observations.

The number of detected data may not be adequate enough to perform GOF tests, bootstrap, and ROS methods.
Those methods will return a 'N/A' value on your output display!

It is necessary to have 4 or more Distinct Values for bootstrap methods.
However, results obtained using 4 to 9 distinct values may not be reliable.
It is recommended to have 10 to 15 or more observations for accurate and meaningful results and estimates.

For all methods (except KM, DL/2, and ROS Methods),		Number treated as Detected	0
Observations < Largest ND are treated as NDs		Single DL Non-Detect Percentage	100.00%

Warning: There are only 4 Distinct Detected Values in this data
Note: It should be noted that even though bootstrap may be performed on this data set
the resulting calculations may not be reliable enough to draw conclusions

It is recommended to have 10-15 or more distinct observations for accurate and meaningful results.

Full Precision OFF
Confidence Coefficient 95%
Number of Bootstrap Operations 2000

Mean of Detected	0.0334	Mean of Detected	-3.565
SD of Detected	0.025	SD of Detected	0.833
Minimum Non-Detect	0.021	Minimum Non-Detect	-3.863
Maximum Non-Detect	0.062	Maximum Non-Detect	-2.781

Note: Data have multiple DLs - Use of KM Method is recommended		Number treated as Non-Detect	8
For all methods (except KM, DL/2, and ROS Methods),		Number treated as Detected	0
Observations < Largest ND are treated as NDs		Single DL Non-Detect Percentage	100.00%

Warning: Data set has only 2 Distinct Detected Values.
This may not be adequate enough to compute meaningful and reliable test statistics and estimates.
The Project Team may decide to use alternative site specific values to estimate environmental parameters (e.g., EPC, BTV).

Unless Data Quality Objectives (DQOs) have been met, it is suggested to collect additional observations.

The number of detected data may not be adequate enough to perform GOF tests, bootstrap, and ROS methods.
Those methods will return a 'N/A' value on your output display!

It is necessary to have 4 or more Distinct Values for bootstrap methods.
However, results obtained using 4 to 9 distinct values may not be reliable.
It is recommended to have 10 to 15 or more observations for accurate and meaningful results and estimates.

Anthracene

General Statistics			
Number of Valid Data	36	Number of Detected Data	2
Number of Distinct Detected Data	2	Number of Non-Detect Data	34
		Percent Non-Detects	94.44%

Raw Statistics		Log-transformed Statistics	
Minimum Detected	1.1	Minimum Detected	0.0953
Maximum Detected	1.7	Maximum Detected	0.531
Mean of Detected	1.4	Mean of Detected	0.313
SD of Detected	0.424	SD of Detected	0.308
Minimum Non-Detect	9.8	Minimum Non-Detect	2.282
Maximum Non-Detect	11	Maximum Non-Detect	2.398

Note: Data have multiple DLs - Use of KM Method is recommended	Number treated as Non-Detect	36
For all methods (except KM, DL/2, and ROS Methods),	Number treated as Detected	0
Observations < Largest ND are treated as NDs	Single DL Non-Detect Percentage	100.00%

Warning: Data set has only 2 Distinct Detected Values.
This may not be adequate enough to compute meaningful and reliable test statistics and estimates.
The Project Team may decide to use alternative site specific values to estimate environmental parameters (e.g., EPC, BTV).

Unless Data Quality Objectives (DQOs) have been met, it is suggested to collect additional observations.

The number of detected data may not be adequate enough to perform GOF tests, bootstrap, and ROS methods.
Those methods will return a 'N/A' value on your output display!

It is necessary to have 4 or more Distinct Values for bootstrap methods.
However, results obtained using 4 to 9 distinct values may not be reliable.
It is recommended to have 10 to 15 or more observations for accurate and meaningful results and estimates.

General UCL Statistics for Data Sets with Non-Detects

User Selected Options	
Full Precision	OFF
Confidence Coefficient	95%
Number of Bootstrap Operations	2000

Minimum Detected	0.00075	Minimum Detected	-7.195
Maximum Detected	0.0011	Maximum Detected	-6.812
Mean of Detected	0.000925	Mean of Detected	-7.004
SD of Detected	0.000247	SD of Detected	0.271
Minimum Non-Detect	0.0007	Minimum Non-Detect	-7.264
Maximum Non-Detect	0.05	Maximum Non-Detect	-2.996

Note: Data have multiple DLs - Use of KM Method is recommended		Number treated as Non-Detect	36
For all methods (except KM, DL/2, and ROS Methods),		Number treated as Detected	0
Observations < Largest ND are treated as NDs		Single DL Non-Detect Percentage	100.00%

Warning: Data set has only 2 Distinct Detected Values.
This may not be adequate enough to compute meaningful and reliable test statistics and estimates.
The Project Team may decide to use alternative site specific values to estimate environmental parameters (e.g., EPC, BTV).

Unless Data Quality Objectives (DQOs) have been met, it is suggested to collect additional observations.

The number of detected data may not be adequate enough to perform GOF tests, bootstrap, and ROS methods.
Those methods will return a 'N/A' value on your output display!

It is necessary to have 4 or more Distinct Values for bootstrap methods.
However, results obtained using 4 to 9 distinct values may not be reliable.
It is recommended to have 10 to 15 or more observations for accurate and meaningful results and estimates.

General UCL Statistics for Data Sets with Non-Detects

User Selected Options	
Full Precision	OFF
Confidence Coefficient	95%
Number of Bootstrap Operations	2000

Raw Statistics		Log-transformed Statistics	
Minimum Detected	3	Minimum Detected	1.099
Maximum Detected	5	Maximum Detected	1.609
Mean of Detected	4	Mean of Detected	1.354
SD of Detected	1.414	SD of Detected	0.361
Minimum Non-Detect	9.8	Minimum Non-Detect	2.282
Maximum Non-Detect	11	Maximum Non-Detect	2.398

Note: Data have multiple DLs - Use of KM Method is recommended	Number treated as Non-Detect	36
For all methods (except KM, DL/2, and ROS Methods),	Number treated as Detected	0
Observations < Largest ND are treated as NDs	Single DL Non-Detect Percentage	100.00%

Warning: Data set has only 2 Distinct Detected Values.
This may not be adequate enough to compute meaningful and reliable test statistics and estimates.
The Project Team may decide to use alternative site specific values to estimate environmental parameters (e.g., EPC, BTV).

Unless Data Quality Objectives (DQOs) have been met, it is suggested to collect additional observations.

The number of detected data may not be adequate enough to perform GOF tests, bootstrap, and ROS methods.
Those methods will return a 'N/A' value on your output display!

It is necessary to have 4 or more Distinct Values for bootstrap methods.
However, results obtained using 4 to 9 distinct values may not be reliable.
It is recommended to have 10 to 15 or more observations for accurate and meaningful results and estimates.

SD of Detected	624.2	SD of Detected	3.828
Minimum Non-Detect	1	Minimum Non-Detect	0
Maximum Non-Detect	5	Maximum Non-Detect	1.609

Note: Data have multiple DLs - Use of KM Method is recommended		Number treated as Non-Detect	4
For all methods (except KM, DL/2, and ROS Methods),		Number treated as Detected	2
Observations < Largest ND are treated as NDs		Single DL Non-Detect Percentage	66.67%

Warning: There are only 3 Distinct Detected Values in this data set
The number of detected data may not be adequate enough to perform GOF tests, bootstrap, and ROS methods.
Those methods will return a 'N/A' value on your output display!

It is necessary to have 4 or more Distinct Values for bootstrap methods.
However, results obtained using 4 to 9 distinct values may not be reliable.
It is recommended to have 10 to 15 or more observations for accurate and meaningful results and estimates.

Mean of Detected	0.171	Mean of Detected	-4.093
SD of Detected	0.29	SD of Detected	2.983
Minimum Non-Detect	0.005	Minimum Non-Detect	-5.298
Maximum Non-Detect	0.025	Maximum Non-Detect	-3.689

Note: Data have multiple DLs - Use of KM Method is recomm		Number treated as Non-Detect	14
For all methods (except KM, DL/2, and ROS Methods),		Number treated as Detected	1
Observations < Largest ND are treated as NDs		Single DL Non-Detect Percentage	93.33%

Warning: There are only 3 Distinct Detected Values in this data set
The number of detected data may not be adequate enough to perform GOF tests, bootstrap, and ROS methods.
Those methods will return a 'N/A' value on your output display!

It is necessary to have 4 or more Distinct Values for bootstrap methods.
However, results obtained using 4 to 9 distinct values may not be reliable.
It is recommended to have 10 to 15 or more observations for accurate and meaningful results and estimates.

General UCL Statistics for Data Sets with Non-Detects

User Selected Options	
Full Precision	OFF
Confidence Coefficient	95%
Number of Bootstrap Operatio	2000

Raw Statistics		Log-transformed Statistics	
Minimum Detected	1.9	Minimum Detected	0.642
Maximum Detected	4	Maximum Detected	1.386
Mean of Detected	2.95	Mean of Detected	1.014
SD of Detected	1.485	SD of Detected	0.526
Minimum Non-Detect	9.8	Minimum Non-Detect	2.282
Maximum Non-Detect	11	Maximum Non-Detect	2.398

Note: Data have multiple DLs - Use of KM Method is recomm	Number treated as Non-Detect	15
For all methods (except KM, DL/2, and ROS Methods),	Number treated as Detected	0
Observations < Largest ND are treated as NDs	Single DL Non-Detect Percentage	100.00%

Warning: Data set has only 2 Distinct Detected Values.
This may not be adequate enough to compute meaningful and reliable test statistics and estimates.
The Project Team may decide to use alternative site specific values to estimate environmental parameters (e.g., EPC, BTV

Unless Data Quality Objectives (DQOs) have been met, it is suggested to collect additional observations.

The number of detected data may not be adequate enough to perform GOF tests, bootstrap, and ROS methods.
Those methods will return a 'N/A' value on your output display!

It is necessary to have 4 or more Distinct Values for bootstrap methods.
However, results obtained using 4 to 9 distinct values may not be reliable.
It is recommended to have 10 to 15 or more observations for accurate and meaningful results and estimates.

For all methods (except KM, DL/2, and ROS Methods),		Number treated as Detected	0
Observations < Largest ND are treated as NDs		Single DL Non-Detect Percentage	100.00%

Warning: There are only 3 Distinct Detected Values in this data set
The number of detected data may not be adequate enough to perform GOF tests, bootstrap, and ROS methods.
Those methods will return a 'N/A' value on your output display!

It is necessary to have 4 or more Distinct Values for bootstrap methods.
However, results obtained using 4 to 9 distinct values may not be reliable.
It is recommended to have 10 to 15 or more observations for accurate and meaningful results and estimates.

Note: Data have multiple DLs - Use of KM Method is recommended		Number treated as Non-Detect	45
For all methods (except KM, DL/2, and ROS Methods),		Number treated as Detected	0
Observations < Largest ND are treated as NDs		Single DL Non-Detect Percentage	100.00%

Warning: There are only 3 Distinct Detected Values in this data set
The number of detected data may not be adequate enough to perform GOF tests, bootstrap, and ROS methods.
Those methods will return a 'N/A' value on your output display!

It is necessary to have 4 or more Distinct Values for bootstrap methods.
However, results obtained using 4 to 9 distinct values may not be reliable.
It is recommended to have 10 to 15 or more observations for accurate and meaningful results and estimates.

General UCL Statistics for Data Sets with Non-Detects

User Selected Options	
Full Precision	OFF
Confidence Coefficient	95%
Number of Bootstrap Operations	2000

The number of detected data may not be adequate enough to perform GOF tests, bootstrap, and ROS methods.
Those methods will return a 'N/A' value on your output display!

It is necessary to have 4 or more Distinct Values for bootstrap methods.
However, results obtained using 4 to 9 distinct values may not be reliable.
It is recommended to have 10 to 15 or more observations for accurate and meaningful results and estimates.

RE: Wastebeds 1-8 Site, Town of Geddes, Onondaga County, NY
Human Health Risk Assessment Interim Deliverable

Dear Ms. Edwards:

This letter is an interim Human Health Risk Assessment (HHRA) submittal for the Wastebeds 1-8 Site in Geddes, NY. This submittal was completed in accordance with the July 2, 2008 conference call between the New York State Department of Environmental Conservation (NYSDEC), Honeywell, and O'Brien & Gere. Three Appendices are attached to this submittal and include:

- **Appendix A**: Chromium Speciation and Hexavalent Chromium/Total Chromium ratio analyses
- **Appendix B**: Site Exposure Units
- **Appendix C**: Exposure Frequency – Soils, Seep Sediment, and Aquatic Sediment

In May 2008 O'Brien & Gere collected samples from areas throughout the Wastebeds 1-8 Site to evaluate the levels of hexavalent and total chromium in Site soil and seep sediment. The samples collected serve three primary purposes:

- Provide hexavalent chromium data relevant to the *USEPA Human Health Risk Assessment, Onondaga Lake, Wastebeds 1-8: Bike Trail, Geddes, NY* (2007) [Onondaga Canalways Trail HHRA].
- Provide speciated chromium data for use in the Wastebeds 1-8 HHRA.
- Provide a Cr^{+6} to total chromium (Cr^{+6}/Cr Total) ratio that could be applied to historically collected total chromium data to derive a statistically defensible Cr^{+6} concentration.

Appendix A provides the results of the May 2008 chromium sampling and reviews the results of analyzing the speciated chromium data set for use in the Onondaga Canalways Trail HHRA and Wastebeds 1-8 HHRA.

In addition, to facilitate progress in development of the Wastebeds 1-8 HHRA, an updated sample summary table and Site figures for each of the Site Exposure Units are provided for your review in **Appendix B**. The updates reflect sample location comments from NYSDEC's April 1, 2008 letter on

RAGS Tables 1 to 6. **Appendix C** provides the proposed method for adjusting the exposure frequency for Wastebeds 1-8 receptors exposed to surface soil, seep sediment, and aquatic sediment via the ingestion and dermal exposure routes.

Please contact me or Douglas Crawford of O'Brien & Gere with any questions.

Sincerely,

A. J. Labuz

Alfred J. Labuz
Remediation Manager

APPENDIX A

Chromium Speciation

In May 2008, O'Brien & Gere collected 41 surface soil samples, including five seep sediment locations, and 12 subsurface soil samples from the various exposure areas at the Wastebeds 1-8 Site to evaluate the levels of hexavalent and total chromium in Site soil and seep sediment (summarized in **Table 1**). The surface soil and subsurface soil sample locations are presented on **Figures 1 and 2**, respectively. The samples collected serve three primary purposes:

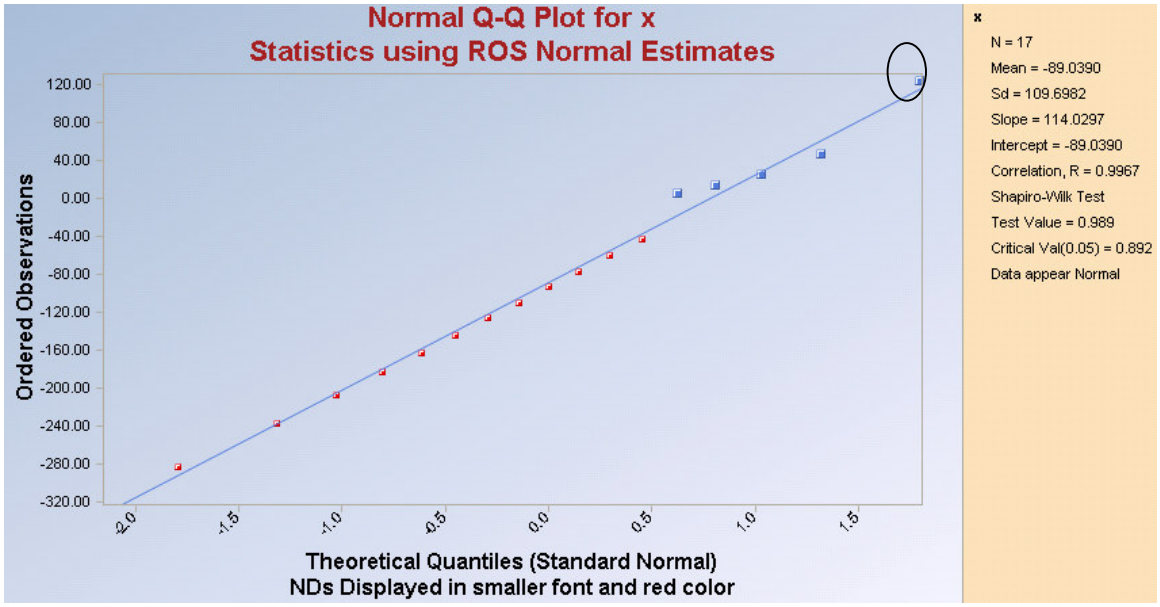
- Provide hexavalent chromium (Cr^{+6}) data relevant to the *USEPA Human Health Risk Assessment, Onondaga Lake, Wastebeds 1-8: Bike Trail, Geddes, NY* (2007) [Onondaga Canalways Trail HHRA].
- Provide speciated chromium data for use in the Wastebeds 1-8 HHRA.
- Provide a Cr^{+6} to total chromium (Cr^{+6}/Cr Total) ratio that could be applied to historically collected total chromium data to derive statistically valid Cr^{+6} concentrations.

The following sections provide summaries of the data as they relate to each of these items.

Onondaga Canalways Trail HHRA

Table 2 summarizes hexavalent chromium data collected in the proximity of the proposed Onondaga Canalways Trail. These sample locations are approximately co-located with sample locations utilized in the USEPA Onondaga Canalways Trail HHRA (2007), and are generally within approximately 100 ft of the proposed Onondaga Canalways Trail. The 95% upper confidence limit (UCL) on the mean hexavalent chromium concentration was estimated to be 30.2 mg/kg, using USEPA ProUCL® (V. 4) software (**Table 2**). ProUCL® was run using regression-on-order statistics (ROS) for replacement of non-detect samples and the recommended UCL was based on Kaplan-Meier estimates using the Student's t-distribution cutoff value (*i.e.*, KM(t) statistic). ProUCL® output is provided in **Attachment A**.

A quantile-quantile plot characterizing the distribution of the hexavalent chromium data set is shown below. Points in red are the non-detect values substituted using ROS methods in ProUCL®. The data is normally distributed with 95% confidence. Note that although the sample concentration at WB18-SS-40 (124 mg/kg; shown with circle in figure below) was considerably higher than other samples, it follows the same goodness-of-fit trajectory as the other sample points in the data set.



Wastebeds 1-8 HHRA

In addition to supporting the USEPA Onondaga Canalways Trail HHRA (2007), the May 2008 chromium data set will also be utilized in the Wastebeds 1-8 HHRA. The May 2008 chromium data set will provide speciated chromium samples to supplement the existing Wastebeds 1-8 HHRA data set. The observed ratio of hexavalent to total chromium (Cr^{+6}/Cr Total) in the May 2008 data set is being used to estimate hexavalent chromium concentrations in historical Site samples for which only total chromium concentrations were measured. In **Table 3**, the ratio of Cr^{+6}/Cr Total from the May 2008 data set has been estimated for the following data subsets:

- Exposure area
- Depth (surface and subsurface soil)
- Medium (soil and seep soil).

In cases where hexavalent chromium samples were non-detect, half the analytical reporting limit was used to calculate the Cr^{+6}/Cr Total ratio for that sample. The mean Cr^{+6}/Cr Total ratio for each data subset is summarized below.

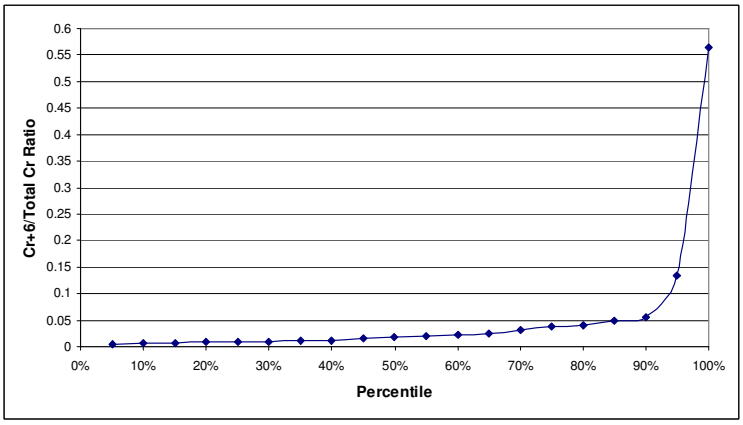
Exposure Area	Depth	Medium	Sample Number	Mean Ratio (Cr^{+6}/Cr Total)
Biosolids Area	Subsurface (2-10 ft)	Soil	1	0.05
Biosolids Area	Surface (0-2 ft)	Soil	5	0.07
Lakeshore Area	Subsurface (2-10 ft)	Soil	2	0.04
Lakeshore Area	Surface (0-2 ft)	Seep Sediment	1	0.01
Lakeshore Area	Surface (0-2 ft)	Soil	5	0.05
New York State Fair Parking Area	Subsurface (2-10 ft)	Soil	6	0.12
New York State Fair Parking Area	Surface (0-2 ft)	Soil	10	0.03
Site Ditches	Surface (0-2 ft)	Seep Sediment	3	0.01
Upland Old Field Successional Area	Subsurface (2-10 ft)	Soil	3	0.02
Upland Old Field Successional Area	Surface (0-2 ft)	Seep Sediment	1	0.01
Upland Old Field Successional Area	Surface (0-2 ft)	Soil	16	0.01

- Average surface soil Cr^{+6}/Cr Total ratios vary from 0.01 to 0.07 (1-7%).
- Average subsurface soil Cr^{+6}/Cr Total ratios vary from 0.02 to 0.12 (2-12%).
- Average seep sediment Cr^{+6}/Cr Total ratios are uniformly low (0.01).

It should be noted that the sample number in the above data subsets varies from 1 to 16. In order to increase the sample size to facilitate statistical analysis, the Site-wide data set was examined. In addition, because seep sediment data represents soils wetted by seep water and not true aquatic sediment, these were also evaluated together with soil data.

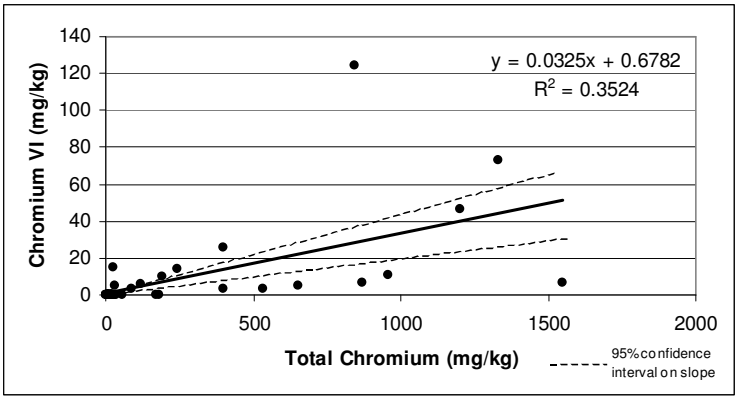
Exposure Area	Depth	Medium	Sample Number	Mean Ratio (Cr^{+6} / Total Cr)
Site-Wide	Surface (0-2 ft)	Soil	36	0.03
Site-Wide	Subsurface (2-10 ft)	Soil	12	0.07
Site-Wide	Surface (0-2 ft)	Seep Sediment	5	0.01
Site-Wide	Surface (0-2 ft)	Soil and Seep Sediment	41	0.03
Site-Wide	Surface (0-2 ft) and Subsurface (2-10 ft)	Soil and Seep Sediment	53	0.04

The Site-wide average Cr^{+6}/Cr Total ratio for all exposure areas, depths, and media is 0.04 (4%). The cumulative frequency distribution of the Site-wide ratios are shown below, with approximately 90% of the ratios less than 0.05 (5%).



Statistical Analysis

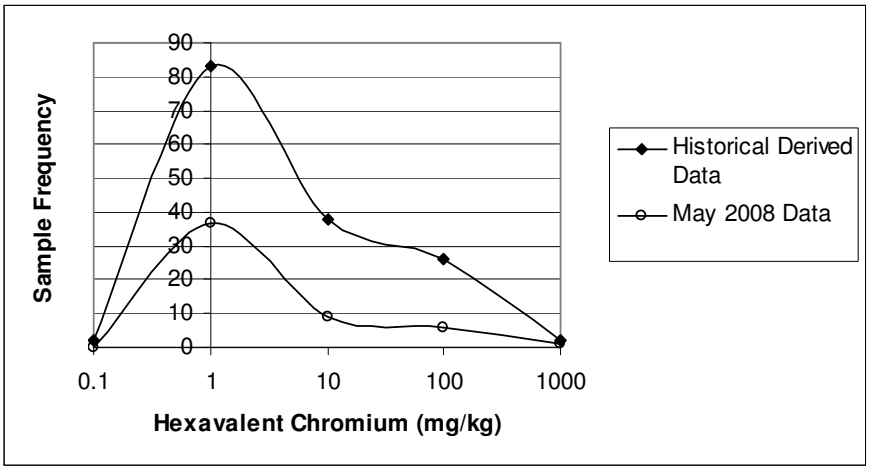
In order to evaluate the Site Cr^{+6}/Cr Total ratio statistically, Site-wide hexavalent chromium concentrations were regressed against co-located total chromium concentrations. The slope of the regression corresponds to the Cr^{+6}/Cr Total ratio. The confidence interval around the slope can be used to bound the true value of the ratio. **Attachment A** provides the results of the regression analysis that is also plotted below.



The mean slope is 0.03 (3%) and the 95% confidence interval of the slope is 0.02 to 0.04 (2-4%). In other words, the true mean Site-wide Cr^{+6}/Cr Total ratio is bounded between 2% and 4%, with 95% confidence.

Deriving historical hexavalent chromium concentrations

Table 4 presents the results of using the upper bound Site-wide Cr^{+6}/Cr Total ratio (4%) to derive historical hexavalent chromium concentrations from historical total chromium concentrations. The derived hexavalent chromium concentrations range from 0.06 to 560 mg/kg with a mean of 11 mg/kg. For comparison, the hexavalent chromium concentrations in the May 2008 data set range from non-detect (<0.4 mg/kg) to 124 mg/kg with a mean of 7 mg/kg. Histograms of the May 2008 hexavalent chromium data and the derived historical hexavalent chromium data are compared in the figure below.



Note that although there are more samples in the historical derived data set than in the May 2008 data set, the distribution of samples is similar with the bulk of the hexavalent chromium concentrations less than 10 mg/kg. The similarity in the shape of the distributions suggests that the Cr^{+6}/Cr Total ratio of 4% used to derive historical hexavalent chromium concentrations is reasonable and results in concentrations consistent with those observed in the May 2008 data set.

Summary

- With regard to the Cr^{+6} data collected in the proximity of the proposed Onondaga Canalways Trail, the 95% UCL on the mean hexavalent chromium concentration was estimated to be 30.2 mg/kg.
- With regard to Site-wide speciated chromium data collected in May 2008, the 95% confidence interval of the true mean Cr^{+6}/Cr Total ratio is 0.02 to 0.04 (2-4%).
- Use of the Site-wide upper bound Cr^{+6}/Cr Total ratio (4%) to estimate historical hexavalent chromium concentrations from historical total chromium concentrations yields historical hexavalent chromium concentrations that are consistent with those measured in May 2008.

Notes:
UCL based on USEPA ProUCL (V. 4.0) recommendation. It is possible that in certain instances, the calculated 95% UCL is smaller than the mean detected concentration. This reflects a low detection frequency and non-detect samples largely outnumbering detected samples, causing the 95% UCL recommended by ProUCL v4.0 to be smaller than the mean detected concentration, since it reflects the large number of non-detect samples.
* = When compound is not detected, one-half of the detection limit is utilized.
NA = UCL could not be calculated because ProUCL does not provide 95% UCLs when there is insufficient data, as defined by fewer than 3 samples or fewer than 2 unique detected samples. In these cases, the average ratio
** = Rationales are defined as follows:
Chebyshev (Mean, Sd) UCL = (1-α)100% UCL of the mean based upon the chebyshev theorem (using the sample mean and sample standard deviation - non-parametric).
Chebyshev (MVUE) UCL = (1-α)100% UCL of the mean based upon the chebyshev theorem (using the minimum variance unbiased estimate - non-parametric).
Adjusted Gamma UCL = Computation of UCL of the mean of a Gamma, G(k,θ) distribution (parametric).
Student's-t UCL = Computation method based upon student's t-distribution (parametric).

APPENDIX C

Exposure Frequency

Issue

Honeywell seeks agency concurrence on the proposed method for adjusting the exposure frequency for Wastebeds1-8 receptors exposed to surface soil, seep sediment, and aquatic sediment via the ingestion and dermal exposure routes.

Background

Honeywell's February 25, 2008 RAGS 1-6 submittal for the Wastebeds 1-8 Site proposed the adjustment of two parameters to account for the fact that certain receptors are simultaneously exposed to surface soils, seep sediments, and, in some cases, aquatic sediments (Ditch and Ponded Area). Honeywell believes that this exposure scenario overestimates the risk obtained through the incidental ingestion and dermal exposure routes. Honeywell proposed to adjust the fraction ingested parameter (FI) for the ingestion exposure route and to add an area correction factor for the dermal exposure route to account for this issue. In response, the NYSDEC and USEPA suggested that Honeywell modify the exposure frequency of the receptors that are exposed to these media. NYSDEC's April 1, 2008 comment on this issue and Honeywell's response are provided below.

Specific Comment 12 (from NYSDEC's April 1, 2008 letter)

Page A-10, fraction ingested: Apportioning soil and sediment ingestion using the fraction ingested adjustment is not typically performed at Superfund sites. However, the rationale for doing so seems logical provided that exposure to sediment occurs in the same way as exposure to soil (e.g., it is as readily available for contact as soil and would be encountered with the same frequency). Another way to consider exposure to sediments without adjusting the fraction ingested factor would be to modify the exposure frequency with which a receptor has contact with this medium. If this were done, the fraction ingested for both soil and sediment would be 1, but the exposure frequency for sediment could be reduced to the number of days seep sediment is available for contact. More information on the presence of seep sediment (e.g., do the seeps flow year-round or only during wet weather events?) would help inform the decision of which approach would be more appropriate. Please explore further. If the later approach of adjusting the exposure frequency is used, the same concept could be applied to the Area Correction Factor for dermal exposure.

Honeywell's Response (May 9, 2008 revised response based on the conference call between NYSDEC, EarthTech, USEPA, and O'Brien & Gere on May 9, 2008)

The exposure frequency for soil will not be adjusted for any receptor and it will be assumed that receptors coming in contact with soils will do so 100% of the time they are on the Site. For seep sediment, however, the EF will be adjusted to reflect the aerial extent of the seep sediment in a given exposure unit. For instance, if seep sediment accounts for 10% of the surface area within an Exposure Unit a hypothetical overall exposure

frequency of 100 days would be adjusted to 10 days to reflect the lower potential to come in contact with seep sediment instead of soil in a given Exposure Unit.

Proposal

Honeywell proposes to adjust the exposure frequency to seep and aquatic sediment to reflect the aerial extent of the media. Table 1 presents the percentage of each media type (seep, aquatic sediment, and soil) for each Exposure Unit where receptors are exposed to two or three of these media types. Table 2 uses these percentages to adjust the previously approved exposure frequencies. Note the soil exposure frequency was not adjusted, and aquatic sediment exposure frequency was rounded up to one. Honeywell proposes to apply these new RME exposure frequencies to the receptor populations listed on Table 2 for the dermal and ingestion exposure routes for soil, seep sediment, and aquatic sediment. The exposure frequencies for the Central Tendency scenario will be adjusted in a similar manner. Honeywell seeks agency concurrence with this issue prior to the production of the RAGS Table 1-10 series for this Site.

APPENDIX C, TABLE 1
CALCULATION OF EXPOSURE FREQUENCY FOR RECEPTORS EXPOSED TO
SOIL, SEEP SEDIMENT AND/OR AQUATIC SEDIMENT
Honeywell Wastebeds 1 through 8 Site, Geddes, New York

Exposure Unit	Exposure Areas	Area of EA (acres)	Area of Media Type within EA (acres)		
			Seep	Aquatic Sediment	Soil
1	NY State Fair Parking Area[1]	80.68	---	---	80.68
	Upland Old Field Successional Area[2]	174.82	8.74	---	166.10
	Biosolids Area[1]	19.45	---	---	19.45
	Ponded Area[3]	0.14	---	0.14	---
	Ditch A - South[3]	0.13	---	0.13	---
	Total	275.22	8.74	0.27	266.23
	Percent of Total	---	3%	0.1%	97%
2	NY State Fair Parking Area[1]	80.68	---	---	80.68
	Upland Old Field Successional Area[2]	174.82	8.70	---	166.1
	Biosolids Area[1]	19.45	---	---	19.45
	Total	274.95	8.70	0.0	266.23
	Percent of Total	---	3%	0%	97%
3	NY State Fair Parking Area[1]	80.68	---	---	80.68
	Upland Old Field Successional Area[2]	174.82	8.74	---	166.10
	Biosolids Area[1]	19.45	---	---	19.45
	Lakeshore Area[4]	36.05	9.0	---	27.0
	Total	311.00	17.8	0.0	293.3
	Percent of Total	---	6%	0%	94%
6	Lakeshore Area[4]	36.05	9.0	---	27.0
	Ditch A - South[3]	0.13	---	0.13	---
	Total	36.18	9.01	0.13	27.04
	Percent of Total	---	25%	0.4%	75%

Notes:
(1) exposure area is comprised of 100% soil
(2) Upland Old Field Successional Area estimated as 5% seep sediment and 95% soil
(3) Ponded Area and Ditch A are considered 100% aquatic sediment
(4) Lakeshore Area estimated as 25% seep sediment and 75 % soil.
--- media type not found in indicated expoure area

APPENDIX C, TABLE 2
CALCULATION OF EXPOSURE FREQUENCY FOR RECEPTORS EXPOSED TO
SOIL, SEEP SEDIMENT AND/OR AQUATIC SEDIMENT
Honeywell Wastebeds 1 through 8 Site, Geddes, New York

Exposure Unit	Receptor Population	RME Total Exposure Frequency (days)	Proposed RME Exposure Frequency		
			Seep Sediment[1]	Aquatic Sediment[2]	Soil[3]
EU1	Transient Trespasser	94	3	1	94
EU2	Lunchtime trespasser	95	3	---	95
	Utility/sewer worker	20	1	---	20
EU3	Trespasser/ATV recreator (12-18 yrs)	94	5	---	94
	Trespasser/ATV recreator (18-30 yrs)	42	2	---	42
	Construction worker	125	7	---	125
EU 6	Trespasser/Fisherperson	42	10	1	42

Notes:
(1) Proposed exposure frequency for seep sediment was determined by multiplying the total exposure frequency by the percentage (aerial extent) of the Exposure Unit that is comprised of this media type.
(2) Aquatic sediment exposure frequency was rounded up to 1 day.
(3) Proposed exposure frequency for soil is set at 100% of the original exposure frequency

Re: Wastebeds 1 through 8 Site, Geddes, New York, NYSDEC Comments on the HHRA Risk Assessment Interim Deliverable, dated July 31, 2008

Dear Mr. McAuliffe:

The New York State Department of Environmental Conservation has reviewed the Wastebeds 1-8 document named above and have comments as detailed below.

Chromium Speciation Analysis

1. In order to be consistent with the HHRA for the Wastebeds 1-8, the historically collected chromium data (adjusted using the hexavalent chromium (Cr+6) to total chromium (Cr) ratios) should also be considered in developing the chromium EPCs for the Bike Trail HHRA. Once final ratios are agreed upon, EPA will revise the HHRA for the Bike Trail appropriately.

2. A review of the speciated chromium data by statisticians in EPA's Technical Support Center, which is housed in the Office of Research and Development, National Exposure Research Laboratory, confirmed (using the Wilcoxon Mann Whitney test) that Cr^{+6} and Cr concentrations from the Biosolids Area are statistically higher than those from the rest of the site and therefore should not be used in developing the site-wide Cr^{+6}/Cr ratio. A calculation of the 95% confidence interval on the slope of the regression line when the Biosolids data are removed from the dataset yields an upper bound value of 0.0097 (1%) for the Cr^{+6}/Cr ratio. The upper bound estimate for data from the Biosolids Area only yields a value of 0.1124 (11%) for the Cr^{+6}/Cr ratio. It is recommended that these ratios be applied to the historically collected data.

3. There are a number of issues that impact the calculation of the site-wide ratio of Cr^{+6}/Cr that should be discussed in the uncertainty section of the Wastebeds 1-8 HHRA. These include the anomalous subsurface result from the State Fair Parking Lot (WB18-SB-134)

the anomalous subsurface result from the State Fair Parking Lot (WB18-SB-134) that has a Cr^{+6}/Cr ratio of 0.57 and the high number of non-detects in the site-wide data (70%).

4. The narrative text should have made it clear that the values in the tables include substitution of 1/2 the RL (i.e., 0.2 mg/kg) for the ND Cr+6 results. (However, the 95% UCL calculations do not necessarily do so).

5. The ProUCL output, from which the 95% UCL of 30.2 mg/kg (Cr+6) is derived by the KM(t), also provides a second recommendation of 39.49 mg/kg by KM(bootstrap) (Table A1). Please explain why the 39.49 mg/kg value is not used.

Appendix B

6. In Appendix B, it appears that there are a number of soil samples at depths much greater than those to which any receptor would be exposed are marked "yes" for "included in HHRA." This should be explained or corrected.

Appendix C – Surface Soil, Seep Sediment, and Aquatic Sediment Exposure Frequencies

7. The proposed methodology for adjusting the exposure frequency to seep and aquatic sediment based on aerial extent of the media is acceptable.

Overall, the approach taken and results are reasonable. Please incorporate information contained in the above comments when submitting HHRA Tables and narratives. If you have any questions, please call me at 518-402-9676.

Sincerely,

Susan Edwards
