During the month of July 1997, the U.S. EPA Region II Superfund Technical Assessment and Response Team (START) contractor collected soil and concrete chip samples from various locations throughout the site. Prior to sample collection, START established a surveying grid and staked out the 76 sample locations. The sampling grid and corresponding sample locations are shown on the attached map. After sampling results were received, seven locations were identified as being contaminated with greater than one percent asbestos.

The U.S. EPA Region II On-Scene Coordinator, Emergency Response Cleanup Services (ERCS) contractor, and START returned to the site in September 1997. The seven locations previously identified with asbestos contamination were excavated and contaminated soil was transported off site and disposed of in an approved landfill. The seven locations were then resampled and confirmation sampling did not identify asbestos at any location. The site was demobilized on September 18, 1997.
