ENGINEER'S CONSTRUCTION CERTIFICATION STATEMENT

OWNER: Emerson Power Transmission
(Formerly Morse Industrial Corp.)
Tompkins, New York

NYSDEC SITE NO. 7-55-010

ENGINEER: Radian Engineering of New York

PROJECT: Remedial Design, Petroleum-Containing Soil

I hereby certify, as a Professional Engineer registered in the State of New York that, based on our continuous observations of the subject contract, the work of this contract has been completed in general conformance with the approved design documents, work plans, and the Record of Decision, per the following chronology:

Cleanup of the soil began during a first phase (Phase I) of excavation (October 1995 through January 1996). The excavation of soil was completed in accordance with the remedial design for the total petroleum hydrocarbon (TPH)-contaminated soil, detailed in the document entitled "Remedial Design, Petroleum-Containing Soil," Radian Engineering, Inc., May 1995. For the TPH-containing soil, excavation and removal of soils to levels below 1000 parts-per-million (ppm) TPH was chosen as the selected remedy (as recorded in the Record of Decision, December 1994, for Morse Industrial Corporation, Ithaca, Tompkins County, New York, Site No. 7-55-010 and documented in a NYSDEC letter, dated 22 August 1994).

Confirmatory sampling indicated that soil with TPH concentrations above the NYSDEC clean-up objective remained along a majority of the margins of the first phase of excavation. In accordance with Section 4.2 of the May 1995 Remedial Design, a second phase (Phase II) of remedial activities was implemented from 25 October through 6 December 1996. Prior to commencing with Phase II, details of the anticipated activities were communicated to Mr. Amar Nagi, Bureau of Construction Services, Division of Hazardous Waste Remediation, NYSDEC, in a letter transmittal dated 16 October 1996. Phase II field activities were completed during 1996, and included well abandonments, demolition and disposal of the historic scrap chute/scrap dock, temporary rerouting and permanent replacement of the sanitary sewer line, and excavation and disposal of all soil above the NYSDEC clean-up objective.

Details/records of Phase I and Phase II activities are provided in the documents entitled, "Remedial Activities Report, Remedial Design Petroleum-Containing Soil, October 1995 - January 1996," Radian International LLC, April 1996 (Phase I) and "Remedial Activities Report -- Phase II Remedial Design Petroleum-Containing Soil, October 1996 - December 1996," Radian International LLC, April 1997 (Phase II).

INTRODUCTION

This report details activities conducted during the soil excavation of non-hazardous, petroleum-containing soil from the historic scrap conveyor/loading area at Emerson Power Transmission (EPT), Ithaca, New York (Morse Industrial Corporation, Site No. 7-55-010). These activities were conducted under an Order on Consent, Index #A7-0125-97-09, that EPT entered into with the New York Department of Environmental Conservation (NYSDEC) in 1988.

Cleanup of the soil began during a first phase (Phase I) of excavation completed during the period October 1995 through January 1996. The excavation of soil was completed in accordance with the remedial design for the total petroleum hydrocarbon (TPH)-contaminated soil, detailed in the document entitled "Remedial Design, Petroleum-Containing Soil," Radian Engineering, Inc., May 1995. For the TPH-containing soil, excavation and removal of soils to levels below 1000 parts-per-million (ppm) TPH was chosen as the selected remedy. This selection is recorded in the Record of Decision, December 1994, for Morse Industrial Corporation, Ithaca, Thompson County, New York, Site No. 7-55-010 and documented in a NYSDEC letter, dated 22 August 1994.

During Phase I, approximately 1500 cubic yards of petroleum-containing soil was excavated and disposed. This phase of work included removal of soil from all the areas originally specified in the Remedial Design (Areas A, B, and C), plus the removal of additional soil to the west (designated as Area D) and north of those originally specified areas (northern expansions of Areas A, B and C) in an attempt to reach the clean-up goal of 1000 ppm TPH. In January 1996, the Phase I excavation was completed. Confirmatory sampling indicated that soil with TPH concentrations above the NYSDEC clean-up objective of 1000 ppm TPH remained along a majority of the margins of the first phase of excavation. A summary of these Phase I soil removal activities, and other associated remedial activities (i.e., tank closures, sump and concrete removal, and sewer line replacement), and the environmental condition of the soil at the excavation margins were submitted to the NYSDEC in the document entitled "Remedial Activities Report, Remedial

Design Petroleum-Containing Soil, October 1995--January 1996," Radian International LLC (Radian), April 1996. This document is enclosed as Appendix A.

In accordance with Section 4.2 of the May 1995 Remedial Design, a second phase (Phase II) of remedial activities was implemented from 25 October through 6 December 1996. The objective of the Phase II excavation was to remove soils that confirmatory sampling during the Phase I excavation indicated that the 1000 ppm TPH clean-up goal was exceeded. Prior to commencing with Phase II, details of the anticipated activities were communicated with Mr. Amar Nagi, Bureau of Construction Services, Division of Hazardous Waste Remediation, NYSDEC, in a letter transmittal dated 16 October 1996. This letter is attached in Appendix A. Proposed activities included well abandonments, demolition and disposal of the historic scrap chute/scrap dock, temporary rerouting and permanent replacement of the sanitary sewer line, and soil excavation and disposal. It should be noted that the proposed construction schedule was accelerated and that all field construction activities were completed in 1996.

This document provides further detail of the completion of the Phase II activities and describes the environmental condition of the soils at the final excavation margins as determined by confirmatory sampling and laboratory analysis. In addition to this introductory section, Section 2.0 summarizes the remedial activities conducted in the historic scrap conveyor/loading area. Section 3.0 provides an overview of Phase II site preparation activities. Section 4.0 describes the Phase II soil excavation activities which were conducted between 25 October 1996 and 6 December 1996. Section 5.0 presents soil disposal activities and Section 6.0 contains site restoration information. Results for the confirmatory soil samples, collected along the final excavation margins, are discussed in Section 7.0. The conclusions made following the Phase I and II remedial activities are presented in Section 8.0.

2.0

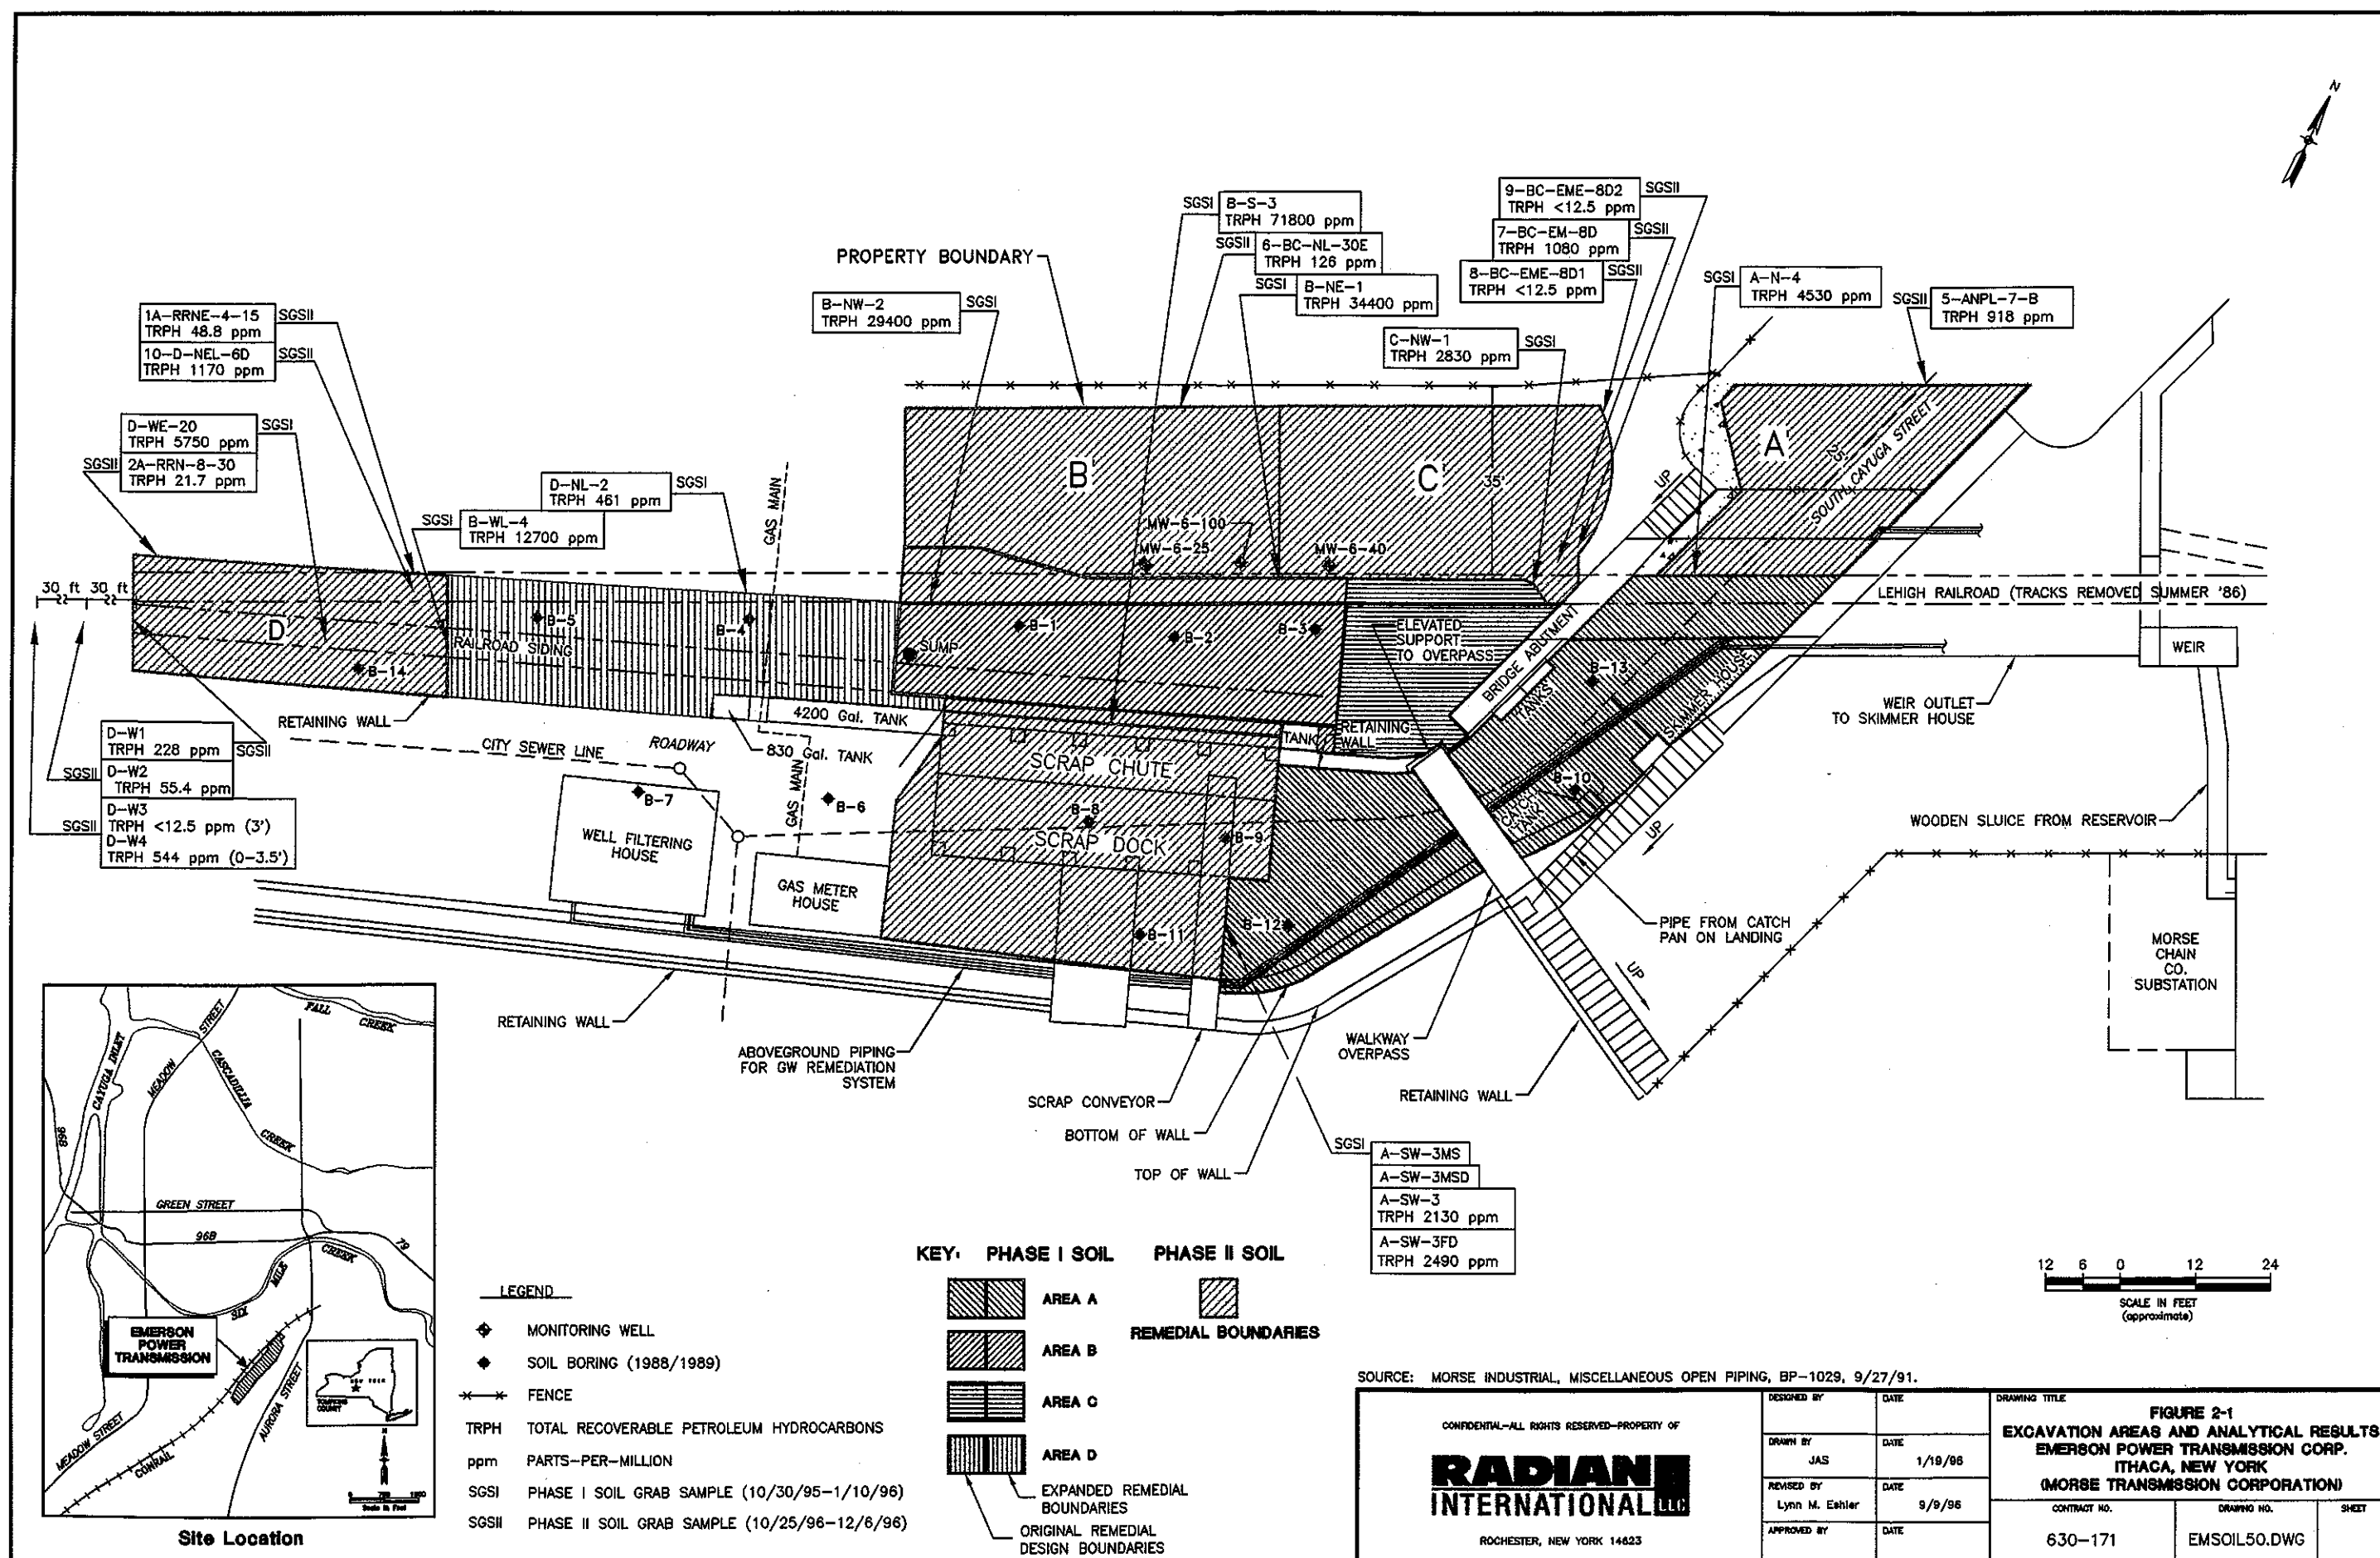

PHASE II REMEDIAL ACTIVITIES SUMMARY

Figure 2-1 shows where soil was removed from the historic scrap conveyor/loading area during both the Phase I and Phase II excavation activities. In all cases, soil was removed to bedrock, the depth of which varied from approximately 1.5 to 11 feet below grade. A total of approximately 3170 cubic yards of soil was removed -- approximately 1500 cubic yards during Phase I and 1670 cubic yards during Phase II. The four areas of the site where soil was removed during Phase II are described as follows (see Appendix A for details regarding Phase I):

- Area A' -- Soil was removed north of Phase I Area A to the northern side of the facility's South Cayuga Street overpass and an additional distance of approximately 25 feet into South Cayuga Street (this portion of South Cayuga Street is located on EPT property).
- Area B' and C' -- Soil north of Phase I Areas B and C was removed to the property margin which is located approximately 34 feet to the north-northwest of and parallel to the historic Lehigh Railroad tracks.
- Area D' -- Soil to the west of Phase I Area D was removed down the railroad siding from an area approximately 20 feet wide and a distance of approximately 120 feet from the Phase I Area D western margin.
- Scrap Chute/Scrap Dock Area-- Soil was removed from underneath and south of the scrap chute.

Other activities completed during Phase II included the demolition and removal of the historic scrap chute/scrap dock in order to gain better access to the petroleum-containing soils underlying and around this structure, and the temporary re-routing and replacement of the sanitary sewer line located in Areas A' and the Scrap Chute/Scrap Dock Area.

Section 3.0 provides an overview of Phase II site preparation activities and Section 4.0 the Phase II soil excavation activities, which were conducted between 25 October 1996 and 06 December 1996.

3.0 SITE PREPARATION ACTIVITIES

Tasks completed in order to prepare the site for soil excavation activities included: abandoning a cluster of monitoring wells, surveying the EPT property margins, protecting piping in the vicinity of the scrap chute/scrap dock, demolition of the scrap chute/scrap dock, clearing and grubbing areas to be excavated, and temporarily re-routing the sanitary sewer.

3.1 Monitoring Well Abandonment

A cluster of three groundwater monitoring wells, located in Area B' and C', was abandoned. These wells, MW-6-25, MW-6-40, and MW-6-100, were open rock boreholes with steel casings seated 1 foot into the top-of-bedrock to seal off the overburden. Bedrock in this area is located approximately 9 to 11 feet below grade. The wells were 25, 40, and 100 feet deep as indicated in their well identifications.

The open rock intervals of these wells were tremie grouted with a cement bentonite grout by Nothnagle Drilling, Inc. of Rochester, New York on 21 October 1996. The steel casings were left in place for later removal at the time soil was excavated from this area.

3.2 Property Survey

The EPT property lines along the northern margins of the proposed Phase II excavation areas were surveyed and marked on 29 October 1996 by T. G. Miller Associates of Ithaca, New York.

3.3 Piping Protection

On 25 October 1996, work began to install barrier protection along the retaining wall, above the piping for an operating 2-PHASE™ Extraction system. This piping is used to transport water and vapor collected from extraction wells (which have been installed to address a

TCE release which is also being addressed under the Order on Consent, Index #A7-0125-97-09) to the treatment building. Figure 2-1 shows the location of the 2-PHASE piping ("Aboveground Piping for GW Remediation System"). The barrier was installed by Sessler Wrecking of Waterloo, New York to protect this piping during the demolition of the scrap chute/scrap dock.

Additionally, EPT process piping which is routed along the upper portion of the retaining wall, just beneath a scrap conveyor and a small walk bridge that both extended from the scrap chute/scrap dock to the alley at the top of the retaining wall, was protected. This process piping protection was approved by the Ithaca Fire Department, and the Ithaca Building Department. Upon completion of the piping protection, Permit # 17007 was issued 28 October 1996 for demolition of the scrap chute/scrap dock, in compliance with Chapter 146 of the Ithaca Municipal Building Code. This permit is included in Appendix A.

3.4 Scrap Chute/ Scrap Dock Demolition

Demolition of the historic scrap chute/scrap dock was performed so that excavation of non-hazardous petroleum-containing soil underlying this structure could occur safely and in a more thorough manner. The scrap chute/scrap dock was demolished by Sessler Wrecking of Waterloo, New York on 29 October 1996. The structure was demolished utilizing two Komatsu 300 excavators. One excavator was mounted with a LaBounty shear, and the other was mounted with a hydraulic ram. The scrap chute/scrap dock was safely on the ground in less than one day.

The concrete and reinforcement bar was then separated as the concrete was broken into small manageable pieces. The reinforcement bar was recycled by Wallace Industries Inc. of Ithaca, New York, and the concrete was used as fill material at the property of Ms. Gloria Huff, 47 Sage Road (tax map 3-2-10.1) in the town of Enfield, New York. The Sheldon Group of Ithaca, New York, is managing the filling activities at the property, and the site has a NYSDEC permit for the use of clean fill.

3.5 Clearing and Grubbing

Marcor Environmental Remediation, Inc. (Marcor) cleared the site of brush, undergrowth, and small trees on 5 November 1996, to allow access by excavation equipment to Areas B' and C', and Area D'. These materials were piled on EPT property for eventual decay. Root systems were not removed at this time, but were removed during soil excavation activities.

The railroad ties from Area D' were also cleared by Marcor prior to soil excavation activities to be completed in the area. The railroad ties were staged on and covered with plastic sheeting in EPT Parking Lot 6 while awaiting analysis for off-site disposal.

3.6 Sewer Line

An Ithaca city sanitary sewer line ("City Sewer Line" on Figure 2-1) runs through Area A' and the Scrap Chute/Scrap Dock Area. This line was temporarily rerouted while excavation occurred. A permit was issued by the Ithaca Sewer and Water Department to reinstall/replace a permanent line once excavation in these areas had been completed. These temporary and permanent sewer line installations were completed by Collins & Walton of Elmira, New York. The original clay tile was replaced with PVC piping. The PVC line was installed along the original sewer line location.

4.0

SOIL REMOVAL

The second phase (Phase II) of soil excavation was conducted by Marcor Environmental Remediation, Inc, of Rochester, New York. Excavation began on 7 November 1996 and was completed on 4 December 1996. The areas which were excavated during Phase II are shown on Figure 2-1. This figure also shows the areas where soil was excavated during the earlier Phase I soil excavation and the locations of confirmatory soil samples which were collected to confirm the NYSDEC clean-up goal of 1000 ppm was achieved. As stated earlier, soil excavation during Phase II continued until the clean-up goal of 1000 ppm TPH was achieved along all of the final excavation margins.

4.1

Area A'

Excavation in Area A' began in the vicinity of soil boring B-13 (see Figure 2-1), beneath the abandoned railroad bridge, where Phase I activities ceased, and continued into the upper portion of South Cayuga Street (this portion of south Cayuga Street is located on EPT property). The existing property fence was removed to facilitate access by the excavation equipment into Area A'. Approximately 75 cubic yards of soil were removed from this area. All soil was removed to bedrock which, in this area, was encountered from approximately 1.7 to 4 feet below ground surface. The property fence was put back in place upon completion of excavation in this area.

A confirmatory sample (5-ANPL-7-B) was collected from the north margin of the Phase II Area A' excavation cavity, at the property margin. No samples were taken from the south and west edges of the Phase II excavation, since the soil at these margins had already been excavated and replaced with clean fill during the Phase I excavation. No samples could be taken from the east side of the excavation, due to the presence of bedrock, and/or concrete retaining walls.

4.2 Area B' and C'

Excavation activities were then conducted in Areas B' and C', north of Areas B and C originally excavated during Phase I. This excavation extended north from the Phase I excavation margins to the property line.

All soil in this area was removed to bedrock, which was encountered from approximately four feet below ground surface at the northern most excavation margin to eleven feet below ground surface in the vicinity of the original Phase I excavation margins. A total of approximately 950 cubic yards of soil was removed from Area B' and C'.

Two confirmatory samples were collected from the east side of the Phase II excavation cavity near the abandoned railroad bridge abutment (7-BC-EM-8D and 9-BC-EME-8D2). The first sample that was collected near the abandoned railroad bridge, 7-BC-EM-8D, indicated levels of TPH in excess of the 1,000 ppm TPH clean-up criteria. Additional material was removed to bring the excavation as close to the abandoned railroad bridge as deemed safe, and sample 9-BC-EME-8D2 was collected.

Two additional confirmatory samples were collected from the north side of the Area B' and C' excavation along the EPT property margin (6-BC-NL-30E and 8-BC-EME-D1).

4.3 Area D'

Work in Area D' began by excavating test pits and collecting soil samples for TPH analysis in order to better identify the western margin of the excavation area (i.e., the location where TPH concentrations meet the NYSDEC clean-up criteria of 1000 ppm TPH) prior to initiating removal of soil from the area. Three test pits were excavated at approximately 30 foot intervals, beginning approximately 30 feet further west from where a test pit sample (D-WE-20) had been collected during Phase I. This Phase I sample was collected approximately 20 feet beyond the original Phase I Area D western excavation margin. The analytical result indicated the

TPH concentration in this area still exceeded the NYSDEC TPH clean-up goal. Two samples were collected from the western most test pit - one composite soil sample (D-W4) and one of the hardpan immediately underlying approximately 3 feet of fill (D-W3). One sample (D-W-2) was collected from the next test pit, and one sample (D-W1) from the test pit located 30 feet west of the Phase I sample location. Results from all of these Phase II sample locations indicated TPH concentrations were below the NYSDEC TPH clean-up criteria; therefore, it was determined that Area D' would be excavated westward to the first location where the NYSDEC TPH clean-up goal was met (D-W1). This was approximately 50 feet beyond the original western Phase I excavation limit. A total of approximately 415 cubic yards of soil was removed from Area D'. All soil was excavated to bedrock, which was approximately 7 to 8 feet below ground surface.

A confirmatory sample, 10-D-NEL-6D, was collected from an original northern margin of the Area D' excavation. Concentrations of TRPH in this sample exceeded the NYSDEC clean-up criteria; therefore, additional soil was excavated from this margin. Two confirmatory samples, 1A-RRNE-4-15 and 2A-RRN-8-30, were then collected from the extended margin. No confirmatory samples were collected from the south or east sides of the Area D' excavation due to the presence of a retaining wall and an existing excavation margin.

4.4 Scrap Chute/Scrap Dock Area

Excavation in the Scrap Chute/Scrap Dock Area began in the vicinity of soil boring B-9 (see Figure 1-1), and proceeded westward toward soil boring B-6. All soil in this area was removed to bedrock, which was encountered approximately 3-5 feet below grade surface. The total calculated yardage of soil removed from this area was 230 cubic yards.

No confirmatory samples were collected from the margins of this area due to the presence of a retaining wall to the south, existing excavation margins to the north and east, and the presence of a gas meter house, utilities, and an abandoned storage tank to the west.

5.0

SOIL AND RAILROAD TIE DISPOSAL

During excavation activities, removed soil was transported to and stockpiled in parking lot No. 6 at the EPT facility. Soil was placed on, and covered by, 10 mil polyethylene sheeting to minimize the potential for wind and rain erosion and associated contaminant migration.

On 2 December 1996, the loading of the stockpiled soil into over-the-road dump trailers began. This material was transported to High Acres Landfill in Fairport, New York, for use as a landfill cover as allowed by 6 NYCRR Part 360. A total of approximately 1670 cubic yards of soil were transported to the High Acres facility. The soil was manifested as a Non-Hazardous Special Oily Waste (Oily Soil). The Bills of Lading were signed by the Environmental Engineer, Ms. Kari Jacot of EPT. Disposal documentation is provided in Appendix B.

The railroad ties were also transported to High Acres Landfill for disposal upon laboratory confirmation that the ties were non-hazardous waste. Laboratory analytical results and disposal documentation for the railroad ties are provided in Appendix B.

Excavated areas were backfilled with clean bank run gravel and No. 2 crusher-run stone obtained from Cayuga Crushed Stone, Inc., Lansing, New York. Fill material was placed and compacted using excavation equipment and gas-powered vibratory tamping machines. Bank run gravel was selected for backfilling to obtain maximum compaction on each horizontal loose lift. Crusher-run stone was used on the top six inches to leave a clean, level finished grade.

All areas were filled to the original grade. However, if any further settlement occurs during the winter, additional fill will be brought in and compacted to bring areas back to grade. Additionally, in Spring 1997, topsoil will be placed on the slope at the Area B' and C' property margin, and the area will be seeded.

7.0

CONFIRMATORY SOIL SAMPLING

Upon excavation of each main area, confirmatory soil samples were collected from the excavation margins. Each sample was a composite of multiple grab samples taken from the same immediate area. Also, as specified in the NYSDEC STARS Memo #1, "Petroleum-Contaminated Soil Guidance Policy," the wall samples were collected at approximately two-thirds the depth of the excavation cavity, or based on visual observations, from an area believed to represent a worse case. Confirmatory samples collected from the excavation margins were analyzed for total recoverable petroleum hydrocarbons (TRPH) by EPA Method 418.1.

No samples were collected from the bottom of the excavation cavities due to the presence of bedrock in all areas. Additionally, where contaminated soil was removed up to a previously excavated area or up to a subsurface structure or other feature such as concrete retaining walls, the gas meter house, utilities, and a storage tank abandoned during Phase I, no samples were collected.

The soil samples were analyzed by a laboratory certified by the New York State Department of Health (NYSDOH), Recra Environmental Inc. of Amherst, New York, Approval Program Number 10026. Analytical results for the Phase II samples are provided in Appendix C, summarized in Table 7-1, and discussed below. These Phase II results and the Phase I TRPH analytical results are presented on Figure 2-1. All final excavation margin results were below the NYSDEC 1000 ppm TPH clean-up goal. Results for samples collected during Phase I which exceeded this clean-up goal are still presented on the figure and in the table. Soil was excavated from these areas during Phase II.

7.1

Area A'

Sample 5-ANPL-7-B was collected at the northern margin of the excavation cavity. Bedrock in this area was shallow, so the sample was collected where the excavation was deep enough to allow representative sampling. This sample showed a concentration of 918 ppm

Table 7-1
TRPH Analytical Results

Phase I Soil Excavation Margins Sampling Results			
Sample ID	Location	TRPH (ppm)	Notes/Actions

NYSDEC clean-criteria is 1,000 ppm TPH.

U -- TRPH was analyzed for but not detected. Detection limit reported.

TRPH. This was the highest TRPH result of all the samples collected from the final excavation margins but was below the clean-up criteria. Retaining walls, and/or existing excavation margins border the other Area A' excavation margins; therefore, additional confirmatory samples from this area were not collected. Sample A-N-4, located at the southern margin of Area A', was collected during Phase I. Soil in this area was excavated during Phase II.

7.2 Area B' and C'

Confirmatory samples were collected from the northern and eastern excavation margins of the Area B' and C'. Samples 6-BC-NL-30E and 8-BC-EME-8D1 were collected from the northern margin and showed TRPH concentrations of 120 ppm and less than 12.5 ppm (the detection limit), respectively. Sample 7-BC-EM-8D was collected from an original eastern margin and found to contain a TRPH concentration of 1080 ppm, slightly above the clean-up criteria. Additional soil was excavated from this eastern margin and a new confirmatory sample, 9-BC-EME-8D2, was collected from the expanded excavation. The concentration of TRPH in this final excavation margin sample was less than 12.5 ppm (the detected limit).

During Phase I, Phase I samples, B-NW-2, B-NE-1 and C-NW-1, shown in Figure 2-1, were collected along the southern margin of Area B' and C'. Soil in these areas was excavated during an expansion of the Phase I margins and during Phase II excavation activities.

7.3 Area D'

As explained earlier, prior to commencing with soil removal from this area, sample test pits were dug and soil samples collected west down the abandoned Lehigh Railroad bed in order to determine the western margin of Area D'. Sample results (D-W1, D-W2, D-W3, and D-W4) were all below the clean-up level. Results for D-W1, where TRPH concentrations were measured at 228 ppm TRPH, represent the soil conditions at the final Area D' western excavation margin.

Three confirmatory samples, 10-D-NEL-6D, 1A-RRNE-4-15, and 2A-RRN-8-30, were collected from the northern side of the excavation. The results of sample 10-D-NEL-6D indicated that clean-up criteria had not been reached. Additional soil was therefore excavated from the entire length of the north side of the cavity; and confirmatory samples, 1A-RRNE-4-15 and 2A-RRN-8-30, were collected to characterize this new margin. Concentrations in both of these final samples were well below the clean-up criteria at 48.8 and 21.7 ppm TRPH, respectively.

A Phase I sample, B-WL-4, located at the eastern margin of Area D', and the test pit sample, D-WE-20, were collected during Phase I. Soil in these areas was excavated during Phase II.

7.4 Scrap Chute/Scrap Dock Area

No confirmatory soil samples were collected from margins of the Scrap Chute/Loading Area due to a retaining wall bordering the southern margin, existing excavation margins bordering the northern and eastern margins, and a gas house, storage tank, and utilities bordering the western margin. No confirmatory samples were taken from the bottom of the excavation because the excavation was completed to bedrock in this area.

During Phase I, Phase I samples, B-S-3 and A-SW-3 were collected along the northern and eastern margins of this area, respectively. Soil in these areas was excavated during Phase II excavation activities.

8.0

CONCLUSIONS

At the conclusion of Phases I and II of the soil excavation program to remove non-hazardous, petroleum-containing soil from the scrap chute/scrap dock area, a total of approximately 3170 cubic yards of soil was removed. This material was transported and disposed at High Acres Landfill in Fairport, New York, for use as landfill cover as allowed by 6 NYCRR Part 360. Confirmatory soil samples collected from all final excavation margins showed that concentrations of petroleum in remaining soil were below the NYSDEC clean-up criteria of 1000 ppm TPH in all cases (this approved clean-up criteria was documented in a NYSDEC letter, dated 22 August 1994).

The "Remedial Design, Petroleum-Containing Soil," Radian Engineering, Inc., May 1995, has been fully implemented, and the remedial goal "to reduce, control, or eliminate the contamination present within the soils on-site," as stated in the Record of Decision, December 1994, for Morse Industrial Corporation, Ithaca, Thompson County, New York, Site No. 7-55-010 has been achieved.

Mr. Amar Nagi
Bureau of Construction Services
Division of Hazardous Waste Remediation
New York State Department of Environmental Conservation
50 Wolf Road
Albany, NY 12233-7010

Subject: Transmittal of Remedial Activities Report - Emerson Power Transmission,
Tompkins, New York, Site No. 7-55-010

Dear Mr. Nagi:

Enclosed is one copy of the Remedial Activities Report for work performed at Emerson Power Transmission (EPT), Site No. 7-55-010. This report describes soil excavation activities performed from October 1995 through January 1996 in accordance with the document entitled "Remedial Design, Petroleum-Containing Soil", Radian Corporation, May 1995.

If you have any questions, please call Derek Chase at Emerson at (314)553-2767 or me at (703)713-6437.

Sincerely,

A handwritten signature in dark ink, appearing to read "Edward M. Andrechak". The signature is fluid and cursive, with a long horizontal stroke at the end.

Edward M. Andrechak
Project Manager

Re: Soil Disposal
Emerson Power Transmission
Ithaca, New York
MARCOR Job Number R0-01453-001

Dear Ms. Wilder:

Pursuant to your request, MARCOR Environmental Remediation, Inc. (MARCOR) is forwarding copies of the non-hazardous waste manifests and weight tickets for the disposal of contaminated soil from the above referenced site during December, 1996.

If you have any questions please contact me at (716) 247-6955 ext. 208.

Sincerely,
MARCOR Environmental Remediation Inc.

A handwritten signature in black ink, appearing to read "Keith Hambley", with a long, sweeping horizontal line extending to the right.

RE: Analytical Results

Dear Ms. Eshler:

Enclosed are the results concerning the analyses of the samples recently submitted by your firm. The pertinent information regarding these analyses is listed below:

Quote #: NY96-028

Program: Emerson Power-Ithaca

Matrix: Soil

Samples Received: 11/07/96

Sample Dates: 11/06/96

If you have any questions concerning these data, please contact me at (716) 691-2600 and refer to the I.D. number listed below. It has been our pleasure to provide Radian Corporation with environmental testing services. We look forward to serving you in the future.

Sincerely,

RECRA ENVIRONMENTAL, INC.

ANALYTICAL RESULTS

Prepared For:

Radian Corporation
155 Corporate Woods, Suite 100
Rochester, New York 14623

Prepared By:

Recra Environmental, Inc.
10 Hazelwood Drive, Suite 106
Amherst, New York 14228-2298

METHODOLOGY

The specific methodologies employed in obtaining the enclosed analytical results are indicated on the specific data tables. The method number presented refers to the following U.S. Environmental Protection Agency reference:

- * 40 CFR Part 136 "Guidelines Establishing Test Procedures for the Analysis of Pollutants Under the Clean Water Act" October 26, 1984 (Federal Register) U.S. Environmental Protection Agency.

COMMENTS

Comments pertain to data on one or all pages of this report.

The enclosed data has been reported utilizing data qualifiers (Q) as defined on the Inorganic Data Comment Pages.

WET CHEMISTRY DATA

No deviations from protocol were encountered during the analytical procedures.

"This data report shall not be reproduced, except in full, without the written authorization of the client."

ENVIRONMENTAL
INC.

INORGANIC DATA COMMENT PAGE

Laboratory Name: Recra Environmental, Inc.

USEPA Defined Inorganic Data Qualifiers:

- B** - Indicates a value greater than or equal to the instrument detection limit, but less than the contract required detection limit.
- U** - Indicates element was analyzed for but not detected. Report with the detection limit value (e.g., 100).
- E** - Indicates a value estimated or not reported due to the presence of interference.
- S** - Indicates value determined by Method of Standard Addition.
- N** - Indicates spike sample recovery is not within control limits.
- *** - Indicates duplicate analysis is not within control limits.
- +** - Indicates the correlation coefficient for Method of Standard Addition is less than 0.995.
- M** - Indicates duplicate injection results exceeded control limits.
- W** - Post digestion spike for Furnace AA analysis is out of control limits (85-115%), while sample absorbance is less than 50% of spike absorbance.

RE: Analytical Results

Dear Ms. Eshler:

Enclosed are the results concerning the analyses of the samples recently submitted by your firm. The pertinent information regarding these analyses is listed below:

Quote #: NY96-028
Project Name: Emerson Power - Ithaca
Matrix: Soil
Samples Received: 11/21/96
Sample Dates: 11/20/96

If you have any questions concerning these data, please contact me at (716) 691-2600 and refer to the I.D. number listed below. It has been our pleasure to provide Radian Corporation with environmental testing services. We look forward to serving you in the future.

Sincerely,

RECRA ENVIRONMENTAL, INC.

ANALYTICAL RESULTS

000001

Prepared For:

Radian Corporation
155 Corporate Woods, Suite 100
Rochester, New York 14623

Prepared By:

Recra Environmental, Inc.
10 Hazelwood Drive, Suite 106
Amherst, New York 14228-2298

METHODOLOGY

The specific methodologies employed in obtaining the enclosed analytical results are indicated on the specific data tables. The method number presented refers to the following U.S. Environmental Protection Agency reference:

- * 40 CFR Part 136 "Guidelines Establishing Test Procedures for the Analysis of Pollutants Under the Clean Water Act" October 26, 1984 (Federal Register) U.S. Environmental Protection Agency.

COMMENTS

Comments pertain to data on one or all pages of this report.

The enclosed data has been reported utilizing data qualifiers (Q) as defined on the Inorganic Data Comment Pages.

WET CHEMISTRY DATA

Client Sample 10-D-NEL-6D was analyzed at a dilution factor of five (5).

No other deviations from protocol were encountered during the analytical procedures.

"This data report shall not be reproduced, except in full, without the written authorization of the client."

INORGANIC DATA COMMENT PAGE

Laboratory Name: Recra Environmental, Inc.

USEPA Defined Inorganic Data Qualifiers:

- B - Indicates a value greater than or equal to the instrument detection limit, but less than the contract required detection limit.**
- U - Indicates element was analyzed for but not detected. Report with the detection limit value (e.g., 100).**
- E - Indicates a value estimated or not reported due to the presence of interference.**
- S - Indicates value determined by Method of Standard Addition.**
- N - Indicates spike sample recovery is not within control limits.**
- * - Indicates duplicate analysis is not within control limits.**
- + - Indicates the correlation coefficient for Method of Standard Addition is less than 0.995.**
- M - Indicates duplicate injection results exceeded control limits.**
- W - Post digestion spike for Furnace AA analysis is out of control limits (85-115%), while sample absorbance is less than 50% of spike absorbance.**

A FULL SERVICE ENVIRONMENTAL LABORATORY

December 18, 1996

Ms. Lynn Eschler
Radian International LLC
155 Corporate Woods, Suite 100
Rochester, NY 14623

PROJECT: EMMERSON POWER
Submission #: 9611000309

Dear Ms. Eschler:

Enclosed are the analytical results of the analyses requested. The analytical data was provided to you on 11/26/96 per a Facsimile transmittal. All data has been reviewed prior to report submission.

Should you have any questions please contact me at (716) 454-6810.

Thank you for letting us provide this service.

Sincerely,

COLUMBIA ANALYTICAL SERVICES

Effective 04/01/96

CAS LIST OF QUALIFIERS

(The basis of this proposal are the EPA-CLP Qualifiers)

- U - Indicates compound was analyzed for but was not detected. The sample quantitation limit must be corrected for dilution and for percent moisture.
- J - Indicates an estimated value. For further explanation see case narrative / cover letter.
- B - This flag is used when the analyte is found in the associated blank as well as in the sample.
- E - This flag identifies compounds whose concentrations exceed the calibration range.
- A - This flag indicates that a TIC is a suspected aldol-condensation product.
- N - Spiked sample recovery not within control limits.
(Flag the entire batch - Inorganic analysis only)
- * - Duplicate analysis not within control limits.
(Flag the entire batch - Inorganic analysis only)
 - Also used to qualify Organics QC data outside limits.
- D - Spike diluted out.
- S - Reported value determined by Method of Standard Additions. (MSA)
- X - As specified in the case narrative.

2-methylphenol (o-cresol) 200.0 mg/L = 200,000 ug/L

3-methylphenol (m-cresol) 200.0 mg/L = 200,000 ug/L

4-methylphenol (p-cresol) 200.0 mg/L = 200,000 ug/L

All measured concentrations were less than the regulatory level; therefore, the railroad ties do not exhibit a characteristic of haz. waste. They should be acceptable for disposal at High Acres landfill.
