Re: Summary of Environmental Due Diligence by Labella
Emerson Power Transmission Ithaca, New York

Dear Karen:

As you are aware, LaBella Associates, PC, (LaBella), on behalf of L Enterprises LLC, is conducting environmental due diligence investigations at the Emerson Power Transmission facility property in Ithaca, New York. LaBella conducted initial investigations between July 27 and October 6, 2013, and supplemental investigations between December 3, 2013 and January 17, 2014. On behalf of Emerson, WSP observed the majority of LaBella's due diligence investigation activities to document the field procedures and collect representative split samples for laboratory analysis from select locations and intervals.

Enclosed is a letter report that presents a summary of the split sampling results from the environmental due diligence investigations conducted by LaBella. The report includes figures showing individual sample locations and tables summarizing the sampling results. The laboratory analytical reports are also included in the Enclosure.

Re: Summary of Environmental Due Diligence by Labella
Emerson Power Transmission Ithaca, New York

Dear Karen:

On behalf of Emerson, WSP is submitting this letter report which presents a summary of the environmental due diligence investigations conducted by LaBella Associates, PC, (Labella), on behalf of L Enterprises LLC, at the Emerson Power Transmission (EPT) facility in Ithaca, New York, and the results of split samples collected by WSP. LaBella conducted the initial due diligence investigations between July 27 and October 6, 2013, and supplemental due diligence investigations between December 3, 2013 and January 17, 2014. WSP observed the majority of LaBella's due diligence investigation activities to document their field procedures and collect representative split samples for laboratory analysis from select locations and intervals.

Initial Due Diligence Investigation (July-December 2013)

Investigation activities performed by Labella included indoor air sampling, a soil gas survey, soil and sediment sampling, seep sampling, monitoring well installation, and groundwater sampling. Below is a description of the activities that were observed by WSP along with a description of WSP's split sampling activities and results.

Subslab Vapor Sampling and Indoor Air Sampling

On July 28, 2013 and July 29, 2013, Labella installed sub-slab soil gas probes and collected sub-slab soil gas samples, and indoor air samples in a number of the onsite buildings, as well as an outdoor air sample. WSP was present onsite to observe and document the sub-slab and indoor air sampling activities. All samples were collected by LaBella over an 8-hour time period. WSP recorded the initial and final vacuum measurements and sample collection times but did not collect split samples for analysis. LaBella had the samples analyzed by Centek Laboratories, LLC, for Volatile Organic Compounds (VOCs) using Environmental Protection Agency (EPA) Method TO-15. Following the conclusion of the sub-slab soil gas sampling, Labella sealed the sub-slab probe locations.

Electromagnetic Surveys

On July 27, 2013, WSP observed Labella conducting geophysical surveys in four areas onsite. Electromagnetic (EM) 31 and 61 technologies were used to conduct survey grids comprised of 3-foot line-spacing's in the former Spray Pond area (AOC #3) located in Parking Lot #4 and in the area

informally called the “Rice Paddy”, located south of Building #30 (Figure 1). In addition, LaBella conducted EM-61 surveys in an approximately 20-foot by 40-foot area directly adjacent (south) of Building #30 (oil shed or Dock #7) and in the former propane aboveground storage tank (AST) area south of Building #30 (Figure 1). The survey in the area directly adjacent to Building #30 was done to clear the area for potential utilities in advance of the proposed drilling activities.

No obvious anomalies in the audible signal were noted by WSP from either of the two EM devices while the surveys were performed. WSP did not receive final results from Labella of the EM surveys.

Soil Investigation

Between July 30 and September 26, 2013, LaBella installed 83 direct-push soil borings, designated LBA-SB-200 through LBA-SB-252, LBA-SB-301 through LBA-SB-301, and LBA-SB-401 through LBA-SB-426 (Figures 1 and 2). Additionally, between August 12 and September 4, 2013, Labella conducted direct-push soil sampling activities within the boreholes later completed as monitoring wells. Table 1 lists the boring names, sample names (with associated depths), analytical parameters, and location for the split soil samples collected by WSP.

All soil borings were advanced from the ground surface to refusal at the top of bedrock using a direct-push drill rig (Geoprobe® or equivalent) equipped with a 4-foot-long 2-inch diameter stainless-steel macro-core sampler with a single-use acetate liner. Upon retrieval of each core, the drillers opened the acetate liner for field screening and collection of laboratory samples. LaBella conducted headspace screening of the soil in the field using a photoionization detector (PID). Also, an X-Ray Fluorescence (XRF) Spectrometer was used to measure estimated concentrations of metals in the soil samples. Total depths of the overburden ranged from less than 1 foot in areas beneath the concrete slabs in the buildings to approximately 20 feet in areas of the site overlain by thick sections of fill.

WSP collected 28 split soil samples from the direct-push boring locations and 17 split soil samples at 16 of the monitoring well overburden drilling locations (45 total samples). In accordance with WSP’s Standard Operating Procedures, all samples were placed in laboratory-supplied pre-cleaned bottles and packed in coolers with ice. WSP shipped the sample containers under chain-of-custody to Accutest Laboratories in Marlborough, MA. Samples were analyzed for one or more of the following:

- Target Compound List (TCL) VOCs by EPA Method 8260b
- 10 additional VOCs in Table 2 - Soil Cleanup Levels for Gasoline Contaminated Soils of the NYSDEC’s *Soil Cleanup Guidance* (CP-51) by EPA Method 8260b
- A library search of up to 25 Tentatively Identified Compounds (TICs) VOCs by EPA Method 8260b
- Semi-Volatile Organic Compounds (SVOCs) by EPA Method 8270C
- A library search of up to 25 TIC SVOCs by EPA Method 8270C
- Resource Conservation and Recovery Act (RCRA) Metals plus by EPA Methods 6010/7000-series
- Copper by EPA Method 6010
- Cyanide by EPA Method 9012
- Polychlorinated Biphenyls (PCBs) by EPA Method 8082

In general, VOC samples were collected from the depth interval with the highest PID readings, except in circumstances where sample volume was not sufficient to collect a split. Metals and SVOC analyses were run on samples collected at locations where visual staining was present, or where readings from the XRF indicated elevated concentrations of metals. Samples for PCB analysis were collected from

targeted locations where historical site information indicated the former presence of PCB-containing transformers.

Thirty-two of the split soil samples were analyzed for VOCs, 18 samples was analyzed for SVOCs, 5 samples were analyzed for PCBs, 17 samples were analyzed for RCRA metals, 4 samples were analyzed for arsenic, and 2 samples were analyzed for copper. The analytical results for the split soil samples are presented in Tables 2 and 3. Laboratory analytical reports are provided in Enclosure A.

Test Pits

On August 8 and 9, 2013, WSP observed Labella excavate 19 test pits and collect soil samples for field screening purposes. The test pits were conducted to verify the results of the EM surveys described above. Test pits LBA-TP-01 through LBA-TP-06 were located in the Former Spray Pond in Parking Lot 4, LBA-TP-7 through LBA-TP-09 were located in the 'Rice Paddy' area south of the main onsite buildings, LBA-TP-10 through LBA-TP-12 were located around Building 30 (Former Oil Shed), LBA-TP-13 was located in the fill area where the former Propane AST saddles are located, LBA-TP-14 through LBA-TP-16 were located along the perimeter of the south-end driveways, LBA-TP-17 was located southeast of Building 24 in Upper Parking Lot #7, LBA-TP-18 was located northeast of Building 24 in an upper parking lot and LBA-TP-19 was located near the Guard Shack (Figures 1 and 2).

WSP collected five split soil samples at four of the test pit locations. Three samples (LBA-TP-03, LBA-TP-10, and LBA-TP-16) were analyzed for VOCs, two samples (LBA-TP-8, and LBA-TP-16) were analyzed for RCRA metals plus cyanide, and one sample (LBA-TP-8) was analyzed for PCBs. The analytical results for the split soil samples are presented in Table 4. Laboratory analytical reports are included in Enclosure A.

Supplemental Due Diligence Investigation

From December 3, 2013, through January 17, 2014, Labella conducted a Supplemental Due Diligence Investigation. The work included double cased monitoring well installation, soil sampling, test pit installation, and groundwater sampling. Below is a description of the activities that were directly observed by WSP along with a description of the split sampling activities conducted by WSP.

Test Pits

On December 5, 2013, Labella excavated four additional test pits, designated LBA-TP-20 through LBA-TP-23 as part of the Supplemental Due Diligence activities. WSP did not collect any split samples from these locations.

Direct Push Soil Borings

Between December 3 and December 13, 2013, LaBella installed 24 additional soil borings designated LBA-SB-501 through LBA-SB-524 in four areas at the site: inside Building 24, Building 2, Buildings 8, 15 and 35, and south of Building 30 (Figures 1 and 2). WSP collected 18 split samples from 16 of the boring locations. Fourteen of the samples were analyzed for VOCs and 5 of the samples were analyzed for RCRA metals. Four of the 5 metals samples were also analyzed for cyanide. The soil analytical results for the split samples are presented in Table 6. Laboratory analytical reports are included in Enclosure A.

Monitoring Well Installation

Between December 9, 2013, and January 6, 2014, LaBella installed 16 double-cased or open bedrock monitoring wells at 11 locations (i.e., five locations were nested pairs), designated LBA-MW-34 through LBA-MW-44 (Figures 1 and 2). The bedrock well locations were focused on the northern half of the EPT site in Building 24 (LBA-MW-40, LBA-MW-41, and LBA-MW-42), Building 2 (LBA-MW-34, LBA-MW-37, LBA-MW-38), Buildings 6A, 8, 13A, and 35, (LBA-MW-35, LBA-MW-36, LBA-MW-43, and LBA-MW-44), and Building 5 (LBA-MW-39). WSP observed the well installation activities. Table 7 provides a list of monitoring wells installed by Labella including well construction details.

The monitoring well boreholes were installed by advancing 4.25-inch inside-diameter hollow-stem augers to the top of bedrock, which ranged from 8 inches to 11 feet bgs. A temporary surface conductor casing was set at the top of bedrock, and the boreholes were advanced using nominal 6-inch air rotary methods into competent rock to set a permanent steel casing. A 6-inch steel casing was set in each 'rock socket' and emplaced with an annular seal consisting of 95/5 Portland cement/bentonite grout. After a sufficient time for the grout to cure, the bedrock borehole was advanced using 3.5-inch nominal outside diameter NX rock core. Rock coring was conducted in 5 or 10-foot-runs, and the core was logged in the field by LaBella's field geologist for rock type, rock quality description, facture density, and weathering or alteration. WSP documented confirmation logging to ensure that the final screened intervals of the monitoring wells were appropriately placed such that they did not straddle multiple hydrogeologic zones.

The B-zone wells were completed as open bedrock boreholes ranging in depth from 12 to 35 feet bgs, with the exception of LBA-MW-34N, which was fitted with PVC screen from 13 to 21 feet bgs (Table 7). The C-zone monitoring wells were constructed of a 10-foot section of 0.010-inch slotted PVC screen and blank PVC riser. Final C-zone well screen lengths ranged from 5 feet to 11 feet. The annular space of the screened interval of each well was backfilled with appropriately-sized clean quartz filter sand to a height of approximately 2 feet above the top of the screen. A seal consisting of approximately 3 feet of hydrated bentonite chips topped by a mixture of 95-percent Portland Cement/5-percent powdered bentonite grout was emplaced above the filter pack.

Due to the construction of LBA-MW-29, WSP recommended that Labella properly abandon the well following discrete interval sampling activities. Therefore, on January 7, 2014, Labella abandoned well LBA-MW-29 by removing the inner casing and screen, over drilling, and grouting the borehole in place in accordance with the procedures in NYSDEC's CP-43: Groundwater Monitoring Well Decommissioning Policy.

Groundwater Sampling

Between December 3, 2013 and January 17, 2014, WSP collected split groundwater samples from all new monitoring wells (i.e., LBA-MW-34 through LBA-MW-44), from discrete intervals in well LBA-MW-29 prior to abandonment, from a temporary well installed at LBA-SB-503 in Building 24 (Figure 1), and from within seven open bedrock 'rock sockets' for wells LBA-MW-34N, LBA-MW-34S, LBA-MW-35, LBA-MW-36, LBA-MW-39, LBA-MW-40S, and LBA-MW-31. The samples were collected by Labella using various methods as described below. Labella provided a split groundwater sample to WSP at each location.

A peristaltic pump was used to collect the groundwater grab samples from within the open bedrock 'rock sockets'. WSP documented that LaBella purged and sampled in accordance with EPA's low-flow protocol at 13 of the 16 new monitoring wells. Most of the low-flow groundwater samples were collected using a peristaltic pump, except those collected at LBA-MW-34N, LBA-MW-35, LBA-MW-42S, and LBA-MW-43N, which were sampled using a bladder pump. WSP documented that drawdown was observed in all of the wells sampled via low-flow, and in two cases (i.e., LBA-MW-34N, and LBA-MW-36) the well had to recharge for several hours before a groundwater sample could be collected and a split sample provided to WSP.

Due to slow recharge, the split samples collected at LBA-MW-34S, LBA-MW-37, and LBA-MW-38 were collected as grab samples using bailers. WSP documented that all three wells went dry during the initial purge and were sampled the following day. Follow-up groundwater samples were also collected using passive diffusive bag (PDB) samplers from a subset of the new monitoring wells (LBA-MW-34N, LBA-MW-34S, LBA-MW-37, and LBA-MW-38) that had poor recharge during the first sampling attempt.

Prior to well abandonment, discrete interval samples were collected using PDBs in well LBA-MW-29. Samples were collected from depths centered at 18 feet, 21 feet, 28 feet, 33 feet, 38 feet, 43 feet and 48 feet. Split water samples were provided to WSP upon retrieval of the PDB samplers.

All split groundwater samples were placed in laboratory-supplied pre-cleaned bottle ware and submitted to Accutest Laboratories in Marlborough, MA, for analysis of one or more of the following parameters.

- Target Compound List (TCL) VOCs by EPA Method 8260b
- 10 additional VOCs listed in the Soil Cleanup Levels for Gasoline Contaminated Soils (Table 2) of the NYSDEC's *Soil Cleanup Guidance* (CP-51) by EPA Method 8260b
- A library search of up to 25 Tentatively Identified Compounds (TICs) VOCs by EPA Method 8260b
- Resource Conservation and Recovery Act (RCRA) Metals plus by EPA Methods 6010/7000-series
- Copper by EPA Method 6010
- Cyanide by EPA Method 9012

The results of the samples collected from within the open bedrock 'rock sockets' are provided in Table 8. The results of the PDB discrete interval sampling conducted in well LBA-MW-29 and the groundwater samples collected from all new wells are provided in Table 9. The results for the grab sample collected from the temporary well installed in boring LBA-SB-503 are provided in Table 10. Laboratory analytical reports are included in Enclosure A.

Pipe Discharge

On December 11, 2013, LaBella noted a seep emanating from a pipe located beneath the former PCB transformer pad west of Building 24. The pipe was discharging on the north side of the pad. WSP collected a split water sample from LaBella's grab sample. The water sample was shipped to the laboratory for analysis of VOCs and PCBs. The analytical results are provided in Table 11, and the laboratory analytical report is included in Enclosure A.

LNAPL Sample

On January 6, 2014, WSP measured less than 0.01-foot of light non aqueous phase liquid (LNAPL) on the surface of the water column in monitoring well LBA-MW-35. On January 2, 2014, WSP collected a

sample of the LNAPL for analysis of VOCs and PCBs as well as hydrocarbon fingerprinting using NYSDOH Method 310.13. The results are presented in Table 12, and the laboratory analytical report is included in Enclosure A.
