1.0 INTRODUCTION

MACTEC Engineering and Consulting, PC (MACTEC), is submitting this Site Characterization Report (Report) to the New York State Department of Environmental Conservation (NYSDEC). This Report addresses the Site Characterization (SC) at the Ruddick's Dry Cleaners site (Site) in the City of Elmira, New York (Figure 1.1). This Report was prepared in response to Work Assignment (WA) No. D0003826-29 (NYSDEC, 2006), and in accordance with the requirements of the July 1997 Superfund Standby Contract No. D003826 between the NYSDEC and MACTEC. The field work and report were conducted under WA# D0004434-5 and the April 2005 Superfund Standby Contract No. D0004434-5 between the NYSDEC and MACTEC.

This Report is one of six site-specific SC reports for the Region 8 Dry Cleaners – Group 2 multiple Site Characterizations WA. The other five SC reports address the sites listed below:

- HTS Coin Operated Laundry and Dry Cleaners (Site No. 8-08-038)
- Universal Dry Cleaners (Site No. 8-08-040)
- Up to Date Cleaners (Site No. 8-26-019)
- Associated Textile Rental Services (Site No. 8-08-041 - replaces Schmidt Brothers)
- Rolling Plains (Site No. 8-28-138 – replaces Ace Cleaners)

The former Ruddick's Dry Cleaners site, Site No. 8-08-037, is currently listed as a potential hazardous waste site, or "P" site, by the NYSDEC, because insufficient information exists to determine whether wastes were disposed of at the site and whether, if present, those wastes pose a potential significant threat to public health or the environment (New York State [NYS], 2006).

The purpose of the SC is to provide information to be used by the NYSDEC to reclassify the site to one of the following categories:

Class 1 — Hazardous waste constitutes a significant threat to public health or the environment, as described in Title 6 New York Codes, Rules, and Regulations (NYCRR) Part 375 (NYS, 2006); and the significant threat to public health or the environment is causing, or presents an imminent danger of causing, either irreversible or irreparable damage to the environment

Class 2	Hazardous waste sites presenting a significant threat to public health or the environment; as defined in 6 NYCRR 375 (NYS, 2006).
Class 3	Hazardous waste sites at which contamination does not presently constitute a significant threat to public health or the environment.
Not Classified	Sites where hazardous waste disposal is not documented.

To complete its reclassification, the NYSDEC requires information to establish the following:

- The existence of documented hazardous waste disposal, as defined in NYCRR Part 371 (NYS, 1999a).
- The site's significance with respect to the threat it poses to public health and the environment as defined in 6 NYCRR Part 375 (NYSDEC, 2006).
- Identification of contaminant source.

MACTEC collected reclassification documentation and is presenting it to the NYSDEC so it can recommend follow up action for the Site (i.e., reclassify, delist, or perform additional investigation).

The WA was divided into three tasks. Task 1-Work Plan Development, included a search of state and county site records, and performance of a site inspection to develop information necessary for reclassification or delisting. Task 1 activities did not develop adequate data on which to base a delist or reclassification recommendation. Therefore, Task 2, Subsurface Investigation, was conducted. Task 3-Reporting, was the preparation of this Report. Resources used to prepare this Report include: (1) information provided in the WA, (2) appropriate guidelines in the NYSDEC Draft DER-10 Guidance (NYSDEC, 2002), (3) results of previous investigations, if applicable, and (4) results of the SC investigation.

This report is divided into five sections:

Section 1 – Is the introduction to the report.

Section 2- Describes the site background and physical setting, including a summary of previous investigations.

Section 3 - Presents the work conducted during the field investigations.

Section 4 - Presents results of the field investigation.

Section 5 - Presents an investigation summary.

2.0 SITE BACKGROUND AND PHYSICAL SETTING

On May 3, 2006, MACTEC personnel reviewed available records from the NYSDEC office in Albany, New York, and visited the Chemung County, New York offices. Information was also collected from the Site owner by the NYSDEC. As part of the review, MACTEC ordered a copy of an Environmental Data Resources, Inc. (EDR) report which provides a listing of federal and state governmental information pertaining to potential and documented environmental impacts, both at the Site and within the American Standards of Testing and Measurements (ASTM) recommended search radii. Complete lists of all recommended ASTM record searches for standard due diligence requirements are included in the EDR report, which is provided under separate cover. This information was reviewed to support a Site classification, and to help prepare the scope of work for the SC field investigations. The information collected from these sources is summarized below.

2.1 SITE LOCATION

The former Ruddick's Dry Cleaners is located at 384 Norton Street in a residential neighborhood in the City of Elmira, Chemung County, New York (Figure 1.1). The site property consists of approximately 0.21 acres. The Sullivan Street Public Supply Wells are located to the east of this site.

2.2 SITE HISTORY

Sanborn fire insurance maps reviewed from 1931 to 1995 indicate the presence of three buildings on the Site property during that time. The three buildings consisted of: a 2-story building on west side of the property that is labeled with an 'S', typically signifying a store; a small building in the south central portion of the property that may have been attached to the "store"; and, a 2-story building on the eastern portion of the Site property labeled with a 'D', typically signifying a dwelling. The small building in the south central portion of the property was labeled as a dry cleaner on the 1950 to 1994 Sanborn fire insurance maps. This small building is visible in the 1931 Sanborn map, and although its label is not readable, the Sanborn map identifies a gasoline tank in front (north side) of the building, indicating that this building may have originally served as a gas station. The Manning's City Directories reviewed from 1955 to 1990 also confirm the presence of

Ruddick's Dry Cleaning facility from at least 1955 to 1990. The "dwelling" on the eastern portion of the property is not present in the 1988 Sanborn map. Although the 1995 Sanborn map indicates that the entire Site property is vacant, the two-story multi-family home currently located on the west side of the property appears to be older than 10 years, and roughly matches the shape of the home shown on previous year's maps, so its omission from the 1995 map may be a misprint. There is no other building currently located on the Site property.

Based on the presence of water lines in the 1931 Sanborn maps, it is assumed that the former dry cleaner used public water.

2.3 PREVIOUS INVESTIGATIONS

It is not know if any previous site investigations have been completed for the Site property.

The site is of concern based on the presence of chlorinated solvents in the City of Elmira's Sullivan Street Supply Well. Although other sources of chlorinated solvents exit in the greater Horseheads/Elmira valley, it is not known if this Site is contributing to the contamination plume. Chlorinated solvents (primarily trichloroethene [TCE]) were first detected in the City of Elmira's Sullivan Street supply wells in the mid 1980's. Samples collected between 1981 and 1992 indicated concentrations of TCE in the Sullivan Street Wells ranging from 5.0 to 10.3 micrograms per Liter (µg/L), in relation to a NYS groundwater standard of 5 µg/L (New York State Department of Health [NYSDOH], 1994). These wells are located approximately 1100 feet east of the Site, on the west side Newtown Creek (Figure 1.1). There are two supply wells in close proximity to each other. These wells can each produce approximately 3 million gallons per day. The 18-inch diameter wells have casing set to approximately 60 feet below ground surface (bgs), with shutter screen down to 98 feet bgs. Although an air stripper was installed in the late 1990's, the wells are currently not used (LaDouce, 2005). They are turned on twice per year and sampled.

2.4 PHYSICAL SETTING

Topography

The Site is located in the Newtown Creek Valley, which runs north-south, joining the Chemung River Valley to the south, which runs east-west. The Site property is located at 859 feet above mean sea level (msl) and is relatively flat. The valley slopes slightly down to the south and east. Newtown Creek is located at an elevation of approximately 850 feet above msl and approximately 1700 feet east of the Site. Newtown Creek runs south, joining the Chemung River in 1.1 miles. The Chemung River is located at an elevation of approximately 835 feet above msl at the confluence with Newtown Creek. The topography to the west of the site is relatively flat for approximately 1.4 miles, and then rises to a ridge at 1600 feet above msl approximately 2.4 miles from the site. The topography east of Newtown Creek is flat for approximately 0.1 miles, and then rises sharply to a ridge at 1600 feet above msl approximately 1.0 mile from the site.

Climate

The climate of the area is characterized by moderately warm summers and cold winters. Mean monthly temperatures range from 24 degrees Fahrenheit (°F) in January to 70°F in July. Average annual precipitation is 35 inches. Average annual snowfall is 43 inches (National Climatic Data Center, 2004).

Surface Water Hydrology

Surface drainage from the site generally follows the topography, flowing toward low areas and then infiltrating into the ground. The Site property is located within the 100 year flood zone (EDR, 2006).

Groundwater Hydrology

The Newtown Creek and eventually the Chemung River are local groundwater discharge areas. Groundwater at the Site was encountered at approximately 12-15 feet bgs, and based on water level measurements collected, is interpreted to flow southeast towards the Newtown Creek.

Geology

Overburden soils at the site consisted of lacustrine silts, sands and gravels. Surficial geology is mapped as oxidized, non calcareous, fine sand to gravel (Muller, 1986). Based on regional geologic mapping (Rickard and Fisher, 1970) bedrock is expected to consist of shale and siltstones associated with the Upper Devonian West Falls Group; Specifically, the Beers Hill Shale; Grimes Siltstone; Dunn Hill, Millport, and Moreland Shales (Rickard and Fisher, 1970).

Site Walkover

On May 3, 2006 the MACTEC Site Lead, Chuck Staples, and the NYSDEC project manager, Matthew Dunham conducted a walkover of the Site area.

The site walkover consisted of viewing the Ruddick's Dry Cleaners property, and the surrounding neighborhood to assess possible contamination sources and the logistical concerns for the field program. MACTEC personnel documented the walkover with photographs (Appendix A).

Visible sources of contamination (e.g., leaking drums) were not observed, however, detailed inspections of potential sources were not conducted during the site walkover.

2.5 FILE REVIEW

MACTEC reviewed files from various state and local agency offices to develop information to support a reclassification or delisting, and to help prepare the scope of work for the SC field investigations. The EDR report was also reviewed for relevant site information.

2.6 SUMMARY OF DATA RECORDS SEARCH AND ASSESSMENT FINDINGS

Under federal and state regulations a solid waste may be regulated as a hazardous waste if it is a material included in one of the United States Environmental Protection Agency's (USEPA) or the NYSDEC's lists of hazardous wastes. If a material is regulated because of its inclusion on a federal or state list, it is commonly referred to as a "listed hazardous waste." A waste may also be

regulated under the Resource Conservation and Recovery Act as a "characteristic hazardous waste" if it exhibits one of the characteristics of toxicity, corrosivity, reactivity, or flammability.

Results of sampling and analysis of the Sullivan Street Supply Wells indicated the presence of chlorinated solvents (TCE) in groundwater. Spent chlorinated solvents not originating from household sources, including TCE are included on both the USEPA's and the NYSDEC's lists of hazardous wastes. Under 6 NYCRR Part 371.4(a) (1), these spent solvents constitute hazardous waste from non-specified sources. Disposal of these chlorinated solvents has been confirmed by available analytical results from the Sullivan Street Wells, but the source area has not been identified.

As defined by 6 NYCRR Part 375, significant threat can be established by documenting a contravention of environmental standards. Surface water, soil and groundwater are the only media for which NYS has promulgated standards. Under NYS Water Quality Regulations (6 NYCRR Part 701) the state has set numeric standards that are the maximum concentration of compounds in groundwater and surface water that protect public health and/or the environment (NYS, 1999b). In addition, standards for soils have been promulgated under the revised 6 NYCRR 375 Regulations (NYS, 2006).

Analytical data from the Site was not available for review during Task 1, and therefore it was not known if the Site was the source of the TCE contamination or if the Site posed a significant threat. As a result, the SC field investigations were conducted to:

- collect the data necessary to verify the likelihood of uncontrolled waste disposal,
- determine if potential contamination was located on the Site and was migrating offsite, and
- provide sufficient information to allow the NYSDEC to re-classify the site.

3.0 SCOPE OF WORK

To reclassify the Site, the NYSDEC requires data documenting hazardous waste disposal as set forth in 6 NYCRR Part 371, and the potential significant threat to human health and the environment as defined by 6 NYCRR Part 375. Because data necessary to determine if the chlorinated compounds detected in the Sullivan Street Wells originated from the Site or if potential contamination present in Site media are migrating off-site and pose a potential significant threat to human health or the environment were not available in federal and state files reviewed during Task 1, additional field investigations were performed as described below. Task 2 activities included the Field Investigation. The objective of Task 2 activities was to determine whether the volatile organic compounds (VOCs) detected in the city supply well originated from the Site, or whether potential onsite VOC contamination is migrating offsite. Task 3 was the preparation and distribution of this Report.

3.1 TASK 2 - FIELD INVESTIGATIONS

Field investigations included:

1) Geoprobe Soil and Groundwater Sampling
2) Microwell Installation
3) Well Development
4) Synoptic Groundwater Measurement Round

The subsurface soil borings, groundwater sample collection, groundwater monitoring well installation and well development activities were conducted from September 25 through September 29, 2006.

The synoptic groundwater measurement round was conducted on November 2, 2006. A Site land survey was completed by Joseph Lu Engineering (Lu Engineers) on December 14, 2006.

3.1.1 General Field Activities

The following subsections describe the activities conducted during the field investigation, including mobilization, health and safety, and decontamination.

3.1.1.1 Mobilization

Upon receiving the NYSDEC authorization to begin fieldwork, MACTEC and its subcontractors mobilized to the Site and began the field exploration program. Field investigations were conducted from September 25 to September 29, 2006.

A field team orientation meeting was held on-site with MACTEC personnel to familiarize field workers with Site history, health and safety requirements, equipment calibration procedures, and other field procedures.

3.1.1.2 Health and Safety

Field investigation activities were conducted at Level D personal protection. Based on photoionization detector (PID) readings, no upgrades to personal protection were warranted.

3.1.1.3 Decontamination

Sampling methods and equipment for this field program were chosen to minimize investigation derived wastes and minimize possibility of cross contamination. Disposable sampling equipment was used as much as practical to minimize decontamination time and water disposal. Non disposable sampling equipment was decontaminated before and after the collection of each sample.

Non disposable sampling equipment was decontaminated by scrubbing the sample collection equipment with potable water and Liquinox, rinsing with potable water, rinsing with deionized water, and then allowing the equipment to air dry. Decontamination fluids did not exhibit visual or olfactory evidence of contamination and were released on-site to the ground surface in the area of decontamination, allowing the liquid to infiltrate into the soil and not run off-site.

3.1.1.4 Investigation Derived Wastes

The field investigation did not result in the generation of wastes that were considered hazardous (i.e., no visual or olfactory signs of contamination, and no PID readings above 5 parts per million were detected). Therefore drill cuttings and purge water resulting from the investigation were placed on the ground surface in the area of exploration and personal protective equipment and disposable sampling equipment were double bagged and disposed of as non-hazardous refuse.

3.2 GEOPROBE® BORINGS AND SAMPLING

Field investigation activities included the completion of Geoprobe® borings, the collection and analysis of groundwater, soil, and soil vapor samples, and the installation of microwells. Geoprobe sampling was conducted over a five day period from September 25 to September 29, 2006. The purpose of the activities was to provide groundwater data for comparison to NYS Class GA Groundwater Quality Standards set forth under 6 NYCRR Parts 700-705 (NYS, 1999b), and to assist the NYSDEC in evaluating significant threat to public health and the environment as defined by 6 NYCRR Part 375 (NYS, 2006). Soil sample analyses were used to assess whether hazardous waste constituents are present in Site soils, and, if possible, confirm a source of chlorinated solvents. Soil vapor sampling results were used to evaluate whether VOCs present in soil and/or groundwater are migrating towards occupied buildings via vapor migration.

MACTEC used a Geoprobe® 66DT rubber-mounted track rig sampling device to collect groundwater soil, and soil vapor samples to identify potential chlorinated solvents. The Geoprobe® pushed and/or hammered rods and probe tips into the subsurface for sample collection. A total of 21 borings were completed during this investigation, including three soil vapor borings and four microwells. A total of 38 groundwater samples, five soil samples and three soil vapor samples were collected. The boring at GW-18 could not be advanced due to the inability to clear all utilities in the borings vicinity. Sample locations are shown on Figures 3.1 and 3.2 (GS locations correspond to GW locations).

MACTEC worked closely with the NYSDEC, the Ruddick's Cleaners site owner, neighboring property owners, and utility companies while obtaining access to these exploration locations. These locations were chosen to determine groundwater conditions up-gradient and down-gradient of,

as well as at the former dry cleaner building location. Boring locations were also chosen to determine if the Site is the source, or a contributing source of TCE contamination detected in the Sullivan Street Wells.

Soil Sampling. Soil samples were collected using a four-foot long 2 inch diameter core sampler with an acrylic liner for the collection of discrete subsurface soil samples. Soil samples were collected continuously from the ground surface to the groundwater table. PID headspace readings were used to screen soil samples for the presence of VOCs as each soil sample was removed from the sample collection tube. One soil boring (GS-4) was selected for continuous soil sampling to 22 feet bgs, to better characterize site soils. Samples were described using the Unified Soil Classification System. The sample description and classification, VOC headspace reading, and boring observations were recorded on the Field Data Record, included in Appendix B. Based on the PID readings and physical evidence such as color or odor, five unsaturated soil samples were submitted to the laboratory for analysis. Samples exhibiting the highest PID readings and physical evidence of contamination were selected for analysis. Soil samples were shipped to Chemtech Consulting Group, Inc. (Chemtech) for analyses of target compound list (TCL) VOCs using USEPA OLM04.3 methods as described in the NYSDEC Analytical Services Protocol (ASP) of June 2000, including calculation of % moisture. Off-site laboratory analysis included Category B deliverables.

Groundwater Sampling. Groundwater samples were collected using a 2-inch diameter stainless steel mill slot sampling device that was exposed to the aquifer, after being pushed to the desired depth interval. A peristaltic pump or check valve (depending on sample depth) was used for the collection of discrete groundwater samples. One tubing volume of water was purged and one set of field parameters including temperature, conductivity, pH, and turbidity were collected before sampling. VOC samples were collected at a low purge rate (approximately 100 milliliters per minute) to minimize potential volatilization.

To assess vertical extent of contamination, MACTEC attempted to collect groundwater samples from two locations in each boring, the water table and 10 feet into the water table (10 feet below the first sample). Each boring was advanced to at least 10 feet into the water table, which was encountered from 10 feet bgs to 12 feet bgs. For two of the borings (GW-1 and GW-9) a third

sample from 20 feet below the water table was also collected. No sample could be collected from GW-18 due to utilities not being cleared.

Groundwater samples were shipped to Chemtech for analyses of TCL VOCs using USEPA OLM04.3 Methods as described in the NYSDEC ASP of June 2000. Off-site laboratory analysis included Category B deliverables.

Microwell Installation. To determine groundwater flow direction at the Site, four Geoprobe® borings were fitted with one-inch diameter microwells (GW-4, GW-5, GW-6 and GW-7). Microwell locations are shown on Figure 3.1. Groundwater was encountered between 10 feet bgs and 12 feet bgs. The one-inch diameter microwells were installed after groundwater samples were collected from each boring. The microwells were installed as piezometers and used primarily for water level measurements. Microwells were constructed with schedule 40 polyvinyl chloride, with 10 foot lengths of 0.01-inch machine slotted well screens. From these piezometers, water table elevations were determined and a potentiometric map of the Site was created. The wells were constructed with a # 0 sand pack to two feet above the screen, a minimum of two feet of bentonite seal placed above the sand pack, native soil as backfill and sealed at the ground surface with cement or blacktop patch. The wells were completed with a locking cap and a six inch flush mount hex key cover. The wells were developed for twenty minutes with a peristaltic pump to clean the screen and determine if the wells were conductive with groundwater. Well construction diagrams are included in Appendix B

Soil Vapor Sampling. Based on proximity to nearby residences and/or businesses, and discussions with the NYSDEC, three soil vapor samples were collected (GV-1, GV-2, GV-3) and used to evaluate the potential vapor migration of contaminants from the groundwater (Figure 3.1). The Geoprobe® rods were pushed to between 9 and 10 feet bgs, anticipated to be below the rain infiltration line, but above the water table fringe zone. Soil vapor was collected just above the water table to give an indication of the possible vapor migration from potentially contaminated groundwater.

Soil vapor samples were collected from the Geoprobe® points using the Geoprobe® PRT system. To sample with the Geoprobe® PRT system, a specialized point was attached to the end of the Geoprobe® rods. The PRT point was exposed to the soil by allowing a disposable point to drop off

the bottom of the rods while pulling the rods up 0.5 feet. The PRT point allows ¼-inch tubing to be threaded directly to the bottom of the rods, for a small discrete sample point. The tubing was run to the surface and connected directly to the sample collection device. The outside of the rods were sealed at the ground surface with pre-hydrated bentonite. Approximately two liters of soil vapor, plus the volume of the tubing, was purged using 580B OVM PID pump before collecting samples. During the soil vapor purge, vapors were screened using a PID. In addition, helium leak tests were conducted on a subset of the Region 8 Dry Cleaners Group 2 Sites soil vapor samples to ensure samples were representative of sub-surface conditions and not outdoor ambient air. Helium tests were conducted by encapsulating the sample point with a bucket sealed to the ground surface with bentonite. The encapsulated area was filled with helium. The soil vapor sample port was tested for helium breakthrough with a portable monitoring device both before and after collection of the soil vapor sample. No sample had greater than 10 percent of the tracer gas breakthrough. The soil vapor samples were collected with one-liter SUMMA®-type canisters with flow valves (set to approximately 20 minutes per sample). Flow into the canisters was less than 0.1 liters per minute, as requested by the NYSDOH. Samples were sent to Chemtech for VOC analysis by USEPA Method TO-15.

3.3 SUB-SLAB SOIL VAPOR SAMPLING.

One sub-slab soil vapor sample was scoped to be collected from the residential building located on the Site property. Upon further discussions with the NYSDEC Project Manager it was determined that no sample would be collected.

3.4 WATER LEVEL SURVEY

Water levels measurements were conducted November 2, 2006. The round consisted of measuring water levels at the four new microwells, as well as two water levels from adjacent surface water repositories (shown on Figure 1.1). Well caps were opened and the wells were allowed to equilibrate to atmospheric pressure. The depths of the wells as well as the depth to water were measured using a conductivity probe from the top of well risers. Groundwater table elevations were calculated from the well riser elevations (subsection 3.5). Well information and groundwater measurements are presented in Table 3.1.

3.5 SITE SURVEY

After completion of field sampling activities Lu Engineers surveyed the Site, and its' surrounding area including the microwell locations and the two water level locations from adjacent surface water repositories (Eldridge Lake and Weyer Pond shown of Figure 1.1). A base map of the Site was created indicating locations of microwells and all other media sampling locations. Horizontal locations were tied to the NYS Plane Coordinate System using North American Datum of 1983. The Site plan provided horizontal locations of all relevant Site features, which included surrounding homes and businesses at a scale of 1 inch to 50 feet. Relevant features included, but were not limited to all structures, buildings, roads, fences, new monitoring wells, marked underground utilities, fire plugs, and power poles.

Vertical elevations of the four new microwells were tied to msl, North Atlantic Vertical Datum of 1988, and measured to an accuracy of 0.01 feet. Horizontal well measurements are accurate to 0.1 ft. The base map was used to accurately locate all Geoprobe® sample points, microwells, and all other media sampling locations. Temporary sample points were located using a Trimble global positioning system and coordinate data is included in Table 3.2. Sample points are included on Figures 3.1 and 3.2, and the Lu Engineers survey map is included in Appendix C.

4.0 DATA ASSESSMENT

This section presents results of the laboratory analyses for soil, groundwater, and air samples collected during Task 2, as well as results of the water level survey.

4.1 ANALYTICAL RESULTS

Soil and groundwater analytical results were compared to appropriate standards, criteria or guidelines (SCGs). There are no exterior soil vapor standards or guidance values, but if detected concentrations exceeded the NYSDOH sub-slab soil vapor guidance values recommended for mitigation, these concentrations were noted as potential concerns. Reported concentrations of individual analytes indicating contravention of standards or guidelines are summarized in the following sections, and noted on Tables 4.1 through 4.4.

A Data Usability Summary Report (DUSR) was completed in accordance with the NYSDEC's Guidance for the Development of DUSRs (NYSDEC, 1997). This report and complete analytical results, including tentatively identified compounds (TICs), are presented in Appendix D. TICs were not evaluated as part of the DUSR.

Based on laboratory or data usability review, some of the data was qualified with a J, B, and/or D. Compounds were qualified J if the concentration listed was an estimated value, which was less than the specified minimum reporting limit but greater than instrument detection limit. Compounds qualified J were analyzed for and determined to be present in the sample, and the mass spectrum of the compound met the identification criteria of the method. The reporting limits for most target VOCs using the OLM04.3 Methods, including the target chlorinated solvents compounds were 10 µg/L. This is above most of the NYS Class GA groundwater standards; however, the actual instrument detection limit was below the NYS Class GA groundwater standards. A list of Chemtech's instrument reporting limits for the OLM04.3 Method is included in Appendix D.

Compounds qualified B indicated that the compound was found in the trip blank, or laboratory blank, and in the sample. It indicates possible sample contamination and warns the data user to use caution when applying the results of this analyte.

Compounds qualified D indicated that the compound was reported from an analytical run that required a dilution due to concentrations greater than the highest calibration standard.

Analytical results were compared to the SCGs described below.

Soil Samples. Analytical results were compared to NYS Soil SCGs. Soil SCGs are based on the NYSDEC's Soil Cleanup Objectives (SCOs) from 1) 6 NYCRR Subpart 375-6 - Remedial Program Soil Cleanup Objectives for Unrestricted Use, and, if not listed in (1), then 2) "Technical and Administrative Guidance Memorandum 4046 (NYSDEC, 1994); Determination of SCOs and Cleanup Levels".

Groundwater Samples. Analytical results were compared to: (1) the NYS Class GA Groundwater Quality Standards from 6 NYCRR Parts 700-706 (NYS, 1999b) or, where applicable, (2) the NYS Class GA Groundwater Quality Guidance Values from the Division of Water Technical and Operational Guidance Series 1.1.1 "Ambient Water Quality Standards and Guidance Values" (NYSDEC, 1998).

Soil Vapor Samples. There are currently no SCGs for concentrations of compounds in soil vapor. Soil vapor samples were collected to determine whether this environmental medium is contaminated, characterize the nature and extent of contamination, and identify possible sources of the contamination.

4.1.1 Soil Sample Results

A summary of target VOCs detected in soil samples is presented in Table 4.1.

VOCs were not detected in soil samples above the NYSDEC Soil Clean-up Objectives.

Trace concentrations (<10 µg/kg) of tetrachloroethene (PCE) were detected at four of the five sample locations ranging from 0.63 µg/kg (GS-4) to 5.6 µg/kg (GS-1). These detections were all below the NYSDEC SCO of 1300 µg/kg.

Trace concentrations (less than 15 µg/L) of acetone and methylene chloride were detected at sample location GS-3 and trace concentrations(less than 10 µg/L) of 2-butanone, ethyl benzene, methylene chloride, o-xylene, toluene, and m/p xylene were detected in sample GS-5. All detections were less then NYSDEC Soil Clean-up objectives (see Table 4.1).

4.1.2 Groundwater Sample Results

A summary of target VOCs and semi volatile organic compounds (SVOCs) detected in groundwater samples collected is presented in Table 4.2 and 4.3, respectively, and maximum detections of PCE and TCE per boring are presented on Figure 4.1.

TCE was detected at three of the eighteen sample locations with detections ranging from 2.9 J µg/L (GW-5) to 19 µg/L (GW-14). TCE concentrations in groundwater exceeded the NYS Class GA groundwater standard of 5 µg/L at one location GW-14 (see Table 4.2).

PCE was detected at ten of the eighteen groundwater sample locations with detections ranging from 1.2 J µg/L (GW-1) to 16 µg/L (GW-5). PCE concentrations detected at six of the eighteen sample locations exceeded the NYS Class GA groundwater standard for PCE of 5 µg/L (see Table 4.2).

Cis-1,2-dichloroethene was detected at eight of the eighteen sample locations with detections ranging from 1.8 J µg/L (GW-8) to 6.3 J µg/L (GW-5). Cis-1,2-dichloroethene concentrations detected at sample locations GW-4 and GW-5 exceeded the NYS Class GA groundwater standard of 5 µg/L (see Table 4.2).

Trace concentrations (<5 µg/L) of methylene chloride were detected at four of the eighteen sampling locations. In addition, trace concentrations (<5 µg/L) of toluene and acetic acid were reported at location GW-15 and trace detections (<5 µg/L) of trans-1,2-dichloroethene were reported at locations GW-4 and GW-9. All detections for methylene chloride, toluene, acetic acid, and trans-1,2-dichloroethene were less than their associated NYS Class GA groundwater standard of 5 µg/L (see Table 4.2).

Trace concentrations (<5 µg/L) of the SVOC compounds butylbenzyphthalate and di-n-octylphthalate were detected at sample locations GW-9 and GW-15. These detections were well below the NYS Class GA groundwater standards of 50 µg/L for each compound (see Table 4.3).

Several VOC and SVOC TICs were also reported in the groundwater samples collected. TICs are reported in Appendix D (see Table 1.5).

4.1.3 Soil Vapor Sample Results

A summary of target VOCs detected in soil vapor samples is presented in Table 4.4.

The only VOCs for which the NYSDOH has promulgated guidance values for soil vapor are TCE, PCE, and 1,1,1-trichloroethane (1,1,1-TCA) (NYSDOH, 2006). These guidance values are only applicable when evaluating sub-slab soil vapor samples in relation to indoor air concentrations, and not exterior soil vapor samples.

Trace concentrations (<10 µg/m^3) of TCE, PCE, and/or 1,1,1-TCA were reported at all three sample locations. These concentrations are not indicative of source area concentrations. In addition, there were slightly elevated concentrations (>100 µg/m^3) of acetone, cyclohexane, heptane, hexane, and propylene at one or more of the sample locations (see Table 4.4).

4.2 POTENTIOMETRIC SURFACE MAP

The microwell survey and depth to water measurements were used to calculate groundwater table elevations (presented on Figure 4.2). Microwell survey and water elevation data are presented in Table 3.1. Depth to water across the survey area varied from approximately 11 feet bgs to 13 feet bgs. Groundwater elevations varied from 847.35 feet above msl, to 847.23 feet above msl. The groundwater table gradient appears to be flat, varying by only 0.12 feet in elevation over 125 feet of distance, or 0.001 ft/ft (GW-6 to GW-4). Interpreted groundwater flow, based on site groundwater elevations, as well as groundwater elevations measured at the other Region 8 Dry Cleaner's - Group II sites in the Elmira Valley, is to the south/southeast, towards the Newtown Creek.

5.0 INVESTIGATION FINDINGS

A review of physical and chemical data collected during the SC resulted in the following findings:

1) The Site is located in a residential neighborhood that is serviced by public water. Low concentrations of TCE (<10.3 µg/L) have been detected in the City of Elmira's Sullivan Street public supply well, located approximately 0.2 miles east of the Site. Groundwater measurements collected at the Site and in the greater Elmira Valley indicate that groundwater flow is generally to the south south-east and not towards this supply well.
2) No chlorinated solvents were detected above the NYSDEC Soil Cleanup objectives in the five soil samples collected. Three of the samples were collected from around the reported location of the former Dry Cleaners building footprint.
3) TCE, a NYS listed hazardous waste, was detected approximately 800 feet up-gradient of the Site at location GW-14 at a concentration of 19 µg/L in comparison to the NYS standard of 5 µg/L. Low concentrations of TCE (<5 µg/L) were detected in groundwater at the site, and groundwater samples collected down-gradient of the Site at GW-9 and GW-10 showed no detections of TCE, indicating that the Site is not likely a contributing source to the TCE detected in the city supply wells.
4) PCE, a common dry cleaning solvent and a NYS listed hazardous waste, was detected in groundwater samples collected from 10 of 18 sample locations; concentrations detected exceeded NYS groundwater standard of 5 µg/L at PCE at 6 of the 18 locations. PCE was not detected in groundwater samples collected from presumably up-gradient sample locations GW-14, GW-13, and GW-12. PCE was detected at the highest concentrations in groundwater samples collected from locations GW-5 (16 µg/L) and GW-4 (14 µg/L), located at the southern edge of the site property; GW-4 is located adjacent to the reported former Dry Cleaners building. Trace concentrations (<10 µg/kg) of PCE was detected on-site at four of the five sampled locations; however, concentrations were below NYSDEC soil cleanup objectives. This data, combined with lower concentrations of PCE detected in downgradient groundwater samples indicate that the Site is likely the source of PCE detected in groundwater.
5) Trace concentrations (less than 10 $\mu g/m^3$) of PCE and TCE were detected in the three Geoprobe soil vapor samples. 1,1,1 TCA was detected in only one Geoprobe soil vapor sample, GV-1.

Data Gaps. Based on the SC, the following data gaps still exist:

1. Based on anticipated groundwater flow direction and concentrations detected, the source of PCE contamination detected in groundwater appears to be in the vicinity of the Site, but a source area has not been located.
2. The downgradient extent of PCE contamination above NYS Class GA water standard of 5 has not been defined.

DATA USABILITY SUMMARY REPORT

DATA VALIDATION REPORT

Volatile & Semi-volatile Analyses

SDG No. X4586
Sampling Date: September 27 & 29, 2006

Submitted to:

MACTEC, Inc.,
511 Congress Street
Portland, ME 04112
207-775-5401

Submitted by:

EDV, Inc.,
1326 Orangewood Avenue
Pittsburgh, PA 15216
412-341-5281

December 26, 2006

Site:	Ruddick Cleaners/NYSDEC
Client:	MACTEC, Inc.
Analytical Laboratory:	Chemtech 284 Sheffield Street Mountainside, NJ 07092
Sample Delivery Group (SDG):	X4586
Sampling Date:	September 27 & 29, 2006
Analyses:	Volatile
Analytical Method:	CLP OLM 4.3 and USEPA TO-15

Summary of Data Validation:

The adherence of laboratory analytical performance to CLP and USEPA TO-15 Analytical Specifications were evaluated during the data validation process. The USEPA Region II's data validation SOP Checklists (SOP HW-18 Rev 0, August 1994**,** SOP, HW-15 Rev 2, May 1993) and the National Functional Guidelines for Organic Data Review (October 1999), were used as guidelines for data qualifications.

Volatile: 1,1,1-Trichloroethane in some samples was qualified as a non-detect due to method blank contamination. Some compounds were qualified as estimated due to calibration issues. One acetone sample result was qualified as estimated due to calibration range exceedance.

Semi-volatile: Benzaldehyde, 2,4-dinitrophenol and bis (2-ethyl hexyl) phthalate were qualified as estimated due to calibration issues. Some other compounds were qualified as estimated due to internal standard area issues.

The sample qualifiers applied by the data validator are in section 15.0 and Attachment A- Form 1s. The detailed discussions can be found in the report.

3.0 Detection Limits

All Contract Required Detection Limits (CRDLs) were met.

4.0 Holding Time

Holding times were acceptable.

4.1 Sample Preservation

Samples were appropriately preserved.

4.2 Percent Moisture

Percent moisture is not applicable.

4.3 Chain of Custody Record

Chain of Custody Record was present.

5.0 Calibration Quality Control

5.1 Initial Calibration

Air samples-Methylene chloride-35.34% recovery exceeded the 30 %RSD criterion. All results were qualified as estimated due to this anomaly.

SVOA: For ICAL done on instrument BNAA, the following compound exceed the 30% relative percent difference criterion.

Compound	**%RSD-10/08/06**
Benzaldehyde	30.8
2,4-dinitrophenol	37.0
Bis-2-ethyl hexyl phthalate	32.4

Detected results for these compounds in affected samples were qualified "J" to indicate the results are estimated and non-detected results were qualified "UJ" to indicate the results are estimated due to this anomaly.

5.2 Continuing Calibration (CCAL)

For water samples the following %D criteria were exceeded;

Compound	**%D-10/04/06**	**%D-10/05/06**
Dichlorodifluoromethane	37.4	-
Bromomethane	32.3	-
Chloroethane	31.9	-
Trichlorofluoromethane	28.5	40.3
1,1-Dichloroethene	29.6	-
1,2-Dichloroethane	-	29.4
Bromoform	-	31.0
1,2-Dibromo-3-chloropropane	-	46.6

6.0 Blanks Quality Control

VOA: Method blank reported 1,1,1-trichloroethane contamination. All affected detected acetone results were qualified as non-detects due to this anomaly.

SVOA: Method blank reported bis (2-ethyl hexyl) phthalate contamination at 10µg/L. This resulted in associated detected results for this compound being qualified as a non-detect at CRDL.

7.0 Surrogate Recoveries

Recoveries are acceptable.

8.0 Accuracy

8.1 Laboratory Control Samples (LCS)/Blank Spikes

LCS recoveries were acceptable.

8.2 Matrix Spike/Matrix Spike Duplicates (MS/MSD)

8.2.1 Frequency

No MS/MSDs were analyzed.

8.2.2 Recovery

Recoveries are no applicable.

9.0 Precision

9.1 Matrix Spike Duplicates

The results were acceptable.

9.2 Matrix Duplicate

RPDs were acceptable.

10.0 Field QC

10.1 Field Blanks/Rinse Blanks

There were no field blanks associated with this SDG.

10.2 Trip Blanks

Trip blanks reported some contamination but there were no affected sample results thus no qualification was necessary.

10.3 Field Duplicate

Sample RCGW00201301XD was presented as a field duplicate. The original sample is identified as RCGW00201301XX. RPD for tetrachloroethene exceed the QC criterion. However, the compound was qualified by the laboratory as estimated "J" and therefore required no further qualification. Sample RCGV00101001XD was presented as a field duplicate. The original sample is identified as RCGV00101001XX. RPDs are calculated when both original and duplicate report detects. RPDs were acceptable.

11.0 Internal Standards (IS)

11.1 IS Area Counts

SVOA: IS area counts for perylene d-12 was below the required QC limits. All affected samples were qualified as non-detects.

11.2 Retention Time (RT)

All RTs were within the method accepted criteria.

12.0 Target Compound Identification

All target compounds identification is acceptable.

12.1 Tentatively Identified Compounds (TICs)

TICs were acceptable.

13.0 Calculations and Transcription

Raw data were accurately transcribed to summary data sheets.

14.0 Additional Comments

Acetone in sample RCGV00201001XX was qualified as estimated "J" due to calibration range exceedance. The sample was reanalyzed at 20X dilution in which acetone was reported as a non-detect. Based on professional judgment and technical information the validator determined that the compound was present in the sample, but an accurate concentration was not attainable at 2X dilution, thus an estimated concentration.

15.0 Data Qualifier Table

Volatile

Sample Identification	Compound	Qualifier	Section Reference
RCGW00201301XD, RCGW00202301XX, RCGW00401301XX, RCGW00402301XX	Dichlorodifluoromethane, bromomethane, chloroethane, trichlorofluoromethane, 1,1-dichloroethene	UJ	5.2

4.0 Holding Time

Holding times were acceptable.

4.1 Sample Preservation

Samples were appropriately preserved.

4.2 Percent Moisture

Percent moisture results are acceptable.

4.3 Chain of Custody Record

Chain of Custody Record was present.

5.0 Calibration Quality Control

5.1 Initial Calibration

SVOA: For ICAL done on instrument BNAA, the following compound exceed the 30% relative percent difference criterion.

Compound	**%RSD-10/08/06**
Benzaldehyde	30.8
2,4-dinitrophenol	37.0
Bis (2-ethyl hexyl) phthalate	32.4

Detected results for these compounds in affected samples were qualified "J" to indicate the results are estimated and non-detected results were qualified "UJ" to indicate the results are estimated due to this anomaly.

5.2 Continuing Calibration (CCAL)

VOA: The following compounds exceeded the 25% CCAL criterion:

Compound	**%D 9/30/06**	**%D-10/03/06**
Methyl acetate	28.4	-
Trichlorofluromethane	-	26.1
Acetone	-	30.4
2-butanone	-	27.4

6.0 Blanks Quality Control

VOA: Method blank VBLK04 reported acetone and 2-butanone contamination at 17 and 7 µg/L respectively. Method blank VBLK03 reported acetone contamination at 11 µg/L. All associated detected results for these compounds were qualified as non-detects.

SVOA: Method blank reported bis (2-ethyl hexyl) phthalate and di-n-butyl phthalate contamination at 10µg/L and 1.5µg/L respectively. This resulted in associated detected results for this compound being qualified as a non-detect at CRDL.

7.0 Surrogate Recoveries

Recoveries were acceptable.

8.0 Accuracy

8.1 Laboratory Control Samples (LCS)/Blank Spikes

LCS recoveries were acceptable.

8.2 Matrix Spike/Matrix Spike Duplicates (MS/MSD)

8.2.1 Frequency

2.0 Completeness Checklist

The following table identifies the summary form information and raw data found in the data package. Form numbers shown in parentheses refer to the current U.S. EPA CLP SOW equivalent reporting of results in an alternate summary format that has been determined to be acceptable. Analyses in this data package were performed in accordance with USEPA CLP Method.

Completeness Checklist

3.0 Detection Limits

All Contract Required Detection Limits (CRDLs) were met.

4.0 Holding Time

Holding times were acceptable.

4.1 Sample Preservation

Samples were appropriately preserved.

4.2 Percent Moisture

Percent moisture results are acceptable.

4.3 Chain of Custody Record

Chain of Custody Record was present.

5.0 Calibration Quality Control

5.1 Initial Calibration

SVOA: For ICAL done on instrument BNAA, the following compound exceeded the 30% relative percent difference criterion.

Compound	%RSD-10/08/06
Benzaldehyde	30.8
2,4-dinitrophenol	37.0
Bis-2-ethyl hexyl phthalate	32.4

Detected results for these compounds in affected samples were qualified "J" to indicate the results are estimated and non-detected results were qualified "UJ" to indicate the results are estimated due to this anomaly.

5.2 Continuing Calibration (CCAL)

VOA: The following compounds exceeded the 25% difference criterion.

Compound	%D-10/04/06	%D-10/05/06	%D-10/08/06
Dichlorodifluoromethane	37.4	-	26.3
Chloromethane	-	-	29.8
Bromomethane	32.3	-	30.2
Chloroethane	31.9	-	30.8
Acetone	-	-	34.4
Trichlorofluoromethane	28.5	40.3	-
1,1-dichloroethene	29.6	-	-
1,2-dichloroethane	-	29.4	-
Bromoform	-	31.0	-
1,2-Dibromo-3-chloropropane	-	46.6	-

Detected results for these compounds in affected samples were qualified "J" to indicate the results are estimated and non-detected results were qualified "UJ" to indicate the results are estimated due to this

anomaly.

6.0 Blanks Quality Control

Method blanks were acceptable.

7.0 Surrogate Recoveries

VOA: Surrogate recovery for toluene-d_8 in sample RCGW01701901XX was 113% which was above the 88-111% QC limits. There were no detects for this sample thus, no qualification was necessary.

8.0 Accuracy

8.1 Laboratory Control Samples (LCS)/Blank Spikes

LCS recoveries were acceptable.

8.2 Matrix Spike/Matrix Spike Duplicates (MS/MSD)

8.2.1 Frequency

Frequency was met.

8.2.2 Recovery

Recoveries are acceptable.

9.0 Precision

9.1 Matrix Spike Duplicates

The results were acceptable.

9.2 Matrix Duplicate

RPDs were acceptable.

10.0 Field QC

10.1 Field Blanks/Rinse Blanks

No field blanks were reported with this SDG.

10.2 Trip Blanks

Trip blank reported no contamination.

10.3 Field Duplicate

Sample RCGW01501301XD was presented as a field duplicate. The original sample is identified as RCGW01501301XX. RPDs are calculated when both original and duplicate report detects. RPDs were

acceptable.

11.0 Internal Standards (IS)

11.1 IS Area Counts

SVOA: IS area counts were below the required QC limits for perylene-d_{12} in samples RCGW01501301XX and RCGW01501301XD. All affected compounds were qualified as estimated due to this anomaly.

11.2 Retention Time (RT)

All RTs were within the method accepted criteria.

12.0 Target Compound Identification

All target compounds identification is acceptable.

12.1 Tentatively Identified Compounds (TICs)

TICs were acceptable.

13.0 Calculations and Transcription

Raw data were accurately transcribed to summary data sheets.

14.0 Additional Comments

VOA: Samples RCGW01700901XX and RCGW01701901XX were reanalyzed due to surrogate recovery issues. Based on professional judgment and technical information, the validator presented the reanalyses.

SVOA: Sample RCGW01501301XX and RCGW01501301XD were reanalyzed due to internal standard area issues. Based on professional judgment and technical information, the validator presented the original analyses.

15.0 Data Qualifier Table

Volatile

Sample Identification	Compound	Qualifier	Section Reference
RCGS00300701XX, RCGW01402701XX, RCGW01900901XX	Dichlorodifluoromethane, chloromethane, bromomethane, chloroethane,	UJ	5.2
RCGW01402701XX, RCGW01501301XX, RCGW01502301XX, RCGW01600901XX	Dichlorodifluoromethane, bromomethane, chloroethane, trichlorofluoromethane, 1,1-dichloroethene	UJ	5.2
RCGW00301301XX, RCGW00302301XX, RCGW00801301XX, RCGW00802302XX, RCGW01201301XX, RCGW01202301XX, RCGW01401701XX, RCGW01900901XX, RCTB003XXX01XX	Trichlorofluoromethane, 1,2-dichloroethane, bromoform, 1,2-dibromo-3-chloropropane	UJ	5.2

Semi-volatile

Sample Identification	Compound	Qualifier	Section Reference
RCGW01501301XX, RCGW01501301XD	Benzaldehyde, 2,4-dinitrophenol, bis (2-ethyl hexyl) phthalate	UJ	5.1
	Benzo (b) fluoranthene, benzo (k) fluoranthene, benzo (a) pyrene, indeno (1,2,3-cd) pyrene, dibenz (a,h) anthracene, benzo (g,h,i) perylene	UJ	11.1

DATA USABILITY SUMMARY REPORT
SEPTEMBER 2006 SAMPLING EVENT
RUDDICK CLEANERS
ELMIRA, NY

1.0 Introduction:

Water, soil, and air samples were collected at the Ruddick Cleaner's site in September 2006 and submitted for off-site laboratory analyses. Samples were analyzed by CHEMTECH in Mountainside, New Jersey. A listing of samples included in this investigation is presented in Table 1. Samples were analyzed for the following parameters:

- Air: EPA Method TO-15 for VOCs
- Water: VOCs and SVOCs by CLP OLM04.3
- Soil: VOC by CLP OLM04.3

Deliverables for the off-site laboratory analyses included a Category B deliverable as defined in the New York State Department of Environmental Conservation (NYSDEC) Analytical Services Protocols (NYSDEC, 1995; NYSDEC, 2000).

Data validation was completed based on NYSDEC Division of Environmental Remediation guidance for Data Usability Summary Reports (NYSDEC, 2002) and USEPA Region II Guidelines (USEPA, 1993; USEPA, 1994). Samples were reported in lab sample delivery groups (SDG) X4586, X4707, and X4752. Validation was completed by EDV, Inc. in Pittsburgh, Pennsylvania. Validation reports for each SDG are presented in Attachment 1. With the exception of the items discussed below, results are interpreted to be usable as reported by the laboratory. The following qualifiers are used in the final data presentation.

U = target analyte is not detected at the reported detection limit
J = concentration is estimated
UJ = target analyte is not detected at the reported detection limit and is estimated

A summary of final sample results is presented in Appendix E. Tentatively identified compounds (TICs) were reported in accordance with the CLP methods if detected. A summary of detected TICs is provided in Appendix E.

2.0 Water Samples

2.1 VOCs

X4707

The continuing calibration had percent differences that were greater than the control limit of 25 for methyl acetate (28.4). The results for methyl acetate in samples RCGW00501301XX, RCGW00502301XX, RCGW00602301XX, RCGW00601301XX, RCGW00702301XX, and RCGW00701301XX were non-detect and were qualified as estimated (UJ).

X4586

The continuing calibration had percent differences that were greater than the control limit of 25 for dichlorodifluoromethane (37.4), bromomethane (32.3), chloroethane (31.9), trichlorofluoromethane (28.5), and 1,1-dichloroethene (29.6). The results for these compounds in samples RCGW00201301XD, RCGW00202301XX, RCGW00401301XX, and RCGW00402301XX were non-detect and were qualified as estimated (UJ).

Sample RCGW00201301XD was presented as the field duplicate. The original sample is identified as RCGW00201301XX. The relative percent difference for tetrachloroethene exceeds the QC criterion. However, the compound was qualified by the laboratory as estimated "J" and therefore required no further qualification.

X4752

The initial calibration had relative standard deviations that were greater than the control limit of 30 for chloroethane (44.9) and trichlorofluoromethane (40.1). The results for these compounds in samples RCGW01101501XX, RCGW01102501XX, RCGW01700901XX, RCGW01701901XX, RCGW01901XX, and RCGW01501301XD were non-detect and were qualified as estimated (UJ).

The continuing calibration had percent differences that were greater than the control limit of 25 for dichlorodifluoromethane (37.4), bromomethane (32.3), chloroethane (31.9), trichlorofluoromethane (28.5), and 1,1-dichloroethene (29.6). The results for these compounds in samples RCGW01402701XX, RCGW01501301XX, RCGW01502301XX, and RCGW01600901XX were non-detect and were qualified as estimated (UJ).

The continuing calibration had percent differences that were greater than the control limit of 25 for trichlorofluoromethane (40.3), 1,2-dichloroethane (29.4), bromoform (31.0), 1,2-dibromo-3-chloropropane (46.6) and chloroethane (44.9). The results for these compounds in samples RCGW00301301XX, RCGW00302301XX, RCGW00801301XX, RCGW00802302XX, RCGW01201301XX, RCGW01202301XX, RCGW01401701XX, and RCGW01900901XX were non-detect and were qualified as estimated (UJ).

Samples RCGW01700901XX and RXGW01701901XX were reanalyzed due to surrogate recovery issues. Based on professional judgment and technical information, the validator presented the reanalyses.

2.2 SVOCs

X4707

The initial calibration had relative standard deviations that were greater than the control limit of 30 for benzaldehyde (30.8), 2,4-dinitrophenol (37.0), and bis(2-ethyl-hexyl)phthalate (32.4). The results for these compounds in sample RCGW00101701XX were non-detect and were qualified as estimated (UJ).

The method blank had detections of bis(2-ethyl-hexyl)phthalate (10 µg/L) and di-n-butyl phthalate (1.5 µg/L). An action level was calculated at ten times the detections reported in the

blank. The results for these two compounds in sample RCGW00101701XX were less than the action level and were qualified as non-detect (U).

X4586

The initial calibration had relative standard deviations that were greater than the control limit of 30 for benzaldehyde (30.8), 2,4-dinitrophenol (37.0), and bis (2-ehtyl-hexyl)phthalate (32.4). The results for these compounds in sample RCGW00901701XX were non-detect and were qualified as estimated (UJ).

The method blank reported detections of bis(2-ethyl-hexyl)phthalate (10 µg/L). An action level was calculated at ten times the detection reported in the blank. The result for bis(2-ethyl-hexyl)phthalate in sample RCGW00901701XX was less than the action level and was qualified as non-detect (U).

Sample RCGW00901701XX had area counts for the internal standard perylene d-12 that were low and outside of control limits. The compounds associated with this internal standard were qualified as estimated (J/UJ) and include: benzo(b)fluoranthene, benzo(k)fluoranthene, benzo(a)pyrene, indeno(1,2,3-cd)pyrene, dibenz(a,h)anthracene, benzo(ghi)perylene, and di-n-octyl phthalate.

X4752

The initial calibration had relative standard deviations that were greater than the control limit of 30 for benzaldehyde (30.8), 2,4-dinitrophenol (37.0), and bis(2-ethyl-hexyl)phthalate (32.4). The results for these compounds in samples RCGW01501301XX and RCGW01501301XD were non-detect and were qualified as estimated (UJ).

The method blank reported detections of di-n-butyl phthalate (1.5 µg/L) and bis(2-ethyl-hexyl)phthalate (10 µg/L). An action level was calculated at ten times the detections reported in the blanks. The results for di-n-butyl phthalate in sample RCGW01501301XD was less than the action level and was qualified as non-detect (U). In addition, the results for bis(2-ethyl-hexyl)phthalate in samples RCGW01501301XX and RCGW01501301XD were both less than the action level and were qualified as non-detect (U).

Samples RCGW01501301XX and RCGW01501301XD had area counts that were less than control limits for the internal standard perylene d-12. The compounds associated with this internal standard were qualified as estimated (J/UJ) and include: benzo(b)fluoranthene, benzo(k)fluoranthene, benzo(a)pyrene, indeno(1,2,3-cd)pyrene, dibenz(a,h)anthracene, benzo(ghi)perylene, and di-n-octyl phthalate.

Samples RCGW01501301XX and RCGW01501301XD were reanalyzed due to internal standard area issues. Based on professional judgment and technical information, the validator presented the original analyses.

3.0 Soil Samples

3.1 VOCs

X4707

The continuing calibration had percent differences that were greater than the control limit of 25 for trichlorofluoromethane (26.1), acetone (30.4), and 2-butanone (27.4). The results for these compounds in samples RCGS00100901XX, RCGS00200801XX, RCGS00400401XX, and RCGS00400401XD were non-detect and were qualified as estimated (UJ).

The method blank VBLK04 reported detections of acetone (17 µg/L) and 2-butanone (7 µg/L). In addition, a detection of acetone (11 µg/L) was detected in another method blank. An action level was calculated at ten times the detections reported in the blanks. The result for acetone in sample RCGS00500201XX was less than the action level and was qualified as non-detect (U). In addition, the detections for acetone and 2-butanone in samples RCGS00100901XX, RCGS00200801XX, RCGS00400401XX, and RCGS00400401XD were less than the action level and were qualified as non-detect (U).

X4752

The continuing calibration had percent differences that were greater than the control limit of 25 for dichlorodifluoromethane (26.3), chloromethane (29.8), bromomethane (30.2), and chloroethane (30.8). The results for these compounds in sample RCGS00300701XX were non-detect and were qualified as estimated (UJ).

4.0 Air Samples

4.1 VOCs

X4586

The initial calibration had relative standard deviations that were greater than the control limit of 30 for methylene chloride (35.3). The results for methylene chloride in samples RCGV00101001XX, RCGV0010100XD, and RCGV00301001XX were positive and were qualified as estimated (J).

The method blank reported a detection of 1,1,1-trichloroethane. An action level was calculated at five times the detection reported in the blank. The results for 1,1,1-trichloroethane in samples RCGV001001XX and RCGV00301001XX were less than the action level and were qualified as non-detect (U).

Acetone in sample RCGV00201001XX was qualified as estimated “J” due to calibration range exceedence. The sample was reanalyzed at 20X dilution in which acetone was reported as a non-detect. Based on professional judgment and technical information the validator determined that the compound was present in the sample, but an accurate concentration was not attainable at 2X dilution, thus an estimated concentration.
