Gentlemen:

Attached is one copy of the Supplemental Engineering Report, prepared by Haley and Aldrich of New York ("Haley & Aldrich") on behalf of Kaddis Manufacturing Corporation ("Kaddis"). This document has been submitted to you as follow-up to the agreement between Kaddis and the New York State Department of Environmental Conservation ("NYSDEC"), as the result of the meeting held 24 January 2005 in which Kaddis proposed to perform additional excavation of impacted source area soils as further remedial action at the site.

This Report presents a summary description of the supplemental remedial excavation, including implementation of a post-construction monitoring program. The excavation activities were implemented as follow-up to the findings of the following:

- Remedial Investigation Report, dated January 1996,
- Feasibility Study Report dated 16 May 1997,
- results of remedial activities performed in the fall of 1999 as prescribed by the Remedial Design/Remedial Action Plan, dated September 1998 revised January 1999.
- In general accordance with the findings of follow-up Operations & Maintenance (O&M) monitoring and semi-annual Progress Reports from 2000 through 2004.
- Haley & Aldrich's Geoprobe investigation/TAGM 3028 "Contained-In" request letter to NYSDEC dated 24 June 2005.

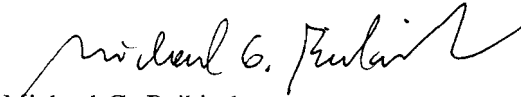

This Report has been prepared as per the agreement between Kaddis and NYSDEC based on the 24 January 2006 meeting and follow-up e-mail correspondence and is intended to document further remedy for mitigation of VOCs-impacted source area soils. Kaddis understands that additional post-excavation monitoring will also be required.

NYSDEC
31 March 2006
Page 2

Also, in accordance with the Department's 5 August 2005 reduction-in-monitoring approval letter to Kaddis, this report also serves as the first post-excavation annual report to NYSDEC. The report summarizes activities through 31 December 2005.

If you need any additional information please do not hesitate to contact us.

Sincerely yours,
HALEY & ALDRICH of NEW YORK

EXECUTIVE SUMMARY

This report presents a Supplemental Engineering Report for the Enarc-O Machine Products (Enarc-O) facility site in Lima, New York. The original Remedial Design Remedial Action Plan (RDRAP) was prepared and submitted to NYSDEC in October 1998 and was revised January 1999. The RDRAP focused on "courtyard" area soils excavation activities performed in the fall of 1999. Since the original remedial excavation, Kaddis has performed more than five years of follow-up O&M monitoring, groundwater sampling, and LNAPL recovery operations. In October 2005, Kaddis performed additional source area soil excavation activities to remove remaining source area VOCs from beneath the footprint of the Enarc-O building adjoining the courtyard.

This Supplemental Engineering Report has been prepared to document the details of the supplemental remedial action for the Enarc-O facility. Additional excavation activities focused on removal of remaining source-area soils. The completion of this work is intended to result in attaining the goals established in Section 5 of the Record of Decision for the site, dated August 1997, and thereby fulfilling Kaddis' remaining obligations under DEC Order on Consent, Index #B8-0112-84-10 (RD/RA), dated June 1999.

Additional soil excavation was performed by Kaddis in the vicinity of the former degreaser beneath the east wing of the building. The majority of identified impacted soils were excavated and removed based on visual observations, photoionization-detector (PID) field-screening readings, and within the limitations imposed on the extent of excavation as a result of building structural stability, and safety considerations.

Approximately 650 cubic yards of impacted soils were removed from beneath the building floor within an approximately 25-foot by 50-foot area beneath and adjoining the former degreaser location. A limited number of small pods of impacted soil remained in the subsurface following excavation, located at the base of the western and southern walls of the excavation, due to engineering factors affecting the building roof support system and the pre-existing south wall foundation support footer (which was kept intact), respectively. The depth of excavation at these locations and need to avoid undermining the standing structure limited the ability to remove these small pods of impacted soils located within the excavation.

Post-excavation monitoring will be conducted to assess the efficacy of the overall remediation, including the recent soil removal. Based on completion of this work, Kaddis requests the Department reclassify the Enarc-O site to a Class 4 site.

1. INTRODUCTION AND PROJECT BACKGROUND

This report presents a Supplemental Final Engineering Report for the Enarc-O Machine Products (Enarc-O) facility site in Lima, New York. The original Remedial Design/Remedial Action Plan (RDRAP) was prepared and submitted to NYSDEC in October 1998 and was revised January 1999. The RDRAP focused on "courtyard" area soils excavation activities, which were performed in the fall of 1999. Since the original remedial excavation, Kaddis has performed more than five years of follow-up O&M monitoring, groundwater sampling, and LNAPL recovery operations.

The site is an approximately 6-acre property located at 1175 Bragg Street in Lima, New York, in the northeastern portion of Livingston County as shown on Figure 1. The Enarc-O facility is a one-story slab-on-grade building, located in the northern half of the site. Enarc-O manufactures precision screw products.

The facility is on the New York State Department of Environmental Conservation (NYSDEC) Inactive Hazardous Waste Site Registry (Site No. 8-26-011). In accordance with 6NYCRR Part 375, a remedial investigation (RI) was performed and the results and findings were summarized in a report entitled "Report on Remedial Investigation, Enarc-O Machine Products, Lima, New York, NYSDEC Registry No. 8-26-011", dated January 1996.

The RI investigation identified the presence of chlorinated volatile organic compounds in soil and groundwater at the site, primarily in the source area, located beneath the facility's courtyard and a portion of the building. Specifically, trichloroethene, tetrachloroethane, 1,1,1-trichloroethane, and cis 1,2-dichloroethene were present at greatest concentrations in the source area.

The RI was followed by a feasibility study (FS), which evaluated numerous potential remedial techniques in light of the known contaminant presence, site conditions and constraints and designated cleanup goals. The FS was summarized in a report entitled "Report on Feasibility Study, Enarc-O Machine Products, Lima, New York, NYSDEC Registry No. 8-26-011", dated May 1997. The FS report selected a combination of response actions to address the presence of contaminants in source-area soils.

Based on these investigations and reports, NYSDEC prepared a Proposed Remedial Action Plan (PRAP, dated June 1997), which presented a description of the proposed remedial actions to be taken at the site. After a public comment period, the PRAP was followed up by a Record of Decision (ROD, dated February 1998), which finalized NYSDEC acceptance of the proposed remedy. No complete exposure pathways were found, therefore the remediation focused on contaminants in the courtyard source area soils and continued site monitoring.

The findings and results of the original RDRAP regarding courtyard remedial excavation activities were presented in the report entitled "Final Engineering Report/O&M Plan, Enarc-O Machine Products, Lima, New York," dated December 1999 and revised May 2000. The report indicated that the source area soils were successfully excavated and presented the O&M Plan to guide future monitoring activities, including SVE system monitoring, semi-annual groundwater sampling and analysis, and semi-annual reporting.

Subsequent groundwater monitoring (October 1999) and Progress Report information indicated that a thin layer of LNAPL appeared in courtyard monitoring well MW-201D, a shallow-bedrock well installed in the source area, soon after the completion of excavation

activities. The appearance of LNAPL was believed to be the result of an influx of rainwater into the excavation during remediation activities, thereby resulting in the remobilization of small volumes of LNAPL previously present under static equilibrium conditions.

In late 1999-early 2000 NYSDEC required Kaddis to increase the frequency and scope of groundwater sampling and analysis, as well as undergo LNAPL monitoring and recovery activities, to effectively monitor and capture the remobilized LNAPL. The LNAPL was not observed to have mobilized to any of the nearby monitoring well locations and did not significantly increase in thickness. As required by NYSDEC, Kaddis also performed a one-day Enhanced Fluid Recovery (high vacuum extraction) operation at MW-201D on 30 June 2000 to remove residual LNAPL from the well and surrounding formation. Less than six gallons of total fluids, primarily water with only a very minor volume of LNAPL, was recovered.

Kaddis continued to perform additional groundwater sampling, LNAPL monitoring, and LNAPL recovery using oil-absorbent socks. Kaddis effectively demonstrated that the LNAPL did not increase in aerial extent or thickness, and instead appeared to have reestablished its former static condition. At the end of 2004 Kaddis was again performing regular SVE system monitoring, semi-annual groundwater sampling and analysis, and semi-annual reporting.

In a letter to Kaddis, dated 11 December 2003, NYSDEC indicated it was of the opinion that on-site VOCs levels in groundwater were not sufficiently declining as a result of the source area soil excavation. To address this, NYSDEC requested Kaddis consideration of a number of Site-related issues, including the continued presence of LNAPL in MW-201D, indoor air quality in nearby residences and in the Enarc-O Plant, further plume definition, upgrades to the SVE system, alternative groundwater remediation technology evaluation, and irregular patterns in the on-Site supply well VOCs levels.

Based on this letter, Kaddis met with NYSDEC project personnel on 21 January 2004, and reached an agreement to continue discussion of the comments and to search for information already in the Site record which was responsive to the comments. Kaddis, Haley & Aldrich, and NYSDEC corresponded for several months, and Haley & Aldrich met again with NYSDEC in Albany on 11 May 2004 and again on 30 June 2004 to further discuss these issues. The Department issued a follow-up letter dated 2 September 2004 in which it essentially maintained its previous assertions regarding the evaluation requested of Kaddis.

Kaddis and NYSDEC met again on 18 November 2004, wherein Kaddis proposed that it would perform additional source area soils excavation beneath the existing Plant in the area of the former degreaser. Kaddis and NYSDEC agreed that this proposal was acceptable, and that a Supplemental RDRAP Work Plan would be submitted to the Department for its review. Pursuant to that agreement, the Supplemental RDRAP Work Plan document was submitted to NYSDEC on 5 August 2005 and approved for implementation. The removal was performed as summarized herein.

2. SOURCE AREA DESCRIPTION

Figure 2 shows the Enarc-O building east wing and configuration of the exterior courtyard and surrounding area. In 1999 remedial action comprising contaminated soil excavation was performed and limited to removal of the outside courtyard source area soil, in accordance with the findings of the RI/ FS and the final remedial action as detailed in the Record of Decision (ROD), dated August 1997.

Remaining VOCs-impacted soil not removed in 1999 consisted primarily of soil beneath the building floor slab in the vicinity of the former degreaser. Based on the findings of the RI and a 3 June 2005 Geoprobe source area investigation (refer to Section 3.1), remaining indoor source area contamination was delineated to a plan area of approximately 50 ft. x 25 ft. surrounding the former degreaser. Refer to Figure 2. VOCs-impacted soil was encountered in the source area Geoprobe borings up to approximately 14 feet below the building finished floor, or to the depth of the inferred top-of-bedrock surface.

3. EXCAVATION DESIGN AND IMPLEMENTATION

As further remedial action at the Site, Kaddis excavated and removed additional source area soil to the extent practicable and as approved by NYSDEC. Source area soil beneath the existing building floor slab in the vicinity of the former degreaser was excavated during site work conducted during 13 October through 28 October 2005.

Marcor Remediation, Inc. of Rochester, New York performed environmental remediation (soils excavation) services and excavation monitoring was performed by Haley & Aldrich personnel. Battle Construction provided general construction management services regarding building wall demolition and reconstruction activities, while simultaneously working with Marcor to ensure excavation and backfilling activities would provide the required basis for reconstruction requirements. TSE of Rochester, New York performed building foundation and structural support engineering services. NYSDEC personnel (Anthony Sylvester) visited the site on occasion to observe ongoing site activities.

3.1 Interior Source Area Excavation

The south wall and floor slab of the building's east wing were removed prior to soil excavation activities. Wall demolition was initiated on 13 October 2005 and floor cutting and removal activities began immediately thereafter. The remaining building structure was kept intact and excavation was performed around two building column installations located beyond the east and west ends of the excavation limits, as required to support the roof during excavation (as shown on Figure 2).

The approximate lateral limits of the proposed excavation, as determined by RI soil vapor survey and the 3 June 2005 Geoprobe investigation results measured approximately 50 by 25 feet. Based on the June 2005 Geoprobe results, the vertical extent of indoor contaminated soils in the vicinity of the former degreaser was determined to be approximately 14 feet below the finished floor surface. The final excavation depth was approximately 14 to 15 feet below the floor across the entire excavation footprint. The final depth was the maximum depth achievable and was determined to be the top-of-bedrock surface in the area based upon backhoe refusal. The lateral and vertical extent of the final excavation varied little from the anticipated limits determined from the preceding delineation investigation. See Figure 2. Upon completion, the excavation was backfilled with flowable concrete fill.

Existing courtyard groundwater monitoring well MW-201D and the existing SPDES system vault and piping located in the courtyard were left intact after excavation completion.

3.2 Constraints and Limitations

As previously mentioned, the estimated limits of excavation were essentially met during actual excavation. Some small pods of impacted soil had to be left in place due to construction limitations. The building roof support beam installation location at the south-west corner of the excavation and the presence of clean courtyard fill materials within the 1999 excavation cavity beneath the southern limits of the additional excavation (south foundation wall) had limited further excavation in these directions.

The safe distance between the roof support beam location and the south-west corner of the excavation had been reached and further excavation toward the west along the south building wall was not feasible. In addition, a three-foot wide supporting bench was left in place from a depth of approximately seven feet below floor grade to the base of the excavation along the excavation's western edge. Further excavation north of the roof support beam toward the west was also deemed inappropriate considering the existing main building foundation adjoining to the west.

Similarly, the depth of the excavation (14 to 15 feet) required that benches of similar dimensions be left in place along the northern and eastern sides of the excavation. The exposed soil observed was a very dense and compact glacial till, competent and near vertical cuts were feasible for the temporary duration of the excavation.

Along the southern edge of the excavation, the building's south wall foundation (footer) was left in place due to the desire to use the existing foundation as support for the new wall and also to avoid breaching the clean backfill which was installed within the 1999 excavation cavity on the south side of the footer.

NYSDEC (A. Sylvester) was informed of the limitations to the extent of the proposed excavation during a site visit on 17 October, 2005 and was in general agreement with the attainable limits of excavation.

Based on the dimensions of the excavation, approximately 980 tons (an estimated 650 cubic yards) of soil was excavated and removed. All excavated soil was disposed of off-site (see additional detail below).

Photographs of the excavation in various stages of completion are presented in Appendix A.

3.3 Confirmatory Soil Sampling

Confirmatory soil sampling was performed from within the completed excavation. Each representative sample consisted of a composited soil sample from the face of each excavation wall, collected at several sub-locations from both above and below the bench top.

Excavation Wall - Conc. (ppb)	North	South	East	West	TAGM 4046 Soil Cleanup Criterion (ppb)
Compound					
TCE	712	5,290 E	541	480	700
1,1,1-TCA	78.0	189	35.0	12.1	800
1,1-DCE	13.9	ND < 30.1	ND < 9.17	ND < 9.58	400
PERC	ND < 7.83	3,150	49.4	ND < 9.58	1,400
Total VOCs	803.9	5,479	625.4	492.1	NA

Soil samples were collected and submitted for laboratory analysis of VOCs using EPA Method 8260B. Results were compared with NYSDEC's TAGM 4046, "Determination of Soil Cleanup Objectives and Cleanup Levels", dated January 1994, revised December 2000, as shown on the table below.

Confirmatory soil sample analysis results show remaining wall face soils (composited) are generally below TAGM levels with the exception of TCE and PERC in the northern and southern walls, as shown above. In addition, although exceeding TAGM action levels, isolated pods of contaminated soil which remain in the subsurface due to the noted constraints appeared to be limited in extent, including potentially-stained soil on the lower southern portion of the western wall, and soil exhibiting elevated PID levels on the southern wall.

Confirmatory sampling laboratory analytical data are presented in Appendix B.

3.4 Soil Disposal

In a 24 June 2005 letter to NYSDEC, Kaddis requested that, based on prior experience and results from the 1999 courtyard excavation, the Department consider application of its TAGM 3028 "Contained-In" Policy to soils proposed for excavation. TAGM 3028 allows for VOCs-contaminated soils to be handled and disposed of as solid waste in an approved landfill facility if specific requirements are met. Kaddis presented laboratory analysis results from its June 2005 Geoprobe investigation activities to support the request. In a letter dated 12 September 2005 Kaddis received approval from NYSDEC to handle and dispose of excavated soil as solid waste. Refer to Appendix C.

Pre-approval for disposal was obtained from Waste Management's High Acres Landfill facility in Fairport, New York. Soils were loaded and transported to the landfill facility by a NYS-licensed waste hauler. Based on the dimensions of the excavation, approximately 980.5 tons of soil was excavated, removed, and disposed at the High Acres facility. Supporting documents are included in Appendix C.

3.5 Air Monitoring

Excavation activities were monitored with a photoionization detector (PID) for health and safety purposes and to allow screening of contaminated soil for purposes of delineation of impacted soils. Field-screening readings indicated that the majority of contaminated soil was present at depth near the former degreaser.

For health and safety purposes, all excavation activities were accompanied by continuous air monitoring in order to minimize the potential exposure to on-site contractors, oversight staff, Enarc-O facility personnel, and neighboring residents. The work area breathing zone was monitored on a nearly continuous basis and perimeter monitoring was also performed regularly, as described in the Site-Specific Health & Safety Plan and in the HASP section of the RDRAP Work Plan.

A Community Air Monitoring Plan (CAMP) was prepared for potential implementation to protect neighboring residential properties from vapor exposures resulting from excavation activities. Air monitoring and CAMP activities were discussed in detail in the RDRAP Work Plan.

Elevated breathing space and work area air VOCs readings were detected on occasion throughout the excavation process but, in general VOCs in air during excavation activities were constrained to the immediate excavation area and did not extend into the airspace outside

the building interior. VOCs readings immediately outside the building's (former) south wall limits and north of the building's east wing were typically non-detect or at background levels, with only infrequent detections above background but typically less than 0.5 ppm in such instances.

In accordance with the HASP and as follow-up to readings collected outside the building limits, property line perimeter readings were collected regularly from along the north-eastern property line between the Enarc-O facility and the neighboring residential property, based on the prevailing wind direction. Property line readings were non-detect or at background levels, with only infrequent detections above background but less than 0.5 ppm.

3.6 Vapor Extraction System & Monitoring

During interior excavation, pre-existing subsurface vapor extraction hardware (i.e. angled wells extending beneath the building floor slab) were removed and disposed. As discussed, excavation efforts achieved removal of nearly all remaining source area soils, and volumes of impacted soil remaining in the subsurface are known to be limited in extent. As such, after discussion with NYSDEC (Edward Hampston) the installation of a replacement soil vapor extraction system was deemed unnecessary.

The two horizontal piping units previously installed beneath the courtyard asphalt have also been abandoned in-place. These two vapor extraction pipes have historically yielded little to no VOCs due to previous removal of the impacted courtyard soils in this area.

No replacement soil vapor extraction system was installed and no further soil vapor extraction system monitoring activities are planned for the Site in the future.

4. FUTURE MONITORING

In accordance with Haley & Aldrich's 17 December 2004 proposal letter to NYSDEC, and based on NYSDEC's follow-up approval letter dated 5 August 2005, post-excavation monitoring will be conducted at the Site as described below to measure the efficacy of the enhanced remedy.

4.1 Groundwater Monitoring

Groundwater samples will be obtained from five on-site shallow wells (MW-2, MW-3, MW-5, MW-201D, and MW-202), the former Enarc-O supply well, and two off-site residential wells (7880 Martin and 1167 Bragg). Groundwater samples will be analyzed for VOCs using USEPA Method 8260B.

4.2 Reporting

Upon issuance of this Supplemental Engineering Report, summary reports of the groundwater monitoring will be prepared and submitted to NYSDEC. The reports will summarize monitoring data, sampling activities, laboratory analyses, and will include tabulations of analytical results for on-site and off-site groundwater. This Report constitutes the first report, summarizing activities through 31 December 2005.

5. SUMMARY

This Supplemental Engineering Report has been prepared to document the details of the supplemental remedial action for the Enarc-O facility. These activities were designed to focus on removal of remaining source-area soil and subsequent on-site monitoring activities. The completion of this work is intended to result in attaining the goals established in section 5 of the Record of Decision for the site, dated August 1997, and thereby fulfilling Kaddis' remaining obligations under DEC Order on Consent, Index #B8-0112-84-10 (RD/RA), dated June 1999.

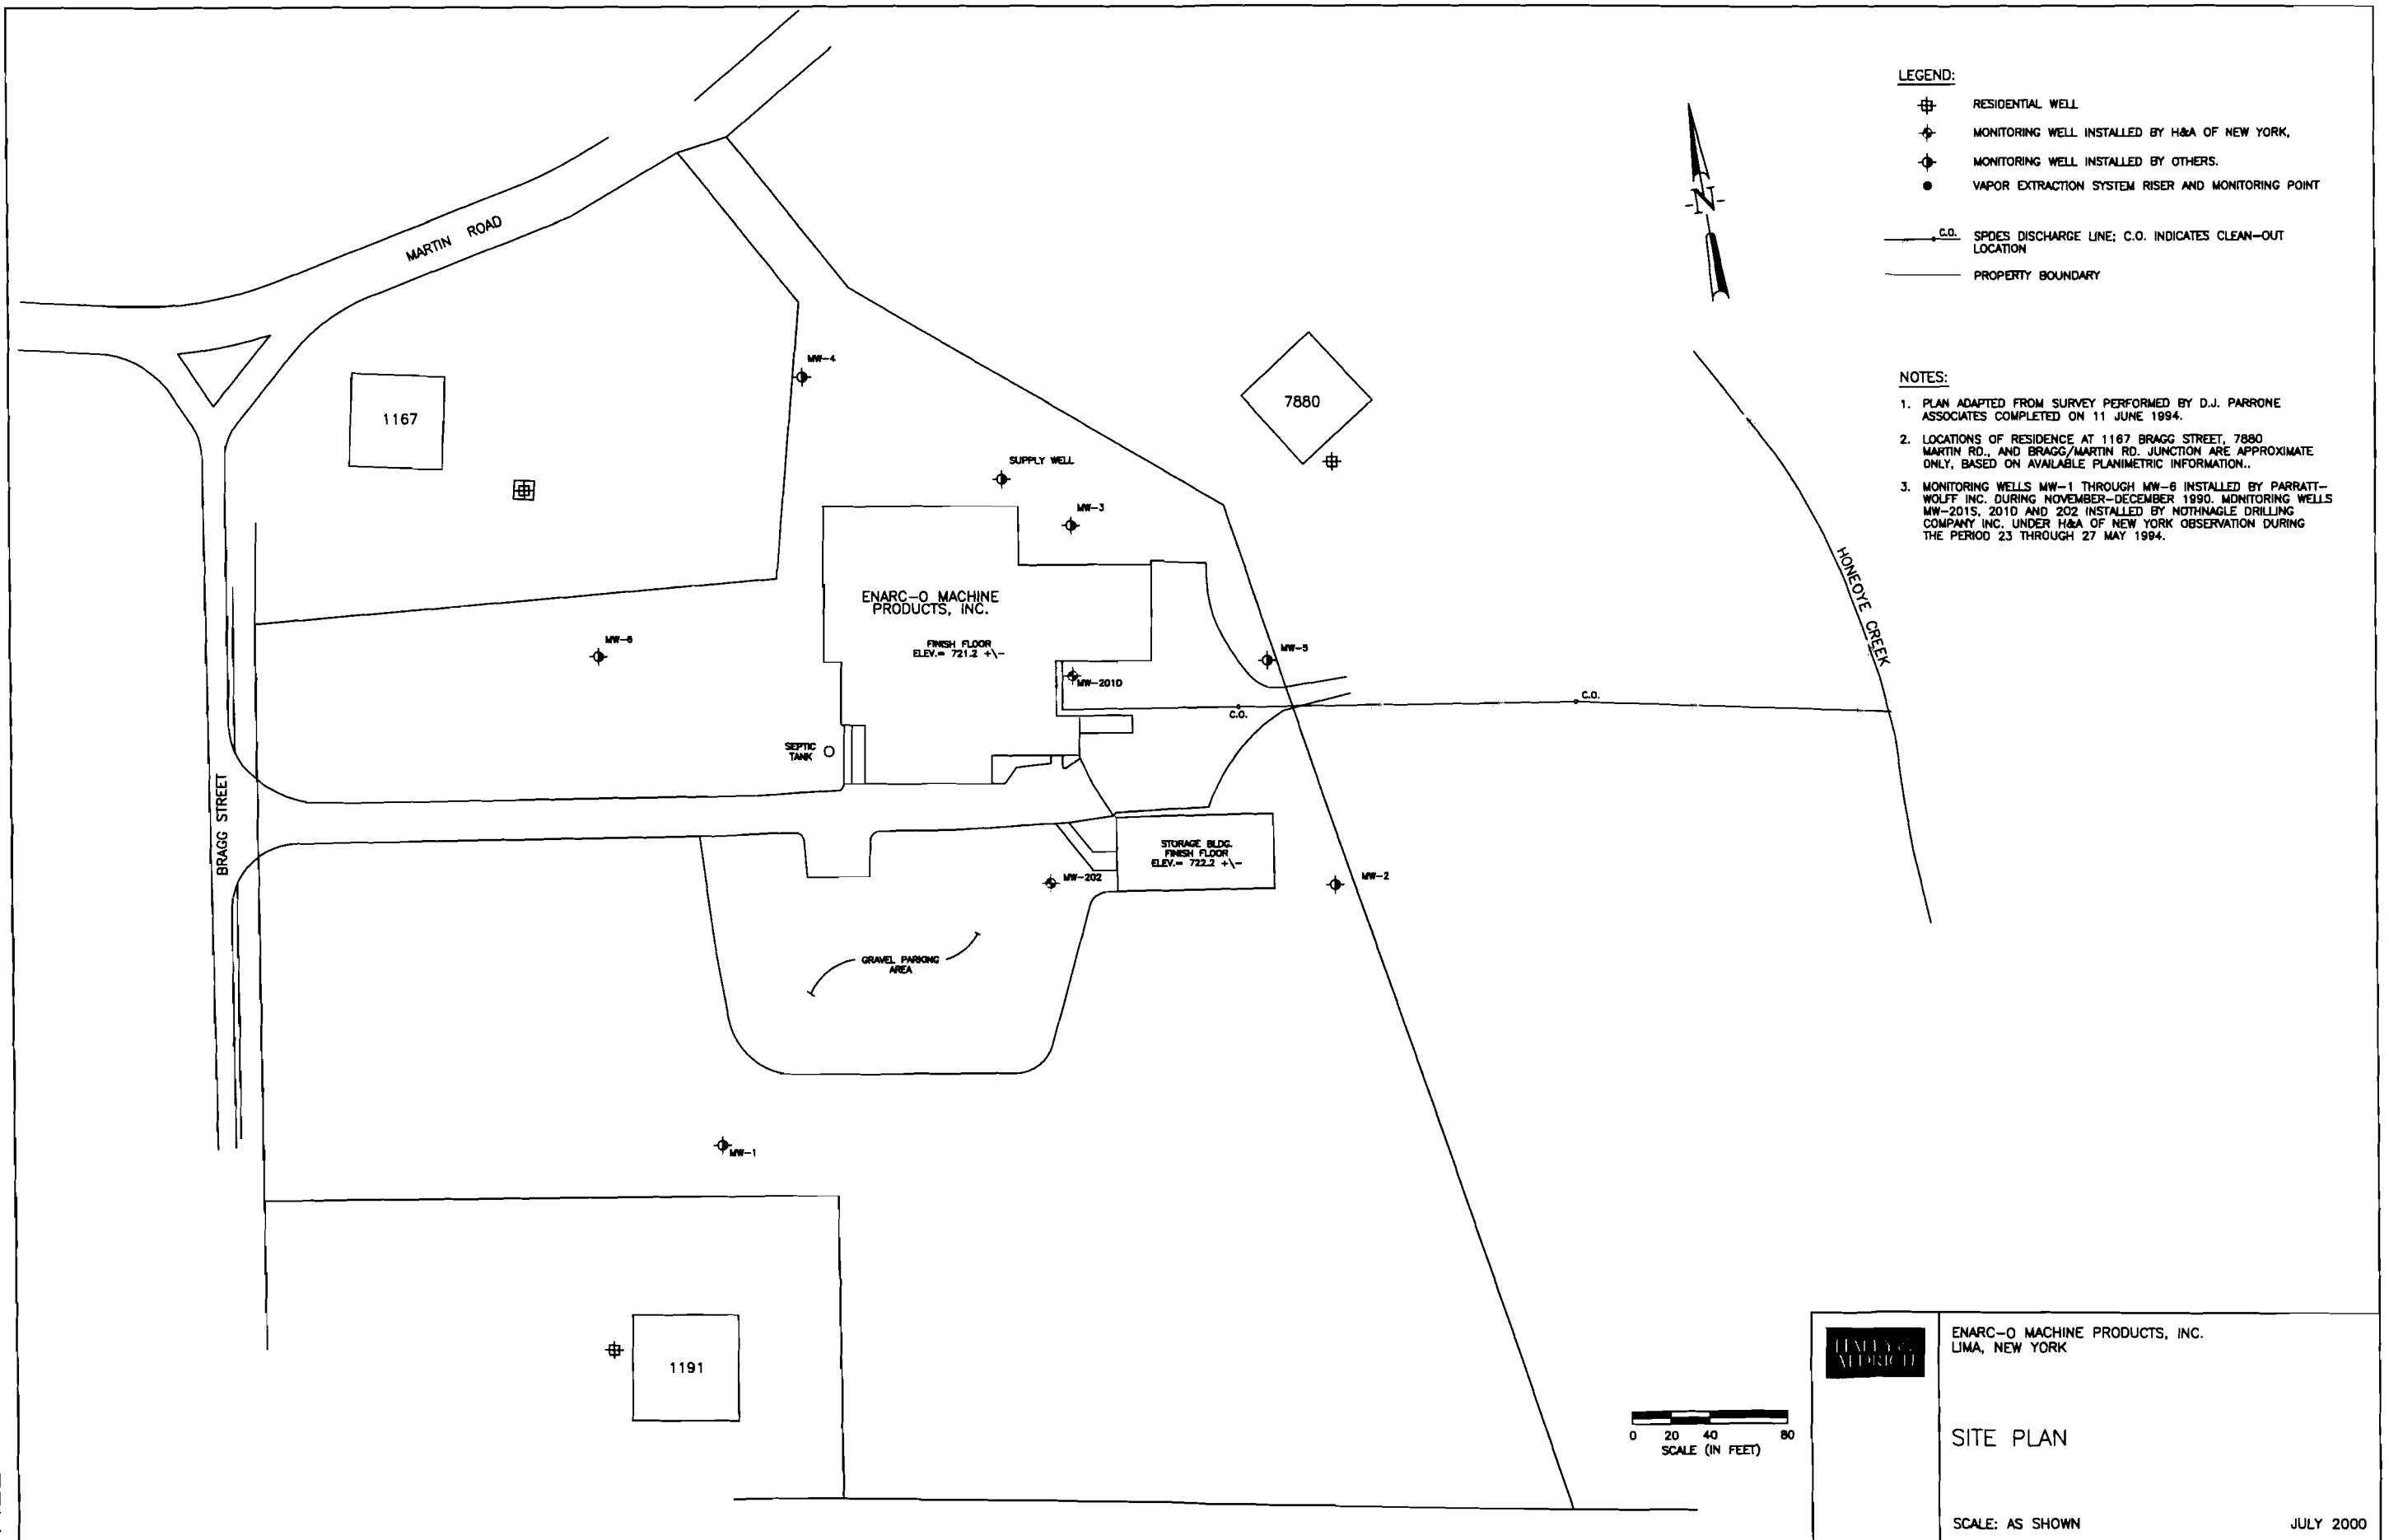

Supplemental remedial action in the form of additional source area soil excavation was performed by Kaddis in the vicinity of the former degreaser beneath the building's east wing. Impacted soil was excavated and removed based on pre-excavation drilling, soil vapor sampling, visual observations, PID screening readings during excavation, and within the limitations imposed on the extent of excavation as a result of structural engineering considerations for excavation and building stability.

Approximately 650 cubic yards of impacted soil were removed from beneath the building floor within an approximately 25-foot by 50-foot area around the former degreaser location. Small pods of impacted soil of limited extent remained in the subsurface due to excavation limitations imposed by the building roof support system as well as the pre-existing south wall foundation support structure (footer), which was kept intact.

Post-excavation monitoring will be conducted to assess the efficacy of the overall remediation, including the recent soil removal. Based on completion of this work, Kaddis requests the Department reclassify the Enarc-O site to a Class 4 site.

Dear Mr. Wilkie:

On behalf of Kaddis Manufacturing (Kaddis), Haley & Aldrich is pleased to present this letter requesting consideration of application of NYSDEC's Technical Administrative Guidance Memorandum (TAGM) 3028 (the "Contained-In" Criteria for Environmental Media, dated 30 November 1992 regarding disposal exemption of environmental media which contains hazardous constituents at levels otherwise requiring disposal as hazardous waste) to on-Site soils proposed for excavation.

Kaddis has proposed to excavate and dispose of remaining former degreaser source area soils which have been impacted by chlorinated solvent compounds. In its 17 December 2004 letter to Edward Hampston of NYSDEC, Kaddis proposed performing further evaluation of additional remediation in the form of temporary and partial building demolition, thereby allowing additional excavation of VOCs-containing sub-slab soils from the general area proximal to the former degreaser.

In order to better delineate the extent of sub-slab contamination Beneath the Enarc-O building, and to also generate analytical data for "Contained-In" consideration, Kaddis performed a Geoprobe sampling and analysis program and installed seven soil borings and performed VOCs field-screening and soil sample collection and laboratory analysis. In accordance with TAGM 3028 protocol soil samples were submitted for analysis of total TCL VOCs constituents and Toxicity Characteristic Leaching Procedure (TCLP) VOCs.

Kaddis installed seven soil borings in the general area of the former degreaser (see attached figure). Soil samples were field-screened for VOCs at two-foot intervals along the entire length of the borehole and the readings recorded (see attached table). One soil sample per borehole was collected by compositing soils across the entire length of the borehole. Soils were collected and remained undisturbed within the individual sampling sleeves until all soil samples from the boring were brought to the surface. A composite soil sample was then immediately packed in laboratory soil jars to minimize loss of VOCs and then collected for VOCs headspacing; remaining sample was then field-screened for VOCs and logged for soil type.

Each composited soil sample was headspaced for VOCs, and the sample with the highest headspace reading (B-1) submitted for laboratory analysis for total VOCs and TCLP VOCs. One additional sample (B-2) was also submitted for laboratory analysis of in order to provide a representative assessment of the sub-slab soil conditions across the general area proposed for excavation.

Soil sample laboratory analysis results are as follows:

Soil Boring ID (constituent)	Total VOCs Concentration (ppm)	TAGM 3028 Soil Action Level (ppm)	TCLP VOCs Concentration (ppb)	TAGM 3028 GW Action Level (ppb)	Haz. Waste Regulatory Disposal Limits (6 NYCRR Part 371) (ppb)
B-1 (TCE)	2.420	58	77.7	5.0	500
B-1 (1,1,1-TCA)	0.101	7,000	ND	5.0	NA
B-2 (TCE)	0.0653	58	ND	5.0	500
B-2 (PERC)	0.0539	12	ND	5.0	700

These results show levels of detected contaminants below action levels for disposal as hazardous waste and below NYSDEC "Contained-In" Criteria Action Levels with the exception of TCLP analysis for TCE in B-1 at approximately 78 ppb, above the Groundwater Action Level of 5.0 ppb. Since the proposed excavated soils will be placed in a Part 360 permitted and lined landfill the groundwater actions levels should not apply, while the 6NYCRR Part 371 hazardous waste disposal limits would apply but are not exceeded.

NYSDEC
6/23/2005
Page 3

We appreciate the opportunity to submit this request and look forward to working with the Department in moving ahead with getting the soils proposed for excavation approved for the "Contained-In" exemption from hazardous waste disposal. We respectfully request that the Department issue Kaddis an approval letter regarding the "Contained-In" exemption as soon as is convenient.

If you have any questions please feel free to call us at (585)321-4207 or 321-4229.

Sincerely yours,
HALEY & ALDRICH OF NEW YORK

Michael G. Beikirch
Project Manager

RE: Former Degreaser Source Area Soils Excavation
TAGM 3028 "Contained-In" Rule Consideration
Enarc-O Machine Products, Inc.
Lima, New York
NYSDEC Registry No. 8-26-011

Dear Mr. Beikirch:

We have completed our review of the soil sampling data submitted with your June 24, 2005 request for a "contained-in" determination at the referenced project site.

Concentrations for 1,1,1-trichloroethene, trichloroethene and tetrachloroethene, were below the soil "contained-in" action level and the Land Disposal Restriction concentration. Therefore, soils excavated from the Former Degreaser Source Area do not have to be managed as hazardous waste and can be transported off-site to a permitted solid waste landfill(Part 360) with a liner and leachate collection system

Should you have any questions regarding the content of this letter, please do not hesitate to contact me at (518) 402-8594.

Sincerely,

Henry Wilkie
