Dear Mr. Conley:

Enclosed are the results from the testing of material submitted on June 13, 1994 from Project 70014-048, AC Rochester.

Sample R-2 appeared to contain a mixture of two types of Arochlors, while samples PZ-129 and RW-4 appeared to contain only the lighter of the two Arochlors seen in R-2. The presence of the heavier Arochlor in R-2 on the ECD trace appeared to correspond to the presence of medium boiling material on the FID trace which may be a mineral oil.

Capacitors tend to contain pure PCBs and usually as lighter Arochlors. Transformers, on the other hand, tend to contain mineral oils with PCBs mixed in, usually as heavier Arochlors. The sample chromatograms suggest the low boiling material was used to clean out capacitors and transformers, the resulting combination of which may be the product R-2. Sample PZ-129 and R-4 may be the mixtures from cleaning a capacitor.

We appreciate this opportunity to be of service to you and hope you will call if you should have any questions.

Sincerely,

Amy Gray

RESULTS FROM THE ANALYSIS OF PRODUCT SAMPLES FOR FINGERPRINT CHARACTERIZATION BY CAPILLARY GAS CHROMATOGRAPHY USING A FLAME IONIZATION DETECTOR (FID) AND ELECTRON CAPTURE DETECTOR (ECD)

Sample ID	GC Characterization
R-2	The GC trace using the flame ionization detector (FID) showed the presence of low, medium and high boiling compounds. The patterns displayed by these peaks are indicative of mineral spirits, mineral oil, and motor oil, Bunker C or tar. The low boiling compounds appeared as a regular pattern of peaks eluting from *n*-C_7 to *n*-C_{12} showing a maximum near *n*-C_{10}. The medium boiling compounds appeared as broad hump eluting from *n*-C_{13} to *n*-C_{24} showing a maximum near *n*-C_{17}. A regular pattern of the *n*-alkanes is seen for the medium boiling product. The high boiling compounds appeared as a broad hump continuing from the medium boiling material to beyond *n*-C_{36} showing a maximum near *n*-C_{28}. A series of peaks were seen in the GC/ECD trace that are possibly due to the presence of PCB. The PCB pattern on the ECD trace appears to be a mixture of PCBs such as Arochlor 1248 and 1260. The large peak seen near 25 minutes on the GC/FID trace is pentacosane, added as a quality assurance check for this GC analysis.
