Subject: NAPL and Groundwater Gauging Report for Performance Monitoring of ISS IRM
RG&E East Station Former MGP, Site ID No. 828204
Rochester, New York

Dear Mr. Priore:

On behalf of our client, Rochester Gas & Electric Corporation (RG&E), this non-aqueous phase liquid (NAPL) and Groundwater Gauging Report of the In-Situ Stabilization (ISS) Interim Remedial Measure (IRM) has been prepared to summarize the findings of the field monitoring event performed on 27 October 2022 at RG&E's East Station Former MGP Site, located off Suntru Street in Rochester, New York. This monitoring event was performed in accordance with the New York State Department of Environmental Conservation (NYSDEC)-approved "The proposed East Station 2013-2018 ISS IRM Monitoring Plan for groundwater level and NAPL gauging and recovery" (Performance Monitoring Plan) by Ish, Inc., dated February 2013. Table I lists the monitoring and recovery wells that were gauged. Figure 1 shows the locations of the wells.

Please refer to the following reports prepared and submitted to NYSDEC for the previously completed monitoring activities at the East Station Site:

- *NAPL and Groundwater Gauging Report for Performance Monitoring of ISS IRM for East Station Former MGP Site, Rochester, New York, October 25, 2021 Monitoring Event, dated February 2022.*

Please refer to the document titled *Summary of the Installation and Monitoring of Groundwater Wells for Water Quality and NAPL at the East Station Site following the Completion of the ISS IRM* dated 4 September 2008, for information regarding the 31 monitoring/recovery wells, the monitoring frequency, and reporting schedule.

Field Activities

Field activities performed on 27 October 2022 consisted of recording static water levels and gauging for light non-aqueous phase liquid (LNAPL) and DNAPL in 31 monitoring/recovery wells. The methods used for groundwater level measurements and NAPL gauging for this performance monitoring event were consistent with those used for previous monitoring events and in past site investigation work. Field activities performed are identified in Table I.

Groundwater Flow Characteristics

The groundwater elevation data is presented in Table II. Since the locations that were gauged during the October 2022 monitoring event consist of a relatively linear network of wells, a groundwater elevation contour figure was not generated for this dataset. Based on results of previous groundwater contours (see the *NAPL and Groundwater Monitoring Report*, dated November 2009, Figures 5 through 8), groundwater flow is generally from the eastern Site area, westerly toward the ISS columns. In the northern area of the Site, groundwater flow is generally to the northwest. In the southern area of the Site, groundwater flow is generally to the southwest.

NAPL Gauging Results Summary

During the October 2022 gauging event, trace LNAPL was detected at recovery well MW-5R and approximately 0.24 feet of DNAPL was measured at well RW-5. Haley & Aldrich recommends continued annual monitoring with the next event scheduled for the fall of 2023. Overburden in the vicinity of MW-5R and RW-5 will be addressed through soil excavation and removal, in accordance with the Record of Decision (ROD) dated June 2022.

We appreciate the opportunity to provide IRM monitoring services on this project. Please do not hesitate to contact us if you have any questions or comments.

Sincerely yours,

- Notes:**
- (1) TOC - top of casing
 - (2) Well elevation datum is NAVD 1988. Groundwater elevation calculated as elevation of the groundwater in the well plus the thickness of LNAPL (when present) based on assumption of an LNAPL density of approximately 1.
 - (3) NP - Not Present
 - (4) NM - Not Measured
 - (5) During the May 4, 2010 gauging, trace DNAPL was measured in DW-3R. After purging well, 0.33 feet of DNAPL was measured on May 5, 2010
