CONRAIL LANDFILL

TABLE OF CONTENTS

SECTION I
EXECUTIVE SUMMARY

This report, prepared for the New York State Department of Environmental Conservation (NYSDEC), presents the results of the Phase I investigation for the Conrail site (NYS Site Number 851002, EPA Site Number NYD082758509), located in the Town of Hornellsville, Steuben County, New York (see Figure I-1).

SITE BACKGROUND

The Conrail Landfill site is currently owned by the Consolidated Railway Corporation (Conrail). The landfill site has been used for the disposal of refuse since at least 1940 when it was owned by the Erie Railroad (Herington, 1981). The landfill was owned by the Erie-Lackawanna Railroad from 1962 to 1975 when it became the property of Conrail (Jackson, 1983; Flint, 1985). The site remained active until approximately 1978 (Jackson, 1983). A site plan is presented in Figure I-2.

The Conrail Landfill site was used for the disposal of wastes from rail cars including rubbish, spoiled produce, rejected shipping goods and other refuse (Herington, 1981). The site was also known to have received demolition debris, train wreckage debris, 55-gallon drums (contents unknown) and spent batteries (Herrington, 1981; Jackson, 1983). It is alleged that sludge containing PCBs was disposed on-site during a period between 1940 and 1976 (NYSDEC, 1985; Schmied, 1983). Soil and sediment samples taken by the NYSDEC indicated elevated metal concentrations and one soil sample contained PCB at a concentration of 300 ppb (Jackson, 1983; Leary and Farrar, 1985). Subsequent soil sampling conducted by the NYSDEC yielded total PCB concentrations ranging

from 8 to 210 ppb (Lacey, J., and J. Sciascia, 1987). No groundwater monitoring has been conducted at the site (NYS Registry Sheet, 1983).

ASSESSMENT

In an attempt to quantify the risk associated with this site, the Hazard Ranking System (HRS) was applied as currently being used by the NYSDEC to evaluate abandoned hazardous waste sites in New York State. This system takes into account the types of wastes at the site, receptors, and transport routes to apply a numerical ranking of the site. As stated in 40 CFR Subpart H Section 300.81, the HRS scoring system was developed to be used in evaluating the relative potential of uncontrolled hazardous disposal substances to cause health or safety problems or ecological or environmental damage. It is assumed by the EPA that a uniform application of the ranking system in each state will permit EPA to identify those releases of hazardous substances that pose the greatest hazard to humans or the environment.

Under the HRS, three numerical scores are computed for each site, to express the relative risk or danger from the site, taking into account the population at risk; the hazardous potential of the substances at a facility; the potential for contamination of drinking water supplies, for direct human contact; and for destruction of sensitive ecological systems and other appropriate factors. The three scores are:

- S_M reflects the potential for harm to humans or the environment from migration of a hazardous substance away from the facility by routes involving groundwater, surface water or air. It is a composite of separate scores for each of the three routes (S_{GW} = groundwater route score, S_{SW} = surface water route score, and S_A = air route score).

- S_{FE} reflects the potential for harm from substances that can explode or cause fires.

- S_{DC} reflects the potential for harm from direct contact with hazardous substances at the facility (i.e., no migration need be involved).

The preliminary HRS score was:

S_M	= 33.56	S_{GW}	= 56.87
S_{FE}	= 0	S_{SW}	= 11.69
S_{DC}	= 0	S_A	= 0

RECOMMENDATIONS

The following recommendations are made for the completion of the Phase II investigation:

- Geophysical study consisting of an electrical resistivity and magnetometer surveys.

- Groundwater monitoring system consisting of 1 upgradient and 3 downgradient wells based on results of geophysical surveys.

- Analyses to include Hazardous Substance List (HSL) metals and organics.

The estimated man-hours required to complete Phase II are 1,300, while the estimated cost is $83,926.07.

SECTION II

SECTION II
PURPOSE

The purpose of the Phase I investigation at the Conrail Landfill was to assess the hazard to the environment caused by the present condition of the site. This assessment is based on the Hazard Ranking System, which involves the compilation and rating of numerous geological, toxicological, environmental, chemical, and demographic factors and the calculation of an HRS score. Details of HRS implementation are included in Section V. During the initial portion of the investigation, available data and records, combined with information collected from a site inspection, were reviewed and evaluated. The investigation at this site focused on the disposal of drum wastes and the alleged disposal of PCB's at the site. Based on this initial evaluation of the Conrail Landfill, a Phase II Work Plan has been prepared for collecting any additional data needed to complete the HRS score. In addition, a cost estimate for the recommended Phase II work is provided.

SECTION III
SCOPE OF WORK

The scope of work for the New York State Inactive Site Investigation Program (Phase I) was to collect and review available information necessary for the documentation and preparation of a Hazard Ranking System score and a Phase II work plan and cost estimate if required. The work activities performed included data collection and review, a site inspection, and interviews with knowledgeable individuals of past and present disposal activities at the site.

The sources contacted during this Phase I investigation included government agencies (federal, state and local), present site owners and operators, and any other individuals that may have knowledge of the site, as identified during the performance of the investigation. These sources are listed in Appendix A. The intent of the list is to identify all persons, departments, and/or agencies contacted during the fourth round of the Phase I investigations even though useful information may not have been collected from each source contacted.

SECTION IV

SECTION IV

SITE ASSESSMENT

SITE HISTORY

The Conrail Landfill site was initially owned by the Erie Railroad in the 1920s or 1930s followed by the Erie-Lackawanna Railroad from 1962 until 1975 (Flint, 1985; Jackson, 1983). Presently, the site is owned and operated by the Consolidated Rail Corporation (Conrail), who purchased the railroad in 1975, and used the site until approximately 1978 (Jackson, 1983).

Disposal activities have occurred at the site since at least 1940, when the Erie-Lackawanna Railroad used the area for small scale disposal of rubbish, spoiled produce and rejected shipping goods (Herington, 1981; Guibord, 1981). Additional disposal activities began when Conrail took over the site in 1975 (Herington, 1981). Conrail used the site for the disposal of numerous miscellaneous wastes including railroad ties, 55-gallon drums, batteries, brush, garbage, and wreckage from railroad accidents (Herington, 1981; Jackson, 1983). There is some concern that the site may have received PCB waste from an industrial facility in Sharon, PA during a period between 1940 and 1976. However, a subsequent investigation conducted by the NYSDEC has indicated that the PCB levels of site soils (0.008 to 0.3 ppm) are much less than those observed in PCB contaminated sludge from the alleged Sharon, PA source (40,000 ppm) (Bailey, 1987). Therefore, it was concluded by the NYSDEC that this site does not contain PCB contamination similar to that found at the alleged source in Sharon, PA (Bailey, 1987). No records are known to exist for the site which indicate the quantity of the various wastes disposed of on-site.

Disposal activities at the Conrail site were prohibited by the U.S. Army Corps of Engineers and the NYSDEC in 1976, although disposal activities continued until approximately 1978 (Jackson, 1983; Anonymous, 1981). Remedial action conducted at the site include the removal of drums and waste batteries, excavation of contaminated surface soils, and capping of the site. These remedial activities occurred in 1983 and were conducted by Bakers of Jerico Hill (Flint, 1985). Surface water and sediment monitoring have also been conducted at the site.

SITE TOPOGRAPHY

The Conrail site is located on the south side of Cedar Street on the Conrail access road in the Town of Hornellsville, Steuben County, New York (see Figure IV-1). The land surface at the site is irregular due to past disposal practices, but originally was a flat, low-lying area adjacent to a wetland area (USGS, 1965).

The northern portion of this 20-acre site is bordered by the Conrail access road and the Conrail switch yard. Originally, a cinder road located in the northwest and northeast corners of the site provided access to the landfill. This road has been barricaded with a three-foot high berm to prevent scavenger dumping.

A surface drainage ditch, located to the west of the site, allows surface water runoff to flow in a southerly direction toward the Canisteo River. The boundary of the landfill is quite pronounced along the west, south, and eastern boundaries. In these areas the fill appears to be between 5 and 15 feet in depth. Some evidence of flooding was apparent along the southwestern and southern perimeter of the landfill. Leachate seeps were observed along the southeastern and eastern sides of the landfill adjacent the marshy area (ES Site Visit, 1985). Exposed demolition materials, railroad ties, and an occasional 55-gallon barrel were observed along the face of the landfill. Cinders, railroad ties, and miscellaneous scrap metal were observed at several locations on the surface of the landfill. South of the Conrail site is the Canisteo River and the eastern boundary is formed by a wetland or marshy area.

Regional Geology and Hydrology

The Conrail Landfill site is located within the Allegheny Plateau physiographic province. The plateau exhibits notable relief within Steuben County rising from an elevation of 700 feet at Keuka Lake to 2,400 feet above sea level in the southwestern portion of the county. The plateau is mature and eroded with disecting streams creating valleys ranging from 300 to 600 feet in depth (USDA, 1978). The bedrock of the region consists of nearly horizontal layers of deltaic sandstone and shale deposited during the late Devonian period (USDA, 1978).

In the recent past, most of New York State, including the site, has been repeatedly covered by a series of continental ice sheets. The work of the glacier in Steuben County widened pre-existing valleys, transported loose rock and soil material, and deposited widespread accumulations of till, stratified ice contact sediments, and outwash throughout the region. The melting ice, ending approximately 12,000 years ago, produced large volumes of meltwater. The meltwater subsequently shaped channels and deposited large accumulations of stratified, granular sediments.

As glacial ice retreated from the region, meltwater formed lakes in front of the ice margin. The Steuben County region is sparcely covered by these lacustrine deposits. The main glacial deposits in the county are till and outwash (USDA, 1978). Glacial and outwash deposits are found in the northwestern and western portion of the county along the Canisteo River and its tributaries (USDA, 1978).

Granular deposits in this region frequently act as shallow aquifers since the proglacial lacustrine silts and clays along with the tills often inhibit groundwater movement. However, fine-grained, water-lain sediments such as silts and clays, frequently exhibit horizontal laminations and sand seams. These internal features create secondary porosity which facilitate lateral groundwater movement through otherwise low permeability materials.

Local Sensitive Environments

The Conrail site is located directly in a NYS Freshwater Wetland area (Dupont, 1985). There are no critical habitats of endangered species located near the site (Ozard, 1985).

SITE HYDROLOGY

Bedrock at the Conrail Landfill site is expected to be the Wiscoy sandstone and shale (NYS Museum and Science Service, 1970). The Wiscoy formation is anticipated at varying depths from a few feet to over 30 feet below ground surface. Fractures along bedding joints within the Wiscoy may create an aquifer system capable of yielding acceptable quality water at rates of 40 gpm or less (Great Lakes Basin Study, 1975). The groundwater flow direction of the bedrock aquifer may be to the south (regional trend), but will vary locally.

Groundwater present in the shallow unconsolidated deposits, considered to be the aquifer of concern, may recharge the deeper bedrock aquifer. Permeability of the unconsolidated deposits have been reported to range from 1.4×10^{-3} to 1.4×10^{-4} cm/sec (USDA, 1978) and capable of allowing vertical and horizontal movement of water through the soil column. Groundwater flow direction within the shallow aquifer system probably parallels the ground surface flowing in a southeasterly and southerly direction toward the Canisteo River which may act as a discharge point for the shallow aquifer system in the vicinity of the Conrail site.

SITE CONTAMINATION

The Conrail Landfill site was an active disposal area from approximately 1940 until closure in 1978 (Herington, 1981). From 1940 to 1975, the site was used by the Erie-Lackawanna Railroad for the disposal of small quantities of wastes including rubbish, spoiled produce and rejected shipping goods (Guibord, 1981). Disposal activities were conducted on a larger scale after the site was purchased by Conrail in

1975 (Herington, 1981). Much of the large scale disposal activities occured in 1976 when Conrail was renovating their rail system (Herington, 1981). At that time, the Conrail site was used to dispose of various wastes including railroad ties, 55-gallon drums, empty pails, batteries, brush, garbage, and wreckage from major rail accidents (Herington, 1981; Jackson 1983). It was alleged that sludge containing PCBs was disposed of at the landfill site between 1940 and 1976 (Schmied, 1983). However, studies conducted by the NYSDEC have indicated that soils at the disposal site did not contain PCBs at levels similar to those found at the alleged source in Sharon, PA (Bailey, 1987). Soil samples collected by the NYSDEC in 1985 detected PCBs at a concentration of 0.30 ppm (Leary and Farrar, 1985). Additional soil sampling conducted in 1986 consisted of the collection of 21 samples from the site. PCB were detected in all of the soil samples with concentrations ranging from 0.008ppm to 0.21 ppm (Lacey and Sciascia, 1987). These levels were much lower than those found at the alleged Sharon, PA source (40,000 ppm) (Bailey, 1987). No records are known to exist which indicate the quantity of sludge, if any, disposed of on-site.

Between 1982 and 1985, remedial actions were undertaken at the landfill site by contractors retained by Conrail. In 1982, SCA Chemical Services removed 32 barrels from the site which contained caustic liquids, non-chlorinated solvents, flammable solids, and other unidentified liquids and solids (NYSDEC, 1982). In 1985, Frontier Chemical Waste Process removed a number of mercury cell batteries from the disposal site (NYSDEC, 1985). Also, in 1983, a local contractor was hired to excavate and remove contaminated topsoil from the disposal site. These soils were transported to the Bath County Landfill for disposal. The site was then capped with cover soil removed from Cunningham Creek which is located on the Conrail property (Flint, 1985).

Surface water, sediment, soil, and leachate camples were collected at the site analyzed for metals and organic pollutants by the NYSDEC in 1983 (Jackson, 1983). The sample locations at the site are indicated in Figure IV-1. Results of the metals analyses for soil and sediment samples are provided in Table IV-1.

With the exception of the sediment sample taken from the east side of the landfill, none of the samples collected had detectable levels of organic pollutants. The sediment sample taken from the east side of the landfill contained a detecable level of polynuclear aromatic hydrocarbons (PNAs) (Jackson, 1983). All sediment samples collected downstream of the site contained metal concentrations that were greater than the metal concentrations in samples upstream of the site. The upstream sediment samples were collected in the stream bordering the west side of the site (see Table IV-1) (Jackson, 1983). Downstream surface water and leachate samples did not show higher metal concentrations than the upstream samples (Jackson, 1983). Surface water pollutant concentrations were below the NYS Class D standards in all cases. all analytical results are provided in the appendix in their entirety.

TABLE IV-1

ANALYTICAL RESULTS FOR SAMPLES TAKEN AT THE CONRAIL LANDFILL

Parameter (ppm)	Sediment East Side	Sediment South Side	Downstream Creek Sediment	Upstream Creek Sediment
Zn	430.0	38.5	21.5	18.0

SECTION V

NARRATIVE

NARRATIVE SUMMARY

The Conrail Landfill site covers approximately 20-acres in the Town of Hornellsville, Steuben County, New York (ES Site Visit, 1985; USGS, 1978). The Erie-Lackawanna Railroad began using the site for disposal of rubbish sometime prior to 1940 (Herington, 1981). Conrail landfilled the site with demolition debris and railroad waste on a large scale from 1975, when it purchased the property from the Erie-Lackawanna Railroad, until approximately 1978 when the site was closed (Jackson, 1983; Herington, 1981).

Under various railroad company ownerships, the site was used to dispose of an unknown quantity of demolition debris, batteries, 55-gallon drums and railroad car refuse by landfilling at the site (Jackson, 1983; Herington, 1981). According to sampling and analysis conducted by the NYSDEC, soils and sediments near the site contained elevated concentrations of metals (Jackson, 1983). The site also allegedly received sludge containing high levels of PCBs between 1940 and 1976 (Schmied, 1983). PCBs were detected in soil samples at concentrations ranging from 0.008 to 0.3 ppm (Leary and Farrar, 1985; Lacey and Sciascia, 1987). However, these levels were much lower than PCB levels found in sludges at the alleged source in Sharon, PA (i.e., 40,000 ppm) (Bailey, 1987). The site is located in a NYS Freshwater Wetland and 100 year flood plain (Dupont, 1985; Anonymous, 1981).

Between 1982 and 1985, contractors undertook remedial actions at the site under the direction of Conrail. SCA Chemical Services, Inc. removed 32 drums containing caustic liquid, flammable solids and non-chlorinated solvents (NYSDEC, 1982). In 1985, Frontier Chemical Waste Process removed a number of spent mercury cell batteries from the site (NYSDEC, 1985). In 1983, contaminated topsoil was excavated from the site and the site was then capped with clean fill material. The excavated material was disposed in the Bath County Landfill (Flint, 1985).

No legal action related to the site has been carried out to date.

Facility Name: Conrail Landfill

Location: Cedar Street, Town of Hornellsville, Stueben County, NY

EPA Region: II

Person(s) in charge of the facility: G. Flint - Supervisor of Structures - Conrail

Name of Reviewer: L. Cordone/J. Baker Date: 2/14/86

General Description of the facility:

The Conrail Landfill site has received railroad generated waste since at least 1940. The site was initially owned by the Erie Railroad in the 1930s or 40s, followed by the Erie-Lackawanna Railroad from 1962 to 1975. In 1976, site ownership was assumed by Conrail. Wastes disposed at the site included spoiled produce, rejected shipping goods, demolition debris, 55-gallon drums, and other miscellaneous refuse. It is alleged that the site may have received PCB containing sludge during a period between 1940 and 1976. However, an investigation conducted by the NYSDEC Division of Environmental Enforcement concluded that PCB levels present in site soils (0.008 to 0.3 ppm) were much less than those found at the alleged source site (40,000 ppm) in Sharon, PA. The site is located in a NYS Freshwater Wetland and 100 year flood plain.

FOR
HAZARD RANKING SYSTEM

FACILITY NAME: Conrail Landfill Site

LOCATION: South side of Cedar St. on the Conrail access road, Town of Hornellsville, Stueben County, New York

GROUND WATER ROUTE

1. OBSERVED RELEASE

Contaminants detected (5 maximum):

No groundwater monitoring data available for this site (NYSDEC, 1985).

Rationale for attributing the contaminants to the facility:

Not applicable.

* * *

2. ROUTE CHARACTERISTICS

Depth to Aquifer of Concern

Name/description of aquifer(s) in concern:

Site is in a wetland area where the water table is at or near the surface for most of the year (USDA, 1973). Aquifer of concern exists in glacial overburden overlying bedrock. Water supply wells installed in the Hornell/Canisteo area are typically screened in the glacial overburden (shallow) aquifer (Moravec, 1988).

Depth(s) from the ground surface to the highest seasonal level of the saturated zone [water table(s)] of the aquifer of concern:

0 to 8 feet (ES Site Visit, 1985). Ground surface of the site is elevated above the wetland over most of the site area due to landfilling.

Depth from the ground surface to the lowest point of waste disposal/ storage:

0 feet (ES Site Visit, 1985).

Net Precipitation

Mean annual or seasonal precipitation (list months for seasonal):

Mean annual precipitation is 36" (USDOC, 1979).

Mean annual lake or seasonal evaporation (list months for seasonal):

Mean annual lake evaporation is 27" (USDOC, 1979).

Net precipitation (subtract the above figures):

9" (36" - 27" = 9").

Permeability of Unsaturated Zone

Soil type in unsaturated zone:

Wayland silt loam (USDA, 1973).

Permeability associated with soil type

1.4×10^{-4} to 1.4×10^{-3} cm/sec (USDA, 1973).

Physical State

Physical state of substances at time of disposal (or at present time for generated gases):

Solid wastes (demolition debris, spent batteries, garbage) (Jackson, 1983).
Liquid wastes (corroded drums containing flammable liquids and solvents) (NYSDEC, 1982).

3. CONTAINMENT

Containment

Method(s) of waste or leachate containment evaluated:

Unlined landfill and no run-on control; rusty containers and no liner (ES Site Vist, 1985).

Method with highest score:

Unlined landfill and no run-on control or containers leaking and no liner - score =3.

4. WASTE CHARACTERISTICS

Toxicity and Persistence

Compound(s) evaluated:

PCBs detected in the soil at a concentrations ranging form 0.008 to 0.3 ppm (Leary and Farrar, 1985; Lacey and Sciascia, 1987).

Compound with highest score:

PCBs. Toxicity = 3; Persistence = 3 = 18.

Hazardous Waste Quantity

Total quantity of hazardous substances at the facility, excluding those with a containment score of 0 (Give a reasonable estimate even if quantity is above maximum):

32 drums containing hazardous wastes (NYSDEC, 1982).

Basis of estimating and/or computing waste quantity:

Drums that contained caustic liquid and non-chlorinated solvents were removed from the site in 1982. Many of these drums were observed to be corroded (Herington, 1986). For HRS scoring, the drums were scored as if they had not been removed as they were in poor condition and may have leaked prior to their removal.

5. TARGETS

Ground Water Use

Use(s) of aquifer(s) of concern within a 3-mile radius of the facility:

The aquifer is used both as a public and private drinking water source. The Village of Canisteo's main source of water is from a well located in the village limits. This source is supplemented by a spring-fed reservoir located south of the site (Keefe, 1986). Wells drilled in the Hornell/Canisteo area are typically screened in the glacial overburded aquifer, located above the bedrock (Moravec, 1988).

Distance to Nearest Well

Location of nearest well drawing from aquifer of concern or occupied building not served by a public water supply:

1,000 feet north of site (ES Site Visit, 1985; USGS, 1978).
1,000 feet southwest of site.

Distance to above well or building:

1,000 feet (USGS, 1978).

Population Served by Ground Water Wells Within a 3-Mile Radius

Identified water-supply well(s) drawing from aquifer(s) of concern within a 3-mile radius and populations served by each:

Village of Canisteo and Bell Haven Hamlet receive water from a public well in the Village of Canisteo (Keefe, 1986). Other residents outside the Village of Hornell, but within the 3-mile radius of the site use private wells as their only water source (Keefe, 1986). Water supply wells drilled in the Hornell/Canisteo area are typically screened in the glacial overburden (shallow) aquifer (Moravec, 1988).

Computation of land area irrigated by supply well(s) drawing from aquifer(s) of concern within a 3-mile radius, and conversion to population (1.5 people per acre):

No irrigation practiced in the area (Dupont, 1985).

Total population served by ground water within a 3-mile radius:

Village of Canisteo population 2,679 (Rand McNally, 1985). Other outlying residents (441 residences) (3.8 persons/residence) = 1,677 (USGS, 1978). Total population: 2,679 + 1,677 = 4,356.

SURFACE WATER ROUTE

1. OBSERVED RELEASE

Contaminants detected in surface water at the facility or downhill from it (5 maximum):

Monitoring of the surface water near the site has not detected elevated pollutant concentrations when compared to metal concentrations in upgradient surface water (Jackson, 1983).

Rationale for attributing the contaminants to the facility:

Not applicable, no observed release.

2. ROUTE CHARACTERISTICS

Facility Slope and Intervening Terrain

Average slope of facility in percent:

0 to 3% (ES Site Visit, 1985).

Name/description of nearest downslope surface water:

Wetland area adjacent to and underneath landfill. Area drains into the Canisteo River approximately 300 yards south of the site which is the surface water body of concern. There is also a small creek running along the western edge of the site (ES Site Visit, 1985; USGS, 1978).

Average slope of terrain between facility and above-cited surface water body in percent:

From landfill surface to Canisteo River area the average slope is approximately 0 to 3% (ES Site Visit, 1985).

Is the facility located either totally or partially in surface water?

Site is located directly in a NYS designated Freshwater Wetland (Dupont, 1985).

Is the facility completely surrounded by areas of higher elevation?

Yes (ES Site Visit, 1985; USGS, 1978).

1-Year 24-Hour Rainfall in Inches

2.4" (USDOC, 1963).

Distance to Nearest Downslope Surface Water

Canisteo Creek - 900 feet (ES Site Visit, 1985).

Physical State of Waste

Solid wastes (demolition debris, spent batteries, garbage) (Jackson, 1983).

Liquid wastes (corroded drums containing flammable liquids and solvents) (NYSDEC, 1982).

3. CONTAINMENT

Containment

Method(s) of waste or leachate containment evaluated:

Containers leaking and no diversion or containment structure (NYSDEC, 1982). Landfill not adequately covered and no diversion system present (ES Site Visit, 1985).

Method with highest score:

Potentially leaking containers or inadequate landfill cover - HRS Score = 3 (NYSDEC, 1982, ES Site Visit, 1985).

4. WASTE CHARACTERISTICS

Toxicity and Persistence

Compound (s) evaluated

PCBs detected in soil at concentrations ranging from 0.008 to 0.3 ppm (Farrar and Leary, 1985; Lacey and Sciascia, 1987).

Compound with highest score:

PCBs - Toxicity = 3; Persistence = 3: Score = 18 (HRS Users Manual,1982.)

Hazardous Waste Quantity

Total quantity of hazardous substances at the facility, excluding those with a containment score of 0 (Give a reasonable estimate even if quantity is above maximum):

32 drums containing hazardous wastes (NYSDEC, 1982).

Basis of estimating and/or computing waste quantity:

Drums containing non-chlorinated solvents and caustic liquids were removed from the site in 1982. Many of these drums were observed to be corroded (Herington, 1982). For HRS Scoring, the drums were scored as if they had not been removed from the site as the drums were in poor condition and may have leaked prior to their removal.

* * *

5. TARGETS

Surface Water Use

Use(s) of surface water within 3 miles downstream of the hazardous substance:

The Canisteo river is used recreationally for fishing (Kosowski, 1986).

4. WASTE CHARACTERISTICS

Toxicity and Persistence

Compound(s) evaluated

PCBs detected in soil at concentrations ranging from 0.008 to 0.3 ppm (Farrar and Leary, 1985; Lacey and Sciascia, 1987).

Compound with highest score:

PCBs - Toxicity = 3; Persistence = 3 (HRS Users Manual, 1982).

Hazardous Waste Quantity

Total quantity of hazardous substances at the facility, excluding those with a containment score of 0 (Give a reasonable estimate even if quantity is above maximum):

32 drums containing hazardous wastes (NYSDEC, 1982).

Basis of estimating and/or computing waste quantity:

The drums containing non-chlorinated solvents and caustic liquid that were removed in 1982 were observed to be corroded (Herington, 1982). For HRS scoring, the drums are scored as if they remain on-site since they were in poor condition and PCBs were detected in the landfill soil at concentrations ranging from 0.008 to 0.3 ppm (Leary and Farrar, 1985; Lacey and Sciascia, 1987).

* * *

5. TARGETS

Surface Water Use

Use(s) of surface water within 3 miles downstream of the hazardous substance:

The Canisteo River is used recreationally for fishing (Kosowski, 1986).

Is there tidal influence?

No.
(USGS Topographic Map: Hornell and Canisteo Quadrangles, 1978)

Distance to a Sensitive Environment

Distance to 5-acre (minimum) coastal wetland, if 2 miles or less:

Not a coastal area (USGS Topographic Map: Hornell and Canisteo Quadrangles, 1978).

Distance to 5-acre (minimum) fresh-water wetland, if 1 mile or less:

Site is located in a Freshwater Wetland (Dupont, 1985).

Distance to critical habitat of an endangered species or national wildlife refuge, if 1 mile or less:

There are no federally designated critical habitats in New York State (Ozard, 1986).

Population Served by Surface Water

Location(s) of water-supply intake(s) within 3 miles (free-flowing bodies) or 1 mile (static water bodies) downstream of the hazardous substance and population served by each intake:

Surface water is not used as potable water source (Keefe, 1986).

Computation of land area by above-cited intake(s) and conversion to population (1.5 people per acre):

Irrigation not practiced in the area (Dupont, 1985).

Total population served:

None. Surface water is not used as a potable water source (Keefe, 1986).

Name/description of nearest of above water bodies:

Not applicable. Surface water is not used as a potable water source (Keefe, 1986).

Distance to above-cited intakes, measured in stream miles:

Not applicable.

AIR ROUTE

1. OBSERVED RELEASE

Contaminants detected:

HNU meter readings up- and downwind of the site taken on 5/1/86 did not indicate organic vapor levels in excess of background levels (ES Site Visit, 5/1/86).

Date and location of detection of contaminants:

Not applicable.

Methods used to detect the contaminants:

HNu meter.

Rationale for attributing the contaminants to the site:

Contaminants are not attributed to the site based on HNu meter readings taken at the site (ES Site Visit, 5/1/86).

* * *

2. WASTE CHARACTERISTICS

Reactivity and Incompatibility

Most reactive compound:

Not applicable. No reactive or incompatible wastes are known to exist on site (NYSDEC, 1985).

Most incompatible pair of compounds:

Not applicable. No incompatible pair of compounds are known to exist on-site (NYSDEC, 1985).

Toxicity

Most toxic compound:

No toxic compounds with the potential to impact the air pathway are known to be present on-site (NYSDEC, 1985).

Hazardous Waste Quantity

Total quantity of hazardous waste:

32 drums containing hazardous wastes were previously located on-site (NYSDEC, 1982).

Basis of estimating and/or computing waste quantity:

Barrells containing caustic liquid and non-chlorinated solvents that were removed in 1982 were observed to be corroded (Herington, 1986). However, because the drums were removed from the site, they do not pose a threat to the air pathway. Therefore, the hazardous waste quantity score for the air pathway is zero.

* * *

3. TARGETS

Population Within 4-Mile Radius

Circle radius used, give population, and indicate how determined:

0 to 4 mi (0 to 1 mi) 0 to 1/2 mi 0 to 1/4 mi

125 buildings x 3.8 people per building = 475 people. Houses counted from USGS Topographic Map (USGS, 1978).

Distance to a Sensitive Environment

Distance to 5-acre (minimum) coastal wetland, if 2 miles or less:

Not a coastal area (USGS Topographic Map: Hornell and Canisteo Quadrangles).

Distance to 5-acre (minimum) fresh-water wetland, if 1 mile or less:

Site is located in a Freshwater Wetland (Dupont, 1985).

Distance to critical habitat of an endangered species, if 1 mile or less:

There are no federally designated critical habitats in New York State (Ozard, 1986).

Land Use

Distance to commerical/industrial area, if 1 mile or less:

Site is adjacent to the Conrail railroad switching yards (ES Site Visit, 1985).

Distance to national or state park, forest, or wildlife reserve, if 2 miles or less:

None within 2 miles (ES Site Visit, 1985; USGS Topographic Map, 1978).

Distance to residential area, if 2 miles or less:

Six or seven houses are located on a hill approximately 2,000 feet (0.4 mile) north of the site (ES Site Visit, 1985; USGS, 1978).

Distance to agricultural land in production within past 5 years, if 1 mile or less:

Approximately 3,000 feet east of the site (Dupont, 1985).

Distance to prime agricultural land in production within past 5 years, if 2 miles or less:

Approximately 3,000 feet east of the site (Dupont, 1985).

Is a historic or landmark site (National Register of Historic Places and National Natural Landmarks) within view of the site?

No (USDOI, 1983).

FIRE AND EXPLOSION

1. CONTAINMENT

Hazardous substances present:

No information was discovered during the Phase I study which indicates that a fire and explosion situation existed or presently exists at the site (Phase I Record Search).

Type of containment, if applicable:

Not applicable.

* * *

2. WASTE CHARACTERISTICS

Direct Evidence

Type of instrument and measurements:

No measurements to determine the fire and explosion potential were taken on-site.

Ignitability

Compound used:

No ignitable compounds are known to exist on-site (NYSDEC Registry Sheet, 1985).

Reactivity

Most reactive compound:

No reactive compounds are known to exist on-site (NYSDEC Registry Sheet, 1985).

Incompatibility

Most incompatible pair of compounds:

No incompatible compounds are known to exist on-site (NYSDEC Registry Sheet, 1985).

Hazardous Waste Quantity

Total quantity of hazardous substances at the facility:

32 drums containing hazardous wastes were previously located on-site (NYSDEC, 1982).

Basis of estimating and/or computing waste quantity:

Barrels containing caustic liquid and non-chlorinated solvents that were removed in 1982 were observed to be corroded (Herington, 1986). However, because the drums were removed from the site, they do not pose a threat to fire safety.

* * *

3. TARGETS

Distance to Nearest Population

1,000 feet (USGS, 1978).

Distance to Nearest Building

1,000 feet (USGS, 1978).

Distance to Sensitive Environment

Distance to wetlands:

Site is located in a freshwater wetland (Dupont, 1985).

Distance to critical habitat:

There are no federally designated critical habitats in New York State (Ozard, 1986).

Land Use

Distance to commercial/industrial area, if 1 mile or less:

Site is adjacent to Conrail Switching Yards (ES Site Visit, 1985).

Distance to national or state park, forest, or wildlife reserve, if 2 miles or less:

Greater than 2 miles (ES Site Visit, 1985; USGS, 1978).

Distance to residential area, if 2 miles or less:

Six or seven houses located on a hill approximately 2,000 feet (0.4 mile) north of site (ES Site Visit, 1985; USGS, 1978).

Distance to agricultural and in production within past 5 years, if 1 mile or less:

Approximately 3,000 feet east of the site (Dupont, 1985).

Distance to prime agricultural land in production within past 5 years, if 2 miles or less:

Approximately 3,000 feet east of the site (Dupont, 1985).

Is a historic or landmark site (National Register or Historic Places and National Natural Landmarks) within the view of the site?

No (USDOI, 1983).

Population with 2-Mile Radius

1,159 people (Estimate based on house count using USGS Topographic Map; 305 buildings x 3.8 people/building = 1,159 people).

Buildings Within 2-Mile Radius

305 buildings (USGS, 1978).

DIRECT CONTACT

1. OBSERVED INCIDENT

Date, location, and pertinent details of incident:

Based on information reviewed during the Phase I Study, there is no confirmed instance in which contact with hazardous substances at the site has caused injury, illness or death to humans or animals.

* * *

2. ACCESSIBILITY

Describe type of barrier(s):

The access road leading to the northern border of the site does have a gate. The site is not completely surrounded by a fence (ES Site Visit, 1985).

* * *

3. CONTAINMENT

Type of containment, if applicable:

32 corroded drums containing caustics and solvents were removed from the site in 1982 (Herington, 1986). PCB levels ranging from 0.008 to 0.3 ppm were detected in soil borings and test pits on-site (Leary and Farrar, 1985; Lacey and Sciascia, 1987). However, because the site was covered with clean fill soil in 1983 (Flint, 1985) the PCB contaminated soil are not accessible to direct contact.

* * *

4. WASTE CHARACTERISTICS

Toxicity

Compounds evaluated:

PCBs detected in on-site soil at concentrations ranging from 0.008 to 0.3 ppm (Farmer and leary, 1985; Lacey and Sciascia, 1987).

Compound with highest score:

PCB - toxicity = 3.

5. TARGETS

Population within one-mile radius

125 residences x 3.8 = 475 = House count from Topo Map (USGS, 1978).

Distance to critical habitat (of endangered species)

There are no federally designated critical habitats in New York State (Ozard, 1986).

PHONE: 607-324-7989
LOCATION: Conrail Building INTERVIEWER: Cordone
DATE/TIME: 12/13/85, 11:30
SUBJECT: Conrail Landfill

REMARKS:

The Conrail site was initially owned/used by the Erie Railroad in the 1920'/30's. The site wa used by the Erie-Lakawana railroad in 1962. It was then taken over by Conrail in 1976. The site received mainly railroad tie butts and dirt from excavations. In 1983, Bakers of Jerrico Hill was contracted to remove top debris from the landfill and cover it with soil from Cunningham Creek (Conrail property). The removed debris (tie butts and paper rolls, etc.) were taken to the Bath County landfill. In 1982, SCA Chemical Services, Inc. removed 32 barrels of organic waste liquid and 32 empty barrels. Also removed were signal batteries. This was done by a Niagara-based outfit. The site has been inactive since 1976. Bakers of Jerrico Hill constructed a berm on the north side of the creek (flowing behind the site) to prevent flooding of the wetland area.

General Site Information

The Conrail Demolition Landfill is located south of Cedar Street on a Conrail access road, south of the City of Hornell, in the Town of Hornellville, Steuben County.

The site topography is a flat, low-lying area which is adjacent to a protected wetland. The dump is bordered to the north by railroad tracks and to the south by the Canisteo River and wetlands. Surface water flows generally to the south towards the wetlands and Canisteo River. Groundwater flow is generally believed to flow south.

Background Site Information

The site was originally owned and used by Erie Lackawana until 1975; then it was taken over by Conrail and used until 1976.

The operation consisted of dumping railroad ties, empty pails, fifty-five gallon drums, batteries, brush and garbage into the wetlands for fill.

In 1976, this operation was prohibited by the U.S. Army Corps of Engineers and the Department of Environmental Conservation because it was located in a protected wetlands.

Conrail was then instructed to remove as much solid waste as possible to the Bath Landfill, have the drums and batteries tested and removed to a hazardous waste disposal site, cover the remaining area with two feet of cover material, and establish a vegetative cover.

To date, the drums have been removed and cover material has been applied. However, the slopes are inadequate and more work is necessary to properly close the site.

Sampling Information

The site area was inspected and sampled on August 18, 1983, by Debbie Jackson and David Boger from DEC.

Sample Listing:

83-229-01: East side of fill - leachate sample in area of dead cattails and railroad ties. Leachate is an orangish-red color with an oil sheen on top. pH = 6.9. Analyzed for pp organics, metals.

83-229-02: Sediment sample on east side of fill. Analyzed for metals.

83-229-03: Sediment sample taken from the south side of the fill near dead vegetation. Analyzed for metals.

83-229-04: Creek sample - downstream. pH = 7.7. Analyzed for pp organics, metals.

83-229-05: Sediment sample from downstream creek. Area has no aquatic vegetation. Analyzed for metals.

83-229-06: Creek sample from upstream. Area has aquatic vegetation. pH = 7.9. Analyzed for pp organics, metals.

83-229-07: Creek sediment and upstream sample. Analyzed for metals.

Samples were taken between 11:30 a.m. and 1:00 p.m. on a hot, cloudy day. Delivery to the mobile lab occurred before 3:00 p.m. No preservatives were added to the samples in the field.

General Inspection

The site was pretty much covered with vegetation; although, quite a lot of solid waste, i.e., railroad ties and batteries, were exposed on the fill edges. Debris was also found in the wetland area where leachate seepage was occurring.

Recommendations

The solid waste should be cleared out of the wetlands and the proper cover and grading should be applied to the exposed areas. Also, a leachate drainage network should be installed to prevent leachate seepage into the wetlands.

Samples

83-229-01 East side of fill - leachate sample in ~~area~~ area of dead cattails, and rail road ties orangish red color with an oilish sheen on top.
pH = 6.9
analyzed for p.p. organics, metals

83-229-02 sediment sample on east side of fill.
analyzed for metals

83-229-03 - sediment sample = south side of fill near dead vegetation
analyzed for metals

83-229-04 Creek sample - down stream
pH = 7.7
analyzed for pp organics metals

83-229-05. sediment sample from down stream - Creek.
area has no aquatic vegetation
analyzed for metals
83-229-06 Creek sample - upstream
area has aquatic vegetation
pH = 7.9
analyzed for pp organics, metals
83-229-07 Creek sediment sample - upstream;
analyzed for metals.

All samples delivered to the Mobil lab by 3:00 pm.
No preservatives added in the field

INTERVIEW FORM

INTERVIEWEE/CODE: Lawrence Keefe

TITLE-POSITION: District Director, NYSDH, Hornell District Office

ADDRESS: Steuben County DOH, 282 Canisteo Street

CITY: Hornell, NY 14843

PHONE: 607-324-5120

LOCATION: Phone Interview INTERVIEWER: Cordone

DATE/TIME: 1/9/86 - 1330

SUBJECT: Groundwater/Surface Water Targets for Conrail and Lindley Landfill Sites

REMARKS:

Conrail Site:

- Hornell receives water from several reservoirs located north of the city (outside of the 3 mile radius from the Conrail site).
- The village of Canisteo's main source of water is from a well (estimated depth 60') located within the village limits. This source is supplemented by a spring-fed reservoir located to the northwest of the village.
- The populated area* just northeast of Canisteo receives drinking water from the Village of Canisteo.
- The populated area east of the Canisteo Reservoir uses private well water.
- Other areas outside of the Village of Hornell or Canisteo (and within the 3 mile Conrail site radius) are using private well water as potable water.
- The population of South Hornell uses private well water as potable water.
- Most private wells in the valley are 30 to 60 feet deep.

Lindley Landfill

- All areas within the 3 mile radius of the site (including Presho) draw potable water from private wells.

* This is Belle Haven Hamlet - along old Route 36.

Joe Sciascia
Sampling Results for Westinghouse Conrail Site -
Hornellsville. (851002)

January 29, 1987

The following are analytical results for Soil Samples collected on 10/28/86.

Sample No.	Total PCB's (PPM)	Sample No.	PCB's (PPM)
1	0.08	12	0.04
2	0.03	13	0.01
3	0.01	14	0.02
	(Clordane 0.01 PPM)	15	0.14
4	N.D.	16	0.027
	(Clordane 0.19 PPM)	17	0.01
5	0.01	18	0.01
6	0.13	19	0.02
7	0.21	20	0.02
8	0.008	21	0.17
9	0.04		
10	0.03		
11	0.15		

According to reports received from the Pennsylvania Department of Environmental Resources sludge from the Westinghouse, Sharon, Pa. plant was found to contain PCB's in the 40,000 PPM range. The levels we found in an area thought to be used for disposal by the retired site operator, Jesse Barnard, are substantially lower and not indicative of concentrated PCB contamination. The levels of PCB's found at this site probably are comparable with those found in unpaved roadways and perhaps roadside drainage ditches and below any action levels that I am aware of.

My understanding is that DEE became involved with the site because of the possible PCB disposal. Under the circumstances, it may now be appropriate to refer the project back to the region for possible futher phased assessment.

Please advise

cc: Carl Hoffman, BSHW

New York State Department of Environmental Conservation

MEMORANDUM

TO: Westinghouse PCB Hornell File and Hornell Street Extension File
FROM: Robert Leary and Dennis Farrar RL DF
SUBJECT: Site Investigation
DATE: 5/2/85

On May 1, 1985, we met Otto Tertinek in Hornell for the purpose of an inspection and sampling of the Hornell site. We first generally inspected the site and took photographs as located on the attached map. The site had a good vegetation growth of brush, weeds, and grasses although some poor growth areas were noted.

The inspection revealed that fill had been placed over layers of old disposed railroad ties since in many areas the fill had filtered into railroad tie crevices and had holes from the surface into the rairoad tie layer.

Three railroad tracks crossed the paved road to the former disposal area. The track farthest west existed when the road was paved since the road met the track at grade. The other two tracks were added after the road paving as additional pavement had been added to meet the higher track grade.

We also met who had formerly worked at the yards. He stated the cleanout tracks were moved as required to allow continual disposal. He believed the Erie Railroad disposed material at the western end of the site, then the Erie-Lackawanna disposed material on the easterly side of the Erie area, and finally Conrail disposed material on the eastern end of the site. He recalled that Conrail built the disposal track on the east end of the yard. These general areas are noted in the attached map.

We then attempted to take soil samples of the site. At the first location, we could not penetrate through the railroad tie layer. At the second location, we penetrated through the railroad tie layer to a four-foot depth at which two one-quart soil samples were taken. This depth was a practical maximum with our equipment. Photographs were taken of the excavation.

We then left this site and went to the Hornell Street Extension site. Photographs were again taken as noted on the attached map. The area to the west of Route 36 is used as a minibike play area. The area to the east of Route 36 is used for trailer storage or is unused.

CLASSIFICATION CODE: 2a REGION: 8 SITE CODE: 851002

NAME OF SITE : Conrail
STREET ADDRESS: So. of Cedar Street on a Conrail Access Road
TOWN/CITY: Hornellsville (T) COUNTY: Steuben ZIP:

SITE TYPE: Open Dump- Structure- Lagoon- Landfill-X Treatment Pond-
ESTIMATED SIZE: 40 Acres

SITE OWNER/OPERATOR INFORMATION:
CURRENT OWNER NAME....: Conrail
CURRENT OWNER ADDRESS.:
OWNER(S) DURING USE...: Erie-Lackawana
OPERATOR DURING USE...: same
OPERATOR ADDRESS.....: out of business
PERIOD ASSOCIATED WITH HAZARDOUS WASTE: From unknown To 1978

SITE DESCRIPTION:
Lat 42 17' 40" N Long. 77 38' 10" W
flat topography - rural area nearest dwelling 1,000 feet
nearest water body: It is in a protected wetland adjacent to an unnamed tributary which flows to Canistro River 200 feet
The Conrail site is an inactive landfill closed in 1978. Final closure is still not completed. The side slopes need to be improved and a vegetative cover crop established.
This site was inspected December 6, 1983, At this time, a leachate outbreak was noted on the east side in an area of dead cattails.
This site is also suspected of receiving PCB wastes from a Westinghouse factory in Pennsylvania, further investigation in warrented,.

Ap—0 to 10 inches; very dark brown (10YR 2/2) silt loam; strong medium granular structure; friable; neutral; abrupt smooth boundary.

A1—10 to 13 inches; black (10YR 2/1) silt loam; weak medium subangular blocky structure; very sticky; mildly alkaline; abrupt wavy boundary.

IIC—13 to 60 inches; gray (5Y 5/1) marl; massive; friable; moderately alkaline; calcareous.

Depth to bedrock is more than 5 feet. Depth to marl or to friable material impregnated with carbonates ranges from 12 to 20 inches.

The A1 or Ap horizon has hue of 10YR, value of 2, and chroma of 1 or 2. Reaction ranges from slightly acid to mildly alkaline.

The C horizon has hue of 2.5Y or 10YR, value of 3 to 5, and chroma of 1 or 2. It ranges from loam to silty clay loam and is moderately alkaline and calcareous. Some profiles do not have a C horizon.

The IIC horizon has hue of 10YR to 5Y, value of 5 to 7, and chroma of 1 or 2. It is moderately alkaline calcareous marl.

Warners soils are near Canandaigua and Edwards soils. Warners soils formed in marl material, which is lacking in Canandaigua soils. Warners soils have a mineral surface layer and Edwards soils have an organic surface layer.

We—Warners silt loam. This is a nearly level soil in depressions on flood plains. It formed in alluvial deposits along streams that are charged with lime, which is precipitated out in the form of marl. In their natural condition these areas are ponded or have ground water within a few inches of the surface. The areas are generally round and are 10 to 40 acres in size.

Included with this soil in mapping were small areas of Edwards soils and Canandaigua soils.

This soil is used mainly for woodland or wildlife habitat. Wetness is the major limitation to farming because the soil lies in areas that are difficult to drain. Wetness and the hazard of flooding severely limit nonfarm uses. Capability subclass IIIw; woodland subclass 5w.

Wayland Series

The Wayland series consists of deep, very poorly drained and poorly drained silty soils that formed in alluvium that was derived mainly from slightly acid soil material. These soils are in level or depressed slack-water areas on flood plains and are subject to periodic flooding.

In a representative profile the surface layer is very dark grayish brown silt loam about 8 inches thick. The subsurface layer is mottled, grayish brown friable silt loam to a depth of 17 inches. From a depth of 17 to 31 inches the subsoil is gray silt loam that is distinctly mottled. From a depth of 31 to 47 inches the substratum is a light gray prominently mottled silt loam that is slightly acid. Below a depth of 47 inches the substratum is grayish colored stratified layers of silt and very fine sand.

The available water capacity is high. Permeability is slow in the solum and substratum. A water table that controls the root zone is at or near the surface for most of the year. If the soils are not limed, the surface layer is slightly acid.

Representative profile of Wayland silt loam, in a pasture in the town of Howard, adjacent to County Route 27, about 3 miles south of the hamlet of Howard:

Ap—0 to 8 inches; very dark grayish brown (10YR 3/2) silt loam; dark yellowish brown (10YR 3/4) root stains; weak fine subangular blocky structure; friable; many fine roots; no coarse fragments; medium acid; abrupt smooth boundary.

A2g—8 to 17 inches; grayish brown (10YR 5/2) silt loam; common medium distinct brown to dark brown (7.5YR 4/4) mottles; weak medium and fine sub angular blocky structure; friable; common fine roots; few patchy clay films; no coarse fragments; slightly acid; clear wavy boundary.

B21g—17 to 25 inches; gray (10YR 5/1) silt loam; many coarse distinct yellowish brown (10YR 5/4) mottles; moderate coarse prismatic structure; firm; few fine roots; few fine pores; grayish brown (2.5Y 5/2) prism coats; no coarse fragments; medium acid; abrupt wavy boundary.

B22g—25 to 31 inches; gray (5Y 5/1) silt loam; many medium and coarse distinct brown to dark brown (10YR 4/3) and dark yellowish brown (10YR 4/4) mottles; strong coarse prismatic structure parting to moderate coarse subangular blocky; firm; few fine roots; common fine pores; no coarse fragments; slightly acid; abrupt wavy boundary.

C1g—31 to 47 inches; light gray (N 6/0) silt loam; many coarse prominent yellowish brown (10YR 5/8) mottles; massive; firm; few fine roots; few fine pores; no coarse fragments; slightly acid; abrupt smooth boundary.

IIC2g—47 to 60 inches; gray (N 5/0) silt and very fine sand; stratified; firm; slightly acid; occasional thin gravel strata.

Depth to contrasting gravelly or sandy material is more than 40 inches. Depth to rock is more than 5 feet. Reaction ranges from medium acid to mildly alkaline in the solum and the upper part of the substratum and from slightly acid to moderately alkaline in the lower part of the substratum.

The A1 and Ap horizons have hue of 10YR or 2.5Y, value of 2 or 3, and chroma of 1 or 2.

The B horizon has hue of 10YR through 5Y, value of 4 to 6, and chroma of 1 or 2. It ranges from silt loam to silty clay loam.

The C horizon is neutral, light gray or gray (N 6/0 or N 5/0), or it has hue of 10YR to 5Y, value of 4 to 6, and chroma of 1 or 2. It ranges from silt loam to silty clay loam to a depth of 40 inches.

Wayland soils are in drainage sequence with well drained Tioga soils and moderately well drained and somewhat poorly drained Middlebury soils.

Wn—Wayland silt loam. This is a nearly level soil in low areas of flood plains along major rivers and streams. The areas are long and narrow and range from 5 to 100 acres in size.

Included with this soil in mapping were small areas of soils that formed in alluvial deposits that have layers of gravel within a depth of 40 inches. Also included were small spots of Middlebury, Palms, or Edwards soils, and an area in the vicinity of Arkport, of a mineral soil approximately 20 inches deep over muck.

If the soil is not drained, it is better suited to permanent pasture or trees. Some isolated areas can be drained and used for row crops, if suitable outlets are available. The dominant vegetation consists of water-tolerant grasses, sedges, and trees. Wetness and the hazard of flooding are the major limitations to farming and most nonfarm uses. Capability subclass IIIw; woodland subclass 4w.

Wellsboro Series

The Wellsboro series consists of deep, moderately well drained soils that formed in glacial till that was

[1] This mapping unit is made up of two or more dominant kinds of soil. See mapping unit description for the composition and behavior of the whole mapping unit.

lations of steel that intersect soil boundaries or soil horizons are more susceptible to corrosion than installations entirely within one kind of soil or within one soil horizon.

Erosion factors are used in an equation that predicts the amount of erosion resulting from certain land treatment. The soil erodibility factor *K* is a measure of the susceptibility of the soil to erosion by rainfall. In table 12, soils having the highest *K* values are the most erodible. The soil-loss tolerance factor *T* is the

[1] This mapping unit is made up of two or more dominant kinds of soil. See mapping unit description for the composition and behavior of the whole mapping unit.

Hydrologic groups are used to estimate runoff after rainfall. Soil properties that influence the minimum rate of infiltration into the bare soil after prolonged wetting are depth to a water table, water intake rate and permeability after prolonged wetting, and depth to layers of slowly or very slowly permeable soil.

Flooding is rated in general terms that describe the frequency, duration, and period of the year when flooding is most likely. The ratings are based on evidences in the soil profile of the effiects of flooding, namely thin strata of gravel, sand, silt, or, in places, clay deposited by floodwater; irregular decrease in organic-matter content with increasing depth; absence of distinctive soil horizons that form in soils of the area that are not subject to flooding; local information about floodwater heights and the extent of flooding; and local knowledge that relates the unique landscape position of each soil to historic floods. Most soils in low positions on the landscape where flooding is likely to occur are classified as Fluvents at the suborder level or as fluventic subgroups. See the section "Classification of the Soils."

The generalized description of flood hazards is of value in land use planning and provides a valid basis for land use restrictions. The soil data are less specific, however, than those provided by detailed engineering surveys that show flood-prone areas at specific flood frequency levels.

A *seasonal high water table* is the highest level of a saturated zone more than 6 inches thick in soils for a continuous period of more than 2 weeks during most years. The depth to a seasonal high water table applies to undrained soils. Estimates are based mainly on the relationship between grayish colors or mottles in the soil and the depth to free water observed during the course of the soil survey. Indicated are the depth to the seasonal high water table; the kind of water table, whether perched, artesian, or apparent; and the months of the year that the high water commonly is present. Only those saturated zones above a depth of 5 to 6 feet are indicated.

Information about the seasonal high water table helps in assessing the need for specially designed foundations, the need for specific kinds of drainage systems, and the need for footing drains to insure dry basements. Such information is also needed to decide whether or not to construct basements and to determine how septic tank absorption fields and other underground installations will function. Also, a seasonal high water table affects ease of excavation.

Depth to bedrock is shown for all soils that are underlain by bedrock at depths of 5 to 6 feet or less. For many soils, limited depth to bedrock is a part of the definition of the soil series. The depths shown are based on measurements made in many soil borings and other observations during the soil mapping. The kind of bedrock and its relative hardness as related to ease of excavation is also shown. Rippable bedrock can be excavated with a single-tooth ripping attachment on a 200-horsepower tractor, but hard bedrock generally requires blasting.

Potential frost action refers to the likelihood of damage to pavements and other structures by frost heaving and low soil strength after thawing. Frost action is defined as freezing temperatures in the soil and movement of soil moisture into the freezing zone, which causes the formation of ice lenses. Soil texture, temperature, moisture content, porosity, permeability, and content of organic matter are the most important soil properties that affect frost action. It is assumed that the soil is not covered by insulating vegetation or snow and is not artificially drained. Silty and clayey soils that have a high water table in winter are most susceptible to frost action. Well drained very gravelly or sandy soils are the least susceptible.

Engineering test data

Table 14 contains engineering test data for some of the major soil series in Steuben County. These tests were made to help evaluate the soils for engineering purposes. The engineering classifications given are based on data obtained by mechanical analyses and by tests to determine liquid limits and plastic limits. The mechanical analyses were made by combined sieve and hydrometer methods.

Compaction (or moisture-density) data are important to earthwork. If a soil material is compacted at successively higher moisture content, assuming that

NY.	NYD082758509

II. HAZARDOUS CONDITIONS AND INCIDENTS (Continued)

01 ☒ J. DAMAGE TO FLORA — 02 ☐ OBSERVED (DATE: _____) ☐ POTENTIAL ☒ ALLEGED
04 NARRATIVE DESCRIPTION
Dead trees in wetland area near site could indicate vegatative stress caused by landfill leachate.

01 ☐ K. DAMAGE TO FAUNA — 02 ☐ OBSERVED (DATE: _____) ☒ POTENTIAL ☐ ALLEGED
04 NARRATIVE DESCRIPTION (Include name(s) of species)
Leachate entering wetland area could effect wildlife.

01 ☐ L. CONTAMINATION OF FOOD CHAIN — 02 ☐ OBSERVED (DATE: _____) ☒ POTENTIAL ☐ ALLEGED
04 NARRATIVE DESCRIPTION
Leachate entering wetland area could effect wildlife.

01 ☒ M. UNSTABLE CONTAINMENT OF WASTES (Spills/runoff/standing liquids/leaking drums) — 02 ☐ OBSERVED (DATE: 1/81) ☐ POTENTIAL ☐ ALLEGED
03 POPULATION POTENTIALLY AFFECTED: _____ 04 NARRATIVE DESCRIPTION
During a site visit corroded drums were observed in the landfill.

01 ☐ N. DAMAGE TO OFFSITE PROPERTY — 02 ☐ OBSERVED (DATE: _____) ☐ POTENTIAL ☐ ALLEGED
04 NARRATIVE DESCRIPTION
NO

01 ☐ O. CONTAMINATION OF SEWERS, STORM DRAINS, WWTPs — 02 ☐ OBSERVED (DATE: _____) ☐ POTENTIAL ☐ ALLEGED
04 NARRATIVE DESCRIPTION
NO

01 ☐ P. ILLEGAL/UNAUTHORIZED DUMPING — 02 ☐ OBSERVED (DATE: 12/13/85) ☐ POTENTIAL ☒ ALLEGED
04 NARRATIVE DESCRIPTION
During a recent site visit, domestic garbage was observed on the access road to the site. Probably the result of illegal dumping by local residents.

05 DESCRIPTION OF ANY OTHER KNOWN, POTENTIAL, OR ALLEGED HAZARDS

III. TOTAL POPULATION POTENTIALLY AFFECTED: Unknown

IV. COMMENTS

The site received railroad ties, batteries, white goods, garbage and drums. An inspection in 1981 revealed corroded drums in the landfill. In 1982, 31 drums containing alkaline liquid, non-chlorinated solvents and flammable solids were removed. In 1985 a number of Hg batteries were removed.

14 DESCRIPTION OF SITE IN RELATION TO SURROUNDING TOPOGRAPHY

Site is located directly in a NYS designated wetland area and 100 year Flood plain of the Canisteo river. The Canisteo river is located abaut 200-500 Ft south of the site and flows to the east. There is a stream located along the western edge of the landfill. that flows south and drains into the wetland area located south and east of the site.

SECTION VI

ASSESSMENT OF DATA ADEQUACY AND RECOMMENDATIONS

ASSESSMENT OF DATA ADEQUACY

A summary assessment of the adequacy of existing data for completion of the HRS score is presented in Table VI-1. Based on this assessment, the following Phase II work plan and cost estimate has been prepared.

PHASE II WORK PLAN

Objectives

The objectives of the proposed Phase II activities are:

- To collect additional field data necessary to identify the occurrence and extent of contamination and to determine if any imminent health hazard exists.

- To perform a conceptual evaluation of remedial alternatives and estimate budgetary costs for the most likely alternative.

- To prepare a site investigation report including final HRS score.

The additional field data required to complete this investigation are described as follows:

Geophysical Survey - A geophysical study consisting of an electrical resistivity survey is recommended. The electrical resistivity survey will be performed at various locations within and beyond the perimeter of the site to investigate site stratigraphy, delineate significant discontinuities and assess the presence and location of contaminant plumes. A magnetometry survey will be conducted as necessary on a grid system to aid in locating buried drums and in delineating the limits of the contaminated area.

Groundwater - A groundwater monitoring system consisting of 4 wells with proposed locations shown in Figure VI-1 is recommended. Borings will be drilled to a maximum depth of 60 feet; soil samples will be taken every 5 feet or more frequently if a change in soil lithology is encountered. The wells will be placed in the aquifer of concern and constructed of 2" PVC pipe. The groundwater samples will be analyzed for HSL metals and organics. In addition, sieve and hydrometer analyses will be performed on representative samples of the subsurface soils. Finally, an in-situ permeability test will be performed on each well.

Air - An air monitoring survey with an HNu meter is recommended to test the air quality above the site during site activities.

TASK DESCRIPTION

The proposed Phase II tasks are described in Table VI-2 as required under the site specific health and safety plan and quality assurance plan which must be submitted prior to initiation of field activities. The proposed monitoring well and sampling locations are presented in Figure VI-1.

COST ESTIMATE

The estimated man-hours required for the Phase II project are presented in Table VI-3 and the estimated project costs by tasks are presented in Table VI-4.

TABLE VI-1

ASSESSMENT OF ADEQUACY OF DATA

HRS Data Requirement	Comments on Data
Observed Release	
Groundwater	Data inadequate to score observed release
Surface Water	Data adequate for HRS score
Air	Data adequate for HRS score
Route Characteristics	
Groundwater	Data adequate for HRS score
Surface Water	Data adequate for HRS score
Air	Data adequate for HRS score
Containment	Data adequate for HRS score
Waste Characteristics	Data adequate for toxicity/persistence - information unconfirmed for waste quantity evaluation
Targets	Data adequate for HRS score
Observed Incident	Data adequate for HRS score
Accessibility	Data adequate for HRS score

TABLE VI-2
PHASE II WORK PLAN - TASK DESCRIPTION

Tasks		Description of Task
II-A	Update Work Plan	Review the information in the Phase I report, conduct a site visit, and revise the Phase II work plan.
II-B	Conduct Geophysical Studies	Conduct resistivity and magnetometry surveys.
II-C	Conduct Boring/Install Monitoring Wells	Install 1 upgradient and 3 downgradient wells. The borings will be drilled to a depth of approximately 60 feet. Wells will be constructed of 2" PVC pipe.
II-D	Construct Test Pits/Auger Holes	No further construction of test pits/auger holes necessary.
II-E	Perform Sampling & Analysis	
	Soil samples from borings	Soil samples collected at 5 ft. intervals during drilling and at changes in subsurface lithologies. Perform one grain size analysis and permeability test per subsurface lithology change.
	Soil samples from surface soils	No further studies necessary.
	Soil samples from auger holes/test pits	No further studies necessary.
	Sediment samples from surface water	No further studies necessary.
	Groundwater samples	4 groundwater samples are to be collected and analyzed for HSL metals and organics.
	Surface water samples	No further studies necessary.

TABLE VI-2 (Continued)
PHASE II WORK PLAN - TASK DESCRIPTION

Tasks		Description of Task
	Air samples	Using the HNU determine the presence of organics.
	Waste samples	No further sampling necessary.
II-F	Calculate Final HRS	Based on the field data collected in Tasks II-B - II-E, complete the HRS form.
II-G	Conduct Site Assessment	Prepare final report containing significant Phase I information, additional field data, final HRS and HRS documentation records, and site assessments. The site assessment will consist of a conceptual evaluation of alternatives and a preliminary cost estimate of the most probable alternative.
II-H	Project Management	Project coordination, administration and reporting.

Air Violation - open burning violation ? Some documentation late 60's, early 70's

We do have inspections after 1978 New 360 regs that they were still dumping

We definitely have 360 and wetlands violations on old conditions - statute of limitations involved ?

Can H.D. establish a health hazard due to vermin ?

Knife involved - was kept abreast of

(22)

Maybe at can go after BL Fine - ticket

if they are not cooperative — start talking to media

They submitted a 360 application in 78 - IN COMP - State

They submitted plans for closure in 79 . we approved . No work ever done

Cooper + Fidge inspect site

Maybe write a ticket - letter giving them a chance to do the work before we get nasty .

Letter giving them 20 days to send letter of committmeed that they will do remedial work.

they are in 100 yr. flood plain - I have copy of maps.

Meeting at site

Lay out specific workplan √Done

Cooper + I prepare a letter - Peter + al review draft - cease dumping, block access, basic- √done

New York State Department of Environmental Conservation

MEMORANDUM

TO: Charles Goddard - Bureau Hazardous Site Control, Albany
FROM: Glen Bailey - Div. Environmental Enforcement, Buffalo
SUBJECT: Conrail Demolition/Debris Site, Hornellsville, Steuben County Site #851002
DATE: 2/13/87

Glen R. Bailey

On October 19, 1983, the Buffalo Field Unit of the Division of Environmental Enforcement was assigned the matter of an investigation to locate the site of alleged disposal of sludges from an air pollution control wet scrubber at a Westinghouse facility in Sharon, Pennsylvania. The allegations were referred to this Department from the Pennsylvania DER through Walter Demick. DER and USEPA were then involved in clean-up actions related to these sludges at the Sharon facility, where the sludges were found to contain up to 40,000 mg/kg of PCBs.

The best information available indicated that these sludges had been transported by the Erie Lackawanna Railroad for years. The sludges had been allegedly piled at a railroad access area where they weathered and dried, and were then loaded via a clam shell bucket into gondola cars and transported to an unknown location in New York State for disposal. Based upon the results of extensive investigation by this division, with the assistance of the Bureau of Environmental Conservation Investigations, we concluded that the most likely location for such disposal to have occurred was at Conrail's Hornellsville site.

This conclusion was based upon information obtained from individual employee's recollections and upon the normal operating practices of the Erie Lackawanna Railroad during the period involved. Due to the current status of the Erie Lackawanna Railroad, and due to the extensive loss of records during the floods of 1972, no documentation was found to support the actual location of disposal. However, some of the employees interviewed recalled the disposal of similar substances at described locations at the Hornellsville site.

On May 1, 1985, staff from this office went to the site, and based upon the general area of deposition identified on-site by a former employee, attempted to collect soil samples for PCB analysis. These samples were collected by hand, and due to the extent of cover and debris in the area, the samples were no deeper than four feet from the surface. The analytical results reflected trace levels of PCBs (0.3 mcg/g) in the samples. Due to the known history of this site and the suspected levels of PCBs in the sludges allegedly disposed of, these results were inconclusive.

(22)

On October 28, 1986, Staff from this office again went to the site, and again consulted on-site with former employees to identify the most probable area of relevant past disposal. At this time arrangements had been made with Conrail to have a backhoe and operator on-site to facilitate sampling at the depths of probable disposal. Composite samples were collected from twenty-one locations from depths at three to seven feet from the surface. The analytical results from these samples were not significantly different than the results from the previous sampling.

Based upon this information, it is reasonable to conclude that this site does not contain PCB contamination similar to that found at the alleged source in Sharon, Pennsylvania. The Division of Environmental Enforcement is concluding its investigation in this matter.

Please continue to address this site in a routine manner without regard to the alleged PCB-contaminated sludges. If further assistance by this Division is necessary, please follow your normal routine for such a referral.

BUREAU OF ... DIVISION ... HAZARDOUS WASTE

Jeffrey Lacey
Joe Sciascia
Sampling Results for Westinghouse Conrail Site - Hornellsville. (851002)

January 29, 1987

The following are analytical results for Soil Samples collected on 10/28/86.

Sample No.	Total PCB's (PPM)	Sample No.	PCB's (PPM)
1	0.08	12	0.04
2	0.03	13	0.01
3	0.01 (Clordane 0.01 PPM)	14	0.02
		15	0.14
4	N.D. (Clordane 0.19 PPM)	16	0.027
		17	0.01
5	0.01	18	0.01
6	0.13	19	0.02
7	0.21	20	0.02
8	0.008	21	0.17
9	0.04		
10	0.03		
11	0.15		

According to reports received from the Pennsylvania Department of Environmental Resources sludge from the Westinghouse, Sharon, Pa. plant was found to contain PCB's in the 40,000 PPM range. The levels we found in an area thought to be used for disposal by the retired site operator, Jesse Barnard, are substantially lower and not indicative of concentrated PCB contamination. The levels of PCB's found at this site probably are comparable with those found in unpaved roadways and perhaps roadside drainage ditches and below any action levels that I am aware of.

My understanding is that DEE became involved with the site because of the possible PCB disposal. Under the circumstances, it may now be appropriate to refer the project back to the region for possible futher phased assessment.

Please advise

MEMORANDUM

TO: John Greenthal, Director, Albany
FROM: Barbara Guibord, Assistant Counsel, Buffalo
SUBJECT: Recommendation To Drop The Hornell Site From Compliance Team List

DATE: June 1, 1981

The Conrail Demolition landfill site is located in the City of Hornellsville, County of Steuben in Region 8. It first came to the attention of the Region as a result of a letter dated November 30, 1978 from an adjacent landowner complaining that Conrail had dumped materials into a landfill which eventually encroached onto his property. The Region's inspection of the landfill verified the landowner's complaint. The Conrail site was several acres in size and did extend onto nonConrail-owned property. Visual inspection reflected a large mound with a variety of trash, railroad ties, and switching material disposed in the area. The site is located in a wetlands. A row of willow trees are dead or dying in the vicinity of the landfill.

Compliance Team investigation focused on interviewing past and present Conrail employees living in the Hornell area to determine the historic waste disposal practices of Conrail. One man, Mr. Price, had been a foreman for Conrail in charge of "clean-up" for 15 years, from 1960 through 1975. Prior to 1960, Mr. Price was employed for 44 years with Erie-Lackawanna. He indicated that the site was used by both railroads to dispose of rubbish, spoiled produce, and rejected goods from the New Jersey docks. There were no water outlets or steam outlets in the area to wash out tank cars. Those cars requiring a full cleaning were sent to Chicago. He stated that to his knowledge, there were no chemicals or hazardous wastes buried at the site. Mr. Price's information was corrobated by other retired Conrail employees living in the area.

The Compliance Team consulted with Professor Walter Friend, Chairman of the Department of Horticulture at Alfred Technical University in the Hornell area. Pursuant to our request, Professor Friend inspected the site to determine the possible cause of the willow trees dying. He stated that the trees' disease was probably not attributable to any toxic leachate emminating from the site. Rather, it was due to a lack of oxygen caused by water impoundment around their trunks as the site interfered with normal water drainage. He noted that other vegetation around the trees was thriving and that the trees had been dead for a period of years.

We then determined that EPA's consultant, Fred C. Hart Associates, had inspected the site and had taken water and sediment samples at the site. Although the official, written results had not yet been sent, Fred C. Hart Associate's Environmental Engineer, Mike Rosenberg, indicated that the samples were found not to contain any hazardous wastes. The samples were tested for the priority pollutants.

(23)

As a result of our investigation, it appears that this site is not an inactive hazardous waste disposal site under Article 27, Title 13, triggering any further Compliance Team activity. Therefore, it is respectfully requested that this site be referred back to Region 8 for any possible action on the wetlands violation.

MEMORANDUM

NYSDEC, Region #8

TO: Frank Shattuck, Regional Solid Waste Engineer

FROM: Carol Herington, Senior Engineering Technician

RE: Conrail Demolition Landfill - #.
Hornellsville (T), Steuben County

DATE: January 8, 1981

On Tuesday, December 30, 1980, I met with Richard LaValle of the Hornell area regarding the old Conrail Demolition Landfill south of the City of Hornell. Mr. LaValle has been a resident of the area for 50 years and his family has owned property in the valley for nearly 100 years. Mr. LaValle currently owns property immediately adjacent to the southeast face of the Conrail Landfill. In 1976, Mr. LaValle was informed by Conrail that they had inadvertently filled on his property. Conrail requested permission to continue filling but Mr. LaValle refused. They also asked Mr. LaValle 'what he wanted" but he said he would need some time to assess the damages. This was one of Mr. LaValle's main reasons for contacting us. He would like our assistance with some "formula" for assessing the existing and/or potential damages from the landfill and its contents.

Mr. LaValle was also of great assistance in supplying me with information regarding the Conrail Landfill. He can remember dumping at the site for 40 years. When Erie-Lackawanna owned the site, there was some small scale dumping. Major dumping began when Conrail took over around 1975. This also marks the time when Conrail was replacing most of its tracks. LaValle mainly remembers railroad ties being buried at the landfill. He also recalls a clean-out track into the landfill where they emptied boxcars, gondola cars, etc. This landfill was also Conrail's major site for disposal of wreckage from major rail accidents in this part of the country. Mr. LaValle recalls seeing brown, oily leachate southeast of the landfill and in 1952, the water in a ditch which used to divide Erie (now Conrail) property from LaValle's land was frequently covered with an oily scum. This ditch has since been filled. Mr. LaValle also agreed to try and find any other neighbors or ex-Conrail employees that might be willing to talk to us.

We then conducted an inspection (see attached reports) of the Conrail Landfill. I noted numerous deficiencies which you will find listed below.

1. Access to site unlimited evidence of very recent dumping of household wastes.

2. Site never received proper cover, grading and seeding as per Conrail's January 1979 closure plans.

3. No submission of written engineering report with information regarding the nature of materials in the landfill, as per D.E.C. orders in 1978. Specific requests were for bills of lading.

4. No sampling done by Conrail.

5. There is evidence of adverse effect on the environment. A wooded swamp along the southeast corner of the landfill has a large "swath" of dead willow trees.

In addition to these obvious problems, I noted several indicators of possible hazardous materials. Along with literally thousands of railroad ties, I noted several 55 gallon drums in the south and southeast landfill faces. I also saw several 10 gallon pails, some with a "Karmac" label with asbestos and asphalt as ingredients and 10 to 12 large triple-cell batteries sitting on the ground around the landfill.

We seem to have some clear Part 360 violations at this site as well as some good background data regarding suspected in-place toxics.

Please advise me of your recommendations for "next step" action.

MEMORANDUM
NYSDEC, Region #8

To: Eric A. Seiffer
From: Paul F. Schmied
Re: PCB Leachate at Conrail Yard
Hornell (C), Steuben (C)
Date: September 2, 1983

Pennsylvania Department of Environmental Resources has advised us that sludge from an air pollution control device (wet scrubber) may have been shipped to Hornell from a Westinghouse plant at Sharon, PA, starting during the 1940s until 1976 when the practice was stopped. Two to three railroad cars were shipped "periodically" which is estimated at about 12 cars per year. The material was dumped at the Hornell yards.

Cleanup at the Westinghouse plant in Sharon is now underway with "encouragement" of USEPA and PDER. Current chemical analyses of sludge in the decant tank there show 40,000 mg/kg PCB which is greater than the action level of 50 mg/kg. This material is now disposed at CECOS.

No records are available to confirm that any of this material was shipped anywhere. Current and former Conrail employees at Sharon, PA, Youngstown, OH; and Hornell have been very cooperative in supplying information from memory, as no records appear to exist.

The railroad has closed the dump site recently and has restricted access. I believe Carol Herington worked on this for a long time. The closed site may or may not be the site at which the PCB contaminated material was dumped.

Mr. John Dessano, a retired railroader in the Hornell area (telephone 607-324-7411), may know where the material was dumped in the 1970s, according to railroad sources. There may be leachate which may contain PCB at very high levels.

If a suspect site is located, if analyses are done, and if tests are positive and cleanup appears needed, then DEC should endeavor to include it with the work now being done by Westinghouse in Sharon, PA.

Contacts at PDER are:

Joe Williams
Water Quality Specialist
PDER

Initial contact on this was made via Walter Demick, DS&HW, Albany.

27

Region Solid & Hazardous Waste staff are not able to accept this additional investigation at this time due to lack of staff, the imminent legislative hearing, and regular program responsibilities.

Accordingly, I suggest this matter be referred to the Division of Hazardous Waste Enforcement for investigation and appropriate followup. If you agree, a transmittal memo from you to John Greenthal is attached for your use.

APPENDIX B
PROPOSED UPDATED NYS REGISTRY SHEET

(47-15-11 (10/83)

NEW YORK STATE DEPARTMENT OF ENVIRONMENTAL CONSERVATION

DIVISION OF SOLID AND HAZARDOUS WASTE

INACTIVE HAZARDOUS WASTE DISPOSAL SITE REPORT

PRIORITY CODE: 2a SITE CODE: 851002

NAME OF SITE: Conrail REGION: 8

STREET ADDRESS: South of Cedar St. on a Conrail access road

TOWN/CITY: Hornellsville COUNTY: Steuben

NAME OF CURRENT OWNER OF SITE: Conrail

ADDRESS OF CURRENT OWNER OF SITE: 104 Loder St., Hornell, NY 14843

TYPE OF SITE: OPEN DUMP ☐ STRUCTURE ☐ LAGOON ☐
LANDFILL [x] TREATMENT POND ☐

ESTIMATED SIZE: 20 ACRES

SITE DESCRIPTION:

Lat. - 42°, 17', 40" N; Long. - 77° 38', 10" W
Flat topography - rural area, nearest dwelling 1,000 feet. Nearest water body: It is in a protected wetland adjacent to an unnamed tributary which flows to Canistro River 200 feet. The Conrail site is an inactive landfill closed in 1978. Final closure is still not completed. The side slopes need to be improved and a vegetative cover crop established. This site was inspected December 6, 1983. At this time, a leachate outbreak was noted on the east side in an area of dead cattails. This site is also suspected of receiving PCB wastes from a Westinghouse factory in Pennsylvania. Further investigation is warranted.

HAZARDOUS WASTE DISPOSED: CONFIRMED [x] SUSPECTED ☐

TYPE AND QUANTITY OF HAZARDOUS WASTES DISPOSED:

TYPE	QUANTITY (POUNDS, DRUMS, TONS, GALLONS)
Drums with unknown chemicals	Removed from site
Railroad ties, track waste, metal scrap	
Lead batteries	20
PCB's oil	Unknown

TIME PERIOD SITE WAS USED FOR HAZARDOUS WASTE DISPOSAL:

Unknown, 19 ___ TO ___, 19 78

OWNER(S) DURING PERIOD OF USE: Erie-Lackawana/Conrail

SITE OPERATOR DURING PERIOD OF USE: Same

ADDRESS OF SITE OPERATOR: Erie-Lackawana (out of business) Conrail - 104 Loder St., Hornel NY

ANALYTICAL DATA AVAILABLE: AIR ☐ SURFACE WATER [x] GROUNDWATER ☐
SOIL ☐ SEDIMENT [x] NONE ☐

CONTRAVENTION OF STANDARDS: GROUNDWATER ☐ DRINKING WATER ☐
SURFACE WATER ☐ AIR ☐

SOIL TYPE: Silt clay

DEPTH TO GROUNDWATER TABLE: 0 feet

LEGAL ACTION: TYPE: Comm's Order ___ STATE ☐ FEDERAL ☐
STATUS: IN PROGRESS ☐ COMPLETED ☐
REMEDIAL ACTION: PROPOSED ☐ UNDER DESIGN ☐
IN PROGRESS [x] COMPLETED ☐

NATURE OF ACTION: Cover and grading of site

ASSESSMENT OF ENVIRONMENTAL PROBLEMS:

Final closure needs to be completed, it is schedule for late fall 1983. Periodic surveillance is necessary to assess any environmental problems. Further investigation/sampling is necessary to adequately evaluate this site.

ASSESSMENT OF HEALTH PROBLEMS:

Insufficient information.
