1.0 INTRODUCTION

On September 2, 2025, HRP Associates, Inc. (HRP) was authorized to complete New York State Department of Environmental Conservation (NYSDEC) Work Assignment (WA) No. 56 (D009808-56) for Remedial Investigation/Feasibility Study (RI/FS) at the City of Corning Fire Department (Site), located at 2 Corning Boulevard, Corning, New York (**Figure 1 – Site Location**). The scope of work was developed based on HRP's review of documents detailing previous subsurface investigations at the property, including the 2024 Parsons Site Characterization (SC) Investigation (Parsons, 2024) and the Community Liaison Plan (Parsons, 2012), as well as discussions with NYSDEC staff.

The City of Corning has been the focus of several extensive environmental investigations due to potential widespread contamination associated with the surrounding historic glass-making manufacturing. Environmental investigations have shown that historic glass manufacturing operations were known to have disposed of waste primarily containing ash, brick, and/or glass (ABG). For the purposes of this report, ABG refers to anthropogenic fill composed of industrial waste containing identifiable ABG constituents. ABG was specifically defined as a heterogeneous mixture of residual byproducts generated from historical glassmaking operations. ABG could include a variety of glass colors, several types of brick, and white or black ash. Other materials included the by-products of glass making including slag and furnace residue. Each of these materials had been found throughout the City of Corning. Waste from these industries were often used to fill and level portions of the city and can be found at depths ranging from surface level to 10 feet below-grade surface.

These materials can pose significant risks to the public's health, as well as the surrounding environment. ABG is known to contain metals, such as arsenic, barium, chromium, lead, and mercury. ABG may also contain semivolatile organic compounds (SVOCs), which—along with metals—are regulated under New York Codes, Rules, and Regulations (NYCRR) Part 375 Soil Cleanup Objectives (SCOs). Additionally, the NYSDEC may classify these materials as a nuisance condition under Commissioner Policy 51, Section G.

2.0 PROJECT BACKGROUND AND OBJECTIVE

This scope of work has been developed to provide the necessary details for the construction, operation, and implementation of the Interim Remedial Measures (IRM). The following report identifies the investigation of the City of Corning Fire Department located at 2 Corning Boulevard, Corning, New York, and was conducted to further delineate the nature and extent of the observed contamination in support of planned remedial activities. Additionally, this report was prepared under NYSDEC-approved Work Assignment D009808-56 in support of the IRM at the City of Corning Fire Department Site.

2.1 Site Background

The Corning Fire Department Site is located in the northeastern portion of the City of Corning **(Figure 1)**. It is bounded by the following:

- NYS flood control land and the Chemung River to the south
- Center Way and the Corning Family YMCA property to the west
- Corning Boulevard and the Guthrie Medical Center property to the north
- Memorial Stadium to the east.

The Site includes the fire station building, asphalt paved driveway and parking lot, and lawn areas. The City of Corning Municipal Water Supply Well #9 and an associated building is located on the southeast portion of this Site. The Site is comprised of tax parcel 318.05-02-001.200 (frontage along Corning Boulevard and Center Way) and the western portion of tax parcel 318.05-01-068.000 (the eastern portion of this tax parcel contains Memorial Stadium and is not included as part of this Site). Site tax parcels are identified in **Figure 2.**

The property was formerly owned by Corning Glass Works prior to 1945 when it was transferred to the City of Corning. Anecdotal reporting by multiple residents in the area indicated that a large pile of glass waste was present in the location of the existing fire station building prior to the flood of 1972. Much of the surrounding area is a former low area along the Chemung River that had been extensively filled from the 1930s, or earlier, to the early 1960s. A 1920 property deed contained a condition that allowed Corning Glass Works to maintain ash dumps within the limits of Study Area project 851046, which included a portion of the frontage parcel of this Site (Parsons, 2012).

The Site is currently operated by the City of Corning Fire Department and is zoned for community service/commercial use.

2.2 Previous Environmental Investigation

This section summarized the assessment of existing Site conditions presented in the Site Characterization Report (SCR) prepared by Parsons in August 2024. The SCR was completed to investigate potential impacts to the Site from the presence of ABG previously identified. ABG was observed in subsurface soil borings and test pits installed across the Site. Semivolatile organic compounds (SVOCs) and metals were detected at concentrations that exceed Commercial SCOs in subsurface soil boring samples. ABG was not observed in surface soil samples; however, two

SVOCs were detected at concentrations exceeding Commercial SCOs. Metals such as arsenic, cadmium, and lead were detected at concentrations exceeding Commercial SCOs in test pit soils across the Site. The SCR recommended additional characterization of surface and subsurface soils to further evaluate the nature and extent of contamination and the observed ABG at the Site.

2.3 Site Topography, Geology, and Hydrology

The Site is located adjacent to the Chemung River and is underlain by alluvial silts and fine sands derived from post-glacial floodplain deposits. These sediments generally exhibit low permeability. According to published sources, these river valley deposits are likely more than 80 feet in thickness in the vicinity of the Site and are underlain by low permeability shale and siltstone bedrock of the Upper Devonian period. Depth to bedrock had not been confirmed but was estimated to exceed 80 feet below grade (ft bg). Depth to the water table is expected to be approximately 20 ft bg. Shallow groundwater is typically present within sandy layers and is believed to flow in a southeasterly direction (Caldwell, 1986).

3.0 FIELD INVESTIGATION AND SCOPE

The pre-design investigation was completed in accordance with the PDI workplan (WP) dated November 4, 2025 and approved by the NYSDEC on November 14, 2025. The field investigation was performed on November 17th and 18th, 2025 in accordance with NYSDEC's DER-10 standards.

The investigation tasks described in the work plan utilized the NYSDEC's *DER-10, Technical Guidance for Site Investigation and Remediation*, dated May 2010 (DER-10). HRP followed the procedures outlined in the previously approved generic Field Activity Plan (FAP), Quality Assurance Project Plan (QAPP), and Health and Safety Plan (HASP). As required by the NYSDEC, the Work Plan for this Work Assignment (WA) incorporated the following Site-specific components:

1. Preliminary Site Activities
2. Soil Boring Installation
3. Surface Soil Sampling
4. Base Map Development and Site Survey

The Pre-Design Investigation Field Activities Work Plan (FAP) established site-specific procedures for the November 17–18, 2025 field program, including sampling methods and documentation requirements. A site-specific Health and Safety Plan (HASP), incorporating a Community Air Monitoring Plan (CAMP), was implemented during intrusive activities. CAMP monitoring was conducted for volatile organic compounds (VOCs) and particulates. No exceedances of any action levels for VOCs or particulates were recorded **(Appendix A)**. The HASP supplements HRP's NYSDEC-approved generic HASP and includes requirements for oversight, PPE, air monitoring, site controls, and decontamination.

A site-specific Quality Assurance Project Plan (QAPP), supplementing the NYSDEC-approved Generic QAPP, defined the Quality Assurance/Quality Control (QA/QC) protocols governing sample collection, handling, instrumentation, calibration, data validation, and corrective actions. Laboratory analyses were performed by the NYSDOH ELAP-certified laboratory, Pace Laboratories Inc. (Pace). All analytical data packages, including Category B deliverables and data usability summary reports (DUSRs), were produced in NYSDEC-compliant formats and validated by an independent contractor following applicable USEPA CLP guidelines and method-specific QC criteria. QA/QC measures implemented throughout the investigation ensured that all data met the data quality objectives and analytical requirements of the PDI WP.

3.1 Preliminary Site Activities

The Site layout consists of a 100 x 100-foot grid **(Figure 3)**, with one 1-foot-deep boring advanced near the center of each grid cell. Prior to initiating subsurface drilling activities during the pre-design investigation, and in accordance with New York State law, HRP submitted a ticket with UDIG Dig Safely New York, ticket #11115-000-936, to have the Site marked for underground utilities. The Site mark out was performed on November 16, 2025. All identified anomalies were marked at the ground surface with flags and paint.

A Trimble GPS Geo7X 7000 was used to mark specific soil sampling locations before subsurface work. Soil borings were advanced with a stainless-steel hand auger to achieve a depth of 1 ft bg in place of a Geoprobe, as specified in the PDI WP. Additionally, the southernmost cell in Column C was excluded from the pre-determined sampling grid following NYSDEC Flood Control's determination that the proposed sampling point was situated on the adjacent berm, where intrusive activities are not permitted.

3.2 Soil Boring Installation and Surface Soil Sampling

A total of 22 soil borings were installed during the PDI. All installed soil borings were named in accordance with the established grid, and their locations are depicted on **Figure 3**, which was designed to provide adequate distribution and coverage across the Site. Subsurface anomalies and overhead utilities affected some planned soil boring locations prior to installation; however, the affected borings were relocated within the same grid cell to maintain proper site coverage. A minimum 10-foot distance was maintained for soil borings in close proximity to marked or observed utilities.

During soil boring installation, soil samples were logged and screened by an HRP geologist. Soil samples were logged using the Unified Soil Classification System (AST International, 2018) including grain size, color, and nature of fill material, and obvious physical evidence of contamination (i.e., odor, staining). Additionally, if ABG was observed in the soil boring, the size, color, and texture of the material were recorded in the sample logs and the material was photographed. **Table 2** provides a summary of the observed ABG at the Site.

A small portion (1-2 oz) of each sample was placed in a polyethylene zip top bag and allowed to attain ambient temperature before photo-ionization detector (PID) headspace analysis. PID headspace analysis measurements and soil descriptions are presented on soil boring logs included in **Appendix B.**

If ABG was not observed in the soil sample, two soil samples from each boring were collected from the following depth intervals and analyzed for Target Analyte List (TAL) Metals and Target Compound List (TCL) SVOCs. Sample concentrations were compared against Part 375 Commercial Use SCOs.

- 0-2 inches (excludes sod/grass/organic)
- 2-12 inches

Additionally, to support future IRM waste disposal, a composite sample for waste characterization was collected at each sample location. These samples were analyzed if ABG was present or if laboratory results detected a contaminant of concern at a concentration exceeding Commercial Use SCOs. Quality control samples, including duplicates and matrix/matrix spike duplicates, were collected at a frequency of one per 20 samples to ensure precision and accuracy. A summary of soil sample collection and analysis is provided in **Table 2.**

All non-disposable soil sampling equipment was decontaminated between samples using an Alconox wash followed by a clean water rinse.

Each soil boring was backfilled with soil cuttings. Each soil boring was restored to match pre-sampling conditions. Photographs from the PDI WP, including photographs of observed ABG materials, are included as **Appendix C**.

3.3 Soil Sampling Collection and Handling Procedures

Soil sampling equipment included stainless steel trowels, bowls, spoons, scoops, hand auger, sample containers, sampling zip lock bags, and coolers with ice. Nitrile gloves were worn by personnel collecting and handling the samples. All non-disposable equipment and tooling used for sampling were properly decontaminated as described in the PDI WP. Decontamination took place between sampling locations and intervals. Soil samples were collected using clean laboratory-supplied appropriate containers and preserved on ice in coolers during field sampling activities. Target samples were then submitted for laboratory analysis, as listed in **Table 2**.

3.4 Base Map Development and Site Survey

A comprehensive topographic and American Land Title Association (ALTA) survey was performed to provide base maps for developing the remedial design. Twin Tier Land Surveying was enlisted to perform the survey and collect ground surface point elevation data to construct a Site contour map with 1-foot intervals. The surveyor provided Computer-Aided Design (CAD) and PDF survey files for all collected Site data. The survey is provided as **Appendix D**. The survey referenced horizontally to the North American Datum 1983, 2011 adjustment (NAD83/2011), and vertically to the North American Vertical Datum of 1988 (NAVD88) as in accordance with New York State Standards.

The field survey included establishing a project horizontal control and the collection of planimetric features for the development of 2D mapping. Only the exterior Site features were recorded in the survey. Subsequently, a base map of the Site was developed using CAD software that was utilized to place all PDI soil borings.

4.0 RESULTS

4.1 Ash, Brick, and Glass Results

Field observations from ABG soil boring operations are summarized in **Table 2**. As documented in the table, ABG was encountered in 14 of the 22 borings. The recovered material consisted of trace quantities of slag along with fragments of colored glass (black, white, blue, red, or green), and substantial brick pieces. ABG was observed in both the 0-2 inches below grade interval and the 2-12 inches below grade interval.

4.2 Analytical Results

Pace was selected as the laboratory to perform all analytical work to ensure compliance with NYSDEC requirements. 22 samples (with an additional 9 QA/QC samples) were analyzed by Pace. Sample results were compared against Part 375 Commercial Use SCOs. Sample locations are provided on **Figure 3**. Laboratory results are provided in **Appendix E.**

4.2.1 PDI

PDI samples were samples collected during the investigation to characterize surface and shallow subsurface conditions at the Site. These samples were analyzed for SVOCs and metals to confirm contaminant concentrations against regulatory cleanup objectives and to define the extent of contamination.

No compounds were detected at concentrations that exceed the Commercial Use SCO. A full list of detections and results are listed in **Table 3.**

4.2.2 Waste Characterization

Waste characterization samples were collected along with the PDI samples to provide a waste profile for the on-site soil. Of the 22 samples collected, 12 were analyzed for hazardous waste characteristics including Toxic Characteristic Leaching Procedure (TCLP) sampling for VOCs, SVOCs, Resource Conservation and Recovery Act (RCRA) 8 Metals, total polychlorinated biphenyls (PCBs), and total cyanide, to determine whether the material meets hazardous waste criteria and to inform proper handling, storage, and disposal in compliance with state and federal standards. Laboratory results are provided in **Appendix E.**

FLAG/QUALIFIER SUMMARY

*	QC result is outside of established limits.
†	Wide recovery limits established for difficult compound.
‡	Wide RPD limits established for difficult compound.
#	Data exceeded client recommended or regulatory level
ND	Not Detected
RL	Reporting Limit is at the level of quantitation (LOQ)
DL	Detection Limit is the lower limit of detection determined by the MDL study
MCL	Maximum Contaminant Level
	Percent recoveries and relative percent differences (RPDs) are determined by the software using values in the calculation which have not been rounded.
	No results have been blank subtracted unless specified in the case narrative section.
B	Analyte is found in the associated laboratory blank as well as in the sample.
B-05	Data is not affected by elevated level in laboratory blank since sample(s) result is "Not Detected".
H-05	Holding time was exceeded. pH analysis should be performed immediately at time of sampling. Nominal 15 minute holding time was exceeded.
H-10	Analysis was requested after the recommended holding time had passed.
H3	Sample was received or analysis requested beyond the recognized method holding time.
J	Detected but below the Reporting Limit (lowest calibration standard); therefore, result is an estimated concentration (CLP J-Flag).
L-07	Either laboratory fortified blank/laboratory control sample or duplicate recovery is outside of control limits, but the other is within limits. RPD between the two LFB/LCS results is within method specified criteria.
O-32	A dilution was performed as part of the standard analytical procedure.
S-07	One associated surrogate standard recovery is outside of control limits but the other(s) is/are within limits. All recoveries are > 10%.

Case Narrative

The samples were received in accordance with the Chain of Custody and no significant deviations were encountered during the preparation or analysis unless otherwise noted. Sample Receipt, Container Information, and the Chain of Custody are located at the back of the report.

Results contained within this report relate only to the samples submitted under this Pace Lab Number and meet NELAP requirements for all NELAP accredited parameters unless otherwise noted in the following narrative. The data presented in this report is organized by parameter (i.e. VOC, SVOC, etc.). Sample specific Quality Control data (i.e. Surrogate Spike Recovery) is reported at the end of the target analyte list for each individual sample, followed by the Laboratory Batch Quality Control at the end of each parameter. Tentatively Identified Compounds (TICs), if requested, are reported for compounds identified to be present and are not part of the method/program Target Compound List, even if only a subset of the TCL are being reported. If a sample was re-analyzed or re-extracted due to a required quality control corrective action and if both sets of data are reported, the Laboratory ID of the re-analysis or re-extraction is designated with an "R" or "RE", respectively.

When multiple Batch Quality Control elements are reported (e.g. more than one LCS), the associated samples for each element are noted in the grey shaded header line of each data table. Any Laboratory Batch, Sample Specific % recovery or RPD value that is outside the listed Acceptance Criteria is bolded in the report. In reference to questions H (CAM) or 4 (RCP) when "NO" is checked, the performance criteria for CAM and RCP methods allow for some quality control failures to occur and still be within method compliance. In these instances, the specific failure is not narrated but noted in the associated QC Outlier Summary Report, located directly after the Case Narrative. QC information is also incorporated in the Data Usability Assessment table (Format 11) of our Data Merger tool, where it can be reviewed in conjunction with the sample result, associated regulatory criteria and any associated data usability implications.

Soil/sediments and solids are reported on a dry weight basis unless otherwise noted. Tissues are reported "as received" or on a wet weight basis, unless otherwise noted. Definitions of all data qualifiers and acronyms used in this report are provided in the Glossary located at the back of the report.

HOLD POLICY - For samples submitted on hold, Pace's policy is to hold samples (with the exception of Air canisters) free of charge for 21 calendar days from the date the project is completed. After 21 calendar days, we will dispose of all samples submitted including those put on hold unless you have contacted your Pace Project Manager and made arrangements for Pace to continue to hold the samples. Air canisters will be disposed after 3 business days from the date the project is completed.

Please contact Project Management at 800-624-9220 with any questions.

Report Submission

December 08, 2025: This final report includes the results of all requested analyses. Additional requests will be reported separately.

December 01, 2025: This is a preliminary report. Please note that your project has contingency samples on hold. Contact your project manager to request additional analyses within 3 business days of receiving this report. Requests made after this time frame will be reported separately.

All non-detect (ND) or estimated concentrations (J-qualified) have been quantitated to the limit noted in the MDL column.

Terms

Analytical Method: Both the document from which the method originates and the analytical reference method. (Example: EPA 8260B is shown as 1,8260B.) The codes for the reference method documents are provided in the References section of the Addendum.

Chlordane: The target compound Chlordane (CAS No. 57-74-9) is reported for GC ECD analyses. Per EPA,this compound "refers to a mixture of chlordane isomers, other chlorinated hydrocarbons and numerous other components." (Reference: USEPA Toxicological Review of Chlordane, In Support of Summary Information on the Integrated Risk Information System (IRIS), December 1997.)

Data Qualifiers

A - Spectra identified as "Aldol Condensates" are byproducts of the extraction/concentration procedures when acetone is introduced in the process.

B - The analyte was detected above the reporting limit in the associated method blank. Flag only applies to associated field samples that have detectable concentrations of the analyte at less than ten times (10x) the concentration found in the blank. For MCP-related projects, flag only applies to associated field samples that have detectable concentrations of the analyte at less than ten times (10x) the concentration found in the blank. For DOD-related projects, flag only applies to associated field samples that have detectable concentrations of the analyte at less than ten times (10x) the concentration found in the blank AND the analyte was detected above one-half the reporting limit (or above the reporting limit for common lab contaminants) in the associated method blank. For NJ-Air-related projects, flag only applies to associated field samples that have detectable concentrations of the analyte above the reporting limit. For NJ-related projects (excluding Air), flag only applies to associated field samples that have detectable concentrations of the analyte, which was detected above the reporting limit in the associated method blank or above five times the reporting limit for common lab contaminants (Phthalates, Acetone, Methylene Chloride, 2-Butanone).

C - Co-elution: The target analyte co-elutes with a known lab standard (i.e. surrogate, internal standards, etc.) for co-extracted analyses.

D - Concentration of analyte was quantified from diluted analysis. Flag only applies to field samples that have detectable concentrations of the analyte.

E - Concentration of analyte exceeds the range of the calibration curve and/or linear range of the instrument.

F - The ratio of quantifier ion response to qualifier ion response falls outside of the laboratory criteria. Results are considered to be an estimated maximum concentration.

G - The concentration may be biased high due to matrix interferences (i.e, co-elution) with non-target compound(s). The result should be considered estimated.

H - The analysis of pH was performed beyond the regulatory-required holding time of 15 minutes from the time of sample collection.

I - The lower value for the two columns has been reported due to obvious interference.

J - Estimated value. The Target analyte concentration is below the quantitation limit (RL), but above the Method Detection Limit (MDL) or Estimated Detection Limit (EDL) for SPME-related analyses. This represents an estimated concentration for Tentatively Identified Compounds (TICs). For calculated parameters, this represents that one or more values used in the calculation were

QUALIFIERS

Project: 25K1208
Pace Project No.: 70393827

DEFINITIONS

DF - Dilution Factor, if reported, represents the factor applied to the reported data due to dilution of the sample aliquot.

ND - Not Detected at or above adjusted reporting limit.

TNTC - Too Numerous To Count

J - Estimated concentration above the adjusted method detection limit and below the adjusted reporting limit.

MDL - Adjusted Method Detection Limit.

PQL - Practical Quantitation Limit.

RL - Reporting Limit - The lowest concentration value that meets project requirements for quantitative data with known precision and bias for a specific analyte in a specific matrix.

S - Surrogate

1,2-Diphenylhydrazine decomposes to and cannot be separated from Azobenzene using Method 8270. The result for each analyte is a combined concentration.

Consistent with EPA guidelines, unrounded data are displayed and have been used to calculate % recovery and RPD values.

LCS(D) - Laboratory Control Sample (Duplicate)

MS(D) - Matrix Spike (Duplicate)

DUP - Sample Duplicate

RPD - Relative Percent Difference

NC - Not Calculable.

SG - Silica Gel - Clean-Up

U - Indicates the compound was analyzed for, but not detected.

N-Nitrosodiphenylamine decomposes and cannot be separated from Diphenylamine using Method 8270. The result reported for each analyte is a combined concentration.

Reported results are not rounded until the final step prior to reporting. Therefore, calculated parameters that are typically reported as "Total" may vary slightly from the sum of the reported component parameters.

Pace Analytical is TNI accredited. Contact your Pace PM for the current list of accredited analytes.

TNI - The NELAC Institute.

FLAG/QUALIFIER SUMMARY

*	QC result is outside of established limits.
†	Wide recovery limits established for difficult compound.
‡	Wide RPD limits established for difficult compound.
#	Data exceeded client recommended or regulatory level
ND	Not Detected
RL	Reporting Limit is at the level of quantitation (LOQ)
DL	Detection Limit is the lower limit of detection determined by the MDL study
MCL	Maximum Contaminant Level
	Percent recoveries and relative percent differences (RPDs) are determined by the software using values in the calculation which have not been rounded.
	No results have been blank subtracted unless specified in the case narrative section.
J	Detected but below the Reporting Limit (lowest calibration standard); therefore, result is an estimated concentration (CLP J-Flag).
Ja	Estimated value. The Target analyte concentration is below the quantitation limit (RL), but above the Method Detection Limit (MDL) or Estimated Detection Limit (EDL) for SPME-related analyses. This represents an estimated concentration for Tentatively Id
L-04	Laboratory fortified blank/laboratory control sample recovery and duplicate recovery are outside of control limits. Reported value for this compound is likely to be biased on the low side.
MS-09	Matrix spike recovery and/or matrix spike duplicate recovery outside of control limits. Possibility of sample matrix effects that lead to a low bias for reported result or non-homogeneous sample aliquots cannot be eliminated.
MS-22	Either matrix spike or MS duplicate is outside of control limits, but the other is within limits. RPD between the two MS/MSD results is within method specified criteria.
MS-23	Either matrix spike or MS duplicate is outside of control limits, but the other is within limits. RPD between the two MS/MSD results is outside of the method specified criteria. Reduced precision anticipated for any reported result for this compound.
Q	The quality control sample exceeds the associated acceptance criteria. For DOD-related projects, LCS and/or Continuing Calibration Standard exceedences are also qualified on all associated sample results. Note: This flag is not applicable for matrix spi
R-06	Matrix spike duplicate RPD is outside of control limits. Reduced precision is anticipated for reported result for this compound in this sample.
S-07	One associated surrogate standard recovery is outside of control limits but the other(s) is/are within limits. All recoveries are > 10%.
V-04	Initial calibration did not meet method specifications. Compound was calibrated using a response factor where %RSD is outside of method specified criteria. Reported result is estimated.
V-05	Continuing calibration verification (CCV) did not meet method specifications and was biased on the low side for this compound.
V-06	Continuing calibration verification (CCV) did not meet method specifications and was biased on the high side for this compound.
V-34	Initial calibration verification (ICV) did not meet method specifications and was biased on the low side for this compound. Reported result is estimated.

Case Narrative

The samples were received in accordance with the Chain of Custody and no significant deviations were encountered during the preparation or analysis unless otherwise noted. Sample Receipt, Container Information, and the Chain of Custody are located at the back of the report.

Results contained within this report relate only to the samples submitted under this Pace Lab Number and meet NELAP requirements for all NELAP accredited parameters unless otherwise noted in the following narrative. The data presented in this report is organized by parameter (i.e. VOC, SVOC, etc.). Sample specific Quality Control data (i.e. Surrogate Spike Recovery) is reported at the end of the target analyte list for each individual sample, followed by the Laboratory Batch Quality Control at the end of each parameter. Tentatively Identified Compounds (TICs), if requested, are reported for compounds identified to be present and are not part of the method/program Target Compound List, even if only a subset of the TCL are being reported. If a sample was re-analyzed or re-extracted due to a required quality control corrective action and if both sets of data are reported, the Laboratory ID of the re-analysis or re-extraction is designated with an "R" or "RE", respectively.

When multiple Batch Quality Control elements are reported (e.g. more than one LCS), the associated samples for each element are noted in the grey shaded header line of each data table. Any Laboratory Batch, Sample Specific % recovery or RPD value that is outside the listed Acceptance Criteria is bolded in the report. In reference to questions H (CAM) or 4 (RCP) when "NO" is checked, the performance criteria for CAM and RCP methods allow for some quality control failures to occur and still be within method compliance. In these instances, the specific failure is not narrated but noted in the associated QC Outlier Summary Report, located directly after the Case Narrative. QC information is also incorporated in the Data Usability Assessment table (Format 11) of our Data Merger tool, where it can be reviewed in conjunction with the sample result, associated regulatory criteria and any associated data usability implications.

Soil/sediments and solids are reported on a dry weight basis unless otherwise noted. Tissues are reported "as received" or on a wet weight basis, unless otherwise noted. Definitions of all data qualifiers and acronyms used in this report are provided in the Glossary located at the back of the report.

HOLD POLICY - For samples submitted on hold, Pace's policy is to hold samples (with the exception of Air canisters) free of charge for 21 calendar days from the date the project is completed. After 21 calendar days, we will dispose of all samples submitted including those put on hold unless you have contacted your Pace Project Manager and made arrangements for Pace to continue to hold the samples. Air canisters will be disposed after 3 business days from the date the project is completed.

Please contact Project Management at 800-624-9220 with any questions.

Case Narrative (continued)

Report Submission

All non-detect (ND) or estimated concentrations (J-qualified) have been quantitated to the limit noted in the MDL column.

Total Metals

L2574898-01 through -16: The sample has elevated detection limits for all elements, with the exception of mercury, due to the dilution required by the sample matrix.

The WG2146092-3/-4 MS/MSD recoveries performed on L2574898-13 are outside the acceptance criteria for antimony (46%/45%) and calcium (198%/398%). A post digestion spike was performed and was within acceptance criteria.

The WG2146092-3/-4 MS/MSDrecoveries performed on L2574898-13 do not apply for aluminum (321%/328%), iron (884%/667%) and manganese (159%/140%) because the sample concentrations are greater than four times the spike amounts added.

The WG2146092-4 Laboratory Duplicate RPD performed on L2574898-13 is outside the acceptance criteria for calcium (32%) due to the non-homogeneous nature of the native sample.

The WG2146092-7/-8 MS/MSD recoveries performed on L2574898-14 do not apply for aluminum (155%/188%) and iron (MSD 0%) because the sample concentration is greater than four times the spike amount added.

The WG2146092-7/-8 MS/MSD recoveries performed on L2574898-14 are outside the acceptance criteria for antimony (43%/45%). A post digestion spike was performed and was within acceptance criteria.

DL - Detection Limit: This value represents the level to which target analyte concentrations are reported as estimated values, when those target analyte concentrations are quantified below the limit of quantitation (LOQ). The DL includes any adjustments from dilutions, concentrations or moisture content, where applicable. (DoD report formats only.)

EDL - Estimated Detection Limit: This value represents the level to which target analyte concentrations are reported as estimated values, when those target analyte concentrations are quantified below the reporting limit (RL). The EDL includes any adjustments from dilutions, concentrations or moisture content, where applicable. The use of EDLs is specific to the analysis of PAHs using Solid-Phase Microextraction (SPME).

Case Narrative

The samples were received in accordance with the Chain of Custody and no significant deviations were encountered during the preparation or analysis unless otherwise noted. Sample Receipt, Container Information, and the Chain of Custody are located at the back of the report.

Results contained within this report relate only to the samples submitted under this Pace Lab Number and meet NELAP requirements for all NELAP accredited parameters unless otherwise noted in the following narrative. The data presented in this report is organized by parameter (i.e. VOC, SVOC, etc.). Sample specific Quality Control data (i.e. Surrogate Spike Recovery) is reported at the end of the target analyte list for each individual sample, followed by the Laboratory Batch Quality Control at the end of each parameter. Tentatively Identified Compounds (TICs), if requested, are reported for compounds identified to be present and are not part of the method/program Target Compound List, even if only a subset of the TCL are being reported. If a sample was re-analyzed or re-extracted due to a required quality control corrective action and if both sets of data are reported, the Laboratory ID of the re-analysis or re-extraction is designated with an "R" or "RE", respectively. When multiple Batch Quality Control elements are reported (e.g. more than one LCS), the associated samples for each element are noted in the grey shaded header line of each data table. Any Laboratory Batch, Sample Specific % recovery or RPD value that is outside the listed Acceptance Criteria is bolded in the report. All specific QC information is also incorporated in the Data Usability format of our Data Merger tool where it can be reviewed along with any associated usability implications. Soil/sediments, solids and tissues are reported on a dry weight basis unless otherwise noted. Definitions of all data qualifiers and acronyms used in this report are provided in the Glossary located at the back of the report.

In reference to questions H (CAM) or 4 (RCP) when "NO" is checked, the performance criteria for CAM and RCP methods allow for some quality control failures to occur and still be within method compliance. In these instances the specific failure is not narrated but noted in the associated QC table. The information is also incorporated in the Data Usability format of our Data Merger tool where it can be reviewed along with any associated usability implications.

Please see the associated ADEx data file for a comparison of laboratory reporting limits that were achieved with the regulatory Numerical Standards requested on the Chain of Custody.

The WG2146092-4 Laboratory Duplicate RPD performed on L2574898-13 is outside the acceptance criteria for calcium (32%) due to the non-homogeneous nature of the native sample.

The WG2146092-7/-8 MS/MSD recoveries performed on L2574898-14 do not apply for aluminum (155%/188%) and iron (MSD 0%) because the sample concentration is greater than four times the spike amount added.

(Metals only.)

R - Analytical results are from sample re-analysis.
