

FINAL

VOLUME III

Remedial Investigation Report

**Old Erie Canal Site
Clyde, New York**

**Parker Hannifin Corporation
Cleveland, Ohio**

**General Electric Company
Albany, New York**

November 24, 2003

Contents

VOLUME I

Executive summary	ix
1. Introduction	1
1.1. General.....	1
1.2. Project objectives	1
1.3. Project scope	1
1.3.2. Expanded preliminary screening program (First Expansion).....	2
1.3.3. Refinement of the final locations of the monitoring wells..	2
1.3.4. Additional surface water and storm water investigations (Second Expansion)	3
1.3.4.1. Surface water confirmation sampling program.....	3
1.3.4.2. Expanded storm sewer evaluation	3
1.3.5. Additional RI investigation activities (Third Expansion) ...	3
1.3.5.1. Soil boring and temporary monitoring well installation program	4
1.3.5.2. Overburden and bedrock monitoring wells and sampling	4
1.3.6. Expanded hydrogeologic study and groundwater investigation (Fourth Expansion).....	4
1.4. Property access.....	5
1.5. Report organization.....	5
2. Background.....	7
2.1. General.....	7
2.2. Site background.....	7
2.2.1. General.....	7
2.3. Plant structures.....	9
2.3.1. Plant structures.....	9
2.4. Historical environmental data	11
2.4.1. Past waste disposal practices	11
2.4.2. Previous investigations	11
3. Field investigation methodology.....	17
3.1. General	17
3.2. Public water connection verification program	17

3.2.1. Public records review.....	17
3.2.2. Base map preparation.....	17
3.2.3. Results of residential well identification.....	17
3.3. Electromagnetic field survey.....	18
3.4. Preliminary screening program	19
3.4.1. Direct push boring program	20
3.4.2. Subsurface soil sampling program	20
3.4.3. Ground water sampling.....	21
3.5. Drilling and well installation program	22
3.5.1. Shallow unconsolidated unit drilling procedures.....	22
3.5.2. Shallow bedrock drilling procedures	23
3.5.3. Well installation.....	23
3.5.4. Well abandonment	24
3.5.5. Decontamination procedures	25
3.5.6. Well development.....	25
3.6. Ground water sampling program	26
3.7. Water level monitoring	29
3.7.1. Spot measurements of water levels.....	29
3.7.2. Hydraulic monitoring program	29
3.8. Hydraulic conductivity testing	30
3.9. Surface water sampling	32
3.10. Surface soil/sediment sampling.....	33
3.11. Storm sewer evaluation.....	34
3.11.1. Inspection of storm sewers, manholes and catch basins .	34
3.11.2. Storm water sampling	35
3.11.3. Expanded storm sewer evaluation	35
3.12. Surveying	36
3.13. Handling of investigation derived waste.....	37
3.13.1. Drill cuttings	37
3.13.2. Ground water and surface water	37
3.13.3. Decontamination fluids, sediment, PPE and associated debris	37
4. Geologic conditions	39
4.1. Regional geology	39
4.1.1. Physiographic setting.....	39
4.1.2. Glacial history.....	39
4.1.3. Bedrock stratigraphy.....	41
4.2. Site geology.....	42
4.2.1. Unconsolidated deposits	42
4.2.1.1. Fill.....	42
4.2.1.2. Glaciofluvial deposits	43
4.2.1.3. Glacial till unit	44
4.2.2. Confining unit structure	44
4.2.3. Bedrock.....	45

5. Hydrogeologic conditions	47
5.1. Climate and water budget	47
5.2. Hydrogeologic system.....	48
5.3. Response of the hydrogeologic system	49
5.4. Hydraulic properties.....	51
5.5. Ground water flow	51
5.5.1. Ground water flow within the unconsolidated unit.....	52
5.5.2. Ground water flow within the shallow bedrock.....	54
6. Nature and extent of constituents in ground water.....	55
6.1. General	55
6.2. Distribution of constituents in ground water.....	58
6.2.1. Volatile organic compounds	58
6.2.2. Semi-volatile organic compounds.....	61
6.2.3. Polychlorinated biphenyls.....	62
6.2.4. Pesticides	62
6.2.5. Inorganics.....	62
6.2.6. Results of natural attenuation monitoring.....	64
7. Nature and extent of constituents in surface water.....	71
7.1. General	71
7.2. Distribution of constituents in surface water	73
7.2.1. Volatile organic compounds	73
7.2.2. Semi-volatile organic compounds.....	74
7.2.3. Polychlorinated biphenyls.....	75
7.2.4. Pesticides	75
7.2.5. Inorganics.....	75
8. Nature and extent of constituents in sediment and surface soil ..	77
8.1. General	77
8.2. Distribution of constituents in sediment and surface soil	78
8.2.1. Volatile organic compounds	78
8.2.2. Semi-Volatile organic compounds.....	80
8.2.3. Polychlorinated biphenyls.....	81
8.2.4. Pesticides	81
8.2.5. Inorganics.....	82
9. Nature and extent of constituents in subsurface soil.....	83
9.1 General	83
9.2. Distribution of constituents in subsurface soils	84
9.2.1. Volatile organic compounds	84
9.2.2. Semi-volatile organic compounds.....	85
9.2.3. Polychlorinated biphenyls.....	86
9.2.4. Pesticides	86
9.2.5. Inorganics.....	86

10. Nature and extent of volatile organic compounds in storm water.....	89
10.1. General.....	89
11. Risk assessment	91
11.1. General.....	91
11.2. Methodology	91
11.3. Characterization of exposure setting	92
11.3.1. Chemical and physical site characteristics.....	92
11.4. Constituent fate and transport	96
11.4.1. Constituent-specific considerations	96
11.5. Exposure assessment.....	99
11.5.1. Comparison with background.....	100
11.5.2. Identification of potential human receptors	101
11.5.2.1. Current and future industrial workers	102
11.5.2.2. Current and future maintenance workers	102
11.5.2.3. Current and future adolescent trespasser	103
11.5.2.4. Current and future adults and children recreators.....	103
11.5.2.5. Current and future residents.....	103
11.6. Conclusions.....	104
11.7. Fish and Wildlife Impact Analysis.....	105
12. Summary and conclusions	107
13. Recommendations	125
References	127

Tables

3-1	Summary of Residences with Private Wells on Their properties
3-2	Direct Push Boring Summary
3-3	Monitoring Well Construction Details
3-4	Water Level Measurements
3-5	Hydraulic Conductivity Data
4-1	Depth to Bedrock and Bedrock Surface Elevations
6-1	Ground Water Monitoring Areas
6-2	Area A Summary of Detected Compounds
6-3	Area B Summary of Detected Compounds
6-4	Area C Summary of Detected Compounds
6-5	Area D Summary of Detected Compounds
6-6	Area E Summary of Detected Compounds
6-7	Area F Summary of Detected Compounds
6-8	Area G Summary of Detected Compounds
6-9	Area H Summary of Detected Compounds
6-10	Natural Attenuation Parameters
6-11	Bioattenuation Screening Process
11-1	Detected constituents in storm sewer samples – 2002
11-2	Detected constituents in surface water samples – 2002
11-3	Detected constituents in sediment samples – 2002
11-4	Detected constituents in sub-surface soil samples – 2002
11-5	Detected constituents in surface soil samples – 2002
11-6	Detected constituents in ground water samples – 2002
11-7	Summary of constituents detected in surface soil compared to Site-specific background
11-8	Summary of constituents detected in surface water compared to Site-specific background
11-9	Summary of constituents detected in sediment compared to Site-specific background

Remedial Investigation Report – Old Erie Canal Site

- 4-6 Top of Bedrock Unit Contour Map
- 5-1 Monthly Precipitation and Temperature
- 5-2 Precipitation Less Potential Evapotranspiration
- 5-3 Hydrograph for Well Pairs MW-2 and MW-4
- 5-4 Hydrograph for Wells Located in Northern Portion of the Site
- 5-5 Hydrograph for Wells Located Along Western Portion of the Site
- 5-6 Hydrograph for Wells Located Along Southern Portion of the Site
- 5-7 Hydrograph for Bedrock Wells Located at the Site
- 5-8 Hydrograph for Wells Located South of Clyde River
- 5-9 Hydrograph for Dataloggers at Well pair MW-4
- 5-10 Hydrographs for Wells Along Cross-Section A-A'
- 5-11 Hydrographs for Wells Adjacent to Old Erie Canal
- 5-12 Potentiometric Map for the Overburden Ground Water On July 17, 2002
- 5-13 Potentiometric Map for the Overburden Ground Water On December 16, 2002
- 5-14 Potentiometric Map for the Overburden Ground Water On November 4, 2003.
- 5-15 Potentiometric Map for the Bedrock Ground Water On July 17, 2002
- 5-16 Potentiometric Map for the Bedrock Ground Water On December 16, 2002
- 5-17 Potentiometric Map for the Bedrock Ground Water On November 4, 2003.
- 6-1 Soil Boring and Monitoring Well Location Map
- 6-2 Groundwater Well Sampling Data
- 6-3 Total Concentration of VOCs in Ground Water
- 7-1 Surface Water and Surface Soil/Sediment Sample Location Map
- 7-2 Surface Water Sampling Data

Xylene (total)	3 U	3 U	3 U	3 U	3 U

Notes:

1. All units in ug/L.
2. All analyses performed by Severn Trent Laboratories, Inc. of Buffalo, New York.
3. Volatile organic compounds quantitated by EPA SW-846 Method 8260B.
4. "U" designates that the compound was not detected at or above the quantitation limit shown.
5. "J" designates that the detected concentration should be considered estimated because associated QC criteria was exceeded.
6. "B" designates that the compound was detected in the associated blank as well.
7. "---" designates compound not analyzed.

Vinyl chloride	30	36	8	2.1
Xylene (total)	30 U	---	---	---

Notes:

1. All units in ug/L.
2. All analyses performed by Severn Trent Laboratories, Inc. of Buffalo, New York.
3. Volatile organic compounds quantitated by EPA SW-846 Method 8260B.
4. "U" designates that the compound was not detected at or above the quantitation limit shown.
5. "J" designates that the detected concentration should be considered estimated because associated QC criteria was exceeded.
6. "B" designates that the compound was detected in the associated blank as well.
7. "---" designates compound not analyzed.

Cyanide - Total	10.0 U	10.0 U	10.0 U	10.0 U	10.0 U

Constituent	SW-05 5/21/02	SW-07 5/21/02	SW-08 5/21/02	SW-09 5/21/02
Leachable pH	7.96	7.93	7.70	7.36
Cyanide - Total	10.0 U	10.0 U	10.0 U	10.0 U

Notes:

1. Units for total cyanide in ug/L. Units for pH in standard units.
2. All analyses performed by Severn Trent Laboratories, Inc. of Buffalo, New York.
3. Total Cyanide quantitated by EPA SW-846 Method 9012.
Leachable pH quantitated by EPA SW-846 Method 9045.
4. "U" designates that the compound was not detected at or above the quantitation limit shown.

Notes:

1. All units in ug/kg.
2. All analyses performed by Severn Trent Laboratories, Inc. of Buffalo, New York.
3. Pesticides quantitated by EPA SW-846 Method 8081A.
4. "U" designates that the compound was not detected at or above the quantitation limit shown.
5. "J" designates that the detected concentration should be considered estimated because associated QC criteria was exceeded.

Notes:

1. All units in ug/L.
2. All analyses performed by Severn Trent Laboratories, Inc. of Buffalo, New York.
3. Volatile organic compounds quantitated by EPA SW-846 Method 8260B.
4. "U" designates that the compound was not detected at or above the quantitation limit shown.
5. "J" designates that the detected concentration should be considered estimated because associated QC criteria was exceeded.
6. "B" designates that the compound was detected in the associated blank as well.
7. "D" designates all compounds identified in an analysis at the secondary dilution factor.

1. Introduction

This appendix presents the results of a Fish and Wildlife Impact Analysis (FWIA) for the Old Erie Canal Site located in Clyde, New York (Site). This FWIA is prepared as part of the remedial investigation/feasibility study (RI/FS) currently ongoing for the Site. The FWIA is conducted according to the New York State Department of Environmental Conservation (NYSDEC) document entitled *Fish and Wildlife Impact Analysis for Inactive Hazardous Waste Sites* (NYSDEC 1994; Guidance). Step I - *Site Description* and Step II - *Contaminant-Specific Impact Assessment* of the NYSDEC document is addressed in this report. The purpose of Step I of an FWIA is to characterize the physical and biological characteristics of a site. The purpose of Step II is to determine the potential impacts of site-related constituents on fish and wildlife resources. The FWIA considers three separate areas:

- the Site itself
- the area within a half-mile radius of the Site (the Study Area)
- the area within a two-mile radius of the Site (the Resource Area)

The specific objectives of this FWIA are to:

- describe the ecology of the Site and surrounding environs within a half-mile radius of the Site (Study Area)
- describe fish and wildlife resources including observed vegetation and associated fauna for each covertype within the Study Area
- identify other natural resources such as NYSDEC significant habitats and endangered or threatened species within a two-mile radius of the Site (Resource Area)
- qualitatively describe the value of the identified resources to associated wildlife and humans
- identify potentially complete pathways between Site-related constituents and fish and wildlife resources
- compare Site chemical data to applicable ecologically-based criteria or screening values

The FWIA is organized into five sections:

1. *Introduction.* This section presents general information about the performance of the FWIA, the objectives of the study and the format of the report.
2. *Study area characterization.* This section characterizes the covertypes of the Study Area based on observed vegetation, and associates wildlife species with the covertypes. This section also

discusses resources other than wildlife, such as significant habitats; protected species; surface waters; and freshwater wetlands that exist within a two-mile radius of the Site (the Resource Area).

3. *Description of fish and wildlife resources.* This section presents a qualitative evaluation of the ability of the Study Area to provide habitat for wildlife and discusses the value to humans of wildlife resources within the Study Area.
4. *Identification of fish and wildlife criteria and constituents of potential concern.* This section identifies potentially applicable fish and wildlife regulatory criteria and compares Site media data to associated screening/benchmark values.
5. *Conclusions.* This section presents the FWIA conclusions regarding Site-related constituents and ecological resources within the Study Area.

2. Study area characterization

This section describes the physical and biological components of the Site and Study Area under current conditions. In accordance with Step I of the Guidance, this information is used to identify the ecological communities of the Study Area, associate wildlife species with the communities, evaluate the value of the communities to wildlife and humans, and to provide information necessary for the design of future activities associated with the RI/FS, if required.

2.1. Site description

As presented in Section 2.2 and on Figure 2-1 of the Remedial Investigation report (RI), the Old Erie Canal Site includes the southern and southwestern portions of property owned by Parker-Hannifin at 124 Columbia Street in the Village of Clyde, Town of Galen, Wayne County, New York (hereafter referred to as "Parker-Hannifin's Property"). The Site consists of portions of Parker-Hannifin's Property as well as portions of the abandoned Erie Canal, which is currently owned by the Village of Clyde. The Site is approximately 10.5 acres in size and is bounded to the north by Columbia Street, to the east by the P&C Grocery Store property, and to the west by private residential properties. An active rail line and the New York State Barge Canal (Clyde River) border the Site to the south.

Portions of the Old Erie Canal and an associated former barge turnaround at the Site have in the past been used for landfilling industrial and municipal wastes, and are now covered.

Parker-Hannifin's Property has been the location of industrial activities since the early 1800's. Glass manufacturing dominated Site operations into the early 1930's. Based on a field survey conducted in 1932 for the preparation of Sanborn Fire Insurance maps, the Clyde Glass Works were abandoned and all but one building had been removed.

By 1941 the Property was reportedly purchased by Acme Electric and a new building was constructed. Acme Electric reportedly occupied the Property from 1941 to 1945 and produced transformers for the United States Navy. GE reportedly purchased the Property in 1945 and manufactured electrical equipment, including ballast for fluorescent lights, rectifiers, transistors, and diodes. In 1965 Parker-Hannifin reportedly purchased the Property from GE. Following purchase of the facility in 1965, Parker-Hannifin initially manufactured components for automobile air conditioning systems. Parker-Hannifin's current operations include the manufacture, testing, and overhaul of fuel injection nozzles used in industrial and military operations. Present

facilities on the property include several buildings, fenced storage tanks and mowed lawn and paved parking areas.

2.2. Covertype delineation

Consistent with the Guidance, the Study Area for the FWIA is defined as the Site and the area within a half-mile radius of the Site. The half-mile radius includes commercial, light industrial and residential properties, and terrestrial and aquatic natural communities. Evaluation of ecological communities (covertypes) in the Study Area assists in the identification of ecological receptors of the Site, which may enter the Site from surrounding areas. The following subsections describe the ecological covertypes of the Site and Study Area.

In the context of this report, a "covertype" is defined as an area characterized by a distinct pattern of *natural* (e.g. forest) or *cultural* (e.g. residential) land use. Covertypes of the Study Area were identified based on the physical and vegetative features observed by an O'Brien & Gere biologist during a Study Area reconnaissance on May 1, 2002 and from interpretations of local mapping and aerial photographs that included the Study Area. A map indicating the covertypes of the Study Area is presented as Figure 2-1. Each covertype designation was selected based on a comparison of observed characteristics with the ecological community descriptions presented in the NYSDEC Natural Heritage Program document *Ecological Communities of New York State* (Edinger *et. al* 2002).

Covertype locations and approximate boundaries are depicted on Figure 2-1. The description of each identified covertype, below, includes a list of dominant woody and herbaceous plant species observed during the Study Area reconnaissance. Communities within the Study Area are a mixture of cultural and natural land uses. Roadways, residential properties, commercial businesses, industrial facilities, recreational parks, and schools comprise the majority of the cultural areas. Forested areas, palustrine (wetland) habitats and aquatic (open water) communities comprise the natural areas. Descriptions of the identified covertypes are presented below.

2.3. Terrestrial covertypes

The terrestrial (upland) communities within the Study Area consist mostly of cultural covertypes. The cultural designation reflects the extent of human disturbance to the Study Area for land uses such as roadways, railroad beds, agricultural fields, commercial businesses, residences, and parks. Physical characteristics of the residential areas consist of 0.25-acre to 2-acre lots with interspersed paved driveways and access roads. Commercial businesses, recreational parks, and schools are present in portions of the Study Area, with essentially the same physical

characteristics as the residential areas. In general, these areas do not support large or diverse wildlife communities due to their proximity to anthropogenic disturbances. The natural terrestrial covertypes of the Study Area, existing primarily in the western half of the Study Area, are representative of forested communities. These covertypes are further described below.

Urban structure exterior/mowed lawn with trees. These covertypes, combined as shown on Figure 2-1, are characterized by the exterior surfaces of structures such as commercial buildings, houses, and bridges in an urban or densely populated suburban area (Edinger *et al.* 2002). The northern and eastern portions of the Study Area are comprised mostly of this covertype. The areas immediately surrounding the Site included in this designation consist of the industrial buildings associated with the Parker-Hannifin Property, and the residential and commercial structures associated with the Village of Clyde. The *Mowed lawn with trees* covertype typically contains landscaped areas of ornamental trees, shrubs and grasses.

Cropland. A significant portion of the western and southern parcels of the Study Area consist of agricultural land maintained for row crops, field crops and/or pastureland. As described in Edinger *et al.* (2002), these areas are modified by human disturbances and the biological community is substantially different than what existed prior to human influence. Unless these areas are abandoned and left to natural succession, wildlife utilization will remain limited.

Successional northern hardwoods (SNH). This covertype is characterized by a mixed forest that typically occurs in areas that have been cleared or otherwise disturbed. SNH areas exist at various locations within the Study Area, including areas immediately adjacent to the Old Erie Canal ditch (described below) and other areas adjacent to the *cropland* covertype.

Based on the May 2002 Site reconnaissance of this covertype, primarily conducted by vehicle and limited traversing on foot, the SNH areas have inclusions of *Maple-basswood rich mesic forest* communities. Additionally, relatively small (less than 3 acres) forested and scrub/shrub wetland habitats are also present within the SNH covertype.

The dominant tree species observed in these communities consist of 8-inch to 16-inch diameter (at breast height) specimens of poplar (*Populus* spp.), American elm (*Ulmus americana*) and white ash (*Fraxinus americana*). The shrub layer, sparse in much of the covertype, included: dogwoods (*Cornus* spp.) raspberries (*Rubus* spp.), wild grape (*Vitis* spp.), honeysuckle (*Lonicera* spp.), and saplings of the tree species identified above. Numerous herbaceous species observed include, but are not limited to, buttercup (*Ranunculus* spp.), cinquefoil (*Potentilla* spp.) and miscellaneous grass species. Portions of the SNH that contained areas representative of the *Maple-basswood rich mesic forest* covertype contained 6-inch to 24-inch specimens of sugar maple (*Acer*

saccharum), basswood (*Tilia americana*) and hickories (*Carya spp.*) and shrub species similar to those listed above.

2.4. Aquatic and palustrine covertypes

Unconfined river. Based on the descriptions presented in Edinger *et al.* (2002), the Clyde River, located south of the Site, is representative of an *unconfined river* aquatic community. In the area nearest the Site, the river channel is relatively straight, approximately 100 ft wide, and contains approximately 12 ft of water. Little or no emergent vegetation exists in the channel and the banks are well defined (due to the river also acting as the Barge Canal in this reach). The substrate is likely soft and mucky as the river is more depositional, rather than erosive, in this reach. No shading, typically provided by trees and shrubs along the banks, was observed, likely due to the development existing on both sides of the river.

Shallow emergent marsh. Generally, the Old Erie Canal is a ditch running east/west across the southern border of Site. A portion of the Old Erie Canal formerly used as a waste disposal area, located along the southern portion of Parker-Hannifin's Property, is completely filled and currently covered with a mowed lawn area. East and west of the filled area, the ditch and former turnaround area are representative of the *shallow emergent marsh* covertype as defined by Edinger *et al.* (2002).. The channel is relatively straight, approximately 8 ft wide and contained an average of 6 inches of water. Water quality parameters measured during the May 2002 Site reconnaissance are presented as Table 2-1. Surface water flow was not observable, until the ditch's discharge to a culvert under the railroad tracks approximately 500 ft west of the Site. The water then discharges to the Clyde River.

The ditch contains a substrate characteristic of an emergent wetland habitat, including the presence of a mucky substrate that includes a significant amount of decomposed vegetative matter. The vegetative community was more diverse than that of the former turnaround area and included cattails (*Typha sp.*), reed canary grass (*Phalaris arundinacea*), and duckweed (*Lemna sp.*) in the channel, and knotweed (*Impatiens sp.*), staghorn sumac, *Phragmites*, and boxelder trees (*Acer negundo*) along the shallow banks. The bank vegetation provided an average of 70 percent shading to the channel throughout its length within the Study Area. Based on Site reconnaissance observations, the former turnaround's vegetative community was dominated by *Phragmites* (an invasive grass species). No surface water was observed, but the soils were saturated.

3. Description of fish and wildlife resources

The objective of this section is to identify potential ecological receptors of the Study Area based on observations conducted during the Study Area reconnaissance, or by reasonable association of these resources with the identified covertypes. The results of the tasks performed to meet the objective are discussed in the following subsections.

3.1. Fish and wildlife of the study area

The presence of fish and wildlife in the Study Area was assessed through contact with regulatory agencies, a literature review, and the Study Area reconnaissance performed by an O'Brien & Gere biologist in May 2002. During the Study Area reconnaissance, wildlife were identified based on actual sightings; audible indicators such as bird songs; or other indicators such as tracks, burrows, or scat. A listing of the fish and wildlife species that were either directly observed or concluded to be present based on observed indicators is presented below.

Observed fish and wildlife. Several avian species were observed frequenting the Study Area at the time of the Study Area reconnaissance, including, but not limited to: song sparrow (*Melospiza melodia*), chipping sparrow (*Spizella passerina*), house sparrow (*Passer domesticus*), Eastern phoebe (*Sayornis phoebe*), tufted titmouse (*Baeolophus bicolor*), downy woodpecker (*Picoides pubescens*), American goldfinch (*Carduelis tristis*), Northern cardinal (*Cardinalis cardinalis*), American robin (*Turdus migratorius*), mourning dove (*Zenaida macroura*) and Carolina wren (*Thryothorus ludovicianus*). Additional species observed in the Study Area include: Eastern gray squirrel (*Sciurus carolinensis*) and Northern spring peeper (*Pseudacris crucifer crucifer*).

3.2. Fauna expected within each covertype

In addition to the observed wildlife, a variety of wildlife species typically inhabit the natural communities of the Study Area. The *successional northern hardwood forest*, Clyde River, and wetland covertypes, all off the Site, are likely to contain the most diverse wildlife populations.

Although not observed during the reconnaissance, characteristic wildlife of the *successional northern hardwood forest* community could include various avian species (songbirds, turkey, partridge, hawks and owls); small mammals (raccoon, fox) and large mammals such as white-tailed

deer. The aquatic and wetland habitats within the Study Area have the potential to support benthic invertebrates, reptiles (snakes and turtles), amphibians (frogs, toads, salamanders), fish, waterfowl (ducks and geese), herons, shorebirds, gulls, kingfishers, and songbirds. Potential wildlife inhabitants of the Study Area's dominant natural covertypes are presented in Table 3-1.

3.3. Observation of stress

During the Study Area reconnaissance, no evidence of stress to flora or fauna related to the Site, such as reduced vegetative growth or density, stained soils, leachate seeps, or wildlife mortality, was observed in the Study Area.

3.4. Other resources

Consistent with the FWIA Guidance, Step I includes the identification of other fish and wildlife resources, such as significant wildlife habitats; endangered and threatened species; regulated wetlands; or special surface waters that are present within two miles of the Site (Resource Area). Special resources were identified through contact with regulatory agencies and review of New York State Freshwater Wetlands (NYSFW) and National Wetland Inventory (NWI) maps. The results of these efforts are described below.

3.4.1 Significant habitats and endangered or threatened species

The presence of significant habitats and endangered or threatened species in the Resource Area was evaluated through contact with the New York Natural Heritage Program (NYNHP) and the United States Fish and Wildlife Service (USFWS). Letter responses received by O'Brien & Gere from these agencies are included with this report as Attachment A. The approximate location of the identified special resource, relative to the Site, is presented on Figure 2-2.

The USFWS indicated that, except for occasional transient individuals, there are no federally-listed or proposed endangered or threatened species in the Resource Area.

The NYNHP database has record of a significant floodplain forest community associated with the Clyde River approximately one mile upstream (west) of the Site (see Attachment A). In accordance with NYNHP policy, the exact location of the reported special resources has been omitted from the Attachment.

3.4.2. Wetlands

The potential presence of freshwater wetlands in the Resource Area was evaluated through a review of the Lyons, NY and Savannah, NY quadrangles of the NYSFW map and the USFWS NWI map. The NYSFW map presents the boundaries of wetlands identified and regulated by the NYSDEC. The NWI map presents wetlands inventoried by USFWS to monitor waterfowl habitat. The NWI maps have no regulatory significance but provide an indication of areas potentially meeting the federal criteria for wetlands regulated by the U.S. Army Corps of Engineers.

Based on the mapping review, state regulated wetlands were not identified on the Site or within the Study Area; however, several do exist within the Resource Area encompassing a two-mile radius of the Site. Numerous NWI wetland habitats were identified within two miles of the Site perimeter including many in similar locations as the state-regulated wetlands (see Figure 2-2).

A formal wetland delineation, performed in accordance with NYSDEC and U.S. Army Corps of Engineers methodologies, was not part of the scope of this assessment.

3.4.3. Surface waters.

The Clyde River and associated tributaries are present within the Resource Area. The Clyde River is a Class C water body (6NYCRR Parts 701 and 897). Classification C is for waters supporting fisheries and suitable for primary and secondary contact recreation. A description of the river is presented in Section 2.4.

3.5. Description of fish and wildlife resource value

The value of the covertypes to wildlife and society was evaluated based on habitat requirements of identified wildlife species and potential resource utilization by humans. In accordance with Step I of the Guidance, habitat requirements such as feeding preferences, home range, and cover for species identified in the Study Area were considered. Field observations used to evaluate habitat quality included: 1) the diversity of observed wildlife, 2) the availability of suitable habitat in the Study Area, 3) the size of the habitat, and 4) adjacent land use patterns.

3.5.1. Value of habitat to associated fauna

Site. Terrestrial wildlife species identified in the Study Area were consistent with those expected to inhabit terrestrial and aquatic environments existing in suburban environments. Although some cover is afforded to birds and small mammals on the Site, the gravel, asphalt and mowed lawn areas of the upland portions of the Site do not provide

sufficient food sources, or roosting or nesting areas to make the Site attractive most wildlife species. In addition, the presence of an active rail line along the southern portion of the Site makes the Site unattractive to most wildlife species. Therefore, the value of the Site's upland habitat to wildlife is concluded to be low.

The palustrine habitat associated with the former Barge Canal turnaround provides limited habitat value for semi-aquatic insects, reptiles, birds, and mammals. However, the intermittence of surface water, domination by *Phragmites*, and relatively small size of the area likely limits its utility as habitat for such wildlife.

Study Area. For the majority of the terrestrial cultural portions of the Study Area, the potential to support a diverse or natural wildlife population is low. These areas have limited vegetation and food sources and, therefore, provide inadequate resources to sustain a healthy and diverse wildlife community because of the high degree of development. Based on these considerations, the wildlife habitat value of the terrestrial cultural areas, including the *urban structure exterior* and *cropland* covertypes, is considered to be poor.

The *successional northern hardwood forest*, aquatic, and wetland covertypes of the Study Area offer the most valuable habitat within the Study Area. Avian and small mammal species find suitable food and cover in these areas. Indicators of use of this covertype by other mammals such as muskrat (*Ondatra zibethicus*), beaver (*Castor canadensis*), fox, and deer were not observed during the Study Area reconnaissance; however, these species could potentially inhabit these areas.

Portions of the Clyde River within the Study Area are likely fish habitat. Additionally, the undeveloped areas surrounding these water bodies likely serve as forage, nesting, and roosting areas for local and migratory wildlife.

3.5.2. Value of resources to humans

Site. The current character of the undeveloped areas of the Site provides little value to humans, due in part to the relatively small size and restricted access.

Study Area. The *successional northern hardwood forest* areas of the Study Area likely provide opportunity for hiking, birdwatching, and similar forms of outdoor recreation, including small and large mammal hunting. Similarly, the Clyde River likely provides ample recreation opportunities for the public, including boating and seasonal fishing.

The palustrine areas within the Study Area provide a number of wetland-related values to the public. These values include flood storage capacity, sediment/toxicant retention, and natural productivity. These

3. Description of fish and wildlife resources

characteristics assist in maintaining water quality in areas downstream of these habitats.

Appendix R
Fish and Wildlife Impact Analysis

4. Identification of applicable criteria and constituents of potential concern

This section identifies the applicable ecological criteria, summarizes the potential ecological exposure pathways present at the Site, and identifies constituents of potential concern (COPCs). This information corresponds to Steps ID, IIA, and IIB of the Guidance, respectively.

4.1. Applicable criteria

The Guidance identifies New York State Water Quality Standards and Guidance Values, NYSDEC Division of Water Technical and Operational Guidance Series (TOGS), and NYSDEC Technical Guidance for Screening Contaminated Sediments as examples of contaminant-specific criteria.

Potential site-specific criteria identified in the FWIA Guidance include the Freshwater Wetlands Act (1975) and its implementing regulations (New York State Environmental Conservation Law [ECL] Article 24, 6 NYCRR Parts 663 and 664), and the laws and regulations governing streams and navigable water bodies (ECL Article 15, 6 NYCRR Part 608). The Freshwater Wetlands Act (1975) is designed to prevent the destruction of freshwater wetlands by requiring permits for defined activities in wetlands. The Use and Protection of Waters is regulated by a permit system under 6 NYCRR Part 608. The basis for permit issuance is a determination that the proposal is in the public interest by being reasonable and necessary; will not endanger the health, safety, or welfare of the people; and will not cause unreasonable, uncontrolled, or unnecessary damage to the natural resources of the state.

These and other potentially applicable criteria are listed in Table 4-1. Detailed descriptions of the criteria and media screening value sources are presented in Section 4.3, below.

4.2. Exposure pathway summary

This subsection discusses potential routes of exposure to Site-related contaminants for wildlife receptors. Exposure is the contact of a receptor with a chemical or physical agent. An exposure pathway is a mechanism by which a receptor may be exposed to a chemical or physical agent at, or originating from, a source. The three primary routes of exposure are inhalation, ingestion, and dermal contact. Exposure pathways are classified as being complete or incomplete. An

exposure pathway is complete when receptors exist that could contact a physical or chemical agent under specified conditions. The pathway is incomplete if there are no receptors or no exposures could occur under the specified conditions.

Based on the media sampling performed for the RI, constituents have been detected in Site surface soils, surface water, and sediment. Therefore, direct contact exposures potentially exist for terrestrial and aquatic receptors inhabiting and/or utilizing these media on the Site. Additionally, potentially complete exposures exist via the food chain for wildlife foraging from the Site's surface soils, surface water, and sediment.

4.3. Media screening methods

In accordance with Step IIB of the Guidance, the identification of COPCs for the Site is based on comparisons of maximum detected concentrations to conservative ecologically based screening criteria. Media data utilized for these comparisons includes surface soil, surface water, and sediment samples collected by O'Brien & Gere during field efforts related to the RI performed in May 2002 (see Sections 3.9 and 3.10 of the RI report). Although surface water and sediment sampling was historically performed by the NYSDEC at the Site, O'Brien & Gere's spring 2002 sampling data was utilized for this screening process. The O'Brien & Gere samples were collected in approximately the same locations as the NYSDEC samples and are, therefore, likely more representative of current Site conditions.

Presented in the following subsections is a discussion of the media-specific criteria and/or screening values utilized in the COPC identification process.

4.3.1. Soil screening comparison

Literature references were used to identify ecological soil screening levels. These references are described below. The screening values were chosen based on what is currently available in the literature and the potential receptors and exposure scenarios existing at the Site. The surface soil screening values are summarized on Table 4-2.

Toxicological Benchmarks for Screening Contaminants of Potential Concern for Effects on Terrestrial Plants: 1997 Revision (Efroymson *et al.* 1997a). Plant toxicity data are presented and used to derive benchmarks for screening the potential hazard to terrestrial plants caused by the presence of constituents in soil. The report presents phytotoxicity benchmarks for thirty-eight chemicals. The authors of the report intended that constituents in soil at concentrations exceeding both the phytotoxicity benchmark and the background concentration for the soil

type should be considered COPCs. However, for the FWIA, a comparison of Site concentrations to Site-specific background was not performed for the constituent screening.

If a constituent concentration or the reported detection limit exceeds the screening benchmark, additional evaluation is warranted to determine the potential hazards posed by exposure to the soil constituents. Conversely, if the constituent concentration or its detection limit falls below the proposed benchmark, the constituent may be excluded from further study. Elimination of COPCs based on screening against these benchmarks is assumed to be sufficiently protective of potential adverse impacts to plants in exposed media. As stated in this reference, these benchmarks are suitable for screening purposes, but should not be used to establish remedial goals or as final evidence of phytotoxicity.

Toxicological Benchmarks for Contaminants of Potential Concern for Effects on Soil and Litter Invertebrates and Heterotrophic Processes: 1997 Revision (Efroymson *et al.* 1997b). This reference presents toxicologically-based benchmarks for soil invertebrates and microbial processes. If a chemical concentration or reported detection limit exceeds the screening benchmark, additional analysis may be needed to determine the hazards to exposed receptors. However, if the concentration or detection limit falls below the calculated benchmark, the constituent may be excluded from further study. In this reference, the method for deriving soil benchmarks is based on the NOAA's method for deriving the Effects Range Low (ERL) values (Long and Morgan 1990). The ERL is defined as the tenth percentile of the distribution of toxic effects thresholds for organisms in sediments.

References on toxicity to soil and litter dwelling invertebrates, microbes, and microbial processes were obtained from searches of several bibliographic databases, review articles, and conventional literature searches. Soil benchmarks are based on data provided by toxicity studies in the field or in laboratory settings. These benchmarks are appropriate for screening purposes only. Soil and invertebrate characteristics also play a large part in toxicity and therefore should be incorporated in the evaluation of the potential constituent-specific hazards. For example, if constituent concentrations reported in soils supporting many invertebrates exceed one or more of the benchmarks, or if a benchmark is exceeded by background soil concentrations, it is assumed that the benchmark is a poor measure of risk to soil invertebrates at that particular site.

4.3.2. Surface water screening comparison

Maximum detected surface water constituent concentrations in the Old Erie Canal ditch were compared to the values presented in the following sources: the National Recommended Ambient Water Quality Criteria - Correction (USEPA 1999) and the Technical and Operational Guidance Series Number 1.1.1. New York State Ambient Water Quality Standards

and Guidance Values (NYSDEC 1998). These references are described below. The screening values are summarized on Table 4-3.

National Recommended Ambient Water Quality Criteria-Correction (USEPA 1999). The water quality criteria developed by USEPA under section 304(a) of the Clean Water Act are based on data and scientific judgments about the relationship between chemical concentrations and environmental and human health effects with provision of conservative scaling, or safety factors, to provide an additional margin of safety. National recommended water quality criteria have been developed for 147 constituents.

Technical and Operational Guidance Series Number 1.1.1. New York State Ambient Water Quality Standards and Guidance Values (NYSDEC 1998). The NYSDEC surface water quality standards and guidance values are specific to each “class” of water identified by the state. Standards and guidance values are ambient water quality values derived according to procedures that are in regulation (6 NYCRR Part 702). Standards are values that have been promulgated and placed into regulation. Guidance values may be considered where a standard for a substance or group of substances has not been established for a particular water class and type, but do not have the regulatory implications of the standards.

The NYSDEC standards and guidance values derived for the protection of *freshwater* aquatic life from *chronic* effects or for protection of wildlife for Class C waters, were selected as screening values for this study.

4.3.3. Sediment screening comparison

Maximum detected constituent concentrations in sediment samples collected from the Old Erie Canal ditch were compared to the values presented in NYSDEC’s Technical Guidance for Screening Contaminated Sediments (NYSDEC 1999). Table 4-4 presents a summary of the screening process. The NYSDEC sediment criteria were designed to assess sediment residues and to assist in the preliminary screening assessment of the potential risk posed by the constituents to exposed ecological receptors, if any. NYSDEC developed sediment criteria for two classes of compounds: non-polar organics and metals.

Criteria for non-polar organics were derived using the equilibrium partitioning (EqP) approach which is based on theoretical relationships between the pore water constituent concentration and an estimate of the constituent’s affinity to sorb to organic carbon in the sediment. Recent and historic sediment samples collected from the Site were not analyzed for organic carbon. Therefore, the criteria as presented on Table 4-4 have been normalized for the amount of organic carbon estimated to exist in the sediment samples collected by O’Brien & Gere from the Site. For the purposes of this report, the organic carbon content of each of the Site sediment samples is estimated to be five percent. This estimate is

based, in part, on field observations recorded by the sampling crew. Note that the Site sediment samples were collected from portions of the Old Erie Canal located adjacent to the Site. This area, as described previously, contains a substrate characteristic of an emergent wetland habitat, including the presence of a mucky substrate that includes a significant amount of decomposed vegetative matter. Wetland soils typically have an organic carbon content ranging from ten to 35 percent. Therefore, the estimate of five percent utilized for the criteria comparisons performed herein, in lieu of Site-specific organic carbon analytical data, is considered reasonable and conservative.

The concentration of a biologically available constituent is estimated by the EqP method and related to potential toxicity and bioaccumulation by comparison to existing criteria established for the water column. NYSDEC or USEPA water quality standards and guidance values are used to derive sediment criteria.

Metals criteria were derived based on methods from the Ministry of Ontario and NOAA. In this approach, the lowest effect level (LEL) and severe effect level (SEL) were derived by Persaud *et al.* (1993) using field-based data on the co-occurrence of sediment chemical concentrations and benthic species. The calculation of the LEL for a chemical is a two-step process. The screening level concentrations for each individual benthic species were calculated. The sediment concentrations at all locations at which that species was present are plotted in order of increasing concentrations. The 90th percentile was selected by Persaud as a conservative estimate of the tolerance range of species. In the second step, the 90th percentiles for all of the species are plotted, also in order of increasing concentration. From this plot, the fifth percentile is calculated and used as the LEL. Both the LEL and SEL are presented on the attached sediment screening table (Table 4-4).

4.4. COPC summary

The objective of COPC identification is to identify the specific constituents in the environmental media that are present at concentrations that exceed screening values and, therefore, may require further evaluation as part of additional FWIA tasks. For this FWIA, the identification of COPCs for the Site was based on comparisons of maximum detected constituent media concentrations to ecologically based screening criteria. If the maximum media constituent concentration exceeded the lowest screening value, the constituent was identified as a COPC. In addition, consistent with the Guidance, constituents for which standards or screening values do not exist were included as COPCs. However, it should be recognized that evaluation of Site data for exceedance of the identified benchmark values is the first step in the screening process. Exceedence of screening values does not,

in itself, indicate a risk to wildlife, but is an indication of potential exposures to those constituents identified in the screening step.

The results of the screening process are summarized below. Tables 4-2, 4-3, 4-4 present the COPCs for surface soil, surface water and sediment, respectively.

Surface soils

- five inorganic and one organic constituents were identified as COPCs
- three inorganic and nine organic constituents did not have screening values available in the referenced sources

Surface water

- five inorganic and one organic constituents were identified as COPCs
- six inorganic and 16 organic constituents did not have screening values available in the referenced sources

Sediment

- twelve inorganic and 11 organic constituents were identified as COPCs
- ten inorganic and 20 organic constituents did not have screening values available in the referenced literature.

5. Conclusions

This FWIA evaluated the physical and biological characteristics and potential ecological receptors at the Old Erie Canal Site in Clyde, New York. Step IIB of the FWIA Guidance was performed for this assessment. The results and conclusions of this assessment are presented below.

Site

- The terrestrial portion of the Site is developed with buildings, asphalt, and/or maintained lawns, which prevent or limit use by transient or residential wildlife species. In addition, the active rail line located along the southern portion of the Site further limits use of the Site by transient or residential wildlife species. Ecological receptors are unlikely to utilize the terrestrial portions of the Site due to the lack of and/or poor quality habitat.
- A palustrine habitat, the former Barge Canal turnaround, exists at the western border of the Site. This *Phragmites*-dominated area provides limited habitat for foraging and resting for terrestrial and semi-aquatic receptors. There are no state-regulated wetlands or NWI wetland habitats on the Site. Aquatic areas do not exist on-site.

Study Area

- The terrestrial areas within the Study Area consist of a mixture of natural communities, agricultural fields, and areas exhibiting urban/suburban land use. The northern portion of the Study Area is developed and consists of residential and light commercial areas which prevent or limit use by transient or residential wildlife species.
- The southern portion of the Study Area consists largely of cropland, which provides little fish and wildlife resource value. The cropland areas are interspersed with natural covertypes including successional northern hardwood forests, freshwater wetland, and open water areas that provide appropriate habitat for a variety of fish and wildlife species.
- The Clyde River/Barge Canal dissects the center of the Study Area and likely contains appropriate habitat for a variety of small mammal, avian, reptilian, amphibian and fish species. There are no state-regulated wetlands or NWI wetland habitats in the Study Area.

- The USFWS has indicated that no Federally-listed or proposed endangered or threatened species are known to exist in the Study Area.

Resource Area

- Based on the available mapping, several state-regulated wetlands and NWI wetland habitats are located within two miles of the site.
- The NYNHP has identified a significant natural community located approximately one mile west of the site. This community includes various wetland habitats associated with the floodplain of the Clyde River upstream of the site.

Chemical Constituents

- Concentrations of chemical constituents in Site media (surface soil, surface water, and sediment) were detected above conservative, ecologically-based criteria and/or screening values. Based on the data collected during the RI, and the initial screening of that data using applicable criteria, sufficient information is available to proceed to the Feasibility Study.

1. Data collected on May 21, 2002, by O'Brien & Gere.

2. Source: NYSDEC (1999). Lowest effect level (LEL) and severe effect level (SEL) apply to metals only. For organic constituents, wildlife bioaccumulation and benthic toxicity screening values assume sediment organic carbon content of five percent.

mg/kg = Milligrams per kilogram.

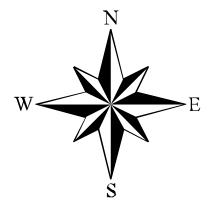

ug/kg = Micrograms per kilogram.

NAP = Not applicable.

NV = No screening value reported.

Natural Heritage Letter Responses

United States Department of the Interior

FISH AND WILDLIFE SERVICE

3817 Luker Road
Cortland, NY 13045

April 23, 2002

Mr. Stephen E. Mooney
Senior Project Scientist
O'Brien & Gere Engineers, Inc.
P.O. Box 4873
Syracuse, NY 13221-4873

Dear Mr. Mooney:

This responds to your letter of April 12, 2002, requesting information on the presence of endangered or threatened species in the vicinity of the Old Erie Canal Site on Columbia Street in the Village of Clyde, Wayne County, New York.

Except for occasional transient individuals, no Federally listed or proposed endangered or threatened species under our jurisdiction are known to exist in the project impact area. In addition, no habitat in the project impact area is currently designated or proposed "critical habitat" in accordance with provisions of the Endangered Species Act (87 Stat. 884, as amended; 16 U.S.C. 1531 et seq.). Therefore, no Biological Assessment or further Section 7 consultation under the Endangered Species Act is required with the U.S. Fish and Wildlife Service (Service). Should project plans change, or if additional information on listed or proposed species or critical habitat becomes available, this determination may be reconsidered. A compilation of Federally listed and proposed endangered and threatened species in New York is enclosed for your information.

The above comments pertaining to endangered species under our jurisdiction are provided pursuant to the Endangered Species Act. This response does not preclude additional Service comments under other legislation.

For additional information on fish and wildlife resources or State-listed species, we suggest you contact the appropriate New York State Department of Environmental Conservation regional office(s) as shown on the enclosed map, and:

New York State Department of Environmental Conservation
New York Natural Heritage Program Information Services
625 Broadway
Albany, NY 12233
(518) 402-8935

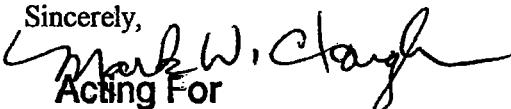

Since wetlands may be present, you are advised that National Wetlands Inventory (NWI) maps may or may not be available for the project area. However, while the NWI maps are reasonably

accurate, they should not be used in lieu of field surveys for determining the presence of wetlands or delineating wetland boundaries for Federal regulatory purposes. Copies of specific NWI maps can be obtained from:

Cornell Institute for Resource Information Systems
302 Rice Hall
Cornell University
Ithaca, NY 14853
(607) 255-4864

Work in certain waters and wetlands of the United States may require a permit from the U.S. Army Corps of Engineers (Corps). If a permit is required, in reviewing the application pursuant to the Fish and Wildlife Coordination Act, the Service may concur, with or without stipulations, or recommend denial of the permit depending upon the potential adverse impacts on fish and wildlife resources associated with project implementation. The need for a Corps permit may be determined by contacting the appropriate Corps office(s) as shown on the enclosed map.

If you require additional information please contact Michael Stoll at (607) 753-9334.

Sincerely,

Acting For

David A. Stilwell
Field Supervisor

Erin M. Crotty
Commissioner

April 30, 2002

Stephen E. Mooney
O'Brien & Gere Engineers, Inc
5000 Brittenfield Pkwy
Syracuse, NY

Dear Mr. Mooney:

In response to your recent request, we have reviewed the New York Natural Heritage Program database with respect to the proposed Environmental Investigation of the Old Erie Canal Site at 124 Columbia Street, site as indicated on the map you provided, including a 2-mile radius, site as located in the Town of Galen, Wayne County.

Enclosed is a report of rare or state-listed animals and plants, significant natural communities, and other significant habitats, which our databases indicate occur, or may occur, on your site or in the immediate vicinity of your site. The information contained in this report is considered sensitive and may not be released to the public without permission from the New York Natural Heritage Program.

The presence of rare species may result in your project requiring additional permits, permit conditions, or review. For further guidance, and for information regarding other permits that may be required under state law for regulated areas or activities (e.g., regulated wetlands), please contact the appropriate NYS DEC Regional Office, Division of Environmental Permits, at the enclosed address.

For most sites, comprehensive field surveys have not been conducted, the enclosed report only includes records from our databases. We cannot provide a definitive statement on the presence or absence of all rare or state-listed species or significant natural communities. This information should not be substituted for on-site surveys that may be required for environmental impact assessment.

Our databases are continually growing as records are added and updated. If this proposed project is still under development one year from now, we recommend that you contact us again so that we may update this response with the most current information.

Sincerely,
Betty Ketcham

Natural Heritage Report on Rare Species and Ecological Communities

Prepared 24 April 2002 by NY Natural Heritage Program, NYS DEC, Albany, New York

This report contains SENSITIVE information that should be treated in a sensitive manner -- Please see cover letter. Refer to the Users' Guide for explanations of codes, ranks, and fields. We do not always provide maps of locations of species most vulnerable to disturbance, nor of some records whose locations and/or extents are not precisely known or are too large to display.

Re: Water Sample Results
Old Erie Canal
Site # 859015
Clyde, Wayne County

ORIGINAL

Dear Mr. Cole:

Enclosed is a copy of the laboratory report for the water sample, which I collected on June 2, 2002 from the sump in the basement of your residence. The water sample was analyzed for volatile organic compounds at the NYS Department of Health's Wadsworth Center in Albany. Also, enclosed is an explanation sheet to help you interpret the report.

No volatile organic compounds were detected in this sample.

If you have any questions about the sample report, please call me at (585) 423-8071.

Sincerely,

David L. Napier
Regional Toxics Coordinator

**Re: Sump Water Sample Results
Old Erie Canal, ID# 859015
Clyde, Wayne County**

Dear Mr. Cole:

Enclosed is a copy of the sample results for a sump water sample which I collected at your residence on March 27, 2000. The sample was analyzed at the New York State Department of Health's Wadsworth Center for volatile organic compounds. Also enclosed is an Analytical Report Explanation Sheet for Water Samples.

No volatile organic compounds were detected in the water sample from your sump. Thank you for allowing me to collect the sample.

If you have any questions regarding the sample results please call me at (716) 423-8071.

Sincerely,

A handwritten signature in black ink that reads "David L. Napier".

RE: Sump Water Sample Results
Old Erie Canal, ID# 859015
Clyde, Wayne County

Dear Mr. Camp:

Enclosed is a copy of the sample results from a sump water sample which I collected from your residence on September 23, 1997. The sample was analyzed at the New York State Department of Health Wadsworth Center for Laboratories and Research for volatile organic compounds.

None of the chlorinated volatile organic compounds which have been detected in previous sump water samples from your basement were detected in this sample. The only compounds detected in this sample were 4-isopropyltoluene at 0.5 micrograms per liter (MCG/L) and naphthalene at 0.8 MCG/L. These compounds are not associated with the contamination at the Old Erie Canal site. They are compounds typically found in fuel oil and/or kerosene. The presence of these compounds at the levels detected does not present a health concern..

If you have any questions regarding this sample result please call me at (716) 423-8071.

Sincerely,

David L. Napier

RE: Sump Water and
Indoor Air Sample Results
Old Erie Canal, ID# 859015
Clyde, Wayne County

Dear Mr. Camp:

Enclosed are copies of the samples results from sump water samples and indoor air samples which I collected from your residence. On October 1, 1996 I collected three water samples from different points in your basement. The results of the sample from location #3 showed the presence of vinyl chloride at 1.9 micrograms per liter (MCG/L) and cis-1,2-dichloroethene at 1.1 MCG/L. Based on this result it was decided that indoor sampling should be conducted in your home to evaluate whether or not the presence of these compounds in the water entering your basement is impacting the air quality in your home.

On November 4, 1996 I collected three more sump water samples from your basement and indoor air samples from the basement and living room and an outdoor air sample. No volatile organic compounds were detected in any of the sump water samples. Several volatile organic compounds were detected in the air samples. I have attached a table which summarizes the air sample results. As you can see the results for the samples in your home are very similar to the results from the outdoor air sample. These results are within the range of typical background levels found in residential homes. Based on these results it does not appear that the air in your home is being impacted by contaminated groundwater.

If you have any questions regarding these sample results please call me at
(716) 423-8071.

Sincerely,

David L. Napier

RE: Water Sample Results
Old Erie Canal, ID #859015
Clyde, Wayne County

Dear Mr. Camp:

Enclosed is a copy of the results for the water sample which I collected from a sump in the basement of your residence on March 25, 1996. The water sample was analyzed for volatile organic chemicals at the State Health Departments Wadsworth Center for Laboratories and Research. Some volatile organic chemicals have been detected at the Old Erie Canal (Parker Hannifin) site, which is located to the east of your property. Two volatile organic compounds, vinyl chloride and cis-1,2-dichlorethene, were detected in the sample. The (PL) symbol after the sample result indicates the compounds were present but less than the minimal reportable value, which is 0.5 MCG/L. These levels do not present a health concern. The drinking water standards for these compounds are, 2.0 MCG/L for vinyl chloride and 5.0 MCG/L for cis-1,2-dichlorethene. With your permission I will resample the sump water in the future to insure that the level of the compounds has not increased.

Along with the laboratory report I have enclosed an explanation sheet to help you understand the detailed report. If you have any questions, please call me at (716) 423-8071.

Sincerely,

David L. Napier
Regional Toxics Coordinator
Bureau of Environmental Exposure
Investigation

RE: Water Sample Results
Old Erie Canal, Site #859015
Clyde, Wayne County

Dear Mr. Camp:

Enclosed is a copy of the sample results for the water sample which I collected from a sump in the basement at your residence on July 12, 1995. The water sample was analyzed for volatile organic compounds and ketones at the New York State Wadsworth Center for Laboratories and Research in Albany.

The laboratory report included with this letter lists the parameters (chemicals) analyzed for in the left-hand column and the corresponding results in the right-hand column. The less-than (<) symbol in front of a result indicates that the parameter was not present at the level indicated, which is the detection limit for the analytical methods used. The detection limit for volatile organic compounds is 0.5 micrograms per liter (MCG/L) or 0.5 parts per billion. The detection limit for the ketone parameters is 10.0 MCG/L or 10.0 parts per billion. As shown on the report the only compound detected in the sample was acetone at 68.0 MCG/L. Acetone is a common laboratory contaminant and this low level result is likely due to laboratory contamination. In order to confirm this, I would like to resample the sump in September. I will call you to arrange this sampling.

Thank you for allowing me to collect the water sample. If you have any questions about the sample results please call me at (716) 423-8071.

Sincerely,

David L. Napier

RESULTS OF EXAMINATION

FINAL REPORT

SAMPLE ID: 9501491 SAMPLE RECEIVED: 95/07/18/ CHARGE: 12.00

POLITICAL SUBDIVISION: CLYDE V. COUNTY: WAYNE

LOCATION: 859015 - OLD ERIE CANA - TOWN OF CLYDE

TIME OF SAMPLING: 95/07/12 10:45

DATE PRINTED: 95/07/30

-----PARAMETER-----

-----RESULT-----

1,2-DIBROMOETHANE (EDB)	< 0.5 MCG/L
CHLOROBENZENE	< 0.5 MCG/L
1,1,1,2-TETRACHLOROETHANE	< 0.5 MCG/L
ETHYLBENZENE	< 0.5 MCG/L
M/P-XYLENE	< 0.5 MCG/L
O-XYLENE	< 0.5 MCG/L
STYRENE	< 0.5 MCG/L
ISOPROPYLBENZENE (Cumene)	< 0.5 MCG/L
BROMOFORM	< 0.5 MCG/L
1,1,2,2-TETRACHLOROETHANE	< 0.5 MCG/L
1,2,3-TRICHLOROPROPANE	< 0.5 MCG/L
N-PROPYLBENZENE	< 0.5 MCG/L
BROMOBENZENE	< 0.5 MCG/L
1,3,5-TRIMETHYLBENZENE	< 0.5 MCG/L
O-CHLOROTOLUENE	< 0.5 MCG/L
P-CHLOROTOLUENE	< 0.5 MCG/L
TERT-BUTYLBENZENE	< 0.5 MCG/L
1,2,4-TRIMETHYLBENZENE	< 0.5 MCG/L
SEC-BUTYLBENZENE	< 0.5 MCG/L
4-ISOPROPYLtolUENE (p-Cymene)	< 0.5 MCG/L
1,3-DICHLOROBENZENE	< 0.5 MCG/L
1,4-DICHLOROBENZENE	< 0.5 MCG/L
N-BUTYLBENZENE	< 0.5 MCG/L
1,2-DICHLOROBENZENE	< 0.5 MCG/L
1,2-DIBROMO-3-CHLOROPROPANE	< 0.5 MCG/L
1,2,4-TRICHLOROBENZENE	< 0.5 MCG/L
HEXACHLOROBUTADIENE (C-46)	< 0.5 MCG/L
NAPHTHALENE	< 0.5 MCG/L
1,2,3-TRICHLOROBENZENE	< 0.5 MCG/L
PH OF VOLATILE ALIQUOT	2

ANALYSIS: KET KETONES - PURGE & TRAP TECHNIQUE (DES 310-25)

DATE PRINTED: 95/07/31

FINAL REPORT

-----PARAMETER-----

-----RESULT-----

2-BUTANONE (METHYL ETHYL KETONE)	< 10. MCG/L
4-METHYL-2-PENTANONE (MIBK)	< 10. MCG/L
ACETONE	68. MCG/L
METHYL TERT BUTYL ETHER	< 10. MCG/L
