- ☑ 10. For the ICV analysis, is the percent recovery for each analyte 90 – 110% (300.0/9056/7199); 95-105% (218.6); 85-115 (218.7)?
- ☑ 11. Are all peak integrations acceptable?
- ☑ 12. Do the peak areas match the Method Parameters Report (has the ICAL file been saved correctly)?
- ☑ 13. For each analyte, were the appropriate standards re-quantitated and printed?
  - ☑ Did the LLOQ meet 50-150% recovery limits at the MRL level standard?
  - ☑ Are recoveries of all standards greater than the MRL standard within (10% for 300.0/9056A; 15% for 218.7) of the true value? If a quadratic curve was used for 218.6/7199, are recoveries of all standards greater than the MRL within 10% of the true value?

1.0 INTRODUCTION

On September 30, 2014, the United States Environmental Protection Agency (U.S. EPA) issued a Record of Decision for Operable Unit 3 (OU3 ROD) in which it documented its selection of remedies for the known source areas at the Olean Well Field Superfund Site (Superfund Site), including a portion of the Superfund Site known as "Parcel B of the Alcas Source Area" (Parcel B).

In February 2016, a Consent Decree (CD) was filed amending and superseding the 1998 CD requiring) requiring Alcas Cutlery Corporation (now known as Cutco Corporation) and Aluminum Company of America (now known as Arconic Corporation) to perform implementation of the remedy for Parcel B that was selected in the OU3 ROD. Pursuant to Sections VI of the 2016 CD and 7.5 of the Statement of Work (SOW), a Remedial Action Work Plan (OU3 RAWP) and supporting deliverables were required to implement the required remedial action for the operable unit. Supporting deliverables for the OU3 RAWP included a Field Sampling Plan (FSP) and Quality Assurance Project Plan (QAPP). On June 8, 2022, the U.S. EPA approved the May 27, 2022, OU3 RAWP with supporting deliverables. The FSP provided a framework for field sampling activities including groundwater performance monitoring required to implement the OU3 remedy. The objective of the QAPP was to address sample analysis and data handling so that data quality is maintained and the work is accurately completed according to the requirements in the OU3 RAWP.

Between August 20 and 22, 2024, groundwater sampling activities were performed at thirteenexisting monitoring wells and three existing sentinel monitoring wells for the purpose of twelve-month post-remedial action performance monitoring. Groundwater samples were submitted for laboratory analysis for the following:

- Volatile Organic Compounds (VOCs) (Tetrachlorethylene [PCE], Trichloroethylene [TCE], cis-1,2 Dichloroethylene [cis-1,2 DCE], trans-1,2 Dichloroethylene [trans-1,2 DCE], and Vinyl Chloride [VC]) – Method 8260D;
- Dissolved Gasses (Ethane, Ethene, and Methane) – Method RSK-175;
- Volatile Fatty Acids (Acetate, Butyrate, and Propionate) – ALS Environmental SOP for Organic Acids in Aqueous Matrices by High Performance Liquid Chromatoraphy;
- Chemical Oxygen Demand (COD) – Method 410.4;

- Sulfate- Method 300.0; and
- Dissolved Metals (Arsenic, Iron, and Manganese) – Method 6010D.

Groundwater samples from the sentinel monitoring wells were submitted for laboratory analysis of VOCs, COD, and dissolved metals. Analytical results were reviewed and validated for usability with respect to the OU3 QAPP.

Analytical results were reviewed and validated for usability with respect to the OU3 QAPP. Data validation included an evaluation of the following:

- Chain of Custody (COC) documentation;
- Holding times;
- Surrogate recoveries;
- Matrix spike/matrix spike dilutions precision and accuracy;
- Laboratory Control Sample (LCS) recoveries;
- Laboratory method blank and trip blank contamination;
- Gas chromatograph/mass spectrometer (GC/MS) instrument performance;
- Sample result verification and identification;
- Internal standard responses;
- Initial and continuing calibrations;
- Quantitation limits; and
- Data completeness.

The following sections of this report provide a narrative discussion of the checklist, including data review and validation procedures and results.

Aqueous samples were collected from the OU3 wells on August 20 - 22, 2024. The subcontracted analytical laboratory for this project was ALS Environmental (ALS) located in Rochester, New York. Analytical results from these samples were reviewed and validated by ALS and CEC NY.

2.1 LABORATORY DATA - FIRST LEVEL REVIEW

The laboratory analyst generating the analytical data has the prime responsibility for the correctness and completeness of the data. All laboratory data was generated and reduced following protocols specified in the appropriate U.S. EPA SW846 methods or other approved method for the analysis being performed. The review conducted by the laboratory analyst constitutes the first level review. At a minimum, the primary analyst reviews the data package to confirm that:

- Analysis information is correct and complete;
- Appropriate test method was used;
- Analytical results are correct and complete (including calculations);
- Quality control (QC) samples are within established control limits;
- Blanks are within established control limits;
- All corrections on raw data and any generated forms are appropriately documented; and
- Raw data, calculations, and results are correctly transcribed.

This review is documented by the analyst and included with the data package. In the case of work performed by subcontracted laboratories, the first level review was performed by the subcontracted laboratory, ALS.

2.2 LABORATORY DATA - SECOND LEVEL REVIEW

The laboratory conducted a secondary review of the data as an independent and detailed review to confirm that the data set is acceptable for release. The secondary review process confirms that:

- COC information is correct;
- Holding times were met (exceeded holding times, if present, are documented in the case narrative);
- Sample preparation information is correct and complete;
- Analysis information is correct and complete;

- Appropriate SOPs have been followed;
- Analytical results are correct and complete (including calculations);
- QC samples are within established control limits;
- Blanks are within established control limits;
- Special sample preparation and analytical requirements have been met;
- Documentation is complete;
- Corrections on raw data and any generated forms are appropriately documented; and
- All documents have been initialed and dated in accordance with laboratory SOPs.

The secondary review was conducted by experienced laboratory personnel who perform data review as a primary function, are organizationally separate from the operating analysts and have direct access to the laboratory's quality assurance (QA) Manager. Any errors found in this review should trigger appropriate actions resulting in the correction of the data. In the case of work performed by subcontracted laboratories, the data is reviewed and approved by the primary laboratory in a manner similar to a secondary review process. ALS confirmed that the data set is acceptable for release.

2.3 LABORATORY DATA - THIRD LEVEL REVIEW

The third level of review for laboratory data is accomplished by the Laboratory Project Manager during preparation of the final laboratory report. A Case Narrative was prepared for each Sample Delivery Group (SDG) (or equivalent) as documentation of the review. This narrative includes comments as appropriate for the proper interpretation of the data as reported. The signature of the laboratory Project Manager, laboratory director, or designated senior QA staff on each SDG report constitutes acceptance and release of the report from the third level review.

The sampling event included two Sample Delivery Groups: R2408139 and R2408140.

2.3.1 Third Level Review for SDG R2408139

According to the Case Narrative SDG R2408139, all analyses were performed consistent with the quality assurance program of ALS. The Case Narrative included the following details:

- Sample Receipt: Twelve (12) water samples were received for analysis at ALS Environmental on 8/23/2024. Any discrepancies upon initial sample inspection are annotated on the sample receipt and preservation form included within this report. The samples were stored at a minimum in accordance with the analytical method requirements.
- Volatiles by GC/MS: Method 8260D: No significant anomalies were noted with the analysis.
- Volatiles by GC: No significant anomalies were noted with the analysis.
- Semi-volatiles by GC: No significant anomalies were noted with the analysis.
- Dissolved Metals: Method 6010D: When analyzed without dilution, the concentration of one or more elements in one or more samples exceeded the respective single element interference check concentration. Affected samples were diluted to reduce the solution concentration to below the interference check concentration per section 9.9.1 of EPA 6010D.
- General Chemistry: Method 300.0 and Method 410.4: Samples required dilution due to the oily nature of the matrix. The Method Reporting Limit (MRL) was increased due to the presence of oil in the samples.

The signature of ALS staff on the SDG report constitutes acceptance and release of the report from the third level review. A copy of the laboratory report is presented in Attachment A.

2.3.2 Third Level Review for SDG R2408140

According to the Case Narrative SDG R2408140, all analyses were performed consistent with the quality assurance program of ALS. The Case Narrative included the following details:

- Sample Receipt: Fourteen (14) water samples were received for analysis at ALS Environmental on 8/23/2024. Any discrepancies upon initial sample inspection are annotated on the sample receipt and preservation form included within this report. The samples were stored at a minimum in accordance with the analytical method requirements.
- Volatiles by GC/MS: Method 8260D: No significant anomalies were noted with the analysis.
- Volatiles by GC: No significant anomalies were noted with the analysis.

3.2.6.6 Matrix Spike/Matrix Spike Duplicate Analyses

Acceptable: MS/MSDs were reported as required. The recovery and RPD values are within the laboratory control limits, except as discussed below. MS/MSD data is presented for information purposes. The laboratory evaluates system performance based on the LCS.

3.2.6.7 Laboratory Reporting Limits

Acceptable with Discussion: Laboratory Method Reporting Limits (MRLs) listed in the QAPP were met except in cases where dilution was required. The QAPP notes that MRLs are not adjusted for dilution.

3.2.6.8 Overall Assessment of Data Usability

The usability of the data is based on the QAPP and U.S. EPA guidance documents noted previously. Upon consideration of the information presented here, the data are acceptable for their intended use.

4.0 DATA USABILITY

The following data quality indicators were evaluated to determine the usability of the analytical results: precision, accuracy, representativeness, completeness, and comparability. These data quality indicators are applicable to both field and laboratory procedures. Each of the data quality indicators are discussed briefly in the following subsections.

4.1 PRECISION

Precision is a measure of the reproducibility of analyses under a given set of conditions (i.e., the degree to which two or more measurements are in agreement). Precision evaluates how far different individual reported values are from the average or mean. Precision is thus a measure of the magnitude of random error and is expressed as the relative percent difference (RPD). The lower the RPD value is, the more precise (i.e., reproducible) the data.

Precision is evaluated using the RPD, which is determined according to the following equation:

$$RPD = \frac{|Value\ 1 - Value\ 2|}{Arithmetic\ Mean\ of\ Value\ 1\ and\ 2}\ x\ 100$$

This equation above is appropriate when the analytical results are greater than 5 times the reporting limit (RL). Acceptable precision for field duplicates in groundwater is typically RPD < 25-percent. For results that are near the limit of quantitation, acceptable precision is achieved when the absolute value of the difference between Value 1 and Value 2 is within 2 times the RL. For results that are reported between the RL and the method detection limit (MDL), precision is considered poor by definition (i.e., the results are considered qualitatively acceptable in that a constituent can be identified but are quantitatively suspect since the concentration cannot be accurately quantified). For this reason, results between the RL and MDL are flagged with the qualifier "J," indicating they are estimated.

Precision for groundwater samples was evaluated using the analytical results for sample for two (2) samples and respective duplicate samples. The precision determination for each duplicate sample is discussed below.

4.1.1 Precision for Duplicate Sample OLN-FD001-D009

Duplicate sample OLN-FD001-D009 is associated with sample OLN-RU016-F009. Sample results and calculated RPD values are summarized in Table 1.

Of the parameters analyzed, the following constituents had an estimated concentration with results between the MDL and the RL (or J-flagged): trans-1,2-DCE and dissolved arsenic. The precision of these constituents is considered poor by definition, and the analytical results are not considered precise.

The following constituents had a quantifiable concentration that met the precision criteria of an RPD < 25-percent: cis-1,2-DCE, methane, dissolved iron, dissolved manganese, and COD. TCE, VC, acetic acid, and sulfate had quantifiable concentrations that met the precision criteria of the absolute difference being within two times the RL. Therefore, these analytical results are considered precise.

4.1.2 Precision for Duplicate Sample OLN-FD002-D009

Duplicate sample OLN-FD002-D009 is associated with sample OLN-RU021-F009. Sample results and calculated RPD values are summarized in Table 1.

The following constituents had quantifiable concentrations that met the precision criteria of an RPD <25-percent: cis-1,2-DCE, VC, methane, acetic acid, dissolved arsenic, dissolved iron, dissolved manganese, sulfate, and COD. The following constituents had quantifiable concentrations that met the precision criteria of the absolute difference being within two times the RL: PCE, TCE, trans-1,2-DCE, and propionic acid. Therefore, these analytical results are considered precise.

4.2 ACCURACY

Accuracy is a measure of the bias that exists in a measurement system (i.e., the degree of agreement between an observed value and a reference or true value). Accuracy measures the average or systematic error of a measurement method or sampling method. Accuracy in the field is determined through the collection of blanks and review of the results for evidence of sample contamination stemming from field activities or sample transport.

Three trip blanks, three field blanks, and one equipment blank were analyzed as part of this Project. Trip blank, field blank, and equipment blank analytical results are summarized in Table 2.

None of the analytes were quantified or estimated in the trip blanks, field blank OLN-FB002-B009, or field blank OLN-BF003-B009. COD was quantified in the equipment blank OLN-EB001-E009 at concentration of 5.6 mg/L and in field blank OLN-FB001-B009 at a concentration of 5.3 mg/L. COD was quantified in fourteen of sixteen field samples between 6.0 and 5,590 mg/L. The concentrations reported in these field samples are greater than the RL and no qualification is required. COD was not quantified above the RL in field samples OLN-RU009-F009 and OLN-WW18M-F009 and no further qualification is required.

4.3 REPRESENTATIVENESS

Representativeness expresses the degree to which data accurately and precisely represent the environmental condition. Representativeness is accomplished by maintaining sample integrity with appropriate preservation and meeting technical holding times and by collecting a statistically significant number of samples. Field representativeness is dependent upon the proper design of the sampling program and is satisfied by following proper sampling techniques.

Field work was conducted in accordance with the January 2022, *Final Field Sampling Plan Operable Units 2 and 3 at the Alcas Source Area, Olean Well Field Superfund Site, Olean, New York* (FSP) as prepared by Civil & Environmental Consultants of New York, Inc. Samples were collected using laboratory provided containers, preserved in a cooler on ice, and were immediately

delivered to the laboratory within specified hold times. All samples were analyzed within the method specified holding time. The samples were collected using consistent and appropriate sampling techniques. Based on the above, the analytical results are considered to be representative.

4.4 COMPLETENESS

Completeness is the measurement of the amount of valid data obtained from a measurement system compared to the amount that was expected to be obtained under "normal" conditions. Completeness establishes whether a sufficient number of valid measurements were obtained. The closer this value is to 100, the more complete the measurement process. Data rejected, whether due to sampling design error, measurement error, or bias or sample matrix interferences, are considered invalid measurements. The following formula was used to estimate completeness:

$$Percent\ Completeness = \frac{V}{T}\ x\ 100$$

Where:

V = number of measurements judged valid

T = total number of measurements

The field completeness objective for this project is greater than 90%.

All proposed sampling points were collected. No data were rejected due to sampling design error, measurement error, or bias or sample matrix interferences. Since all sixteen (16) samples were collected and no data was considered invalid, the dataset is considered to be 100% complete, which meets the field completeness objective.

4.5 COMPARABILITY

Comparability expresses the confidence with which one set of data can be compared to another. It is a qualitative measurement to ensure sampling and analytical procedures are consistent within and between data sets, such as split sampling or monitoring. Analytical data is comparable when

similar sampling, analytical methods, and reporting limits are consistently used for assessments of water quality. Comparability was controlled by requiring the use of specific nationally recognized analytical methods and requiring consistent method performance criteria.

Sampling was conducted in accordance with the FSP. The sampling event followed sampling procedures employed previously and utilized the same laboratory for analysis via consistent analytical methods. Because of this, the sampling procedures between sample locations and across different sampling events were consistent. Thus, the data sets discussed above are considered comparable.

5.0 SUMMARY

CEC NY completed a data review of the aqueous samples data packages prepared by ALS. Based on the data review and validation evaluation, the data were considered to be sufficiently compliant and acceptable in accordance with validation protocols. The quality assurance objectives for data included considerations for precision, accuracy, representativeness, completeness and comparability. The data were 100 percent complete with all data considered usable. The specific samples, the analyses performed, and a usability summary are presented in Table 3.

Dear Michael,

Enclosed are the results of the sample(s) submitted to our laboratory August 23, 2024
For your reference, these analyses have been assigned our service request number **R2408139.**

All testing was performed according to our laboratory's quality assurance program and met the requirements of the TNI standards except as noted in the case narrative report. Any testing not included in the lab's accreditation is identified on a Non-Certified Analytes report. All results are intended to be considered in their entirety. ALS Environmental is not responsible for use of less than the complete report. Results apply only to the individual samples submitted to the lab for analysis, as listed in the report. The measurement uncertainty of the results included in this report is within that expected when using the prescribed method(s), and represented by Laboratory Control Sample control limits. Any events, such as QC failures or Holding Time exceedances, which may add to the uncertainty are explained in the report narrative or are flagged with qualifiers. The flags are explained in the Report Qualifiers and Definitions page of this report.

ALS Environmental

Client: Civil & Environmental Consultants, Incorporated (CEC)
Service Request: R2408139
Project: Olean OU3 12-Month Sampling
Date Received: 08/23/2024
Sample Matrix: Water

CASE NARRATIVE

All analyses were performed consistent with the quality assurance program of ALS Environmental. This report contains analytical results for samples for the Tier level IV requested by the client.
Manual Integrations may have been used in the quantitation of the results in this report. Manual Integrations are readily identified in the raw data on the Quantitation Reports (Organics) by the automatic placement of an “m” next to the sample result. For Ion Chromatography, the manual integrations are identified by the automatic placement of “manipulated” or "manually integrated" in the upper left corner of the chromatogram (Hexavalent Chromium) or “M” by the result in the “Type” column (anions). The reason for the manual integration is noted on the “after” chromatogram, which is found with the original chromatogram and quantitation report. All integrations follow the lab SOP ADM-INT “Manual Integration.”

Sample Receipt:

Twelve water samples were received for analysis at ALS Environmental on 08/23/2024. Any discrepancies upon initial sample inspection are annotated on the sample receipt and preservation form included within this report. The samples were stored at minimum in accordance with the analytical method requirements.

Semivoa GC:

No significant anomalies were noted with this analysis.

Metals:

When analyzed without dilution, the concentration of one or more elements in one or more samples exceeded the associated single element interference check concentration. As per section 9.9.1 of EPA 6010D, affected samples were diluted to reduce the solution concentration of the high concentration element below the interference check concentration, whether or not the high concentration element was an analyte of interest. The dilution has increased the reporting limits accordingly.

General Chemistry:

Method 300.0, R2408136-006: The Method Reporting Limit (MRL) was elevated due to presence of oil in the sample.
Method 300.0, R2408139-006: Sample(s) required dilution due to the oily nature of the matrix. The reporting limits are adjusted to reflect the dilution.

Volatiles by GC:

No significant anomalies were noted with this analysis.

Volatiles by GC/MS:

No significant anomalies were noted with this analysis.

REPORT QUALIFIERS AND DEFINITIONS

U	Analyte was analyzed for but not detected. The sample quantitation limit has been corrected for dilution and for percent moisture, unless otherwise noted in the case narrative.
J	Estimated value due to either being a Tentatively Identified Compound (TIC) or that the concentration is between the MRL and the MDL. Concentrations are not verified within the linear range of the calibration. For DoD: concentration >40% difference between two GC columns (pesticides/Arclors).
B	Analyte was also detected in the associated method blank at a concentration that may have contributed to the sample result.
E	Inorganics- Concentration is estimated due to the serial dilution was outside control limits.
E	Organics- Concentration has exceeded the calibration range for that specific analysis.
D	Concentration is a result of a dilution, typically a secondary analysis of the sample due to exceeding the calibration range or that a surrogate has been diluted out of the sample and cannot be assessed.
*	Indicates that a quality control parameter has exceeded laboratory limits. Under the "Notes" column of the Form I, this qualifier denotes analysis was performed out of Holding Time.
H	Analysis was performed out of hold time for tests that have an "immediate" hold time criteria.
#	Spike was diluted out.
+	Correlation coefficient for MSA is <0.995.
N	Inorganics- Matrix spike recovery was outside laboratory limits.
N	Organics- Presumptive evidence of a compound (reported as a TIC) based on the MS library search.
S	Concentration has been determined using Method of Standard Additions (MSA).
W	Post-Digestion Spike recovery is outside control limits and the sample absorbance is <50% of the spike absorbance.
P	Concentration >40% difference between the two GC columns.
C	Confirmed by GC/MS
Q	DoD reports: indicates a pesticide/Aroclor is not confirmed (≥100% Difference between two GC columns).
X	See Case Narrative for discussion.
MRL LOQ	Method Reporting Limit. Also known as: Limit of Quantitation (LOQ) The lowest concentration at which the method analyte may be reliably quantified under the method conditions.
MDL	Method Detection Limit. A statistical value derived from a study designed to provide the lowest concentration that will be detected 99% of the time. Values between the MDL and MRL are estimated (see J qualifier).
LOD	Limit of Detection. A value at or above the MDL which has been verified to be detectable.
ND	Non-Detect. Analyte was not detected at the concentration listed. Same as U qualifier.

[1] Analyses were performed according to our laboratory's NELAP-approved quality assurance program and any applicable state or agency requirements. The test results meet requirements of the current NELAP/TNI standards or state or agency requirements, where applicable, except as noted in the case narrative. Since not all analyte/method/matrix combinations are offered for state/NELAC accreditation, this report may contain results which are not accredited. For a specific list of accredited analytes, contact the laboratory. To verify NH accredited analytes, go to https://www4.des.state.nh.us/CertifiedLabs/Certified-Method.aspx.

ORGANIC

Preparation Methods for Organic methods are listed in the header of the Results pages.

Regarding "Bulk/5035A":
For soil/solid samples submitted in soil jars for Volatiles analysis, the prep method is listed as "Bulk/5035A". The lab follows the closed-system EPA 5035A protocols once the sample is transferred to a sealed vial, but collection in bulk in soil jars does not follow the collection protocols listed in EPA 5035A. In accordance with the NYSDOH technical notice of October 2012, all results or reporting limits <200 ug/kg are to be considered estimated due to potential low bias.
