Re: Twelve-Month Performance Monitoring Report, Operable Unit 3
Alcas Cutlery Corporation Site
Consent Decree No. II-CERCLA-10202, DJ# 90-11-3

Dear Ms. Wurtz:

Pursuant to Sections 4.5 and 7.3 of the Remedial Design/Remedial Action Statement of Work (SOW) for Operable Units Two (OU2) and Three (OU3), enclosed please find a copy of the Twelve-Month Performance Monitoring Report for OU3. Arconic appreciates the time and effort U.S. EPA Region II has put into this project. Should you have any questions concerning this submittal, please call me at 865-279-2942.

Sincerely,

Michael W. Worden

1.0 INTRODUCTION

The Remedial Action Work Plan (RAWP) for Operable Unit 3 (OU3) for groundwater contamination within the Alcas Source Area and updated supporting documents detail the selected remedy (enhanced anaerobic bioremediation [EAB]) as identified in the Record of Decision (ROD) and the design basis presented in the September 2018 revised Final Design (100% Submittal) Olean Well Field Superfund Site, Operable Unit 3 report as prepared by CDM Smith (OU3 100% Remedial Design [RD]). The location of OU3 (Site) is shown on Figure 1. The U.S. Environmental Protection Agency (U.S. EPA) Region II, in consultation with the New York State Department of Environmental Conservation (NYSDEC), approved the revised OU3 100% RD on September 25, 2018.

Pursuant to Sections VI of the Consent Decree and 7.3 of the Scope of Work (SOW), a RAWP was required to implement the required remedial action for the operable unit. The OU3 RAWP was developed as a general framework document which incorporated by reference all previously approved documents including the September 2018 OU3 100% RD.

The OU3 RAWP was provided to the U.S. EPA, Region II on June 3, 2019. On March 3, 2020, the U.S. EPA, Region II provided technical comments on the OU3 RAWP. In accordance with Section VI of the Consent Decree and Paragraph 6.6 of the Scope of Work, a written response to technical comments was provided to the U.S. EPA on April 29, 2020. A May 15, 2020 email from the U.S. EPA, Region II provided concurrence with the April 29, 2020 response to comments. A revised OU3 RAWP incorporating the April 29, 2020 response to technical comments and updating the schedule was submitted on June 16, 2020. On January 11, 2021, the U.S. EPA, Region II provided technical comments on the revised OU3 RAWP. A revised OU3 RAWP incorporating the response to the January 11, 2021 technical comments was submitted on February 9, 2021. The final OU3 RAWP was submitted on January 31, 2022. At the request of the U.S. EPA, Region II, a schedule update letter and final OU3 RAWP, as prepared by Civil & Environmental Consultants of New York, Inc. (CEC NY), was submitted on May 27, 2022. On June 8, 2022, the U.S. EPA, Region II approved the May 27, 2022, OU3 RAWP with revised schedule.

Implementation of the OU3 RAWP began in January 2023 with the initiation of the procurement process for selecting a constructor. Implementation of the OU3 RAWP consisted of the baseline sampling (May 2023), injection implementation (June 2023), bioaugmentation (August 2023) in the Southern Treatment Area, and performance monitoring. The results of the baseline sampling, injection implementation, bioaugmentation in the Southern Treatment Area, and three-month performance monitoring were presented in the Remedy Implementation and Performance Monitoring Report (RI-PMR) as prepared by CEC NY and submitted to the U.S. EPA on April 9, 2024.

Injection implementation in the Northern Treatment Area began in July 2024. The electron donor was injected at 22 locations (IP-21 through IP-42). Excess electron donor produced during manufacturing was injected near IP-16 and IP-17 in the Southern Treatment Area. The injection locations for both the Southern and Northern Treatment Areas are shown on Figure 2. As specified in the OU3 RAWP, a second Remedy Implementation Report will be submitted for the Northern Treatment Area following bioaugmentation.

This Twelve-Month Performance Monitoring Report was prepared in accordance with Section 1.1.3 of the OU3 RAWP to present details on monitoring activities conducted through August 2024, including the six-, nine-, and twelve-month performance monitoring events.

2.0 PERFORMANCE MONITORING

Performance monitoring samples were to be collected at locations and frequency detailed in Section 5.2 of the OU3 100% RD. The groundwater performance monitoring program was designed to track and monitor changes in the groundwater concentrations to assess performance of each remedial action. The six-month, nine-month, and twelve-month performance monitoring sampling events were conducted on February 12 and 14, 2024, May 28 and 30, 2024, and August 20 and 22, 2024, respectively.

2.1 SUMMARY OF FIELD ACTIVITIES

Groundwater sampling activities were performed at fifteen existing monitoring wells and one public water supply well. Groundwater sampling field activities included groundwater gauging, low-flow purging until field parameter stabilization was attained, followed by groundwater samples being collected and submitted for laboratory analysis.

2.1.1 Groundwater Level Measurements

During the performance monitoring events, depth to groundwater measurements (i.e., gauging) were collected from selected OU3 monitoring wells. The monitoring well locations are provided on Figure 2. Prior to gauging, the condition of each monitoring well was assessed, and the well cap was removed to allow for atmospheric pressure equilibration. The water level indicator was deployed in a slow, controlled manner so as to not disturb potential sediment within the monitoring well and groundwater level measurements were recorded to the nearest 0.01-foot on the groundwater sampling logs (Appendices A, C, and E, respectively). Groundwater gauging procedures were performed in accordance with the Field Sampling Plan (FSP), included as Appendix B of the OU3 RAWP.

2.1.2 Well Purging

Following gauging, field personnel mobilized to each well to perform groundwater purging and sample collection in accordance with the FSP. Due to the narrow diameter of the monitoring wells, purging was performed utilizing a peristaltic pump or bladder pump equipped with dedicated polyethylene tubing. The low-flow method was utilized for purging the monitoring wells targeting a pumping rate of 100 to 200 milliliters per minute (mL/min), with the following exceptions:

- RU-10 contained electron donor within the well screen and could not be sampled during the six-month performance monitoring event; and,
- RU-10 was purged dry and sampled within 24-hours during the nine-month performance monitoring event.

During purging activities, field measurements of water quality parameters were recorded, and are provided in Appendices A, C, and E. Stability criteria for three consecutive readings at three to five minute intervals were as follows:

- pH, ±0.1 standard units (SU);
- Specific conductivity, ±3% milliSiemens per centimeter (mS/cm);
- Dissolved oxygen (DO), ±10% for > 0.5- milligrams per liter (mg/L) or < 0.5mg/L;
- Turbidity, below 5 nephelometric turbidity units (NTUs) or ±10% for values above 5 NTUs;
- Temperature, ±3% degrees Celsius (°C); and
- Oxidation reduction potential (ORP), ±10 millivolts (mV).

Each of the performance monitoring wells were sampled according to the FSP, with the following exceptions:

- RU-10 contained electron donor within the well screen and could not be sampled during the six-month performance monitoring event;
- Turbidity did not stabilize within 10% or below 5 NTUS at CW-13A, RU-19, RU-20, RU-9, RU-28 during the six-month performance monitoring event;
- pH did not stabilize within 0.1 SU at RU-19 during the six-month performance monitoring event;
- Specific conductance did not stabilize within 3% at RU-20 and RU-21 during the six-month performance monitoring event.;
- ORP did not stabilize within 10 mV at UA-3 during the six-month performance monitoring event;

- RU-10 purged dry and sampled within 24-hours during the nine-month performance monitoring event;
- The target pumping rate was exceeded at RU-19 (230 mL/min) and RU-20 (375 mL/min) during the nine-month performance monitoring event;
- Turbidity did not stabilize within 10% or below 5 NTUS at RU-15 during the nine-month performance monitoring event; and
- Turbidity did not stabilize within 10% or below 5 NTUS at RU-11 during the twelve-month performance monitoring event.

Purge water was containerized in 55-gallon drums for off-site disposal.

2.1.3 Groundwater Sampling

A final reading of water quality parameters was recorded on the appropriate field form at the time of sample collection at each location to document conditions. Analysis of alkalinity using field test kits was completed at the time of sampling during the six-, nine-, and twelve-month performance monitoring events. Analysis of ferrous iron using field test kits was completed at the time of sampling during the twelve-month performance monitoring event. At each sample location, field personnel donned powder-free nitrile gloves when sample containers were handled and took care as to not touch the inside of the containers. Care was also taken to reduce the potential for sample aeration and avoid overfilling and diluting preservatives. Samples were collected after low-flow sample tubing had been disconnected from the flow-through cell and the pumping rate was maintained throughout sample collection. Samples collected for volatile organic compound analysis from wells purged and sampled with a peristaltic pump were collected using the "soda straw" method described in the FSP.

2.1.4 Preservation and Handling

Sample containers were labeled in accordance with the FSP. Filled and labeled groundwater sample containers were placed in a cooler in an upright position. Loose ice was placed around and among the groundwater sample containers to cool the samples to less than 6 ºC during shipment. The cooler was filled with additional packing material to secure the containers. Samples were labeled, packaged for shipment, placed on ice in coolers, and delivered to the lab

in Rochester, New York by courier. Chain-of-custody (COC) protocols were maintained during sample collection and transport to courier.

Upon receipt of the samples, the analytical laboratory signed “received by laboratory" on the COC. The laboratory recorded the condition and temperature of the samples upon receipt and identified discrepancies, if present, between the contents of the cooler and COC. The Laboratory Project Manager provided the designated CEC NY personnel with a copy of the COC, sample receipt summary form, and confirmed the analytical testing to be performed prior to processing.

2.1.5 Field Documentation

Field documentation was performed in accordance with the QAPP. The following types of field documentation were recorded:

- Daily field activities were recorded and maintained chronologically in the field book to document field activities, including sample collection, sample management, and observations. A copy of the relevant pages from the field book is provided in Appendices A, C, and E. Field forms, including Daily Tailgate Meeting Forms and Groundwater Monitoring Low-Flow Purge Record, are also provided in Appendices A, C, and E.
- COC and shipping documents were prepared as samples were collected. Copies of the COCs were retained following sample relinquishment prior to shipment. Quality control samples were documented on the COC, as well as in the field book.

2.1.6 Sample Analyses

Groundwater samples were submitted to the analytical laboratory designated in the FSP and the QAPP. Samples were analyzed for the following:

- Volatile Organic Compounds (VOCs) (tetrachloroethylene [PCE], trichloroethylene [TCE], cis-1,2 dichloroethylene [cis-1,2 DCE], trans-1,2 dichloroethylene [trans-1,2 DCE], and vinyl chloride [VC]) – Method 8260C;
- Dissolved Gasses (Methane, Ethane, and Ethene) – Method RSK-175;
- Volatile Fatty Acids (Acetate, Propionate, Butyrate) – Method ALS SOP HPLC;
- Chemical Oxygen Demand (COD) – Method 410.4;
- Sulfate – Method 300.0; and
- Dissolved Metals (Arsenic, Iron, and Manganese) – Method 6010C.

Sentinel monitoring wells CW-13 and CW-13A and water supply well WW-18M were sampled for VOCs, COD, and dissolved metals only. During the six-month performance monitoring event, the sentinel wells were inadvertently submitted for analysis of sulfate.

Equipment decontamination was performed for non-dedicated groundwater sampling equipment in contact with groundwater during sampling activities in accordance with the FSP. Decontamination was performed on the water level indicators, the water quality meters, bladder pumps, and the flow-through cells.

Deionized water and a phosphate-free laboratory detergent solution in a spray bottle were used to perform the decontamination steps. The process included rinsing the equipment in deionized water, spraying the phosphate-free laboratory detergent solution on the equipment, cleaning with soft bristled brushes with the solution, and rinsing a second time with deionized water. Decontamination was required between sampling locations. Decontamination water was containerized in a 55-gallon drum for off-site disposal.

2.2 DATA VALIDATION AND USABILITY

CEC NY performed a qualitative data review of the groundwater samples, quality control samples, and data package prepared by the laboratory to determine compliance against the DQO criteria established in the QAPP. Additionally, CEC NY reviewed the sample collection and handling documentation to ensure the data collected met the project objectives.

Sampling design was controlled by the FSP and approved by U.S. EPA prior to implementation. Quality control samples were collected as specified by the FSP. Field instruments were calibrated by CEC NY or by the equipment rental provider prior to use in the field. Sample collection was implemented according to the U.S. EPA, Region 4 Field Branches Quality System and Technical Procedures as specified in the QAPP. The tables and logs compiled by the field personnel and used as the basis for data interpretation were checked against the original field documentation prior to inclusion in the report. A copy of the field documentation for these samples are presented in Appendices A, C, and E. Samples were collected, properly preserved

when required, delivered via courier under a COC record, and received at ALS no more than four days after samples were collected and within the required temperature range. Hold times for the analytical methods were met. Based on the data review and validation evaluation, the data were considered to be sufficiently compliant and acceptable in accordance with review and validation protocols.

Quality assurance objectives for data included considerations for precision, accuracy, representativeness, completeness, and comparability. The data ranged from 94 to 100 percent complete with all complete data considered usable. Results of the data review, validation, and usability assessment are detailed in the Data Summary Reports provided in Appendices B, D, and F. The analytical results for these monitoring events are summarized in Section 3.0.

3.0 SUMMARY OF RESULTS

The six-, nine-, and twelve-month performance monitoring results were compared to the May 2023 baseline monitoring results to determine the effectiveness of the treatment and the potential of adverse impacts (e.g. increasing metals concentrations) from remedy implementation. The monitoring data are discussed in terms of electron donor distribution, redox conditions, biological parameters, and chlorinated compound degradation progress. Monitoring results discussed in the following subsections are grouped by location to evaluate the observed trends in various areas of the Site as follows:

- Upgradient Wells: Wells located upgradient of the southern half of the targeted treatment area include RU-8, and RU-15;
- Treatment Area Wells: Wells located within the targeted treatment area include RU-9, RU-10, RU-19, RU-20, RU-21, RU-27A, and RU-28;
- Downgradient Wells: Wells located immediately downgradient of the treatment area include RU-11, RU-16, UA-2, and UA-3; and
- Sentinel Wells: CW-13, CW-13A, and WW-18M.

Performance monitoring wells RU-9 and RU-28 are located within the Northern Treatment Area and were considered upgradient wells prior to the twelve-month performance monitoring event.

The validated laboratory analytical results and field readings for the performance monitoring are tabulated in Tables 1 through 3. Historical data (May 2023 baseline through the August 2024 twelve-month performance monitoring event) is presented in Appendix G. Trend graphs for the parameters discussed below are included in Appendix H. Parameters which were not detected above their respective reporting limits (RLs) are graphed at 0.0 mg/L (or applicable unit), with the exception of dissolved metals, which are graphed on a logarithmic scale and therefore present non-detects as the respective RL.

3.1 ELECTRON DONOR

COD is used as a proxy for electron donor distribution and longevity at a particular monitoring well. In general, COD greater than 50 mg/L is optimal to sustain reductive dechlorination. Specific conductivity is likely to increase over time due to the presence of some electron donors.

The presence of volatile fatty acids (VFAs) also indicates the presence of electron donors, as well as the rate and extent of fermentation.

3.1.1 Upgradient Wells

Trend graphs for electron donors at monitoring wells RU-8 and RU-15 are presented in Charts 1 through 4, respectively.

COD was not quantified in RU-8 in the baseline through nine-month performance monitoring events above the RL of 5 mg/L, and was quantified slightly above the RL at 6 mg/L in August 2024. COD at RU-15 increased from an estimated 4.2 J mg/L to 27.3 mg/L in February 2024, and decreased to 9.2 mg/L in August 2024. RU-15 is located approximately 30 feet from IJ-20, which was utilized during the remedy implementation in the Southern Treatment Area (see Figure 2). The specific conductance in upgradient monitoring wells ranged between 0.128 mS/cm and 0.697 mS/cm. VFAs were not quantified or estimated in RU-8 or RU-15 between August 2023 and August 2024.

3.1.2 Treatment Area Wells

Electron donor trend graphs for monitoring wells RU-9, RU-10, RU-19, RU-20, RU-21, RU-27A, and RU-28 are presented in Charts 5 through 18, respectively. Wells RU-10, RU-19, RU-20, RU-21, and RU-27A are located in the Southern Treatment Area and have the potential to be affected by the June 2023 Southern Treatment Area injections. Wells RU-9 and RU-28 are located in the Northern Treatment Area and have the potential to be affected by the July 2024 Northern Treatment Area injections.

COD within the Southern Treatment Area (at monitoring wells RU-10, RU-19, RU-21, and RU-27A) increased between three and six months following the remedy implementation. Concentrations of COD decreased in August 2024 in all wells except RU-10; however, concentrations remain at or above the optimal level (47.5 mg/L at RU-27A and between 272 and 1,970 mg/L in the remaining wells) indicating the continued presence of electron donor. The

specific conductance likewise increased following the remedy implementation and remains elevated with respect to the baseline values, except at RU-27A which decreased by nearly half between May 2024 (0.806 mS/cm) and August 2024 (0.433 mS/cm). The concentration of VFAs increased through August 2024 at RU-10 and RU-19. Acetic acid and propionic acid were quantified at RU-21 and RU-27A in August 2024; however, concentrations are decreasing indicating that additional substrate might be required to sustain the anaerobic treatment zone.

As discussed in the Remedy Implementation and Performance Monitoring Report (CEC NY, 2024), Southern Treatment Area well RU-20 is screened between 30 and 40 feet below ground surface (bgs) and has minimal overlap with the targeted treatment intervals (between 10 and 32 feet bgs). COD at RU-20 ranged between 16.7 mg/L and 56.3 mg/L, suggesting that the electron donor was distributed at depth. The specific conductance remained relatively stable between the baseline and nine-month performance monitoring events, and more than doubled between the nine- and twelve-month events (from 0.875 mS/cm to 1.820 mS/cm). Acetic acid was quantified once (1.5 mg/L in February 2024) and estimated once (0.66 J mg/L in August 2024). No other VFAs have been estimated or quantified at RU-20.

COD was not quantified in the wells within the Northern Treatment Area (RU-9 and RU-28) between the baseline and nine-month monitoring events, with the exception of low level quantifications during the six-month event (6.5 mg/L at RU-9 and 6.2 mg/L at RU-28). Following the remedy implementation in the Northern Treatment Area, COD increased by three orders of magnitude and was quantified at 5,590 mg/L in August 2024 in RU-28. In August 2024, COD was not quantified above the RL of 5 mg/L at RU-9, which is located on the western edge of the Northern Treatment Area, and indicating limited impact from electron donor injections. The specific conductance at RU-9 increased during the three-month performance monitoring event but was within the baseline range during subsequent monitoring events. The specific conductance at RU-28 was stable between May 2023 and May 2024 and increased following the remedy implementation in the Northern Treatment Area (from 0.172 mS/cm to 0.591 mS/cm). VFAs have not been estimated or quantified at RU-9, with the exception of the February 2024 monitoring event when propionic acid was estimated at 1.5 J mg/L confirming limited impact from electron donor injections. VFAs were not estimated or quantified in RU-28

prior to the remedy implementation in the Northern Treatment Area. Following the remedy implementation, propionic acid was quantified at 3.14 mg/L.

3.1.3 Downgradient Wells

Electron donor trend graphs for monitoring wells RU-11, RU-16, UA-2, and UA-3 are presented in Charts 19 through 26, respectively.

COD increased in each of the downgradient wells except RU-11, and was quantified above 50 mg/L at RU-16 (181 mg/L) and UA-3 (99.2 mg/L) in August 2024. The specific conductance at the downgradient wells has remained within the background range, between 0.090 ms/cm and 0.525 mS/cm. With the exception of UA-2, VFAs have only been estimated or quantified in trace amounts (less than 2.7 mg/L). At UA-2, acetic acid and propionic acid were quantified during the three-month performance monitoring event at 82 mg/L and 5.7 mg/L, respectively, but have not been quantified or estimated in subsequent monitoring events.

3.1.4 Sentinel Wells

Electron donor trend graphs for COD and specific conductance at sentinel wells CW-13, CW-13A, and WW-18M are presented in Charts 27 through 29, respectively. The sentinel wells are not sampled for VFAs.

The concentration of COD has been stable or decreasing in the sentinel wells. The specific conductance was relatively stable in each of the sentinel wells between May 2023 and May 2024 but increased in August 2024.

3.1.5 Electron Donor Summary

Injection implementation activities in June 2023 distributed electron donor throughout the Southern Treatment Area, as indicated by concentrations of electron donors which are present within the treatment area at concentrations that can sustain reductive dechlorination, and by the

increasing concentrations of COD at downgradient wells RU-16, UA-2, and UA-3. However, concentrations of electron donor indicators are decreasing at RU-21 and RU-27A. VFAs were not quantified at deeper performance monitoring well RU-20 in August 2024, which is located within the treatment area but is screened between 30 and 40 feet bgs and has minimal overlap with the targeted injection interval; however, the increased specific conductance and COD suggest that electron donors are present.

Injection implementation activities in July and August 2024 distributed electron donor throughout the center of the Northern Treatment Areas, as indicated by the increasing concentrations of electron donors at RU-28. The concentration of electron donors has not increased approximately one month following the remedy implementation at RU-9, which is located on the western edge of the Northern Treatment Area. Sentinel wells CW-13, CW-13A, and WW-18M do not appear to have been influenced by the remedy implementation events.

3.2 REDOX INDICATORS

To determine whether redox conditions at a particular location are suitable to support reductive dechlorination, DO, ORP, sulfate, methane, and ferrous iron data were evaluated to determine the redox state at each well. Over time, DO within treatment areas is expected to decrease to zero, while ORP is expected to reach -100 to -300 mV. Reductive dechlorination of TCE to cis-1,2-DCE and complete dechlorination to ethane and ethane typically occurs under sulfate-reducing (sulfate concentrations less than 10 mg/L) to methanogenic (methane concentrations greater than 1 mg/L) conditions. Ferric iron is an alternate electron acceptor for microbial respiration in the absence of oxygen and nitrate, and reduction of ferric iron produces ferrous iron. Elevated levels of ferrous iron (greater than 1 mg/L) can indicate that the groundwater environment is sufficiently reducing to sustain iron reduction and for anaerobic dechlorination to occur.

3.2.1 Upgradient Wells

Redox trends in upgradient monitoring wells RU-8 and RU-15 are presented in Charts 30 through 33 respectively.

Dissolved oxygen is typically measured below 1 mg/L in the upgradient wells. ORP has been measured between 57 mV and 172 mV. Methane has been quantified between an estimated 0.0051 J mg/L and 0.061 mg/L. Ferrous iron concentrations have remained stable, between not detected and 0.07 mg/L at RU-8 and between 1.10 mg/L and 1.16 mg/L at RU-15. Sulfate concentrations have ranged from 19.6 mg/L at RU-15 to 40.5 mg/L at RU-8.

3.2.2 Treatment Area Wells

The redox parameter trends for monitoring wells RU-9, RU-10, RU-19, RU-20, RU-21, RU-27A, and RU-28 are presented in Charts 34 through 47, respectively. Again, wells RU-10, RU-19, RU-20, RU-21, and RU-27A are located in the Southern Treatment Area and have the potential to be affected by the June 2023 Southern Treatment Area injections. Wells RU-9 and RU-28 are located in the Northern Treatment Area and have the potential to be affected by the July 2024 Northern Treatment Area injections.

With the exception of RU-10, DO has typically measured below 0.5 mg/L within the Southern Treatment Area. During sampling events, electron donor typically presented at the top of the water column, and oxygen typically enters the discharge line when the well is purged dry. The ORP initially decreased in each of the treatment area wells; however, the ORP at RU-10 and RU-21 was slightly above the ideal range in August 2024 (-92 mV and -85 mV, respectively), while the ORP at RU-19 and RU-27A increased between the three- and twelve-month performance monitoring events (-12 mV and 90 mV, respectively, in August 2024). The concentration of methane increased at RU-19 and RU-21, and was quantified at 6.1 mg/L in both wells in August 2024. Methane was quantified at 16 mg/L at RU-21 in May 2024; however, the concentration decreased to 8.4 mg/L in August 2024, suggesting slightly less methanogenic conditions.

Ferrous iron, used to evaluate iron reducing conditions, decreased in each of the treatment area wells by an order of magnitude, with the exception of RU-27A which increased from not detected to 1.62 mg/L in August 2024.

Dissolved oxygen has been less than 0.5 mg/L at deep well RU-20 between the six- and twelve-month performance monitoring events, and ORP values have ranged between -200 and -300 mV, indicative of a reducing, anaerobic environment. Methane initially increased to 6.2 mg/L following the June 2023 remedy implementation and stabilized between 4.1 mg/L and 4.8 mg/L during subsequent monitoring events. Ferrous iron decreased by approximately half, from 0.77 mg/L to 0.38 mg/L.

In the Northern Treatment Area, DO and ORP were relatively stable to slightly increasing through the nine-month performance monitoring event. Following the Northern Treatment Area injections, DO and ORP both saw significant decreases at RU-28 (0.0 mg/L and -59 mV, respectively), while concentrations at RU-9 remained stable. Methane was not detected at RU-9 above the RL (0.0052 mg/L) during any monitoring event. In August 2024, methane was estimated at RU-28 at 0.0032 J mg/L. There was a slight increase in ferrous iron at RU-28 between the baseline (0.07 mg/L) and twelve-month (0.23 mg/L) performance monitoring events.

Sulfate concentrations increased at several of the treatment area wells following the Southern Treatment Area injections. At RU-9, which was upgradient to the Southern Treatment Area, sulfate increased from 14.6 mg/L to 183 mg/L between the baseline and three-month performance monitoring events. Sulfate decreased to within background concentrations in May 2024; however, sulfate increased following the remedy implementation in the Northern Treatment Area (68.9 mg/L in August 2024). Sulfate increased to 201 mg/L at RU-10 in August 2024. At RU-19 and RU-21, sulfate increased through February 2024 (to 370 mg/L and 248 mg/L, respectively), and although concentrations decreased in subsequent monitoring events, remains elevated with respect to baseline concentrations. At RU-20, the concentration of sulfate began to increase in February 2024 and continued through August 2024 (264 mg/L). The sulfate concentrations at RU-27A and RU-28 have remained stable.

3.2.3 Downgradient Wells

Redox parameter trends in downgradient wells RU-11, RU-16, UA-2, and UA-3 are presented in Charts 48 through 55, respectively.

Dissolved oxygen and ORP have remained relatively stable in the downgradient wells, with the exception of DO at RU-11 (decreased to 0.0 mg/L in August 2024), DO at UA-2 (increased to 7.50 mg/L in August 2024), and ORP at UA-2 (decreased from 55 mV to -110 mV between May 2023 and August 2024). Methane concentrations have remained below 1 mg/L in the downgradient wells. Ferrous iron increased at each well except UA-3. Sulfate has remained stable at RU-11. At RU-16, sulfate increased to 63.2 mg/L in February 2024 and returned to the baseline range in August 2024. Sulfate increased in UA-2 in February and May 2024, but remained near background concentrations (49.1 mg/L in May 2024). In August 2024, the sulfate concentration in UA-2 had returned to the baseline range. Concentrations are increasing at UA-3 but remain low with respect to the background wells (quantified at 15. 1 mg/L in August 2024).

3.2.4 Sentinel Wells

Redox parameter trends for DO and ORP in sentinel wells CW-13, CW-13A, and WW-18M are presented in Charts 56 through 58, respectively. Field readings for ferrous iron are included in Appendix G. The sentinel wells are not routinely analyzed for methane or sulfate.

At CW-13, dissolved oxygen ranged between 6.73 mg/L and 9.81 mg/L, with the exception of February 2024 when dissolved oxygen was measured at 0.0 mg/L. ORP has remained stable, ranging between -79.9 to -111 mV. At CW-13A, DO was quantified between 0.12 and 1.03 mg/L between May 2023 and February 2024, and increased to 7.00 mg/L in August 2024. The ORP has remained stable, ranging between 7.7 and 16.4 mV. Dissolved oxygen and ORP have decreased slightly at WW-18M, with DO ranging from 5.41 mg/L in May 2023 to 3.00 mg/L in August 2024, and ORP ranging from 271 mV to 71 mV in the same period.

3.2.5 Redox Summary

Redox conditions were established within the Southern Treatment Area that are conductive to reductive dechlorination; however, as of August 2024 the ORP was slightly below the optimal range at RU-10 and RU-21 and significantly above the optimal range at RU-19 and RU-27A. Within the Northern Treatment Area, RU-9 appears to be unimpacted by the remedy implementation. Dissolved oxygen and ORP are decreasing at RU-28, although the ORP remains above the optimal range (-59 mV in August 2024). With the exception of UA-2, conditions at the downgradient wells are not significantly reducing. Conditions at sentinel wells do not appear to be influenced by the remedy implementation.

Sulfate concentrations in upgradient wells RU-8, RU-15, and RU-28 have remained stable since May 2023. At RU-9, sulfate concentrations increased following both the remedy implementation in the Southern Treatment Area (when the well was upgradient of treatment) and in the Northern Treatment Area. Elevated sulfate concentrations can be a competing alternate electron acceptor for microbial respiration and potentially inhibit anaerobic dechlorination. In conjunction with low COD, elevated sulfate can indicate that additional donor may be required. Sulfate concentrations in the center of OU3 (at RU-10, RU-19, RU-20, and RU-21) continue to increase or remain elevated with respect to the baseline concentrations. Although sulfate concentrations increased at downgradient wells RU-16 and UA-2 following the remedy implementation in the Southern Treatment Area, concentrations were similar to those in the upgradient wells in August 2024.

3.3 DISSOLVED METALS

The OU3 100% RD indicated a potential for increases in arsenic, iron, and manganese due to redox conditions. Trends in dissolved metals are presented in Charts 59 through 74.

Dissolved metals concentrations remained stable at upgradient well RU-8. Dissolved iron and dissolved manganese increased slightly at RU-15 during the six-month performance monitoring

event and returned to baseline concentrations during the nine- and twelve-month performance monitoring events.

Within the treatment area, the concentration of dissolved metals has remained relatively stable at RU-9, RU-10, RU-20, and RU-21. At RU-19, dissolved metals increased between the three- to nine-month performance monitoring events. Concentrations remained stable between the nine- and twelve-month performance monitoring events. At RU-27A, dissolved iron and dissolved manganese increased by two to three orders of magnitude through May 2024; however, concentrations appear to be decreasing in August 2024. Dissolved metals were not quantified or estimated at RU-28 prior to the remedy implementation in the Northern Treatment Area. In August 2024, the concentration of dissolved manganese increased by two orders of magnitude.

The concentration of dissolved metals at the downgradient and sentinel wells have not shown significant (i.e. order of magnitude) increases between the baseline and twelve-month performance monitoring events, with the exception of RU-16, UA-2, and UA-3. Specifically, sentinel wells CW-13 and CW-13A did not demonstrate increases in dissolved metals greater than one order of magnitude from baseline concentrations, suggesting adverse effects were not occurring. At RU-16, dissolved iron and dissolved manganese increased by two orders of magnitude in August 2024, and were quantified at 8.55 mg/L and 19.8 mg/L, respectively. At UA-2, the concentrations of dissolved iron and dissolved manganese increased by an order of magnitude in May 2024 and remained elevated with respect to the baseline in August 2024. Dissolved iron also increased by an order of magnitude at UA-3.

Dissolved metals will be evaluated prior to initiating additional electron donor injection events.

3.4 BIOLOGICAL PARAMETERS

Dehalococcoides (DHC) activity is optimal in the pH range between 6 and 8, so pH trends are evaluated to ensure proper conditions for DHC activity are present within the treatment areas. As discussed in the RI-PMR, the KB-1 Plus culture is acclimated to a pH as low as 5.8. Alkalinity, an indicator of biological activity, is expected to increase over time. The population

of DHC in treatment area wells was measured in May 2024 to assess the effect of the August 2023 bioaugmentation event, and is included in Appendix G. As discussed in the 100% RD, degradation of DCE and VC typically occurs with DHC concentrations greater than 10^4 cells per milliliter (cells/mL). Three functional genes, tceA, vrcA, and bvcA, which have differing reductive capabilities, are also monitored.

3.4.1 Upgradient Wells

Biological indicator trends in upgradient monitoring wells RU-8 and RU-15 are presented in Charts 75 and 76, respectively.

The pH of upgradient wells RU-8 and RU-15 is typically between 5.9 and 6.1 S.U. Alkalinity at RU-8 remained stable through the six-month performance monitoring event (240 mg/L) and increased slightly in August 2024 (340 mg/L). At RU-15, alkalinity increased during the nine-month performance monitoring event (from a baseline concentration of 60 mg/L to 100 mg/L) and remained slightly above the baseline during the twelve-month performance monitoring event (80 mg/L).

3.4.2 Treatment Area Wells

Biological indicator trends in upgradient monitoring wells RU-9, RU-10, RU-19, RU-20, RU-21,RU-27A, and RU-28 are presented in Charts 77 through 83, respectively. As previously discussed, wells RU-10, RU-19, RU-20, RU-21, and RU-27A are located in the Southern Treatment Area and have the potential to be affected by the June 2023 Southern Treatment Area injections. Wells RU-9 and RU-28 are located in the Northern Treatment Area and have the potential to be affected by the July 2024 Northern Treatment Area injections.

Within the Southern Treatment Area, the pH has remained above 5.80 S.U. since the June 2023 injections, while alkalinity is generally increasing. The pH at RU-10 has increased from 5.28 S.U. in May 2023 to 6.60 S.U. in August 2024. The alkalinity in this well has also shown a slight increase in the same period, from 200 mg/L to 280 mg/L. At RU-19, the pH has been

variable with an overall decreasing trend, although the August 2024 measurement (6.09 S.U.) remains within the acceptable range for DHC. The alkalinity at RU-19 has nearly doubled since the baseline monitoring (300 mg/L) and was quantified at 580 mg/L in August 2024. The pH at RU-21 showed the greatest variability between May 2023 (5.67 S.U.) November 2023 (7.41 S.U.) and has since ranged between 6.34 S.U. and 6.73 S.U. The alkalinity at RU-21 has been variable with an overall increase between May 2023 (244 mg/L) and August 2024 (752 mg/L). The pH at RU-27A ranged between 5.95 S.U. and 6.90 S.U., while the alkalinity showed an initial increase following the June 2023 injections and has since stabilized between 360 mg/L and 423 mg/L.

The pH at deep well RU-20 increased following the June 2023 injections (to 8.62 S.U. in November 2023) but has otherwise ranged between 6.82 S.U. and 7.30 S.U. With the exception of one reading in February 2024 (501 mg/L), alkalinity at RU-20 has ranged between 225 mg/L and 248 mg/L.

Within the Northern Treatment Area, pH and alkalinity have been relatively stable. The pH at RU-9 showed the greatest variability between May 2024 (7.67 S.U.) and August 2024 (5.89 S.U.). The pH at RU-28 decreased in apparent response to the July and August 2024 remedy implementation and was quantified at 5.02 S.U. in August 2024.

Monitoring wells within the treatment area were resampled for DHC analysis in May 2024, with the exception of RU-10 as discussed in Section 2.1. DHC were not quantified within the Northern Treatment Area, which was upgradient of the remedy implementation at the time of sampling. The DHC population in the vicinity of RU-19 and RU-27A had a moderate increase of both DHC and the tceA and vcrA function genes; however, the concentrations (47 cells/mL and 35 cells/mL, respectively) remain two orders of magnitude below what is considered necessary for efficient degradation. The population of DHC at RU-21, which was the only monitoring well to have a sufficient population of DHC during the baseline monitoring (4,740 cells/mL), decreased slightly in August 2024 (3,200 cells/mL), while the concentration of the tceA functional gene remained stable. However, the concentration of the vcrA functional gene, which is capable of degrading TCE to ethene, increased by over a half order of magnitude (from

436 cells/mL to 1,600 cells/mL). In deeper well RU-20, the population of DHC remained relatively stable between May 2023 and May 2024 (2.50 cells/mL and 1.40 cells/mL, respectively), with no detections of the functional genes. The bvcA functional gene, which is primarily associated with the degradation of DCE and VCE to ethene, was not quantified in any well during the May 2023 and May 2024 monitoring events.

3.4.3 Downgradient Wells

Biological indicator trends in downgradient monitoring wells RU-11, RU-16, UA-2, and UA-3 are presented in Charts 84 through 87, respectively.

Biological parameters in downgradient monitoring wells have remained relatively stable throughout 2024. With the exception of RU-11, pH in the downgradient monitoring wells is typically between 5.8 and 6.0 S.U. At RU-11, the pH is consistently higher and was between 6.94 and 6.98 S.U. in 2024. A moderate increase in alkalinity was observed at RU-11 and RU-16 (to 260 mg/L and 140 mg/L, respectively, in August 2024).

3.4.4 Sentinel Wells

Biological indicator trends in sentinel monitoring wells CW-13, CW-1A, and WW-18M are presented in Charts 88 through 90, respectively. The pH and alkalinity have remained stable at the sentinel monitoring wells.

3.4.5 Biological Parameters Summary

The pH within the Southern Treatment Area has remained within the optimal range of between 5.8 and 8.0 S.U. while alkalinity is increasing. There was no change in alkalinity within the Northern Treatment Area approximately two weeks after completion of the July and August 2024 injections. The pH at RU-28 decreased to 5.02 S.U. in August 2024. There were no significant changes in the microbial population between May 2023 and May 2024.

The pH and alkalinity at the downgradient and sentinel wells have remained relatively stable.

3.5 VOLATILE ORGANIC COMPOUNDS

The concentration trends for PCE, TCE, cis-1,2-DCE, trans-1,2-DCE, VC, and ethene over time provide direct evidence of the reductive dechlorination and breakdown of TCE, the primary compound of concern at the Site. VOC concentrations for each well are discussed below and presented graphically on both a mass and molar basis. Discussions below on total mass and molar concentration of chlorinated compounds represents the cumulative concentration of PCE, TCE, cis-1,2-DCE, trans-1,2-DCE, VC, and ethene.

3.5.1 Upgradient Wells

Trends in mass concentration and molar fractions for VOCS in upgradient area wells RU-8 and RU-15 are presented on Charts 91 through 94.

The concentration of TCE is increasing at RU-8; however, the May 2023 baseline concentration may be an outlier. In the January 31, 2013, Groundwater Characterization for Evaluation of Natural Attenuation as a Remedial Alternate report as prepared by ENI Engineering, LLC and submitted as Appendix E to the January 31, 2013, Focused Feasibility Study, RU-8 was sampled on November 20, 2011 with a reported concentration of TCE of 0.120 mg/L, which is within the range of concentrations quantified between February and August 2024 (0.15 to 0.20 mg/L). PCE, trans-1,2 DCE, VC, and ethene were not quantified at RU-8 during the baseline monitoring. PCE and VC were estimated during both the February 2024 and August 2024 performance monitoring events, and trans-1,2 DCE was estimated in RU-8 in August 2024. Despite the apparent increase in the concentration of TCE, the molar fractions have remained stable, with over 90% of the total ethenes being TCE (Chart 92).

The concentrations of TCE, cis-1,2 DCE, trans-1,2 DCE, and VC each increased in February 2024 at RU-15, but returned to baseline levels in August 2024 (Chart 93). PCE and ethene have not been quantified at RU-15 during any performance monitoring event. The molar fractions of

TCE, cis-1,2 DCE, and VC have remained stable between May 2023 and August 2024 (Chart 94).

3.5.2 Treatment Area Wells

Trends in mass concentration and molar fractions for VOCs in treatment area wells are presented on Charts 95 through 108. Wells RU-10, RU-19, RU-20, RU-21, and RU-27A are located in the Southern Treatment Area and have the potential to be affected by the June 2023 Southern Treatment Area injections. Wells RU-9 and RU-28 are located in the Northern Treatment Area and have the potential to be affected by the July 2024 Northern Treatment Area injections.

At RU-9, which was upgradient to the treatment area until August 2024, the concentrations of TCE and cis-1,2 DCE have decreased following the three-month performance monitoring event and have remained relatively stable between February 2024 and August 2024 (Chart 95). The molar fractions (Chart 96) show that the composition of the total ethenes at RU-9 is highly variable, alternating between primarily (80-100%) TCE and nearly 50% TCE and cis-1,2 DCE, likely due to the very low concentration of cis-1,2 DCE at this well. Cis-1,2 DCE was estimated or quantified in three of the five monitoring events at concentrations ranging from 0.00027 J mg/L to 0.0015 mg/L. PCE, trans-1,2 DCE, VC, and ethene have not been quantified at RU-9 during any performance monitoring event.

The concentrations of TCE, cis- and trans-1,2 DCE, and VC have decreased at RU-10 between May 2023 and August 2024 (Chart 97). PCE was not quantified above the RL (0.002 mg/L) in May 2023 or May 2024; however, PCE was quantified at 0.012 mg/L in August 2024. Ethene has not been quantified at RU-10. As shown on Chart 98, TCE and cis-1,2 DCE were each nearly 50% of the total ethenes in May 2023 (with less than 3% of trans-1,2 DCE and VC). In 2024, the molar fraction of cis-1,2 DCE increased to between 75% and 85% while the fraction of TCE decreased to 15%.

As shown on Chart 99, between May 2023 and May 2024, the overall trend at RU-19 showed decreasing concentrations of TCE (quantified between 0.23 mg/L and 0.16 mg/L) and increasing

concentrations of cis-1,2 DCE and VC (quantified between 0.097 mg/L to 0.19 mg/L and 0.0059 mg/L to 0.0097 mg/L, respectively). In August 2024, the concentrations of TCE, cis-1,2 DCE, trans-1,2 DCE and VC more than doubled. The concentration of PCE, which was estimated in two of the four monitoring events between May 2023 and May 2024, also doubled in August 2024. Referring to Chart100, between November 2023 and August 2024, there is a slight increase in the molar fraction of TCE (26% to 38%), while cis-1,2 DCE shows a corresponding decrease (69% to 54%). The fraction of VC remains relatively stable, between 3% and 8%.

At RU-20, TCE shows an overall decreasing trend with significantly lower concentrations quantified immediately following the remedy implementation events (0.1 mg/L in November 2023 and August 2024). As shown on Chart 101, the concentration of cis-1,2 DCE has shown a steadier increasing trend, from 0.087 mg/L in May 2023 to 0.34 mg/L in August 2024. Although the concentration of trans-1,2 DCE is three orders of magnitude lower than cis-1,2 DCE, the concentration is remaining relatively stable during the same period (from not quantified above 0.005 mg/L to an estimated 0.0024 J mg/L). The molar fractions of TCE and cis-1,2 DCE also show a response to the remedy implementation events, while the overall trend shows that the fraction of TCE is decreasing (from 83% in May 2023 to 18% in August 2024) while cis-1,2 DCE increases (from 17% to 82% in the same period). PCE, VC, and ethene have not been quantified at RU-20.

The concentration of TCE has shown considerable variability at RU-21, while the concentrations of other VOCs have remained stable to slightly decreasing (Chart 103). Referring to Chart 104, the overall trend shows that the molar fractions of cis-1,2 DCE and VC are increasing while TCE decreases.

The concentration of VOCs, in particular cis-1,2 DCE and VC, increased at RU-27A following the June 2023 Southern Treatment Area injections. Concentrations returned to near baseline levels in February 2024, and continued to decrease through August 2024 (Chart 105). With the exception of the November 2023 monitoring event, the molar fractions at RU-27A have remained relatively stable (Chart 106). PCE and ethene have not been quantified at RU-27A.

The concentration of TCE was elevated at RU-28 during the November 2023 and February 2024 performance monitoring events, and returned to baseline levels in May 2024 (Chart 107). The molar fractions shown on Chart 108 are stable between May 2023 and May 2024 (approximately 85% TCE and 15% cis-1,2 DCE). RU-28 was upgradient to the remedy implementation activities conducted prior to July 2024, and the molar fractions suggest that changes in the mass concentration in November 2023 and February 2024 are unrelated to the injections in the Southern Treatment Area. Concentrations of VOCs remained stable through the August 2024, with the exception of PCE, which was quantified at 0.018 mg/L. Changes in the molar fractions of VOCs in August 2024 (Chart 108) are attributed to the presence of PCE, which had not been estimated or quantified in previous monitoring events, with the exception of November 2023 (estimated 0.00021 J mg/L).

3.5.3 Downgradient Wells

Trends in mass concentration and molar fractions for VOCS in downgradient area wells are presented on Charts 109 through 116.

As shown on Chart 109, there has been an overall decrease in TCE and cis-1,2 DCE at RU-11. TCE was estimated at 0.00028 J mg/L in May 2023, and has not been quantified above the RL (0.001 mg/L) in February or August 2024. As shown on Chart 110, there has been an overall decrease in cis-1,2 DCE as a fraction of total ethenes at RU-11 (from 87% to 73%), with a corresponding increasing in the fraction of VC (11% to 27%).

The mass concentration and molar fractions of VOCS in RU-16 are presented on Charts 111 and 112, respectively. No VOCs were quantified above the RL (0.001 mg/L) at RU-16 in February 2024. However, in August 2024 the concentrations and molar fractions had returned to baseline levels.

At UA-2, the concentrations of TCE and cis-1,2 DCE have been variable throughout 2023 and 2024, but returned to near-baseline concentrations below regulatory levels in August 2024 (Chart 113). However, as shown on Chart 114, the molar fractions of TCE and cis-1,2 DCE have

changed, with TCE decreasing from 57% to 27% of the total ethenes, while cis-1,2 DCE increased from 43% to 59% between May 2023 and August 2024. VC, which had not been quantified at UA-2 above the RL (0.001 mg/L), was estimated at 0.0006 J mg/L in August 2024, suggesting that limited reductive dechlorination is occurring at UA-2.

Concentrations of VOCs at UA-3 have remained relatively stable between May 2023 and August 2024 (Chart 115) and below regulatory levels. However, as shown on chart 116, the molar fraction of TCE is decreasing (from 55% to 27%) while the molar fraction of cis-1,2 DCE is increasing (from 45% to 73%), suggesting that limited dechlorination of TCE to cis-1,2 DCE is occurring even at concentrations below regulatory levels.

3.5.4 Sentinel Wells

Trends in mass concentration and molar fractions for VOCS in the sentinel wells are presented on Charts 117 through 122.

The concentrations of chlorinated VOCs have been relatively stable at CW-13 between the November 2023 and August 2024 (Charts 117 and 118). VOCs have not been quantified above the RL (0.001 mg/L) in any sample collected at CW-13A. There have been minor increases in concentrations of TCE and cis-1,2 DCE at WW-18M between May 2023 and August 2024 (from 0.093 mg/L to 0.012 mg/L and from not detected to 0.0005 mg/L, respectively).

3.5.5 Chlorinated Compounds Summary

The concentration of chlorinated VOCs remained stable in upgradient wells RU-8 and RU-15. Although performance monitoring wells RU-9 and RU-28 are located within the Northern Treatment Area, they were considered upgradient wells prior to the July and August 2024 injections. The twelve-month performance monitoring event was conducted in late August 2024 and prior to bioaugmentation of the Northern Treatment Area. It is therefore to be expected that there were no significant changes in VOC concentrations at these wells.

Within the Southern Treatment Area, changes in the mass concentrations and molar fractions of TCE and cis-1,2 DCE, and to a lesser extent VC, at performance monitoring wells RU-10, RU-20, and RU-21 suggest that reductive dechlorination is occurring at the center of the plume. VOC concentrations at RU-27A, where baseline concentrations were one to two orders of magnitude lower than other wells within the Southern Treatment Area, show a slight decrease between May 2023 and August 2024. Concentrations are currently increasing at RU-19.

At the downgradient wells, mass concentrations of VOCs have remained relatively stable. However, changes in the molar fractions suggest that reductive dechlorination of TCE to cis-1,2 DCE is occurring at UA-2 and UA-3 even at concentrations below regulatory levels, and dechlorination of cis-1,2 DCE to VC is occurring at RU-11. There have been no significant changes in VOCs at the sentinel wells.

4.0 CONCLUSIONS

In January 2023, implementation of the OU3 RAWP began with the initiation of the procurement process for selecting a constructor. Implementation of the OU3 RAWP consisted of baseline sampling, injection implementation and bioaugmentation in the Southern Treatment Area, and performance monitoring. The electron donor was evenly distributed throughout the Southern Treatment Area with the intent of establishing suitable redox conditions and microbial populations to support biodegradation. Implementation of the OU3 RAWP through the three-month post-injection performance monitoring was discussed in the RI-PMR (CEC NY, 2024). Site activities in 2024 consisted of the six-, nine-, and twelve-month performance monitoring events. Remedy implementation in the Northern Treatment Area, including the July and August 2024 injections, will be discussed in a separate report.

Results of the performance monitoring indicated that the remedy implementation was successful in distributing electron donors throughout OU3. Redox parameters, including DO, ORP, ferrous iron, and sulfate, indicate that reduction may not be occurring at the design rate. ORP within the treatment area was above the optimal range (-100 to -300 mV), and was quantified between 90 mV and -92 mV in August 2024. Although DO was consistently quantified below 0.5 mg/L (except at RU-10), the concentration of ferrous iron decreased throughout the Southern Treatment Area. The concentration of sulfate increased at many of the performance monitoring wells following the remedy implementation, and continues to be elevated in several of the treatment area wells. Elevated sulfate concentrations can be a competing alternate electron acceptor for microbial respiration and potentially inhibit anaerobic dechlorination. In conjunction with low COD, elevated sulfate can indicate that additional donor may be required.

The pH remained within the optimal range of 5.8 to 8.0 S.U., with the exception of RU-28, where pH appeared to decrease in response to the injections in the Northern Treatment Area. Alkalinity has increased in the treatment area wells. There were no significant changes in the microbial population during the May 2024 performance monitoring event.

Concentrations of dissolved metals were elevated by one or more orders of magnitude within the treatment area as well as at downgradient wells RU-16, UA-2, and UA-3. The concentration of dissolved metals remained stable within the sentinel monitoring wells, suggesting adverse effects were not occurring.

Trends for VOC mass concentrations show that TCE is generally decreasing and cis-1,2 DCE is generally increasing within the treatment area. Changes in the molar fractions of ethenes within the treatment area also suggest that TCE is being converted to cis-1,2 DCE. Mass concentrations in downgradient and sentinel monitoring wells are generally stable.

The January 8, 2025, Revised Remedy Optimization Work Plan (CEC NY, 2025) was submitted in part to address indications that reduction may not be occurring at the design rate at OU3, as well as the lower than expected microbial populations, and included installation of a bioaugmentation network and collection of additional geochemical parameters to evaluate potential microbial degraders (remedy optimization testing). The installation of the bioaugmentation network will be included in the upcoming Remedy Implementation Report for the Northern Treatment Area. The results of the remedy optimization testing will be provided in a future letter report. As discussed in Section 4.0 of the 100% RD (CDM Smith, 2018), additional electron donor injections are expected to occur every three to four years until site remedial action objectives are met. A revised schedule for future injections will be provided with the results of the remedy optimization testing.

Performance monitoring wells will continue to be monitored semi-annually according to the schedule outlined in the OU3 RAWP.

Notes:
Bolded values were detected at concentrations above the Method Detection Limit (MDL).
mg/l - Milligrams per liter
S.U. - Standard Units
mS/cm - MilliSiemens per centimeter
mV - Millivolts

< - Analyte not detected above Method Reporting Limit (MRL).
J - Estimated value due to etiher being a Tentatively Identified Compound (TIC) or that the concentration is between the MRL and the MDL.
D - Concentration is a result of a dilution.
NA - Not analyzed.

Notes:
Bolded values were detected at concentrations above the Method Detection Limit (MDL).
mg/l - Milligrams per liter
S.U. - Standard Units
mS/cm - MilliSiemens per centimeter
mV - Millivolts
cells/mL - Cells per milliliter

< - Analyte not detected above Method Reporting Limit (MRL).
J - Estimated value due to etiher being a Tentatively Identified Compound (TIC) or that the concentration is between the MRL and the MDL.
D - Concentration is a result of a dilution.
NA - Not analyzed.

Attachment A – Laboratory Analytical Reports
Attachment B – Field Documentation

1.0 INTRODUCTION

On September 30, 2014, the United States Environmental Protection Agency (U.S. EPA) issued a Record of Decision for Operable Unit 3 (OU3 ROD) in which it documented its selection of remedies for the known source areas at the Olean Well Field Superfund Site (Superfund Site), including a portion of the Superfund Site known as "Parcel B of the Alcas Source Area" (Parcel B).

In February 2016, a Consent Decree (CD) was filed amending and superseding the 1998 CD requiring Alcas Cutlery Corporation (now known as Cutco Corporation) and Aluminum Company of America (now known as Arconic Corporation) to perform implementation of the remedy for Parcel B that was selected in the OU3 ROD. Pursuant to Sections VI of the 2016 CD and 7.5 of the Statement of Work (SOW), a Remedial Action Work Plan (OU3 RAWP) and supporting deliverables were required to implement the required remedial action for the operable unit. Supporting deliverables for the OU3 RAWP included a Field Sampling Plan (FSP) and Quality Assurance Project Plan (QAPP). On June 8, 2022, the U.S. EPA approved the May 27, 2022, OU3 RAWP with supporting deliverables. The FSP provided a framework for field sampling activities including groundwater performance monitoring required to implement the OU3 remedy. The objective of the QAPP was to address sample analysis and data handling so that data quality is maintained and the work is accurately completed according to the requirements in the OU3 RAWP.

Between February 12 and 14, 2024, groundwater sampling activities were performed at 13 performance monitoring wells and three sentinel monitoring wells for the purpose of six-month post-remedial action performance monitoring. Groundwater samples from the performance monitoring wells were submitted for laboratory analysis for the following:

- Volatile Organic Compounds (VOCs) (Tetrachlorethylene [PCE], Trichloroethylene [TCE], cis-1,2 Dichloroethylene [cis-1,2 DCE], trans-1,2 Dichloroethylene [trans-1,2 DCE], and Vinyl Chloride [VC]) – Method 8260C;
- Dissolved Gasses (Ethane, Ethene, and Methane) – Method RSK-175;
- Volatile Fatty Acids (Acetate, Butyrate, and Propionate) – ALS Environmental SOP for Organic Acids in Aqueous Matrices by High Performance Liquid Chromatoraphy;
- Chemical Oxygen Demand (COD) – Method 410.4;

- Sulfate- Method 300.0; and
- Dissolved Metals (Arsenic, Iron, and Manganese) – Method 6010C.

Groundwater samples from the sentinel monitoring wells were submitted for laboratory analysis of VOCs, COD, and dissolved metals. The laboratory inadvertently analyzed the sentinel wells for sulfate. Analytical results were reviewed and validated for usability with respect to the OU3 QAPP.

Data validation included an evaluation of the following:

- Chain of Custody (COC) documentation;
- Holding times;
- Surrogate recoveries;
- Matrix spike/matrix spike dilutions precision and accuracy;
- Laboratory Control Sample (LCS) recoveries;
- Laboratory method blank and trip blank contamination;
- Gas chromatograph/mass spectrometer (GC/MS) instrument performance;
- Sample result verification and identification;
- Internal standard responses;
- Initial and continuing calibrations;
- Quantitation limits; and
- Data completeness.

The following sections of this report provide a narrative discussion of the checklist, including data review and validation procedures and results.

2.0 DATA REVIEW

Aqueous samples were collected from the OU3 wells on February 12 - 14, 2024. The subcontracted analytical laboratory for this project was ALS Environmental (ALS) located in Rochester, New York. Analytical results from these samples were reviewed and validated by ALS and CEC NY.

2.1 LABORATORY DATA - FIRST LEVEL REVIEW

The laboratory analyst generating the analytical data has the prime responsibility for the correctness and completeness of the data. All laboratory data was generated and reduced following protocols specified in the appropriate U.S. EPA SW846 methods or other approved method for the analysis being performed. The review conducted by the laboratory analyst constitutes the first level review. At a minimum, the primary analyst reviews the data package to confirm that:

- Analysis information is correct and complete;
- Appropriate test method was used;
- Analytical results are correct and complete (including calculations);
- Quality control (QC) samples are within established control limits;
- Blanks are within established control limits;
- All corrections on raw data and any generated forms are appropriately documented; and
- Raw data, calculations, and results are correctly transcribed.

This review is documented by the analyst and included with the data package. In the case of work performed by subcontracted laboratories, the first level review was performed by the subcontracted laboratory, ALS.

2.2 LABORATORY DATA - SECOND LEVEL REVIEW

The laboratory conducted a secondary review of the data as an independent and detailed review to confirm that the data set is acceptable for release. The secondary review process confirms that:

- COC information is correct;
- Holding times were met (exceeded holding times, if present, are documented in the case narrative);

- Sample preparation information is correct and complete;
- Analysis information is correct and complete;
- Appropriate SOPs have been followed;
- Analytical results are correct and complete (including calculations);
- QC samples are within established control limits;
- Blanks are within established control limits;
- Special sample preparation and analytical requirements have been met;
- Documentation is complete;
- Corrections on raw data and any generated forms are appropriately documented; and
- All documents have been initialed and dated in accordance with laboratory SOPs.

The secondary review was conducted by experienced laboratory personnel who perform data review as a primary function, are organizationally separate from the operating analysts and have direct access to the laboratory's quality assurance (QA) Manager. Any errors found in this review should trigger appropriate actions resulting in the correction of the data. In the case of work performed by subcontracted laboratories, the data is reviewed and approved by the primary laboratory in a manner similar to a secondary review process. ALS confirmed that the data set is acceptable for release.

2.3 LABORATORY DATA - THIRD LEVEL REVIEW

The third level of review for laboratory data is accomplished by the Laboratory Project Manager during preparation of the final laboratory report. A Case Narrative was prepared for each Sample Delivery Group (SDG) (or equivalent) as documentation of the review. This narrative includes comments as appropriate for the proper interpretation of the data as reported. The signature of the laboratory Project Manager, laboratory director, or designated senior QA staff on each SDG report constitutes acceptance and release of the report from the third level review.

The sampling event included one Sample Delivery Group: R2401280.

2.3.1 Third Level Review for SDG R2401280

According to the Case Narrative SDG R2401280, all analyses were performed consistent with the quality assurance program of ALS. The Case Narrative included the following details:

- Sample Receipt: Twenty-four (24) water samples were received for analysis at ALS Environmental on 2/15/2024. Any discrepancies upon initial sample inspection are annotated on the sample receipt and preservation form included within this report. The samples were stored at a minimum in accordance with the analytical method requirements.
- Trip blank sample OLN-TB004-T007 was not received by the lab so the analysis was cancelled.
- Volatiles by GC/MS: Method 8260C: No significant anomalies were noted with the analysis.
- Semivolatiles by GC: No significant anomalies were noted with the analysis.
- Dissolved Metals: Method 6010C: No significant anomalies were noted with the analysis.
- General Chemistry: Method 300.0 and Method 410.4: No significant anomalies were noted with the analysis.

The signature of ALS staff on the SDG report constitutes acceptance and release of the report from the third level review. A copy of the laboratory report is presented in Attachment A.

2.4 COMPLIANCE REVIEW

A basic Compliance Review was conducted by CEC NY to confirm completeness and deliverable compliance with method and contractual requirements for each SDG submitted by the laboratory. This review was conducted primarily to confirm contractual compliance by the laboratory and includes the following:

- Comparison of the laboratory work request and chain-of-custody information with the submitted results;
- Verification of holding times for each sample and analytical fraction; and
- Verification of the report delivery within the contractual window.

The data package deliverable format for chemical analytical data includes:

- Title page and table of contents
- Sample control data
  - Chain-of-custody documents
  - Shipping Form
- Case narrative - nonconformance summary report
- Analysis data sheet (for each sample in SDG):
  - Information similar to CLP Form I
  - Method detection/reporting limit
  - Quality control summary
  - Reagent blank summary

    - Duplicate summary including relative percent difference (when specified)
    - MS/MSD summary including percent recovery (when specified)
    - Calibration summary
- Raw QC and standards data
    - Initial calibration data
    - Continuing calibration data (where specified by method)
    - Reagent blank data
    - Matrix spike data
    - Duplicate data
    - Raw sample data

The samples included in the SDG were prepared and analyzed for volatiles by GC/MS using Method SW-846 8260C, dissolved gases using Method RSK-175, volatile fatty acids by ALS internal SOP for organic acids by High Performance Liquid Chromatography (HPLC), dissolved metals using Method SW-846 6010C, sulfate using Method 300.0, and chemical oxygen demand using Method 410.4. The laboratory data were reviewed and qualified with the following flags:

- U – Indicates the compound was analyzed for but not detected;
- J – Analyte detected at levels less than the Method Reporting Limit (MRL) and greater than or equal to the Method Detection Limit (MDL). Concentration within this range indicates an estimated value;
- E – (Organics) Indicates has exceeded the calibration range for the specific analysis; and
- D - Concentration is the result of a dilution, typically a secondary analysis of the sample due to exceeding the calibration range or that a surrogate has been diluted out of the sample and cannot be assessed.

2.4.1 Compliance Review for SDG R2401280

Samples included in SDG R2401280 were collected, properly preserved, shipped under a completed, COC record, and received at ALS within three days of sampling. All holding times were met. All samples were received intact at ALS and within the required temperature range.

The data package received from ALS was paginated and of good quality. The serial dilution sample summary and post digestion spike summary for the dissolved metals analysis were inadvertently omitted from the data package. The completed data package was reissued on June 11, 2024. The analytical data were 100 percent complete and usable.

2.5 FIELD DATA REVIEW

The tables and logs compiled by the field personnel and used as the basis for data interpretation were checked against the original field documentation prior to inclusion in the report. CEC NY was responsible for performing this review activity. A copy of the field documentation for these samples is presented in Attachment B.

3.0 DATA VALIDATION

Data validation is the process of reviewing data and accepting, qualifying, or rejecting it on the basis of criteria using established U.S. EPA guidelines. The data validation uses a narrative version of a data validation checklist adapted from historic CLP data validation practices in conjunction with data summary tables generated from the project database. Validation of analytical data was conducted by CEC NY.

A Stage 2B validation was performed on the subject laboratory report(s), in accordance with the January 2009 *Guidance for Labeling Externally Validated Laboratory Analytical Data for Superfund Use* as prepared by U.S. EPA. Analytical data were evaluated in general accordance with the January 2022 *Final Quality Assurance Project Plan, Operable Units 2 and 3 at the Alcas Source Area, Olean Well Field Superfund Site, Olean, New York* as prepared by Civil & Environmental Consultants of New York, Inc., the November 2020 *National Functional Guidelines for Organic Superfund Methods Data Review* as prepared by U.S. EPA, and the November 2020 *National Functional Guidelines for Inorganic Superfund Methods Data Review* as prepared by U.S. EPA.

The following laboratory deliverables were evaluated during the review process:

- Chain-of-custody (COC) documentation to assess holding times and verify report completeness;
- Laboratory quality control (QC) sample results, including method blanks, surrogate spikes, internal standards, laboratory control sample/laboratory control sample duplicates (LCS/LCSDs), matrix spike/matrix spike duplicates (MS/MSDs), and laboratory duplicates;
- Instrument calibration and performance checks; and
- Field QC samples to assess trip blank cleanliness and field duplicate precision.

3.1 DATA VALIDATION FINDINGS FOR SDG R2401280

3.1.1 Custody, Preservation, and Completeness

Acceptable: Sample custody was maintained from sample collection to receipt at the laboratory. The samples were received intact and were properly preserved. The reports are complete and contain results for the samples and tests requested on the COC forms, except OLN-TB004-T007 which was inadvertently added to the COC by the field team and was not received by the laboratory.

3.1.2 Volatile Organic Analyses

The field samples and QC samples were analyzed for the OU3-specific VOCs by Method 8260C at the ALS - Rochester, New York laboratory.

3.1.2.1 Holding Times

Acceptable: The samples were analyzed within the QAPP holding time of 14 days.

3.1.2.2 Instrument Tuning and Mass Calibration

Acceptable: The tuning compound bromofluorobenzene was analyzed at the required frequency by the laboratory. The relative abundance values are within the laboratory limits.

3.1.2.3 Initial Calibration

Acceptable: Initial calibrations were analyzed at the required frequency by the laboratory. The QAPP criterion of relative standard deviation (RSD) values less than or equal to 15 percent was met in all initial calibrations. The relative response factors are greater than the QAPP criterion of the method.

3.1.2.4 Calibration Verification

Acceptable: Calibration verification standards were analyzed at the required frequency by the laboratory. The QAPP criterion of percent difference values less than or equal to 20 percent and

relative response factors greater than the minimum response factors per Table 4 of EPA Method 8260C was met in each verification.

3.1.2.5 Blank Analyses

Method Blanks

Acceptable: Method blanks were analyzed by the laboratory at the required frequency as described in the QAPP. Target VOCs were not quantified above the MDL.

Trip Blanks

Acceptable: The QAPP requires trip blanks to be collected each day a field sample is collected. Three trip blanks associated with the sampling event are included in SDG R2401280. Target VOCs were not quantified above the RL in the trip blanks.

3.1.2.6 Surrogate Analyses

Acceptable: Surrogate compounds were added to the samples, blanks, and QC samples as required. The recovery values were within the laboratory control limits.

3.1.2.7 Laboratory Control Sample Analyses

Acceptable: ALS analyzed LCSs at the required frequency. The recovery and relative percent difference (RPD) values were within the laboratory control limits.

3.1.2.8 Matrix Spike/Matrix Spike Duplicate Analyses

Acceptable with Discussion: MS/MSDs were reported as required. The recovery and RPD values were within the laboratory control limits. MS/MSD data are presented in the laboratory analytical report for information purposes. The laboratory evaluates system performance based on the LCS control limits.

3.1.2.9 Internal Standard Evaluation

Acceptable: Internal standards were added to the samples, blanks, and QC samples as required. The recovery and retention time criteria were met.

3.1.2.10 Laboratory Reporting Limits

Acceptable with Discussion: Laboratory Method Reporting Limits (MRLs) listed in the QAPP were met except in cases where dilution was required. The QAPP notes that MRLs are not adjusted for dilution.

3.1.2.11 Overall Assessment of Data Usability

The usability of the data is based on the QAPP and U.S. EPA guidance documents noted previously. Upon consideration of the information presented here, the data are acceptable for their intended use.

3.1.3 Volatile Fatty Acids Analyses

The field samples and QC samples were analyzed for volatile fatty acids (acetate, propionate, and butyrate) using HPLC at the ALS - Rochester, New York laboratory.

3.1.3.1 Holding Times

Acceptable: The samples were analyzed within the QAPP holding time of 28 days.

3.1.3.2 Initial Calibration Verification

Acceptable: Initial calibration verification standards were analyzed at the required frequency by the laboratory. The QAPP criterion of no more than ±30 percent difference from true values were met in all cases.

3.1.3.3 Calibration Verification

Acceptable: Calibration verification standards were analyzed at the required frequency by the laboratory. The QAPP criterion of no more than ±20 percent difference from true values were met in all cases.

3.1.3.4 Blank Analyses

Acceptable: Method blanks were analyzed by the laboratory at the required frequency as described in the QAPP. Target volatile fatty acids were not quantified above the MDL in any method blank.

3.1.3.5 Laboratory Control Sample Analyses

Acceptable: ALS analyzed LCSs at the required frequency. The recovery and relative percent difference (RPD) values were within the laboratory control limits for all LCSs.

3.1.3.6 Matrix Spike/Matrix Spike Duplicate Analyses

Acceptable: MS/MSDs were reported as required. The recovery and RPD values were within the laboratory control limits. MS/MSD data are presented in the report for information purposes. The laboratory evaluates system performance based on the LCS control limits.

3.1.3.7 Laboratory Reporting Limits

Acceptable with Discussion: Laboratory Method Reporting Limits (MRLs) listed in the QAPP were met except in cases where dilution was required. The QAPP notes that MRLs are not adjusted for dilution

3.1.3.8 Overall Assessment of Data Usability

The usability of the data is based on the QAPP and U.S. EPA guidance documents noted previously. Upon consideration of the information presented here, the data are acceptable for their intended use.

3.1.4 Dissolved Gases Analyses

The field samples and QC samples were analyzed for dissolved gases (ethane, ethene, and methane) using Method RSK-175 at the ALS - Rochester, New York laboratory.

3.1.4.1 Holding Times

Acceptable: The samples were analyzed within the QAPP holding time of 14 days.

3.1.4.2 Initial Calibration Verification

Acceptable: Initial calibration verification (ICV) standards were analyzed at the required frequency by the laboratory. The QAPP criterion of 85 to 115 percent recovery were met for each ICV.

3.1.4.3 Continuing Calibration Verification

Acceptable: Continuing calibration verification (CCV) standards were analyzed at the required frequency by the laboratory. The QAPP criterion of 15 percent difference were met for all CCVs.

3.1.4.4 Blank Analyses

Acceptable: Method blanks were analyzed by the laboratory at the required frequency as described in the QAPP. Target dissolved gases were not quantified above the MDL in any method blanks.

3.1.4.5 Matrix Spike/Matrix Spike Duplicate Analyses

Acceptable: MS/MSDs were reported as required. The precent recovery and RPD values were within the laboratory control limits in all instances. Matrix Spike and Matrix Spike Duplicate Data are presented in the report for information purposes. The laboratory evaluates system performance based on the LCS control limits.

3.1.4.6 Laboratory Reporting Limits

Acceptable with Discussion: Laboratory Method Reporting Limits (MRLs) listed in the QAPP were met except in cases where dilution was required. The QAPP notes that MRLs are not adjusted for dilution

3.1.4.7 Overall Assessment of Data Usability

The usability of the data is based on the QAPP and U.S. EPA guidance documents noted previously. Upon consideration of the information presented here, the data are acceptable for their intended use.

3.1.5 Metals Analyses

The field samples and QC samples were analyzed for dissolved metals (arsenic, iron, and manganese) by Method 6010C at the ALS - Rochester, New York Laboratory.

3.1.5.1 Holding Times

Acceptable: The samples were analyzed within the QAPP holding time of 180 days from sample collection for metals.

3.1.5.2 Initial Calibration

Acceptable: Initial calibration and detection limit standards were analyzed daily prior to analysis. The QAPP linearity criterion of correlation coefficient greater than or equal to 0.998 was met for all initial calibrations.

3.1.5.3 Calibration Verifications

Acceptable: Initial calibration verification (ICV) standards and continuing calibration verification (CCV) standards were analyzed at the required frequency. The QAPP criterion of 90 to 110 percent recovery was met in all cases.

3.1.5.4 Blank Analyses

Calibration Blanks

Acceptable: Initial and continuing calibration blanks were analyzed at the required frequency. Target metals were not detected above the MDLs in the calibration blanks.

Method Blanks

Acceptable: Method blanks were analyzed at the required frequency of one per digestion batch. Target metals were not detected above the MDLs in the method blanks.

3.1.5.5 ICP Interference Check

Acceptable: ICP interference check samples were analyzed at the required frequency. The recovery values of spiked metals were within the QAPP criterion of 80 to 120 percent. The non-spiked metals had absolute values less than the MDL.

3.1.5.6 Laboratory Control Sample Analyses

Acceptable: LCSs were analyzed at the required frequency of one per digestion batch. The recovery values were within the laboratory control limits of 80 to 120 percent. The RPD values were within the laboratory control limits of less than 20 percent.

3.1.5.7 Matrix Spike/Matrix Spike Duplicate Analyses

Acceptable: MS/MSDs were reported as required. The recovery values were within the QAPP criterion of 75 to 125 percent and the RPD values were within the laboratory control limits.

3.1.5.8 ICP Serial Dilution Analysis

Acceptable: Serial dilutions were performed at a frequency of one per batch. The criterion of percent difference values less than 10 percent for results greater than 50 times the MDL was met for all analyses.

3.1.5.9 Laboratory Reporting Limits

Acceptable with Discussion: Laboratory Method Reporting Limits (MRLs) listed in the QAPP were met except in cases where dilution was required. The QAPP notes that MRLs are not adjusted for dilution

3.1.5.10 Overall Assessment of Data Usability

The usability of the data is based on the QAPP and U.S. EPA guidance documents noted previously. Upon consideration of the information presented here, the data are acceptable for their intended use.

3.1.6 General Chemistry Analyses

The field samples and QC samples were analyzed for sulfate using Method 300.0 and COD using Method 410.4 at the ALS - Rochester, New York laboratory.

3.1.6.1 Holding Times

Acceptable: The samples were analyzed within the QAPP holding time of 28 days.

3.1.6.2 Initial Calibration

Acceptable: Initial calibrations were analyzed at the required frequency by the laboratory.

3.1.6.3 Calibration Verification

Acceptable: Calibration verification standards were analyzed at the required frequency by the laboratory. The laboratory criterion of 90 to 110 percent recovery was met in all cases.

3.1.6.4 Blank Analyses

Method Blanks

Acceptable: Method blanks were analyzed by the laboratory at the required frequency as described in the QAPP. Target compounds were not quantified above the MRL in any method blanks.

Continuing Calibration Blank

Acceptable: Continuing Calibration Blanks (CCBs) were analyzed by the laboratory at the required frequency as described in the QAPP. Target compounds were not quantified above the MRL in any CCB.

3.1.6.5 Laboratory Control Sample Analyses

Acceptable: ALS analyzed LCSs at the required frequency. The recovery and RPD values were within the laboratory control limits for all LCSs.

3.1.6.6 Matrix Spike/Matrix Spike Duplicate Analyses

Acceptable with Discussion: MS/MSDs were reported as required. The recovery and RPD values were within the laboratory control limits, except as discussed below. MS/MSD data is presented in the laboratory analytical report for information purposes. The laboratory evaluates system performance based on the LCS control limits.

- Chemical oxygen demand: MS/MSD values were below the laboratory control limits of 90 to 110 percent recovery for the samples associated with OLN-RU-009-F007 and OLN-RU020-F007.
- Sulfate: MS/MSD values were below the laboratory control limits of 90 to 110 percent recovery for the sample associated with OLN-FD002-D007

3.1.6.7 Laboratory Reporting Limits

Acceptable with Discussion: Laboratory Method Reporting Limits (MRLs) listed in the QAPP were met except in cases where dilution was required. The QAPP notes that MRLs are not adjusted for dilution

3.1.6.8 Overall Assessment of Data Usability

The usability of the data is based on the QAPP and U.S. EPA guidance documents noted previously. Upon consideration of the information presented here, the data are acceptable for their intended use.

4.0 DATA USABILITY

The following data quality indicators were evaluated to determine the usability of the analytical results: precision, accuracy, representativeness, completeness, and comparability. These data quality indicators are applicable to both field and laboratory procedures. Each of the data quality indicators are discussed briefly in the following subsections.

4.1 PRECISION

Precision is a measure of the reproducibility of analyses under a given set of conditions (i.e., the degree to which two or more measurements are in agreement). Precision evaluates how far different individual reported values are from the average or mean. Precision is thus a measure of the magnitude of random error and is expressed as the relative percent difference (RPD). The lower the RPD value, the more precise (i.e., reproducible) the data.

Precision is evaluated using the RPD, which is determined according to the following equation:

$$RPD = \frac{|Value\ 1 - Value\ 2|}{Arithmetic\ Mean\ of\ Value\ 1\ and\ 2}\ x\ 100$$

This equation above is appropriate when the analytical results are greater than 5 times the reporting limit (RL). Acceptable precision for field duplicates in groundwater is typically RPD < 25-percent. For results that are near the limit of quantitation, acceptable precision is achieved when the absolute value of the difference between Value 1 and Value 2 is within 2 times the RL. For results that are reported between the RL and the method detection limit (MDL), precision is considered poor by definition (i.e., the results are considered qualitatively acceptable in that a constituent can be identified, but are quantitatively suspect since the concentration cannot be accurately quantified). For this reason, results between the RL and MDL are flagged with the qualifier "J," indicating they are estimated.

Precision for groundwater samples was evaluated using the analytical results for two (2) samples and respective duplicate samples. The precision determination for each duplicate sample is discussed below.

4.1.1 Precision for Duplicate Sample OLN-FD001-D007

Duplicate sample OLN-FD001-D007 is associated with sample OLN-RU015-F007. Sample results and calculated RPD values are summarized in Table 1.

Of the parameters analyzed, the following constituents had an estimated concentration with results between the MDL and the RL (or J-flagged): trans-1,2-DCE. The precision of these constituents is considered poor by definition, and the analytical results are not considered precise.

The following constituent had a quantifiable concentration that met the precision criterion of an RPD < 25-percent: cis-1,2-DCE, TCE, methane, dissolved iron, dissolved manganese, sulfate, and COD. VC had quantifiable concentrations that met the precision criterion of the absolute difference being within two times the RL. Therefore, these analytical results are considered precise.

4.1.2 Precision for Duplicate Sample OLN-FD002-D007

Duplicate sample OLN-FD002-D007 is associated with sample OLN-RU008-F007. Sample results and calculated RPD values are summarized in Table 1.

Of the parameters analyzed, the following constituents had estimated concentrations with results between the MDL and the RL (or J-flagged) in either the field sample or duplicate sample: PCE, VC, and COD. The precision of these constituents is considered poor by definition, and the analytical results are not considered precise.

The following constituents had quantifiable concentrations that met the precision criterion of an RPD <25-percent: TCE, dissolved manganese, and sulfate. The following constituents had

quantifiable concentrations that met the precision criterion of the absolute difference being within two times the RL: cis-1,2-DCE and methane. These analytical results are considered precise.

4.2 ACCURACY

Accuracy is a measure of the bias that exists in a measurement system (i.e., the degree of agreement between an observed value and a reference or true value). Accuracy measures the average or systematic error of a measurement method or sampling method. Accuracy in the field is determined through the collection of blanks and review of the results for evidence of sample contamination stemming from field activities or sample transport.

Three trip blanks, two field blanks, and one equipment blank were analyzed as part of this Project. Trip blank, field blank, and equipment blank analytical results are summarized in Table 2.

VOCs, fatty acids, and dissolved metals were not quantified or estimated in the equipment blanks, trip blanks, and field blanks. Dissolved gases and sulfate were not quantified or estimated in the field blanks. COD was not quantified or estimated in the equipment blank. Note that field blank OLN-FB001-B007 (collected 2/12/2024) was analyzed for VOCs, dissolved metals, sulfate and COD only. Two field samples were collected on 2/12/2024: OLN-CW013-F007 and OLN-CW13A-F007. Sentinel wells CW-13 and CW-13A were not analyzed for dissolved gases or fatty acids. Therefore, the field blank collected in association with CW-13 and CW-13A was not analyzed for those constituents.

Dissolved methane was estimated in the equipment blank OLN-EB001-E007 at a concentration of 0.0032 mg/L. Of the twelve field samples analyzed for dissolved gases, dissolved methane was quantified at concentrations between 0.0092 mg/L and 12 mg/L in eight of the field samples. Since the reported concentrations in the field samples are greater than the RL and the concentration reported in the equipment blank is estimated, no further qualification is required. Dissolved methane was estimated in two field samples (0.0049 mg/L at OLN-RU011-F007 and 0.0031 mg/L at OLN-RU028-F007). Since the concentrations reported in the two field samples and the

equipment blank are less than the RL, the reported concentrations of dissolved methane in OLN-RU011-F007 and OLN-RU028-F007 have been adjusted to the RL with a "U" flag.

Sulfate was reported at an estimated concentration of 0.5 mg/L in the equipment blank OLN-EB001-E007. Sulfate was quantified in fourteen of the fifteen field samples at concentrations between 9.6 mg/L and 370 mg/L. The concentrations reported in these field samples are greater than the RL and no qualification is required. Sulfate was not quantified above the RL in field sample OLN-RU27A-F007, and no further qualification is required.

COD was reported at an estimated concentration of 3.8 mg/L in OLN-FB001-B007 (collected 2/12/2024) and 4.8 mg/L in OLN-FB002-B007 (collected 2/13/2024). COD was not quantified above the RL in OLN-FB003-B007 (collected 2/14/2024). In the associated field samples collected on 2/12/2024, COD was quantified at 13.2 mg/L in OLN-CW013-F007 and 22.6 mg/L at CW-13A-F007. Since the reported concentrations are greater than the RL, and the concentration reported in the field blank was estimated, no further qualification is required. COD was quantified in nine of the eleven field samples collected on 2/13/2024 at concentrations between 6.2 mg/L and 749 mg/L. Since the concentrations in the field samples are greater than the RL, no further qualification is required. COD was estimated in one field sample collected on 2/13/2024, OLN-RU011-F007, at a concentration of 4.8 mg/L. Since the reported concentrations in OLN-RU011-F007 and the field blank are less than the RL, the reported concentration at OLN-RU011-F007 has been adjusted to the RL with a "U" flag.

4.3 REPRESENTATIVENESS

Representativeness expresses the degree to which data accurately and precisely represent the environmental condition. Representativeness is accomplished by maintaining sample integrity with appropriate preservation and meeting technical holding times and by collecting a statistically significant number of samples. Field representativeness is dependent upon the proper design of the sampling program and is satisfied by following proper sampling techniques.

Field work was conducted in accordance with the January 2022 *Final Field Sampling Plan Operable Units 2 and 3 at the Alcas Source Area, Olean Well Field Superfund Site, Olean, New York* (FSP) as prepared by Civil & Environmental Consultants of New York, Inc. Samples were collected using laboratory provided containers, preserved in a cooler on ice, and were immediately delivered to the laboratory within specified hold times. All samples were analyzed within the method specified holding time. The samples were collected using consistent and appropriate sampling techniques. Based on the above, the analytical results are considered to be representative.

4.4 COMPLETENESS

Completeness is the measurement of the amount of valid data obtained from a measurement system compared to the amount that was expected to be obtained under "normal" conditions. Completeness establishes whether a sufficient number of valid measurements were obtained. The closer this value is to 100, the more complete the measurement process. Data rejected, whether due to sampling design error, measurement error, or bias or sample matrix interferences, are considered invalid measurements. The following formula was used to estimate completeness:

$$Percent\ Completeness = \frac{V}{T}\ x\ 100$$

Where:

V = number of measurements judged valid

T = total number of measurements

The field completeness objective for this project is greater than 90%.

All proposed sampling points were collected, with the exception of RU-10. The amendment which was injected into the EAB treatment area in June 2023 was present within the screened interval of RU-10, and the well was not sampled. No data were rejected due to sampling design error, measurement error, or bias or sample matrix interferences. Since fifteen out of sixteen samples were collected and no data was considered invalid, the dataset is considered to be 94% complete, which meets the field completeness objective.

4.5 COMPARABILITY

Comparability expresses the confidence with which one set of data can be compared to another. It is a qualitative measurement to ensure sampling and analytical procedures are consistent within and between data sets, such as split sampling or monitoring. Analytical data is comparable when similar sampling, analytical methods, and reporting limits are consistently used for assessments of water quality. Comparability was controlled by requiring the use of specific nationally-recognized analytical methods and requiring consistent method performance criteria.

Sampling was conducted in accordance with the FSP. The sampling event followed sampling procedures employed previously and utilized the same laboratory for analysis via consistent analytical methods. Because of this, the sampling procedures between sample locations and across different sampling events were consistent. Thus, the data sets discussed above are considered comparable.

5.0 SUMMARY

CEC NY completed a data review of the aqueous samples data packages prepared by ALS. Based on the data review and validation evaluation, the data were considered to be sufficiently compliant and acceptable in accordance with validation protocols. The quality assurance objectives for data included considerations for precision, accuracy, representativeness, completeness and comparability. The data were 94 percent complete with all data considered usable. The specific samples, the analyses performed, and a usability summary are presented in Table 3.

ATTACHMENT A
LABORATORY ANALYTICAL REPORT

June 11, 2024 Service Request No:R2401280

Michael Worden
Civil & Environmental Consultants, Incorporated (CEC)
2704 Cherokee Farm Way
Suite 101
Knoxville, TN 37920

Laboratory Results for: Olean OU3 - 6 Month Sampling 2024

Dear Michael,

Enclosed are the results of the sample(s) submitted to our laboratory February 15, 2024
For your reference, these analyses have been assigned our service request number **R2401280.**

All testing was performed according to our laboratory's quality assurance program and met the requirements of the TNI standards except as noted in the case narrative report. Any testing not included in the lab's accreditation is identified on a Non-Certified Analytes report. All results are intended to be considered in their entirety. ALS Environmental is not responsible for use of less than the complete report. Results apply only to the individual samples submitted to the lab for analysis, as listed in the report. The measurement uncertainty of the results included in this report is within that expected when using the prescribed method(s), and represented by Laboratory Control Sample control limits. Any events, such as QC failures or Holding Time exceedances, which may add to the uncertainty are explained in the report narrative or are flagged with qualifiers. The flags are explained in the Report Qualifiers and Definitions page of this report.

Please contact me if you have any questions. My extension is 7472. You may also contact me via email at Janice.Jaeger@alsglobal.com.

Respectfully submitted,

ALS Group USA, Corp. dba ALS Environmental

ALS Environmental

Client: Civil & Environmental Consultants, Incorporated (CEC)
Service Request: R2401280
Project: Olean OU3 - 6 Month Sampling 2024
Date Received: 02/15/2024
Sample Matrix: Water

CASE NARRATIVE

All analyses were performed consistent with the quality assurance program of ALS Environmental. This report contains analytical results for samples for the Tier level IV requested by the client.
Manual Integrations may have been used in the quantitation of the results in this report. Manual Integrations are readily identified in the raw data on the Quantitation Reports (Organics) by the automatic placement of an “m” next to the sample result. For Ion Chromatography, the manual integrations are identified by the automatic placement of “manipulated” or "manually integrated" in the upper left corner of the chromatogram (Hexavalent Chromium) or “M” by the result in the “Type” column (anions). The reason for the manual integration is noted on the “after” chromatogram, which is found with the original chromatogram and quantitation report. All integrations follow the lab SOP ADM-INT “Manual Integration.”

Sample Receipt:

Twenty four water samples were received for analysis at ALS Environmental on 02/15/2024. Any discrepancies upon initial sample inspection are annotated on the sample receipt and preservation form included within this report. The samples were stored at minimum in accordance with the analytical method requirements.
OLN-TB004-T007 was not received by the lab so the analysis was cancelled.

Semivoa GC:

No significant anomalies were noted with this analysis.

Metals:

No significant anomalies were noted with this analysis.

General Chemistry:

No significant anomalies were noted with this analysis.

Volatiles by GC:

No significant anomalies were noted with this analysis.

Volatiles by GC/MS:

No significant anomalies were noted with this analysis.

Please note: This report has been revised to add the Metals forms that were missing from the original report.

Approved by _____ Date 02/28/2024

Cooler Receipt and Preservation Check Form

Project/Client Olean Folder Number

Cooler received on 2/15/24 by: SES COURIER: ALS UPS FEDEX VELOCITY CLIENT

1	Were **Custody seals** on outside of cooler?	Y N	5a	**Perchlorate** samples have required headspace?	Y N NA
2	**Custody papers** properly completed (ink, signed)?	Y N	5b	Did VOA vials, Alk, or Sulfide have sig* **bubbles**?	Y N NA
3	Did all bottles arrive in good **condition** (unbroken)?	Y N	6	Where did the bottles originate?	ALS/ROC CLIENT
4	Circle: **Wet Ice** **Dry Ice** **Gel packs** present?	Y N	7	Soil VOA received as:	Bulk Encore 5035set NA

8. Temperature Readings Date: 2/15/24 Time: 945 ID: IR#12 IR#11 From: Temp Blank Sample Bottle

Observed Temp (°C)	3.8	3.0	3.4	3.7			
Within 0-6°C?	Y N	Y N	Y N	Y N	Y N	Y N	Y N
If <0°C, were samples frozen?	Y N	Y N	Y N	Y N	Y N	Y N	Y N

If out of Temperature, note packing/ice condition: _____ Ice melted Poorly Packed (described below) Same Day Rule

&Client Approval to Run Samples: _____ Standing Approval Client aware at drop-off Client notified by: _____

All samples held in storage location: SMO by SES on 2/15/24 at 948
5035 samples placed in storage location: _____ by _____ on _____ at _____ within 48 hours of sampling? Y N

Cooler Breakdown/Preservation Check**: Date: _____ Time: _____ by: _____

9. Were all bottle labels complete (*i.e.* analysis, preservation, etc.)? YES NO
10. Did all bottle labels and tags agree with custody papers? YES NO
11. Were correct containers used for the tests indicated? YES NO
12. Were 5035 vials acceptable (no extra labels, not leaking)? YES NO N/A
13. Were dissolved metals filtered in the field? YES NO N/A
14. Air Samples: Cassettes / Tubes Intact Y / N with MS Y / N Canisters Pressurized Tedlar® Bags Inflated N/A

pH	Lot of test paper	Reagent	Preserved? Yes	Preserved? No	Lot Received	Exp	Sample ID Adjusted	Vol. Added	Lot Added	Final pH
≥12		NaOH								
≤2		HNO_3								
≤2		H_2SO_4								
<4		$NaHSO_4$								
5-9		For 608pest			No=Notify for 3day					
Residual Chlorine (-)		For CN, Phenol, 625, 608pest, 522			If +, contact PM to add $Na_2S_2O_3$ (625, 608, CN), ascorbic (phenol).					
		$Na_2S_2O_3$								
		ZnAcetate	-	-			**VOAs and 1664 Not to be tested before analysis. Otherwise, all bottles of all samples with chemical preservatives are checked (not just representatives).			
		HCl	**	**						

Bottle lot numbers: _____
Explain all Discrepancies/ Other Comments:

HPROD	BULK
HTR	FLDT
SUB	HGFB
ALS	LL3541

Labels secondary reviewed by: _____
P.C.Secondary Review: _____

*significant air bubbles: VOA > 5-6 mm ; WC >1 in. diameter

REPORT QUALIFIERS AND DEFINITIONS

U	Analyte was analyzed for but not detected. The sample quantitation limit has been corrected for dilution and for percent moisture, unless otherwise noted in the case narrative.
J	Estimated value due to either being a Tentatively Identified Compound (TIC) or that the concentration is between the MRL and the MDL. Concentrations are not verified within the linear range of the calibration. For DoD: concentration >40% difference between two GC columns (pesticides/Arclors).
B	Analyte was also detected in the associated method blank at a concentration that may have contributed to the sample result.
E	Inorganics- Concentration is estimated due to the serial dilution was outside control limits.
E	Organics- Concentration has exceeded the calibration range for that specific analysis.
D	Concentration is a result of a dilution, typically a secondary analysis of the sample due to exceeding the calibration range or that a surrogate has been diluted out of the sample and cannot be assessed.
*	Indicates that a quality control parameter has exceeded laboratory limits. Under the "Notes" column of the Form I, this qualifier denotes analysis was performed out of Holding Time.
H	Analysis was performed out of hold time for tests that have an "immediate" hold time criteria.
#	Spike was diluted out.
+	Correlation coefficient for MSA is <0.995.
N	Inorganics- Matrix spike recovery was outside laboratory limits.
N	Organics- Presumptive evidence of a compound (reported as a TIC) based on the MS library search.
S	Concentration has been determined using Method of Standard Additions (MSA).
W	Post-Digestion Spike recovery is outside control limits and the sample absorbance is <50% of the spike absorbance.
P	Concentration >40% difference between the two GC columns.
C	Confirmed by GC/MS
Q	DoD reports: indicates a pesticide/Aroclor is not confirmed (≥100% Difference between two GC columns).
X	See Case Narrative for discussion.
MRL LOQ	Method Reporting Limit. Also known as: Limit of Quantitation (LOQ) The lowest concentration at which the method analyte may be reliably quantified under the method conditions.
MDL	Method Detection Limit. A statistical value derived from a study designed to provide the lowest concentration that will be detected 99% of the time. Values between the MDL and MRL are estimated (see J qualifier).
LOD	Limit of Detection. A value at or above the MDL which has been verified to be detectable.
ND	Non-Detect. Analyte was not detected at the concentration listed. Same as U qualifier.

Rochester Lab ID # for State Accreditations[1]

NELAP States
Florida ID # E87674
New Hampshire ID # 2941
New York ID # 10145
Pennsylvania ID# 68-786
Virginia #460167

Non-NELAP States
Connecticut ID #PH0556
Delaware Approved
Maine ID #NY01587
North Carolina #36701
North Carolina #676
Rhode Island LAO00333

[1] Analyses were performed according to our laboratory's NELAP-approved quality assurance program and any applicable state or agency requirements. The test results meet requirements of the current NELAP/TNI standards or state or agency requirements, where applicable, except as noted in the case narrative. Since not all analyte/method/matrix combinations are offered for state/NELAC accreditation, this report may contain results which are not accredited. For a specific list of accredited analytes, contact the laboratory. To verify NH accredited analytes, go to https://www4.des.state.nh.us/CertifiedLabs/Certified-Method.aspx.

Acronyms

ASTM	American Society for Testing and Materials
A2LA	American Association for Laboratory Accreditation
CARB	California Air Resources Board
CAS Number	Chemical Abstract Service registry Number
CFC	Chlorofluorocarbon
CFU	Colony-Forming Unit
DEC	Department of Environmental Conservation
DEQ	Department of Environmental Quality
DHS	Department of Health Services
DOE	Department of Ecology
DOH	Department of Health
EPA	U. S. Environmental Protection Agency
ELAP	Environmental Laboratory Accreditation Program
GC	Gas Chromatography
GC/MS	Gas Chromatography/Mass Spectrometry
LUFT	Leaking Underground Fuel Tank
M	Modified
MCL	Maximum Contaminant Level is the highest permissible concentration of a substance allowed in drinking water as established by the USEPA.
MDL	Method Detection Limit
MPN	Most Probable Number
MRL	Method Reporting Limit
NA	Not Applicable
NC	Not Calculated
NCASI	National Council of the Paper Industry for Air and Stream Improvement
ND	Not Detected
NIOSH	National Institute for Occupational Safety and Health
PQL	Practical Quantitation Limit
RCRA	Resource Conservation and Recovery Act
SIM	Selected Ion Monitoring
TPH	Total Petroleum Hydrocarbons
tr	Trace level is the concentration of an analyte that is less than the PQL but greater than or equal to the MDL.

PREPARATION METHODS

The preparation methods associated with this report are found in these tables unless discussed in the case narrative.

INORGANIC

Water/Liquid Matrix

Analytical Method	Preparation Method
200.7	200.2
200.8	200.2
6010C or 6010D	3005A/3010A
6020A or 6020B	ILM05.3
9034 Sulfide Acid Soluble	9030B
SM 4500-CN-N-2016 Amenable and Residual Cyanide	SM 4500-CN-G and SM 4500-CN-B,C-2016
SM 4500-CN-E WAD Cyanide	SM 4500-CN-I

Solid/Soil/Non-Aqueous Matrix

Analytical Method	Preparation Method
6010C or 6010D	3050B
6020A or 6020B	3050B
6010C or 6010D TCLP (1311) extract	3005A/3010A
6010C or 6010D SPLP (1312) extract	3005A/3010A
7199	3060A
300.0 Anions/ 350.1/ 353.2/ SM 2320B/ SM 5210B/ 9056A Anions	DI extraction
For analytical methods not listed, the preparation method is the same as the analytical method reference.	

ORGANIC

Preparation Methods for Organic methods are listed in the header of the Results pages.

Regarding "Bulk/5035A":
For soil/solid samples submitted in soil jars for Volatiles analysis, the prep method is listed as "Bulk/5035A". The lab follows the closed-system EPA 5035A protocols once the sample is transferred to a sealed vial, but collection in bulk in soil jars does not follow the collection protocols listed in EPA 5035A. In accordance with the NYSDOH technical notice of October 2012, all results or reporting limits <200 ug/kg are to be considered estimated due to potential low bias.

Duplicate Matrix Spike Summary
Volatile Organic Compounds by GC/MS

Sample Name:	OLN-RU021-F007	**Units:**	ug/L
Lab Code:	R2401280-018	**Basis:**	NA
Analysis Method:	8260C		
Prep Method:	EPA 5030C		

		Matrix Spike RQ2402015-05			**Duplicate Matrix Spike** RQ2402015-06					
Analyte Name	**Sample Result**	**Result**	**Spike Amount**	**% Rec**	**Result**	**Spike Amount**	**% Rec**	**% Rec Limits**	**RPD**	**RPD Limit**
Tetrachloroethene (PCE)	0.29 J	50.0	50.0	99	52.7	50.0	105	72-125	5	30
Trichloroethene (TCE)	85	132	50.0	95	135	50.0	101	74-122	2	30
Vinyl Chloride	18	54.8	50.0	74	55.5	50.0	76	74-159	1	30
cis-1,2-Dichloroethene	29	73.9	50.0	90	72.2	50.0	86	77-127	2	30
trans-1,2-Dichloroethene	1.2	43.7	50.0	85	44.6	50.0	87	73-118	2	30

Results flagged with an asterisk (*) indicate values outside control criteria.

Results flagged with a pound (#) indicate the control criteria is not applicable.

Percent recoveries and relative percent differences (RPD) are determined by the software using values in the calculation which have not been rounded.

Matrix Spike and Matrix Spike Duplicate Data is presented for information purposes only. The matrix may or may not be relevant to samples reported in this report. The laboratory evaluates system performance based on the LCS and LCSD control limits.

QA/QC Report

Client:	Civil & Environmental Consultants, Incorporated (CEC)	**Service Request:**	R2401280
Project:	Olean OU3 - 6 Month Sampling 2024/300-082.0041	**Date Collected:**	02/13/24
Sample Matrix:	Water	**Date Received:**	02/15/24
		Date Analyzed:	02/23/24

Duplicate Matrix Spike Summary
Dissolved Gases by GC/FID

Sample Name:	OLN-RU021-F007	**Units:**	ug/L
Lab Code:	R2401280-018	**Basis:**	NA
Analysis Method:	RSK 175		

		Matrix Spike RQ2401978-04			Duplicate Matrix Spike RQ2401978-05					
Analyte Name	**Sample Result**	**Result**	**Spike Amount**	**% Rec**	**Result**	**Spike Amount**	**% Rec**	**% Rec Limits**	**RPD**	**RPD Limit**
Ethane	260 U	5270	5210	101	5330	5210	102	76-126	1	20
Ethene	250 U	4980	4860	102	5030	4860	104	67-132	1	20
Methane	12000 D	19000	5250	133	19300	5250	138	46-143	1	20

Results flagged with an asterisk (*) indicate values outside control criteria.

Results flagged with a pound (#) indicate the control criteria is not applicable.

Percent recoveries and relative percent differences (RPD) are determined by the software using values in the calculation which have not been rounded.

Matrix Spike and Matrix Spike Duplicate Data is presented for information purposes only. The matrix may or may not be relevant to samples reported in this report. The laboratory evaluates system performance based on the LCS and LCSD control limits.

Propionic Acid	1.5 J	19.3	20.0	89	20.7	20.0	96	49-162	7	30

Results flagged with an asterisk (*) indicate values outside control criteria.

Results flagged with a pound (#) indicate the control criteria is not applicable.

Percent recoveries and relative percent differences (RPD) are determined by the software using values in the calculation which have not been rounded.

Matrix Spike and Matrix Spike Duplicate Data is presented for information purposes only. The matrix may or may not be relevant to samples reported in this report. The laboratory evaluates system performance based on the LCS and LCSD control limits.

Results flagged with an asterisk (*) indicate values outside control criteria.

Results flagged with a pound (#) indicate the control criteria is not applicable.

Percent recoveries and relative percent differences (RPD) are determined by the software using values in the calculation which have not been rounded.

Matrix Spike and Matrix Spike Duplicate Data is presented for information purposes only. The matrix may or may not be relevant to samples reported in this report. The laboratory evaluates system performance based on the LCS and LCSD control limits.

Results flagged with an asterisk (*) indicate values outside control criteria.

Results flagged with a pound (#) indicate the control criteria is not applicable.

Percent recoveries and relative percent differences (RPD) are determined by the software using values in the calculation which have not been rounded.

Matrix Spike and Matrix Spike Duplicate Data is presented for information purposes only. The matrix may or may not be relevant to samples reported in this report. The laboratory evaluates system performance based on the LCS and LCSD control limits.
