TABLE OF CONTENTS

SECTION I

EXECUTIVE SUMMARY

HARTWELL STREET LANDFILL

This report, prepared for the New York State Department of Environmental Conservation (NYSDEC), presents the results of the Phase I investigation of the Hartwell Street Landfill site (NYS Site Number 915030, No EPA Site Number given) located in the City of Buffalo, Erie County, New York (Figure I-1).

SITE BACKGROUND

The site is located adjacent to the Atlas Steel Casting Company, which has owned the disposal site since 1952 (see Figure I-2). In 1979, Atlas Steel landfilled the site with approximately 400 cubic yards of construction debris including concrete, earthen material, and foundry sand that was excavated on-site during a plant expansion project. The foundry sand contains a chemical irritant (sodium silicate) which has been analyzed and determined to be non-hazardous. A 1982 NYSDEC hazardous waste investigation found significant concentrations of lead in a water sample taken from a puddle adjacent to the site, and significant concentrations of copper, nickel and zinc in soil samples collected at the site.

ASSESSMENT

In an attempt to quantify the risk associated with this site, the Hazard Ranking Scoring system (HRS) was applied as currently being used by the NYSDEC to evaluate abandoned hazardous waste sites in New York State. This system takes into account the types of wastes at the site, receptors, and transport routes to apply a numerical ranking of the

site. As stated in 40 CFR Subpart H Section 300.81, the HRS scoring system was developed to be used in evaluating the relative potential of uncontrolled hazardous substance facilities to cause health or safety problems or ecological or environmental damage. It is assumed by the EPA that a uniform application of the ranking system in each state will permit EPA to identify those releases of hazardous substances that pose the greatest hazard to humans or the environment.

Under the HRS, three numerical scores are computed for each site, to express the relative risk or danger from the site, taking into account the population at risk, the potential for contamination of drinking water supplies, for direct human contact, and for destruction of sensitive ecological systems and other appropriate factors. The three scores are:

- S_M reflects the potential for harm to humans or the environment from migration of a hazardous substance away from the facility by routes involving groundwater, surface water or air. It is a composite of separate scores for each of the three routes (S_{GW} = groundwater route score, S_{SW} = surface water route score, and S_A = air route score).

- S_{FE} reflects the potential for harm from substances that can explode or cause fires.

- S_{DC} reflects the potential for harm from direct contact with hazardous substances at the facility (i.e., no migration need be involved).

The preliminary HRS score was:

S_M	=	1.38	S_A	=	0
S_{GW}	=	2.39	S_{FE}	=	0
S_{SW}	=	0	S_{DC}	=	0

These scores reflect low target scores for groundwater and surface water, although higher risk for direct contact by the public.

RECOMMENDATIONS

The following recommendations are made for the completion of Phase II. The Phase II program at this site should be conducted following a two step approach. The first step would include the collection of samples from the on-site waste piles. If analyses for heavy metals and phenols detect high concentrations of the constituents, additional monitoring of groundwater and surface water under step two would be conducted.

Step 1

- Sampling of waste piles on-site.
- Sample analyses to include heavy metals (ICPES) and phenols.

Step 2

- Groundwater monitoring system consisting of one upgradient and three downgradient wells.
- Surface water and sediment monitoring system consisting of one upgradient, three downgradient stations, and a station in the low-lying area adjacent to the railroad tracks.
- Sample analyses to include heavy metals (ICPES) and phenols.

The estimated man-hour requirements to complete both Step 1 and 2 of Phase II are 818, while the estimated cost is $58,067.

FIGURE I-2

SECTION II

PURPOSE

The purpose of the Phase I investigation at the Hartwell Street Landfill site was to assess the hazard to the environment caused by the present condition of the site. This assessment is based on the Hazard Ranking System, which involves the compilation and rating of numerous geological, toxicological, environmental, chemical, and demographic factors and the calculation of an HRS score. Details of HRS implementation are included in Section V. During the initial portion of the investigation, available data and records,, combined with information collected from a site inspection, were reviewed and evaluated. The investigation at this site focused on the potential of contaminant migration from the disposal of construction debris and foundry sand on-site. Based on this initial evaluation of the Hartwell Street Landfill site, a Phase II Work Plan has been prepared for collecting any additional data needed to complete the HRS score. In addition, a cost estimate for the recommended Phase II work is provided.

SECTION III

SCOPE OF WORK

The scope of work for the New York State Inactive Site Investigation Program (Phase I) was to collect and review all available information necessary for the documentation and preparation of a Hazard Ranking System score and a Phase II work plan and cost estimate if required. The work activities performed included data collection and review, a site inspection, and interviews with knowledgeable individuals of past and present disposal activities at the site.

The sources contacted during this Phase I investigation included government agencies (federal, state and local), present site owners and operators, and any other individuals that may have knowledge of the site, as identified during the performance of the investigation. These sources are listed in Appendix A. The intent of the list is to identify all persons, departments, and/or agencies contacted during the third round of the Phase I investigations even though useful information may not have been collected from each source contacted.

SECTION IV

SITE ASSESSMENT

SITE HISTORY

The Hartwell Street Landfill site has been owned by Atlas Steel Corporation from 1952 to present. The five (5) acre disposal site is located adjacent to the Atlas Steel Manufacturing facility. In September, 1978 complaints were received by Erie County Department of Environment and Planning (ECDEP) regarding landfilling activity at the Hartwell Street Landfill (ECDEP, 1979). Field surveys conducted in November, 1979 and December, 1981 (NYSDEC, 1982) found that construction debris including concrete, earthen material and foundry sand (a precast metal molding material) had been excavated during construction activity at the Atlas Steel facility and was landfilled on the Hartwell Street disposal site. The total volume of fill material is estimated to be 400 cubic yards of which 10% is foundry sand (Atlas Steel, 1985). The foundry sand contains a sodium silicate bonding agent which is a skin and eye irritant. The sodium silicate bonding agent is non-hazardous as determined by laboratory analysis (ARO Corporation, 1984).

SITE TOPOGRAPHY

The Hartwell Street Landfill is located on Atlas Steel Company property in Buffalo, Erie County, New York State. The ground surface is relatively flat. Surface water occurs as puddles and drains west into ditches parallel to the railroad tracks. Several piles (approximately 10' high) of soil and sand have been disposed on the site.

The site is not contained by a fence to prevent unauthorized entry. Furthermore, local residents use the Hartwell Street site as a short-cut.

The disposal site is located outside of the Atlas Steel Corporation's plant fence. East of the site is the end of Hartwell Street, along which are located many urban-type homes. Northwest of the site are railroad tracks. South of the site is the Atlas Steel Plant property.

Local Sensitive Environments

There are no nearby wells, wetlands, or critical habitats.

SITE HYDROLOGY

This summary of site hydrology is based on information from USGS topographic maps, NYS Museum and Science Service Bedrock Geology map and Quaternary Geology map, LaSala (1968).

Regional Geology and Hydrology

The site is located in the Erie-Ontario lowlands physiographic province. The bedrock of this region is predominantly limestone, dolostone, and shale. Most of the rocks are deep aquifers with regional flow to the south.

In the recent past, most of New York State, including the site, has been repeatedly covered by a series of continental ice sheets. The activity of the glacier widened pre-existing valleys and deposited widespread accumulations of till. The melting of ice, ending approximately 12,000 years ago, produced large volumes of meltwater; this water subsequently shaped channels and deposited thick accumulations of stratified, granular sediments.

As glacial ice retreated from the region, meltwater formed lakes in front of the ice margin. The Erie County region is covered by lake sediments; the most recent being from Lake Warren (a larger predecessor to Lake Ontario and Lake Erie). The sediments consist of blanket sands and beach ridges which are occasionally underlain by lacustrine silts and clays (indicating quiet, deeper water deposition).

Granular deposits in this region frequently act as shallow aquifers, whereas lacustrine clays, as well as tills, often inhibit ground water movement. However, fine-grained, water-lain sediments, such as silts and clays, frequently contain horizontal laminations and sand seams. These internal features facilitate lateral ground water movement through otherwise low permeability materials.

Site Hydrogeology

The site lies on the contact between the Camillus Shale and Bertie Limestone (Salina Group) The depth to the top of rock is estimated to be 60 to 80 feet. No wells are known to exist in this rock unit. Ground water may occur in the fractures of this rock unit and may be high in calcium and magnesium hardness and hydrogen sulfide (due to the shaley nature of both formations). Soil stratigraphy on this site is estimated as follows (LaSala, 1968):

Soil Type	Depth
Miscellaneous fill and top soil	0' to 5'
Lacustrine silts and clays	5' to 10'
Till	10' to 60/80'
Top of Rock	60' to 80'

These soils are all expected to be low permeability and are not considered to be shallow soil aquifers.

SITE CONTAMINATION

An estimated 400 cubic yards of fill material, including concrete, earthen material, and foundry sand, were excavated from the Atlas Steel facility during a plant expansion project in 1978 (Atlas Steel Corporation, 1985). Approximately 10% of the fill material is foundry sand which contains a sodium silicate bonding agent, which is non-hazardous, but is a skin and eye irritant. These materials were disposed on Atlas Steel property adjacent to the plant site on what is known as the Hartwell Street Landfill.

In March 1982, the NYSDEC collected two water samples and two soil samples next to the landfilled material, and a third water sample from the basement of a residential home adjacent to the site (see Figure IV-1). Analysis of the water samples found concentrations of lead, chromium, copper, zinc, and total organic carbon. A summary of the water analyses are presented in Table IV-1 and the analytical results are provided in their entirety in the Appendix. As noted in the table, the concentration of lead was in excess of the water quality standards for GA Class groundwaters in New York State (NYSDEC, 1982). The potential for surface and groundwater contamination does exist, however, it should be noted that the samples were collected from intermittent surface waters in an area where groundwaters are not used as a potable water supply. Furthermore, no groundwater monitoring wells are located on-site so the quality of the groundwater has not been determined to date.

The soil samples analyzed contained significant amounts of copper, nickel, and zinc and detectable amounts of chromium, lead, and silver (Table IV-1; NYSDEC, 1982). However, these pollutants may not be indicative of the fill material as no waste samples were collected and analyzed from the piles of fill material on-site.

Approximately 10% of the on-site landfilled material is foundry sand, a material used in metal casting operations at the Atlas Steel facility. The foundry sand presently used by Atlas Steel contains a

water soluble sodium silicate binding agent which is a slight eye and skin irritant, but is considered non-hazardous (Material Safety Data Sheet). According to Atlas Steel, the foundry sands are not phenolic-based binding agents commonly used in sand casting. Analysis of the foundry sand samples collected by the NYSDEC found no detectable concentrations of phenols (NYSDEC, 1982). However, the foundry sand which was analyzed by the NYSDEC was sodium silicate based foundry sand that is currently used by Atlas Steel. It should be noted that the foundry sand previously used at the facility and during the period of waste disposal was not analyzed. Therefore, the possibility exists that the foundry sand at the Hartwell Street Landfill is not a sodium silicate based foundry sand.

HNu meter readings were taken during the recent site inspection (ES and D&M, 1985) and all measurements were less than 1 ppm.

In September, 1979, the NYSDEC recommended that Atlas Steel cease depositing wastes on the Hartwell site or obtain a valid Part 360 permit (NYSDEC, 1979). Atlas Steel discontinued landfilling at the site in 1979 and there is no present evidence of on-site hazardous waste disposal (ES and D&M site inpsection, 1985).

FIGURE IV-1

PRELIMINARY APPLICATION OF HAZARD RANKING SYSTEM

NARRATIVE SUMMARY

The 5-acre Hartwell Street site is located at the end of Hartwell Street adjacent to Atlas Steel Casting Company within the City of Buffalo, Erie County, New York. Atlas Steel has owned the site from 1952 to present.

In 1979, Atlas Steel disposed approximately 400 cubic yards of construction debris including concrete, earthen material, and foundry sand on the Hartwell site. The foundry sand composes 10% of the filled material and is non-hazardous (Atlas Steel Corporation, 1985).

In March, 1982 the NYSDEC collected two surface water samples from intermittent puddles and two soil samples adjacent to the landfill site and a third water sample from the basement of a residential home adjacent to the site. Lead, chromium, copper, zinc and total organic carbon were detected in the water samples (NYSDEC, 1982). The soil samples contained significant concentrations of copper, nickel, and zinc and detectable amounts of chromium, lead and silver (NYSDEC, 1982) indicating soil contamination. However, no analyses were made of the fill material and it is not known whether the metals originated from the fill material. HNu meter readings were taken (ES and D&M Site Inspection, 1985) and all measurements were less than 1 ppm, indicating no air releases.

The site is not enclosed by a fence and local residents frequently use the site as a short-cut to reach a nearby shopping center. The population within a one-mile radius of the site is approximately 22,000 people. No remedial or environmental enforcement actions have been taken as a result of past waste disposal practices at the site.

Facility Name: Hartwell Street Landfill - Atlas Steel Casting Co.

Location: Foot of Hartwell St., adjacent to the Atlas Steel Casting Co.

EPA Region: II

Person(s) in charge of the facility: Atlas Steel Casting Company, 1963 Elmwood Avenue, Buffalo, NY 14207

Name of Reviewer: S. Robert Steele, II Date: 3/22/85

General Description of the facility:

The Hartwell Street Landfill, owned by Atlas Steel Casting Company was used in 1979 to dispose of approximately 400 cubic yards of construction debris including concrete, clean fill and foundry sands (estimated 10% of volume and non-phenolic base). These materials were used as fill since the Hartwell Street Landfill site is a low lying area. Several stockpiles of these materials which were not spread as fill are still on-site. Contaminants including heavy metals (i.e., lead, chromium, copper, zinc, silver) and TOC were detected in soil and water (puddle) samples collected in the vicinity of the site. The site is not enclosed by a fence to prevent unauthorized entry and is used as a common cut-through for local residents.

GROUNDWATER ROUTE

1. OBSERVED RELEASE

Contaminants detected (5 maximum):

No groundwater samples analyzed for contamination. (NYSDEC Registry Sheet, 12/83)

Rationale for attributing the contaminants to the facility:

Not applicable.

* * *

2. ROUTE CHARACTERISTICS

Depth to Aquifer of Concern

Name/description of aquifer(s) in concern:

Bedrock aquifer in limestone (estimate from NYS Quaternary Map)

Depth(s) from the ground surface to the highest seasonal level of the saturated zone [water table(s)] of the aquifer of concern:

60' - 80' (depth to top of rock, ECDEP Site Profile Report, 1982).

Depth from the ground surface to the lowest point of waste disposal/ storage:

Estimate 5 feet (NYSDEC Registry Sheet, 12/83, and Hartwell Street Landfill, Unnamed Report).

Net Precipitation

U.S. Dept. of Commerce, National Climatic Atlas, Climatic Atlas of the United States, 1979.)

Mean annual or seasonal precipitation (list months for seasonal):

Mean annual precipitation is 36".

Mean annual lake or seasonal evaporation (list months for seasonal):

Mean annual lake evaporation is 27".

Net precipitation (subtract the above figures):

9 inches (36" - 27" = 9"

Permeability of Unsaturated Zone

Soil type in unsaturated zone:

Misellaneous fill underlain by silts and clays (ECDEP Site Profile, 3/17/82). (Estimate from NYS Quaternary Geology Map)

Permeability associated with soil type

10^{-5} to 10^{-7} cm/sec in silts and clays (Freeze, R.A., Cherry, J.A., Groundwater, 1979).

Physical State

Physical state of substances at time of disposal (or at present time for generated gases):

Solid (Plant debris, spent foundry sand, pollution control equipment dust). (NYSDEC Registry Sheet, 12/83 and ECDEP Site Profile Report, 1982).

3. CONTAINMENT

Containment

Method(s) of waste or leachate containment evaluated:

Waste piles of fill material, foundry sands and construction debris are uncovered and placed directly on the ground. (Site inspection by ES and D&M, 3/22/85, and NYSDEC Division of Solid and Hazardous Waste, Inactive Hazardous Waste Disposal Site Report, 1983).

Method with highest score:

Waste piles in unlined landfill.

4. WASTE CHARACTERISTICS

Toxicity and Persistence

Compound(s) evaluated:

- o Foundry Sands (contains sodium silicate bonding agent) in fill
- o Copper
- o Nickel
- o Zinc [In soil adjacent to fill material
- o chromium

(NYSDEC Hazardous Waste Site Report, 1982)

Compound with highest score:

Heavy metals (toxicity = 3, persistence = 3) - 18. (NYSDEC Hazardous Waste Site Report, 1982).

Hazardous Waste Quantity

Total quantity of hazardous substances at the facility, excluding those with a containment score of 0 (Give a reasonable estimate even if quantity is above maximum):

Unknown - insufficient data. For purposes of rating the site, 1 to 10 cubic yards of hazardous waste were assumed to be disposed on-site. Foundry sand (40 cubic yards) can not be used as an estimated waste volume because the material has not been found to be a hazardous waste.

Basis of estimating and/or computing waste quantity:

Wastes are known to be disposed on-site due to the detection of heavy metals in the soils. However, the quantity of contaminated material is unknown. (Atlas Steel Corporation, 1985 and NYSDEC Site Profile Report, 1982).

5. TARGETS

Ground Water Use

Uses(s) of aquifer(s) of concern within a 3-mile radius of the facility:

No known wells in Bertie Limestone within 3 miles of site (LaSala, 1968).

Distance to Nearest Well

Location of nearest well drawing from aquifer of concern or occupied building not served by a public water supply:

Not applicable.

Distance to above well or building:

Not applicable.

Population Served by Ground Water Wells Within a 3-Mile Radius

Identified water-supply well(s) drawing from aquifer(s) of concern within a 3-mile radius and populations served by each:

None within a 3-mile radius (New York State Atlas of Community Water System Sources, 1982).

Computation of land area irrigated by supply well(s) drawing from aquifer(s) of concern within a 3-mile radius, and conversion to population (1.5 people per acre):

None within a 3-mile radius.

Total population served by ground water within a 3-mile radius:

None within a 3-mile radius.

SURFACE WATER ROUTE

1. OBSERVED RELEASE

Contaminants detected in surface water at the facility or downhill from it (5 maximum):

Not enough analytical data available (upgradient/downgradient comparison) to score an observed release. Samples not taken from a year round surface water source. Score = 0.

Rationale for attributing the contaminants to the facility:

Samples collected from puddle adjacent to landfill area and sumps in basement of nearby residence (NYSDEC Site Profile, 1982).

2. ROUTE CHARACTERISTICS

(U.S.G.S. Topographic Maps: Buffalo NE, NY; Buffalo NW, NY-ONT Quadrangles, 1965)

Facility Slope and Intervening Terrain

Average slope of facility in percent:

0.5%

Name/description of nearest downslope surface water:

Scajaguada Creek

Average slope of terrain between facility and above-cited surface water body in percent:

0.5%

Is the facility located either totally or partially in surface water?

No

Is the facility completely surrounded by areas of higher elevation?

No

1-Year 24-Hour Rainfall in Inches

2.1" (USDOC Technical Paper No. 40)

Distance to Nearest Downslope Surface Water

1.1 mile to Scajaguada Creek

Physical State of Waste

Solid (ES and D&M site inspection, 3/22/85, and NYSDEC Div. of Solid and Hazardous Waste, Inactive Hazardous Waste Disposal Site Report, 1983).

* * *

3. CONTAINMENT

Containment

Method(s) of waste or leachate containment evaluated:

Waste Piles of construction debris (i.e., clean fill, concrete, bricks, etc) and a small amount (10% of total volume) of foundry sand were placed in piles on-site. The piles are uncovered and placed directly on the ground. No diversion or containment.

Method with highest score:

Waste piles in unlined, uncovered landfill. (Site inspection conducted by ES and D&M, 3/22/85.)

4. WASTE CHARACTERISTICS

Toxicity and Persistence

Compound(s) evaluated

Lead detected in surface water samples collected from on-site puddles and sump in basement of nearby house.

Compound with highest score:

Lead (toxicity = 3, persistence = 3) - 18 (NYSDEC Hazardous Waste Site Report, 1982).

Hazardous Waste Quantity

Total quantity of hazardous substances at the facility, excluding those with a containment score of 0 (Give a reasonable estimate even if quantity is above maximum):

Unknown - insufficient analytical data. For purposes of rating the site, 1 to 10 cubic yards of hazardous wastes were assumed to be disposed on-site. Foundry sand (40 cubic yards) can not be used as an estimated waste volume because the material has not been found to be a hazardous waste.

Basis of estimating and/or computing waste quantity:

Wastes are known to be disposed on-site due to the detection of heavy metals in the soils. However, the quantity of contaminated material is unknown. (Atlas Steel Corporation, 1985 and NYSDEC Site Profile Report, 1982).

* * *

5. TARGETS

Surface Water Use

Use(s) of surface water within 3 miles downstream of the hazardous substance:

None. (Site inspection conducted by ES and D&M, 3/22/85.)

Is there tidal influence?

No

Distance to a Sensitive Environment

Distance to 5-acre (minimum) coastal wetland, if 2 miles or less:

None within 2 miles (Western NYS is not a coastal area).

Distance to 5-acre (minimum) fresh-water wetland, if 1 mile or less:

None within 1 mile (ECDEP Site Profile Report, 3/82).

Distance to critical habitat of an endangered species or national wildlife refuge, if 1 mile or less:

None within 1 mile (NYSDEC Region 9 Division of Fish and Wildlife files).

Population Served by Surface Water

(NYS Atlas of Community Water System Sources, 1982.)

Location(s) of water-supply intake(s) within 3 miles (free-flowing bodies) or 1 mile (static water bodies) downstream of the hazardous substance and population served by each intake:

None within 3 miles.

Computation of land area by above-cited intake(s) and conversion to population (1.5 people per acre):

None within 3 miles.

Total population served:

None

Name/description of nearest of above water bodies:

Not applicable.

Distance to above-cited intakes, measured in stream miles:

Not applicable.

AIR ROUTE

1. OBSERVED RELEASE

Contaminants detected:

HNu meter readings for volatile organics were less than 1 ppm, taken upwind and downwind of the site.

Date and location of detection of contaminants:

ES and D&M Site Inspection, 3/22/85.

Methods used to detect the contaminants:

HNu Meter

Rationale for attributing the contaminants to the site:

Not applicable.

* * *

2. WASTE CHARACTERISTICS

Reactivity and Incompatibility

Most reactive compound:

No known reactive compounds.

Most incompatible pair of compounds:

No known incompatible compounds.

Toxicity

Most toxic compound:

Although heavy metals have been detected at the site, the potential for the metals affecting the air pathway is insignificant. Also, phenols are suspected and should be sampled for, but no documentation exists that indicates that phenols exist on-site.

Hazardous Waste Quantity

Total quantity of hazardous waste:

Hazardous wastes can not be attributed to site for the air pathway until air sampling indicates that contaminants are impacting air quality.

Basis of estimating and/or computing waste quantity:

For scoring purposes, the quantity of hazardous waste on-site is zero. Analytical data are not available which indicates that the waste piles are hazardous.

* * *

3. TARGETS

Population Within 4-Mile Radius

Circle radius used, give population, and indicate how determined:

(0 to 4 mi) 0 to 1 mi 0 to 1/2 mi 0 to 1/4 mi

309,537 people (Complied from 1980 US Bureau of the Census Data).

Distance to a Sensitive Environment

Distance to 5-acre (minimum) coastal wetland, if 2 miles or less:

None within 2 miles (Western NY is not a coastal area).

Distance to 5-acre (minimum) fresh-water wetland, if 1 mile or less:

None within 1 mile (ECDEP Site Profile Report, 3/82).

Distance to critical habitat of an endangered species, if 1 mile or less:

None within 1 mile (NYSDEC Region 9 Dept. of Fish & Wildlife files)

Land Use

(U.S.G.S. Topographic Maps: Buffalo NW, NT-ONT and Buffalo, NE, NY Quadrangles and site visit, 1985)

Distance to commerical/industrial area, if 1 mile or less:

0.0 mi. Site is located in an industrial area.

Distance to national or state park, forest, or wildlife reserve, if 2 miles or less:

None; however Buffalo Zoological Garden is 1.4 miles away.

Distance to residential area, if 2 miles or less:

Approximately 300' (Site inspection conducted by ES and D&M, 3/22/85.)

Distance to agricultural land in production within past 5 years, if 1 mile or less:

None within 1 mile.

Distance to prime agricultural land in production within past 5 years, if 2 miles or less:

None within 2 miles.

Is a historic or landmark site (National Register of Historic Places and National Natural Landmarks) within view of the site?

No.

FIRE AND EXPLOSION

1. CONTAINMENT

Hazardous substances present:

No records were found during the Phase I investigation which indicate that a past or present fire and explosion hazard exists at the site.

Type of containment, if applicable:

* * *

2. WASTE CHARACTERISTICS

Direct Evidence

Type of instrument and measurements:

No measurements were taken to determine if there is a fire or explosion potential at the site.

Ignitability

Compound used:

No ignitable compounds are known to exist on-site.

Reactivity

Most reactive compound:

No reactive compounds are known to exist on-site.

Incompatibility

Most incompatible pair of compounds:

No incompatible compounds are known to exist on-site.

Hazardous Waste Quantity

Total quantity of hazardous substances at the facility:

No hazardous wastes with the potential to create a fire or explosion are known to exist on-site.

Basis of estimating and/or computing waste quantity:

Not applicable, see above comment.

* * *

3. TARGETS

Distance to Nearest Population

Residential area is approximately 300 feet from site (ES and D&M Site Inspection, 3/22/85).

Distance to Nearest Building

Approximately 300 feet (ES and D&M Site Inspection, 3/22/85).

Distance to Sensitive Environment

Distance to wetlands:

None within 1 mile (NYS Wetlands Maps).

Distance to critical habitat:

None within 1 mile (NYSDEC, Region 9, Division of Fish and Wildlife Files).

Land Use

Distance to commercial/industrial area, if 1 mile or less:

0.0 miles, site is located in an industrial area (ES and D&M Site Inspection, 3/22/85).

Distance to national or state park, forest, or wildlife reserve, if 2 miles or less:

None; however, the Buffalo Zoological Garden is 1.4 miles away (USGS Topographic Maps: Buffalo NW, NY-ONT and Buffalo, NE, NY Quadrangles).

Distance to residential area, if 2 miles or less:

Approximately 300 feet (ES and D&M Site Inspection, 3/22/85).

Distance to agricultural and in production within past 5 years, if 1 mile or less:

None within 1 mile (USGS Topographic Maps: Buffalo NW, NY-ONT and Buffalo, NE, NY Quadrangles).

Distance to prime agricultural land in production within past 5 years, if 2 miles or less:

None within 2 miles (USGS Topographic Maps: Buffalo NW, NY-ONT and Buffalo, NE, NY Quadrangles).

Is a historic or landmark site (National Register or Historic Places and National Natural Landmarks) within the view of the site?

No.

Population with 2-Mile Radius

91,630 people (US Census Data, 1980).

Buildings Within 2-Mile Radius

24,100 buildings (USGS Topographic Maps: Buffalo NW, NY-ONT and Buffalo, NE, NY Quadrangles).

DIRECT CONTACT

1. OBSERVED INCIDENT

Date, location, and pertinent details of incident:

During the conduct of the Phase I investigation, information was not found which indicated that an incident related to direct contact occurred at this site.

* * *

2. ACCESSIBILITY

Describe type of barrier(s):

Barriers do not completely surround the facility. Local residents use the site as a short-cut to a shopping center = 3 (Site Investigation).

* * *

3. CONTAINMENT

Type of containment, if applicable:

Waste piles of construction debris and a small amount of foundry sand were placed on-site. The piles are uncovered and placed directly on-ground (ES and D&M Site Visit, 3/22/85; Atlas Steel, 1985).

* * *

4. WASTE CHARACTERISTICS

Toxicity

Compounds evaluated:

Lead detected in surface water samples collected from on-site puddles and sump in basement of nearby house. However, lead in soil and groundwater is not a direct contact concern.

Compound with highest score:

Not applicable, lead is not a direct contact concern.

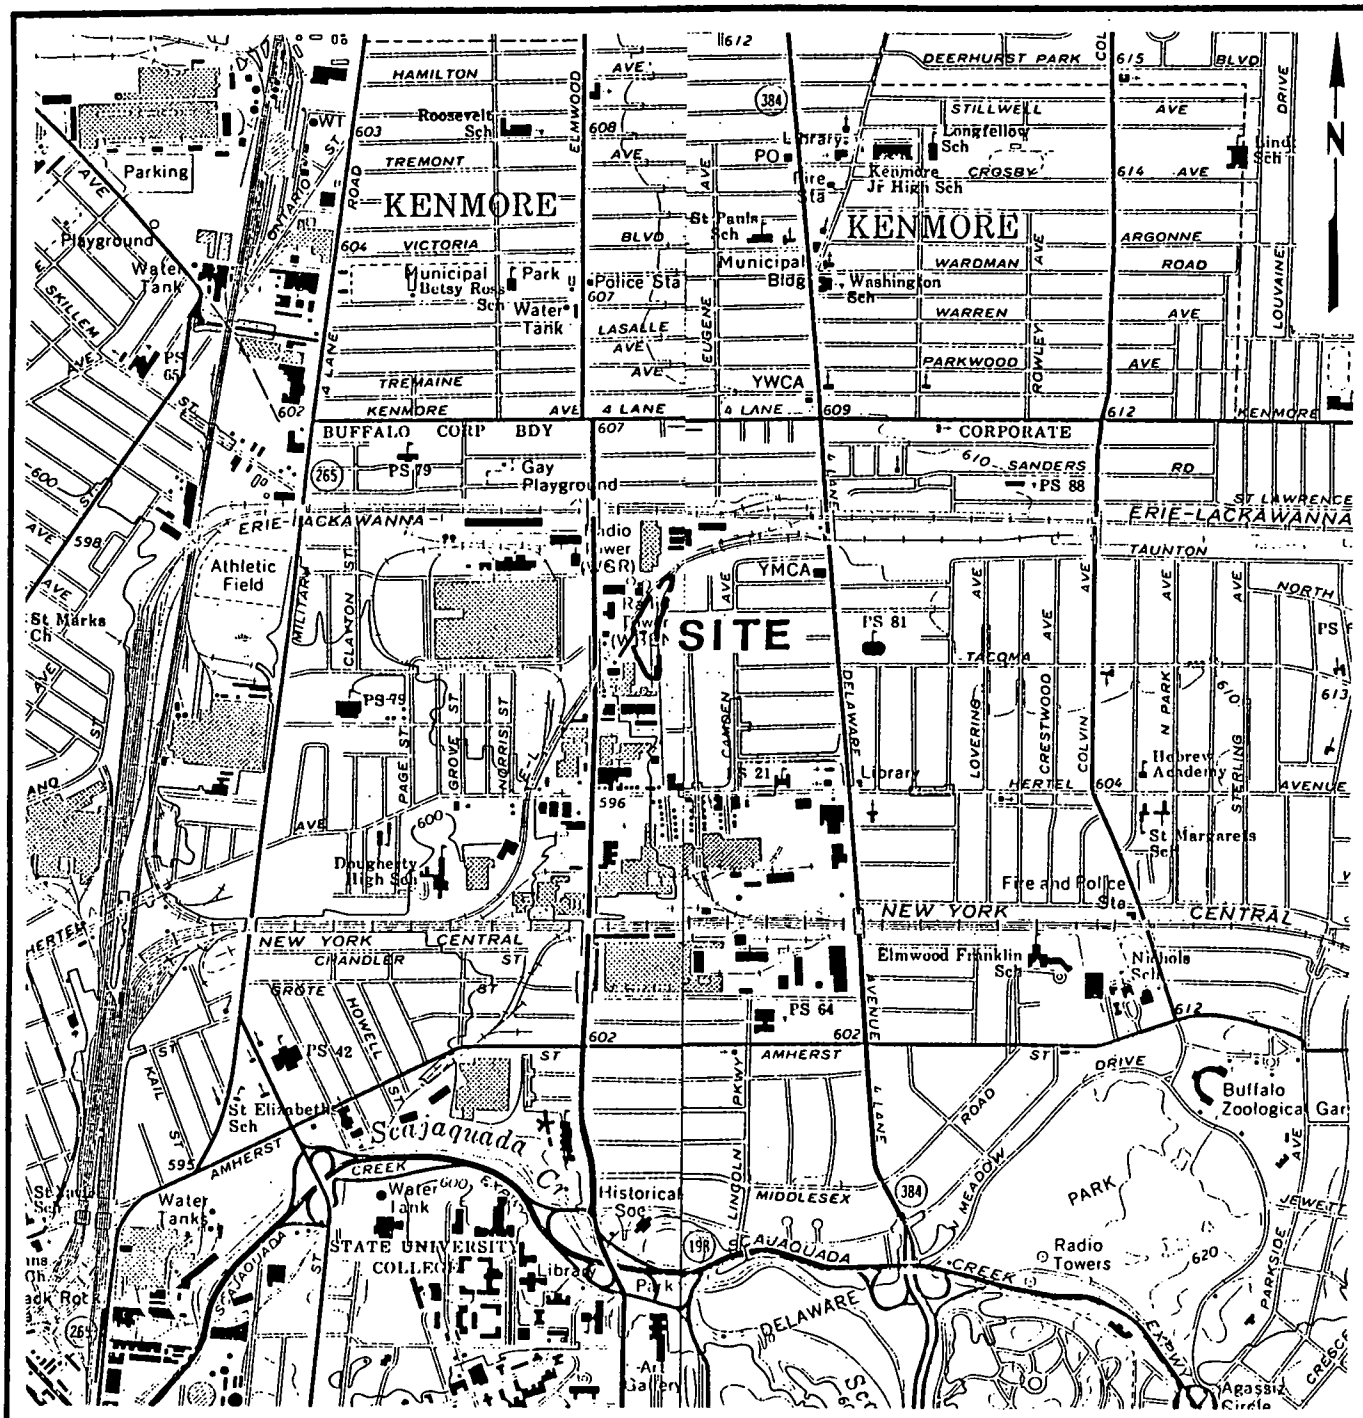
5. TARGETS

Population within one-mile radius

22,810 (US Census Data, 1980).

Distance to critical habitat (of endangered species)

None within one mile (NYSDEC, Region 9).



LATITUDE: 42°57'04"
LONGITUDE: 78°52'35"

SCALE

0 1000 2000 3000 4000 FEET

03 YEARS OF OPERATION
1979 (BEGINNING YEAR) | 1979 (ENDING YEAR) ☐ UNKNOWN

04 DESCRIPTION OF SUBSTANCES POSSIBLY PRESENT, KNOWN, OR ALLEGED
CONSTRUCTION debris including concrete, clean fill, bricks and a small amount of Foundary Sand (Est. 10% of total waste volume) were disposed on-site [illegible] as a result of a plant expansion project

05 DESCRIPTION OF POTENTIAL HAZARD TO ENVIRONMENT AND/OR POPULATION
The construction fill and debris pose no threat to the environment or population. The foundary sand contains a non-hazardous sodium silicate bonding agent. Significant levels of lead were found in a surface water sample and significant concentrations of copper, nickel, and zinc were found in soil samples.

V. PRIORITY ASSESSMENT

01 PRIORITY FOR INSPECTION (Check one. If high or medium is checked, complete Part 2 - Waste Information and Part 3 - Description of Hazardous Conditions and Incidents)
☐ A. HIGH (Inspection required promptly) ☐ B. MEDIUM (Inspection required) ☒ C. LOW (Inspect on time available basis) ☐ D. NONE (No further action needed, complete current disposition form)

SECTION VI

ASSESSMENT OF DATA ADEQUACY AND RECOMMENDATIONS

ASSESSMENT OF DATA ADEQUACY

A summary assessment of the adequacy of existing data for completion of the HRS score is presented in Table VI-1. Based on this assessment, the following Phase II work plan and cost estimate has been prepared.

PHASE II WORK PLAN

Objectives

The objectives of the Phase II activities are:

- To collect additional field data necessary to identify the occurrence and extent of contamination and to determine if any imminent health hazard exists.
- To perform a conceptual evaluation of remedial alternatives and estimate budgetary costs for the most likely alternative.
- To prepare a site investigation report including final HRS score.

The Phase II program at this site should be conducted following a two step approach. The first step would include the collection of samples from the on-site waste piles. If analyses for heavy metals and phenols detect contaminants in high concentrations, additional monitoring of groundwater and surface water would be conducted (Step 2).

The additional field data required to complete this investigation are described as follows:

Step 1

Waste - A waste monitoring system consisting of 4 monitoring stations is recommended. Monitoring stations include on-site waste piles. Analyses to include heavy metals (ICPES) and phenols. Waste samples collected via a hand auger to a depth of 2 feet.

Step 2

Groundwater - A groundwater monitoring system consisting of 3 wells is recommended. Borings will be drilled to a maximum depth of 80 feet; soil samples will be taken every 5 feet or more frequently if a change in soil lithology is encountered. The wells will be placed in the aquifer of concern and constructed of 2" PVC pipe. The groundwater samples will be analyzed for heavy metals (ICPES) and phenols. In addition, sieve and hydrometer analyses will be performed on representative samples of the subsurface soils. Finally, an in-situ permeability test will be performed on each well.

Surface Water and Sediment - A surface water and sediment monitoring system consisting of 4 monitoring stations is recommended in the area adjacent to the railraod tracks, west of the landfill. One station (S-1) will be upgradient of the site, 2 stations will be adjacent to the site, and 1 station will be downgradient. The surface water and sediment samples will be analyzed for heavy metals (ICPES) and phenols.

Air - An air monitoring survey with an HNU meter is recommended to test the air quality during site activities.

TASK DESCRIPTION

The proposed Phase II tasks are described in Table VI-2 as required under the site specific health and safety plan and quality assurance plan which must be submitted prior to initiation of field activities. The proposed monitoring well and sampling location are presented in Figure VI-1.

COST ESTIMATE

The estimated man-hours required for the Phase II project are presented in Table VI-3 and the estimated project costs by tasks are presented in Table VI-4. The estimate total cost for this project is $58,067.

TABLE VI-1

ASSESSMENT OF DATA ADEQUACY

HRS Data Requirement	Comments on Data
Observed Release	
Groundwater	Insufficient to score observed release
Surface Water	Insufficient to score observed release
Air	Data adequate for HRS score, no observed release
Route Characteristics	
Groundwater	Insufficient for HRS score. Estimate for soil types, depth to aquifer of concern.
Surface Water	Data adequate for HRS score
Air	Not applicable, no observed release
Containment	Data adequate for HRS score
Waste Characteristics	Incomplete data for HRS score
Targets	Data adequate for HRS score
Observed Incident	Data adequate for HRS score
Accessibility	Data adequate for HRS score

TABLE VI-2

PHASE II WORK PLAN - TASK DESCRIPTION

Tasks		Description of Task
II-A	Update Work Plan	Review the information in the Phase I report, conduct a site visit, and revise the Phase II work plan.
II-B	Conduct Geophysical Studies	No further studies necessary.
II-C	Conduct Boring/Install Monitoring Wells	Install 1 upgradient and 3 downgradient wells. The borings will be drilled to a depth of approximately 80 feet. Wells will be constructed of 2" PVC pipe.
II-D	Construct Test Pits/Auger Holes	No further construction of test pits/auger holes necessary.
II-E	Perform Sampling & Analysis	
	Soil samples from borings	Soil samples collected at 5 ft. intervals during drilling and at changes in subsurface lithologies. Perform one grain size analysis and permeability test per subsurface lithology change.
	Soil samples from surface soils	No further studies necessary.
	Soil samples from auger holes/test pits	No further studies necessary.
	Sediment samples from surface water	4 sediment samples are to be collected and analyzed for heavy metals (ICPES) and phenols.
	Groundwater samples	4 groundwater samples are to be collected and analyzed for heavy metals (ICPES) and phenols.
	Surface water samples	4 surface water samples are to be collected and analyzed for heavy metals (ICPES) and phenols.

TABLE VI-2 (Continued)

PHASE II WORK PLAN - TASK DESCRIPTION

Tasks		Description of Task
	Air samples	Using the HNu determine the presence of organics during site activities.
	Waste samples	Waste samples collected from on-site waste piles. Analyses to include heavy metals (ICPES) and phenols. Samples to be collected using a hand auger to a depth of 2 feet.
II-F	Calculate Final HRS	Based on the field data collected in Tasks II-B - II-E, complete the HRS form.
II-G	Conduct Site Assessment	Prepare final report containing significant Phase I information, additional field data, final HRS and HRS documentation records, and site assessments. The site assessment will consist of a conceptual evaluation of alternatives and a preliminary cost estimate of the most probable alternative.
II-H	Project Management	Project coordination, administration and reporting.

INTERVIEW FORM

INTERVIEWEE/CODE Mr UMA S. GHOSE /

TITLE - POSITION Works manager / ATLAS Steel Company

ADDRESS 1963 Elmwood Ave

CITY Buffalo STATE NY ZIP 14207

PHONE (716) 875-2273 RESIDENCE PERIOD ____ TO ____

LOCATION ATLAS STEEL CASTING CO. INTERVIEWER S. Robert STEELE, II

DATE/TIME 3/22/85 / 8:30 AM

SUBJECT: HARTWELL STREET Landfill

REMARKS: The materials presently disposed on the site adjacent to the ATLAS STEEL plant (HARTWELL Street Landfill) consists of excavated clean fill and construction debris from a plant expansion project during 1979. An estimated 10% of the material disposed at the Hartwell Street Landfill is non-phenolic based foundry sands. The excavated material was used as fill since the Hartwell Street site was a low lying area. The estimated volume of fill excavated and placed on-site is 400 cubic yards.

NOTE: Only half of the excavated fill was placed at the Hartwell Street landfill site.

AREA OF EXCAVATION

80 x 100 x 2 = 16,000

15 x 30 x 122 = 5400

21,400 / 27 = 800/2 = 400 cubic yards

I AGREE WITH THE ABOVE SUMMARY OF THE INTERVIEW:

Prepared by
Erie County Department of
Environment and Planning

March 17, 1982

HARTWELL STREET LANDFILL

(ATLAS STEEL CASTINGS, INC.)

1963 Elmwood Avenue

Buffalo, New York

Site # 915030

BACKGROUND

The Interagency Task Force (IATF), in volume III of Hazardous Waste Disposal Sites in New York State, reported that filling of a low area on Atlas Steel Casting Plant grounds with earth fill and building debris from the plant occurred at this site. It was also reported that spent sand and pollution control equipment dust were stored at the site prior to off-site disposal. The site is coded "F" indicating that no further action is required.

GENERAL INFORMATION

The Hartwell Street Landfill is located at the west end of Hartwell Street on the northern portion of the Atlas Steel Casting's Inc. property (Exhibit I).

The only solid waste generated from the casting operation at the firm are casting sands with a water soluble sodium silicate binder. In the past, this waste was hauled away by "Custom Topsoil." Recently, due to a shift in economic conditions operations had temporarily slowed. According to a March 8, 1982, telephone conversation with NYSDEC, plant officials have contacted them and reported that plant operations have restarted. NYSDEC has advised the company of disposal and hauling requirements.

FIELD INSPECTIONS

The disposal site was originally field inspected by DEP in February 1979. The field inspection was performed due to a complaint from a citizen living on Hartwell Street. The citizen's complaint was in regard to disposal of material outside of Atlas Steel Casting's fence and general "poor housekeeping" practices in the area.

The Atlas Steel Castings site included areas inside and outside of the company's fence (Exhibit 1). The debris inside the fence included earth fill (from plant modifications), wood pallets, scrap trucks and metal products. The area outside of the fence, (on Atlas Steel Property) consisted of construction and demolition debris which was used to fill in a low area.

The Atlas site was again field checked in November of 1979 due to information indicating that foundry sand was being stored on site. During that inpsection, no foundry sand was observed. Atlas Steel Casting representatives indicated, at that time, that foundry sand had once been temporarily stored on site because they were in the process of changing haulers. Conditions at the site had essentially remained the same as the February inspections, however, accumulations of concrete and brick were also observed on site.

During the most recent inspection (December 14, 1981) conditions at the site had not changed.

At no time during the site investigations was leachate observed on or leaving the site nor were any odors associated with the disposal area.

No evidence that any disposal of hazardous or toxic material were noted.

Exhibit 2 shows general conditions in this study area.

AERIAL PHOTOGRAPHY

Evaluation of aerial photography for the years 1951, 1958, 1960, and 1966 revealed no landfilling activities.

ENVIRONMENTAL DATA

The General Soil, Map and Interpretation for Erie County by the U.S.D.A. Soil Conservation Service (1979) reports that the soils in this area are classified as Urban Soils. This indicates that the area has received extensive disturbance to the original soil by both filling or removal. Permeability, soil texture and structure would be classified as miscellaneous due to the high degree of variation within the area.

Depth to bedrock is reported to be between 60 to 80 feet.

The U.R.S. report describes depth to groundwater to be miscellaneous. Groundwater in this area is not used as a domestic drinking water supply source. All persons who reside in the area receive their drinking water from the City of Buffalo Municipal System.

There are no surface waters or fresh water wetlands within a one mile radius of the site.

The area is not within a 100 year flood plain.

GEOGRAPHIC DATA

The land use in the area is residential, commercial, and industrial. Census figures (1980) report that the population is greater than 10,000.

DIRECT CONTACT

Direct contact would only be by Atlas employees.

FIRE OR EXPLOSION POTENTIAL

None.

CONCLUSION

There is no evidence that hazardous or toxic waste have ever been disposed of at this site. Consequently, this area is not expected to pose an environmental or other hazard.

RECOMMENDATIONS

This department recommends that NYSDEC continue to work with company officials in regard to permit requirements.

No sampling or remedial measures appear to be necessary at the site.

Hartwell

REF-11

NAME OF SITE: Hartwell Street Landfill

LOCATION: Foot of Hartwell Street, Buffalo (C), Erie County

CURRENT OWNER: Atlas Steel Company

HISTORY

It was reported that low areas on the Atlas Steel Casting Plant grounds were filled with earthen materials and building debris. Also spent casting sand and pollution control equipment dust were stored at the site prior to off-site disposal. Citizens living near the plant complained that material was disposed of outside Atlas Steel Casting's fence and that poor housekeeping of materials was practiced in the area. Subsequent investigations by the Erie County Department of Environment and Planning revealed that concrete and brick was accumulating on site, however no foundry sand was observed.

INVESTIGATION

This site was inspected on March 29, 1982 by Messrs. Christoffel and Senior of the DEC - Region 9 office. Samples were obtained from three locations. The first was from a puddle of water on the east side of the landfill. The second location was from a puddle of water on the west side of the landfill, near the Atlas Steel Company property. Both water and soil samples were taken at these locations. The third location was a sump in the basement of a house adjacent to the landfill. A water sample was taken from this location.

SOIL AND GEOLOGICAL INFORMATION

The soil in this area has been classified by the USDA Soil Conservation Service as urban soils. This means that the area has received extensive disturbance to the original soil by filling and/or removal.

The bedrock in this area is of the Skaneateles and Marcellus Formations which are made up of shale and thin limestone. The approximate depth of the bedrock in this area is 60 to 80 feet.

DISCUSSION OF RESULTS

The water samples contained concentrations of lead in excess of the effluent standards at locations #2 and #3, as well as detectable concentrations of chromium, copper, zinc and total organic carbon. The soil samples contained fairly high amounts of copper, nickel, and zinc, and detectable amounts of chromium, lead and silver.

At the time of this inspection there were no signs of leachate or other material leaving the site, nor were there any detectable odors. Access to this site is partially restricted; part of the landfill is fenced on the Atlas Steel property and part is open. This site is above the 100 year flood level. A code of F has been assigned to this site meaning "no further action is required; subsequent investigation has shown that no in-place toxics are present in dangerous amounts, and the sites do not present a toxics hazard".

RECOMMENDATIONS

Based on the data collected, this site does not appear to present a hazard to health or the environment. A final decision should be made concerning remedial work at this site after analysis of samples obtained as part of the Niagara River study.

INTERVIEW FORM

INTERVIEWEE/CODE Jim Snyder Mike Wilkenson /
TITLE - POSITION NYSDEC, Div of Fish & Wildlife
ADDRESS Delaware Ave.
CITY Buffalo STATE NY ZIP
PHONE ( ) RESIDENCE PERIOD TO
LOCATION in DEC office INTERVIEWER Eileen Milligan
DATE/TIME 1/10/85 & 1/11/85 /
SUBJECT: Phase I site information

REMARKS: The above-named interviewees provided us with the following information regarding our Phase I site. (see attached list)

1) Wetlands in Niagara Co. & proximity to sites
2) Types of fish & wildlife in Erie/Niagara area
3) Use by fish & wildlife of Niagara River & tributaries
4) Sensitive environments & proposed wetlands in the Erie/Niagara area

I AGREE WITH THE ABOVE SUMMARY OF THE INTERVIEW:

SIGNATURE: James R. Snyder - Jr. Wildlife Biologist
Michael A. Wilkinson - Conservation Biologist (Aq Biol.)

COMMENTS: No discussion of wetlands / wildlife regarding Mina Landfill site - referred to Olean Office

REF - 13

US CENSUS DATA, 1980

US Census Data used in the HRS scoring was obtained from various County Planning Offices. This data was not obtained from a report. The raw census data combined with County Planning Maps was used to estimate the population within 1, 2, 3, and 4 miles of the Phase I site being investigated. Because of the voluminous amount of data used, the data is not provided in this Appendix.

APPENDIX B

PROPOSED UPDATED NYS REGISTRY SHEET

NEW YORK STATE DEPARTMENT OF ENVIRONMENTAL CONSERVATION
DIVISION OF SOLID AND HAZARDOUS WASTE
INACTIVE HAZARDOUS WASTE DISPOSAL SITE REPORT

CLASSIFICATION CODE: 2a REGION: 9 SITE CODE: 915030

NAME OF SITE : Hartwell Street Landfill
STREET ADDRESS: Foot of Hartwell Street

TOWN/CITY:	COUNTY:	ZIP:
Buffalo	Erie	14207

SITE TYPE: Open Dump- Structure- Lagoon- Landfill-X Treatment Pond-
ESTIMATED SIZE: Acres

SITE OWNER/OPERATOR INFORMATION:
CURRENT OWNER NAME....: Atlas Steel
CURRENT OWNER ADDRESS.: 1963 Elmwood Ave., Buffalo, NY 14207
OWNER(S) DURING USE...: Atlas Steel
OPERATOR DURING USE...: Atlas Steel
OPERATOR ADDRESS.....: 1963 Elmwood Ave, Buffalo, NY 14207
PERIOD ASSOCIATED WITH HAZARDOUS WASTE: From 1952 To present

SITE DESCRIPTION:
Low areas on Atlas Steel Casting Plant have been filled with debris from the plant. It has also been reported that spent sand and pollution control equipment dust were stored at the site prior to off-site disposal. DEC took soil and surface water samples in March 1982. Results indicate detectable amount of TOC in the water samples. Erie County submitted site profile report in March 1982.

HAZARDOUS WASTE DISPOSED: Confirmed- Suspected -X

TYPE	QUANTITY (units)
Plant debris, spent sand, pollution control equipment dust.	Unknown

SITE CODE: 915030

ANALYTICAL DATA AVAILABLE:

Air- Surface Water-X Groundwater- Soil-X Sediment- None-

CONTRAVENTION OF STANDARDS:

Groundwater- Drinking Water- Surface Water- Air-

LEGAL ACTION:

TYPE..: None State- Federal-
STATUS: In Progress- Completed-

REMEDIAL ACTION:

Proposed- Under Design- In Progress- Completed-
NATURE OF ACTION: None.

GEOTECHNICAL INFORMATION:
SOIL TYPE: Clay and silt
GROUNDWATER DEPTH: Not known

ASSESSMENT OF ENVIRONMENTAL PROBLEMS:

Erie County site profile report of March 1982 indicates that no hazardous or toxic waste has been disposed. However, DEC finding of TOC in the water, suggests need for further investigation to assess environmental problem.

ASSESSMENT OF HEALTH PROBLEMS:

Insufficient information
