#### **EXECUTIVE SUMMARY**

Strippit, Inc. is located at 12975 Clarence Center Road in Akron, New York. Historically an approximate 2-acre area on the Strippit, Inc. property (i.e., identified as the Houdaille Industrial – Strippit Division Site and designated herein as the Site) was used to dispose of various materials including suspected hazardous waste until 1979, when disposal ceased. As a result, the New York State Department of Environmental Conservation (NYSDEC) listed the disposal area as an in-active hazardous waste site (NYSDEC Site No. 9-15-053). Subsequently, various studies were completed to evaluate that nature and extent of contamination, and to develop/implement an Interim Remedial Measure (IRM). This IRM was completed in 1994 and it included the consolidation of waste materials and the covering of these waste materials with a composite soil/geomembrane cover. Subsequently, a post-closure monitoring program consisting of site visits to evaluate the condition of the landfill cover and groundwater monitoring to assess the effectiveness of the IRM was implemented beginning in 1995. The post-closure monitoring has been on-going on a routine basis since 1995, with reports submitted to the NYSDEC annually, or more frequently (as warranted).

This Periodic Review Report (PRR) describes the monitoring conducted during the reporting period between February 1, 2014 and January 31, 2015 to assess the condition and function of the remedial activities conducted at the Site. Based on the monitoring completed during the reporting period, the Engineering Controls implemented at the Site (i.e., construction of a soil/geomembrane cover and installation of a groundwater monitoring network to evaluate the effectiveness of the cover system) are functioning as designed and modifications are not required at this time. However, some additional monitoring/remedial actions are recommended as outlined below.

- During a site visit conducted on July 9, 2014, some minor water seepage was observed in isolated locations near the base of the landfill on the northeastern side of the landfill. In addition, cracks observed during the previous reporting period (i.e. between February 1, 2013 and January 31, 2014) appeared similar in size and number to those observed previously, however vegetation and snow cover during monitoring event precluded a complete assessment of the cracks. It is recommended that the seepage continue to be monitored to determine if remedial actions are warranted. The cracks on the north face of the landfill should be monitored prior to the 2015 growing season (i.e., in March or April 2015) to confirm that the cracks have not increased in size or frequency. If cracking has increased, remediation should be completed when weather permits.
- It is recommended that clearing of a retention basin of accumulated vegetation be completed as a precautionary measure.

The groundwater monitoring conducted during the reporting period did not identify evidence of the degradation of groundwater quality when compared to historic data. Specifically, with the exception of the samples collected from GW-3, the pH levels measured in each monitoring well during the reporting period were lower than the levels measured in the previous reporting period, and were generally below the respective historic average pH levels calculated for samples collected from these monitoring wells. However, pH levels were measured at elevated concentrations (i.e., greater than 8.5 s.u.) during the reporting period in samples collected from monitoring wells GW-2, GW-4 and GW-5. While the concentrations of metals detected in select groundwater samples

collected during the reporting period are higher than the concentrations measured during recent reporting periods, the current levels are generally within the range of concentrations observed during historic monitoring events. Remedial actions are not recommended at this time to address possible groundwater impacts, but as requested by the NYSDEC in a letter dated June 11, 2012, the pH of groundwater in the monitoring wells installed at the Site will continue to be measured and reported at the frequency currently being conducted. The next monitoring event is tentatively scheduled to occur on or around July 9, 2015. The next sampling event would occur on or around January 14, 2016. In addition to the above, the cracks on the northern face of the landfill should be monitored prior to the growing season (i.e., in March or April 2015) to confirm that the cracking has not increased or determine if remediation is warranted.

#### 1.0 INTRODUCTION

Strippit, Inc. (Strippit) is located at 12975 Clarence Center Road in Akron, New York. A Locus Plan is included as Figure 1. An approximate 2-acre area located behind (south) of the Strippit facility was historically used to dispose of various materials including suspected hazardous waste until 1979, when disposal ceased. This former disposal area identified by the New York State Department of Environmental Conservation (NYSDEC) as the Houdaille Industrial – Strippit Division Site Number 9-15-053 is defined herein as "the Site".

Beginning in 1981, several studies were completed by various parties to evaluate the nature and extent of contamination at the Site. In accordance with an Interim Remedial Measure (IRM) work plan dated October 1993 prepared by Day Engineering, P. C. [an affiliate of Day Environmental, Inc. (DAY)], an IRM that generally consisted of the consolidation of waste materials at the Site and the covering of these materials with a composite soil and geomembrane liner was conducted in the summer of 1994. The results of the previous studies, including the history of the Site, and the IRM implemented to address impacts at the Site are included in the document titled *Record of Decision*, *Houdaille Industrial – Strippit Division Site, Town of Newstead, Erie County, Site Number 9-15-053* dated March 1995 prepared by the NYSDEC (the ROD).

As documented in the ROD, the Site received a No Further Action designation, however, post-closure monitoring and maintenance was required to evaluate the effectiveness of the IRM. Specific post-closure monitoring and maintenance requirements are described in a document prepared by DAY titled *Post-Closure Monitoring and Maintenance Plan; Interim Remedial Measure; Strippit, Inc.; Akron, New York* dated February 1995 (the Post-Closure Plan). The Post-Closure Plan was reviewed and approved by the NYSDEC prior to implementation.

In accordance with a June 24, 1998 letter prepared by the NYSDEC, the frequency of groundwater sampling outlined in the Post-Closure Plan was reduced from quarterly to bi-annually. During the remaining two quarters, a limited monitoring event that included the measurement of groundwater levels and field parameters (e.g., pH, specific conductivity, etc.), and completion of a site inspection was conducted.

In accordance with an August 21, 2002 letter prepared by the NYSDEC, the testing program outlined in the Post-Closure Plan was further modified to include testing for the following parameters:

- Indicator Parameters: pH, specific conductance, turbidity and temperature
- Total barium, iron, magnesium, and manganese
- Total Phenols

In accordance with a February 10, 2010 letter prepared by the NYSDEC, the frequency of groundwater sampling outlined in the Post-Closure Plan was reduced from bi-annually to annually.

The testing program outlined in the Post-Closure Plan was further modified to include testing for the following parameters:

- Indicator Parameters: pH, specific conductance, turbidity and temperature
- Total barium, iron, magnesium, and manganese

Further, the frequency of the limited monitoring event that included the measurement of groundwater levels and field parameters (e.g., pH, specific conductivity, etc.) and completion of a site inspection was reduced from quarterly to bi-annually (i.e., the groundwater sampling event and one additional event per year).

In accordance with a March 24, 2009 letter prepared by the NYSDEC, a Periodic Review Report (i.e., this document) describing work completed during the preceding calendar year is required for the Site. This report is to be submitted, on or before, mid-March of the following year (i.e., the Periodic Review Report (PRR) for calendar year 2014 is due on, or before, March 2, 2015). The PRR includes the following items:

- Identification of the Engineering Controls required by the remedy for the Site, and the results of observations completed to assess the effectiveness of these controls;
- Inspection forms generated for the Site during the reporting period;
- A summary of monitoring data generated during the reporting period;
- Historic data summary tables and graphical representations of contaminants of concern by media (i.e., groundwater); and,
- Copies of the required laboratory data deliverables for samples collected during the reporting period.

The PRR also includes an evaluation consisting of the following:

- The compliance of the remedy with the requirements of the ROD;
- Conclusions regarding Site contamination based on inspections and/or data generated by the Monitoring Plan for the media being monitored;
- Recommendations regarding necessary changes to the remedy and/or Monitoring Plan;
   and.
- The overall performance and effectiveness of the remedy.

#### 2.0 ENGINEERING CONTROL EVALUATION

The Engineering Controls at the Site consist of a cover system (i.e., landfill cap consisting of multiple layers of soil and a geomembrane liner) over the former disposal area and a groundwater monitoring well network to evaluate the effectiveness of the landfill cap. The approximate boundary of the former disposal area and the locations of the groundwater monitoring wells installed at the Site are depicted on Figure 2.

The integrity of the Engineering Controls at the Site and monitoring well network were evaluated on the following dates during the reporting period: July 9, 2014 and January 14, 2015. Copies of the observation reports completed during each semi-annual monitoring event are included in Appendix A.

During previous reporting periods, an approximate 1,600 square foot area on the north face of the landfill cap (i.e., approximately 100 feet west of monitoring well GW-4) was found to contain animal burrows with areas of cracking and erosion. In June/July 2010, repairs were made to this area (i.e., animal holes were filled with a low permeability soil, linear parting features (cracks and fissures) were repaired, and the area was covered with topsoil and reseeded). The repair area appeared to be in generally good condition during the monitoring event conducted on July 9, 2014 and additional repair of this area does not appear to be warranted at this time. [Note: the ground surface of the repair area was not visible during January 14, 2015 monitoring event due to the snow cover.]

As described in the 2013 PRR, two areas of possible landfill cover degradation were observed on the north slope of the landfill during the previous reporting period, and these areas were described as follows:

- "Evidence of cracking of the landfill cover (i.e., a series of shallow trenches approximately 2 to 3 inches wide and extending north-south on the northern slope of the landfill cap in lines approximately 10 to 15 feet in length) was observed during the January 15, 2014 monitoring event in an area located between 200 and 300 feet to the west of monitoring well GW-4. The apparent cracking extended 2 to 3 inches into the soil cap of the landfill, but did not appear to compromise the cover system.
- A second area of possible cracking of the landfill cover was observed during the January 15, 2014 monitoring event, as a linear depression along an approximate 50 to 70 foot section of the top of the northern slope of the landfill cap. This area of possible cracking was observed between approximately 90 and 150 feet to the west of monitoring well GW-4. The linear depression was approximately one inch deep and six inches wide. [Note: The observed linear depression had the appearance of an animal trail. However, since the linear depression was not a straight line, but followed the edge of the top of the landfill slope, and abruptly terminated at either end without further evidence of a trail in either direction, it is unlikely that the linear depression was caused by animals.] This area of possible cracking did not appear to compromise the cover system."

In a letter dated March 6, 2014, the NYSDEC commented that, "minor water seepage in isolated locations at the north base of the landfill and minor cracking in the landfill has and continues to

occur. The Department agrees...that the areal and vertical extent of these locations be staked and measured during the first quarter of 2014....Similarly, though the Department agrees that additional measurements should be made during the two scheduled landfill monitoring events in July 2014 and January 2015 to determine the rate of cover degradation (if any) in these areas, timing needs to be flexible for the best observations and assessment due to factors of vegetative growth, annual mowing operations and the potential of snow cover next January."

On March 19, 2014, DAY representatives marked the two most prominent series of shallow trenches extending north-south on the northern slope of the landfill cap, as well as the linear depression along an approximate 50 to 70 foot section of the top of the northern slope of the landfill cap. Specifically, bricks painted with fluorescent marking paint were used to demarcate the linear structures, and fluorescent marking paint was used to mark the ground surface between the bricks along the path of the degradation.

During the July 9, 2014 monitoring event, attempts were made to locate the demarcation bricks and re-measure the distances between the bricks. However, due to the vegetative cover, only a partial measurement was possible. The measurements made during the July 9, 2014 monitoring event are included in the completed observation reports located in Appendix A. Based on the measurements and observations made during the July 9, 2014 monitoring event, the areas of cracking did not appear to have increased in size or frequency since the initial measurements completed on March 19, 2014. During the January 14, 2015 monitoring event, approximately two feet of snow were present on the landfill area, and attempts to find the demarcation bricks were not successful. Additional observation and measurement will be required before the start of the 2015 growing season (e.g., March or April 2015) to confirm the findings of the July 9, 2014 monitoring event and assess the current frequency and extent of cracking.

Water seepage from the northeastern side slope of the landfill cap was observed during the July 9, 2014 monitoring event, and a small quantity of pooled water was observed adjacent to this location at the base of the landfill cap. The water seepage and pooled water were located at the southern edge of the asphalt pavement, and approximately 150 feet to the west of monitoring well GW-4. Due to the snow cover during the January 14, 2015 the side slope of the landfill cap was not visible. However, pooled water/ice was not observed in the area where the pooled water was observed on July 9, 2014. [Note: active water seepage from an apparent animal burrow approximately 10 ft. above the base of the north landfill slope, and immediately up-gradient of the area of pooled water was also observed during the previous monitoring period (i.e., January 2014).] This area should continue to be monitored for evidence of further seepage or erosion during future monitoring events.

No evidence of settlement was observed on or at the perimeter of the landfill cap.

During the July 9, 2014 monitoring event, vegetation on and around the landfill cap was observed to be present and apparently healthy.

Groundwater monitoring wells and the gas well were observed to be in good, functioning condition, and locks that were replaced on each of the groundwater monitoring wells in 2011 were in working order. The bailer and rope in monitoring well GW-1 was replaced during the July 9, 2014 monitoring event. During the January 14, 2015 monitoring event, the bailer was lost down the well casing upon unlocking the well and removing the J-plug. The bailer rope, which had been stored inside the protective steel well casing was observed to be severed by apparent chewing. The bailer was recovered from the well and the rope was repaired. However, this rope should be replaced during the next monitoring event.

Drainage ways located to the north and northwest of the landfill cap were observed to be functioning (i.e., not blocked). However, vegetation was observed in the retention basin (i.e., in the same location noted during the previous reporting period), and although it did not block water flow, it is recommended that this vegetation be cleared as a preventative measure.

Day Environmental, Inc. Page 5 of 13 CAH0892 /5022R-15

#### 3.0 GROUNDWATER MONITORING DURING REPORTING PEROID

During each bi-annual monitoring event (i.e., conducted on July 9, 2014 and January 14, 2015) the depth to groundwater was measured from a monitoring point elevation established on the top of each monitoring well casing using an electronic tape water level indicator. In addition, a sample of the groundwater was collected from each monitoring well and the pH was also measured using a Horriba model U-22 water quality meter. The groundwater depths, elevations, and pH measurements made during the monitoring events completed during this report period are presented in the following table.

WELL	TOP OF CASING	GROUNDWATER ELEVATION (ft.) / <b>pH</b> (su)		GROUNDWATER ELEVATION (ft.)		Groundwater Elevation Variation	Historic pH Values (su)		
.,,222	ELEVATION (ft.)	-	, 2014	/ <b>pH</b> (su) January 14, 2015		between monitoring events (ft.)	Average	Max	Min
GW-1	754.32	714.61	7.57	714.30	7.66	0.31	8.80	11.59	5.90
GW-2	770.62	719.84	9.08	719.48	8.26	0.36	10.17	12.23	7.23
GW-3	742.59	710.41	7.63	709.57	7.45	0.84	7.18	11.32	5.57
GW-4	752.24	715.59	9.56	714.94	8.16	0.65	9.04	10.92	6.08
GW-5	771.26	719.84	9.43	719.59	7.86	0.25	10.18	12.27	6.99

Groundwater contour maps, developed based upon the groundwater elevations calculated using the measurements obtained during the July 9, 2014 and the January 14, 2015 monitoring events, are included as Figure 3 and Figure 4 (respectively). As shown, despite the seasonal variation in groundwater elevation as summarized above, groundwater flow is generally to the north-northwest.

As indicated in the above table, the pH levels measured during the reporting period are within the range of historic pH values measured for each location, and generally below the historic average for their respective location. However, the pH levels measured in monitoring well GW-3 during the reporting period and in monitoring well GW-4 on July 9, 2014 are above the historic average for their respective location. The pH levels measured in monitoring wells GW-2, GW-4 and GW-5 during the July 9, 2014 monitoring event are elevated (indicating alkaline conditions) and outside the acceptable Class GA range of 6.5 to 8.5 s.u.

#### **Groundwater Sampling**

In addition to the monitoring described above, groundwater samples were collected and submitted for analytical laboratory testing on January 14, 2015. The samples were collected in general accordance with the procedures outlined in the approved post-closure monitoring and maintenance plan. A Site Plan, showing the location of the monitoring wells is included as Figure 2. Groundwater sampling initially included the measurement of static water levels in each of the monitoring wells installed at the Site (designated GW-1 through GW-5) followed by the purging of

the wells to remove approximately 3 well volumes (or until wells were dry). The monitoring wells were then allowed to recover so that "fresh" water was retained for testing. Groundwater samples were collected for testing using a dedicated bailer, which is permanently stored above the water within each well casing.

The samples collected for analytical laboratory testing were placed in sample containers provided by Paradigm Environmental Services, Inc. (Paradigm), the analytical laboratory. Paradigm also added the necessary preservatives to the sample containers that were provided for the sampling event.

The sample containers were filled by placing approximately equal amounts of sample from the bailer into each container until the container was filled. When the containers were filled they were placed in a plastic cooler containing ice and stored in a locked field vehicle until they were delivered to Paradigm for analytical laboratory testing. Chain-of-custody documentation was maintained throughout the collection of the samples and their delivery to the laboratory.

Copies of the monitoring well sample logs prepared for the January 14, 2015 sampling event are included in Appendix B. These logs summarize in-situ measurements, groundwater depths, purging information and other relative data.

#### **Analytical Laboratory Results**

The samples collected during the January 15, 2014 monitoring event were analyzed by Paradigm for the following parameters.

• Barium, Iron, Magnesium and Manganese via USEPA Method 6010

A copy of the analytical laboratory report for this sample event prepared by Paradigm and executed chain-of-custody documentation are included in Appendix B. Tables summarizing historic test results for the groundwater samples collected from the monitoring wells at the Site are presented in Appendix C.

As discussed below, the majority of the parameters detected in the samples collected during the January 15, 2014 sample event were measured at concentrations below Class GA standards established in NYSDEC Division of Water Technical and Operation Guidance Series (TOGS 1.1.1) Ambient Water Quality Standards and Guidance Values and Groundwater Effluent Limitations, dated June 1998 and appended by tables dated April 2000 and June 2004..

- Concentrations of total barium in samples collected from monitoring wells GW-1 through GW-5 during the January 14, 2015 sample event were below the TOGS standard of 1.0 mg/l.
- Concentrations of total iron in samples collected from monitoring wells GW-1 through GW-5 during the January 14, 2015 monitoring event exceeded the TOGS standard of 0.3 mg/l.
- With the exception of the total magnesium concentration measured in the sample collected from GW-1 (i.e., 57.6 mg/l), concentrations of total magnesium in samples collected from

- monitoring wells GW-1 through GW-5 during the January 14, 2015 sample event were below the TOGS standard of 35 mg/l.
- Concentrations of total manganese in samples collected from monitoring wells GW-1 through GW-5 during the January 14, 2015 sample event were below the TOGS standard of 0.3 mg/l.

Graphic representations of historic variations in concentrations of total barium, total iron, total magnesium, and total manganese, are included as Figure 5 though Figure 8 (respectively). The concentrations presented in these graphs represent analytical laboratory results for groundwater samples collected from monitoring wells GW-1 through GW-5 between April 1995 and January 2015.

As indicated by Figure 5, concentrations of total barium detected in samples collected from monitoring wells GW-1 through GW-5 during the reporting period were comparable to those measured during recent monitoring events. [Note: The increase in the concentration of total barium in the samples collected during the last two reporting periods shown on Figure 5 is due to the laboratory detection limit (i.e., 0.1 mg/l) and not due to an increase in the total barium concentrations as compared to historic levels.] Historically, the highest barium concentrations have been measured in samples collected from upgradient monitoring well GW-2. Historically, the concentrations of total barium have been below the TOGS standard of 1.0 mg/l in the samples collected from monitoring wells GW-1 through GW-5.

As indicated by Figure 6, the concentrations of total iron detected in samples collected from monitoring wells GW-1 through GW-5 during the reporting period are generally consistent with historic concentrations. Historically, the concentrations of total iron measured in samples from groundwater monitoring wells GW-1 through GW-5 fluctuate with no apparent trend evident. The iron concentrations measured in the groundwater samples collected from GW-3 and GW-4 during recent sample events (i.e., since about December 2008) have exhibited relatively stabilized conditions. The historic concentrations of total iron measured in samples from groundwater monitoring wells GW-1 through GW-5 often exceed the TOGS standard of 0.3 mg/l.

As indicated by Figure 7, concentrations of total magnesium detected in samples collected from monitoring wells GW-1 through GW-5 during the reporting period are generally consistent with historic concentrations. Although the magnesium concentrations are variable, concentrations have generally decreased with time. The highest magnesium concentrations have consistently been detected in samples collected from downgradient monitoring wells GW-1 (i.e., samples collected from this location typically contain the highest magnesium concentrations), GW-3 and GW-4. The magnesium concentrations in upgradient monitoring wells GW-2 and GW-5 have historically been lower than those detected in the downgradient monitoring wells. With the exception of the total magnesium concentration measured in the sample collected from GW-1 (i.e., 57.6 mg/l), the magnesium concentrations in the samples collected from monitoring wells GW-1 through GW-5 were below the TOGS standard of 35 mg/l during the January 14, 2015 monitoring event. Magnesium concentrations in excess of 35 mg/l have been detected historically in samples collected from monitoring wells GW-1, GW-3, GW-4, and on one occasion (i.e., January 22, 1996), GW-5.

As indicated by Figure 8, concentrations of total manganese detected in samples collected from monitoring wells GW-1, GW-3, GW-4 and GW-5 during the reporting period are generally consistent with historic concentrations. Historically, the concentrations of total manganese measured in samples from groundwater monitoring wells GW-1 through GW-5 fluctuate with no apparent trend evident. Since June 1999, concentrations of total manganese in groundwater samples

collected from GW-1 through GW-5 have been below the TOGS standard of 0.3 mg/l.	

# INSTITUTIONAL AND ENGINEERING CONTROLS CERTIFICATION FORM 4.0 A completed and signed copy of the Institutional and Engineering Controls Certification Form for the reporting period of February 1, 2014 through January 31, 2015 is included in Appendix D.

#### 5.0 CONCLUSIONS AND RECOMMENDATIONS

The following conclusions are based upon the findings of the work completed during this reporting period.

- The integrity of the Engineering Controls at the Site (i.e., a cover system over the former disposal area and a groundwater monitoring well network to evaluate the effectiveness of the landfill cap) was evaluated on the following dates during the reporting period: July 9, 2014 and January 14, 2015. This evaluation indicated that the cover system appeared to be functioning as designed. Some minor water seepage was observed at the base of the landfill during the July 9, 2014 monitoring event., The cracks observed in the landfill cover during previous monitoring period (i.e., between February 1, 2013 and January 31, 2014) did not appear to have increased, but complete observation of these cracks was limited by vegetation (July 9, 2014) and snow cover (January 14, 2015)...
- Monitoring wells GW-1 through GW-5 were observed to be in good working condition, and each well had a lockable cap and was fitted with a lock, which was locked before and after the January 14, 2015 monitoring event. However, it was noted that the bailer rope in GW-1 was severed by apparent chewing between the time it was replaced on July 2014 and the January 14, 2015 monitoring event, and it is recommend that the rope be replaced again during the upcoming reporting period.
- The June/July 2010 landfill cover repair [i.e., animal holes were filled with a low permeability soil, linear parting features (cracks and fissures) were repaired, and the area was covered with topsoil and re-seeded] area appeared to be in generally good condition during the reporting period and additional repair does not appear warranted at this time.
- Groundwater elevations varied seasonally (i.e., the groundwater elevations measured on January 14, 2015 ranged from about 0.25 feet to 0.84 feet lower than those measured on July 9, 2014). However, groundwater flow directions remained consistent throughout the reporting period (i.e., flowing generally from south-southeast to north-northwest). Based on this groundwater flow pattern monitoring wells GW-2 and GW-5 are located in hydraulically upgradient positions and the remaining monitoring wells (GW-1, GW-3 and GW-4) are located in hydraulically downgradient positions at the Site.
- The pH concentrations measured in the samples collected from GW-2, GW-4 and GW-5 on July 9, 2014 (i.e., pH = 9.08 s. u., pH = 9.56 s. u. and pH = 9.43 s. u., respectively) were elevated (alkaline) and outside the acceptable Class GA range of 6.5 to 8.5 s.u. The pH concentrations measured during the January 14, 2015 sampling event were within acceptable Class GA range of 6.5 to 8.5 s.u. The pH concentrations measured during the reporting period were within the historic range of pH values measured in samples tested between April 1995 and January 2015. However, the pH levels measured in monitoring well GW-3 during the reporting period and in monitoring well GW-4 on July 9, 2014 are above the historic average for their respective location.
- Concentrations of total barium in samples collected from monitoring wells GW-1 through GW-5 during the January 14, 2015 sample event were below the TOGS standard of 1 mg/l and the reported concentrations were comparable to those measured during previous monitoring events. Total barium concentrations measured in samples from monitoring wells

- GW-1 through GW-5 appear to be stabilized or decreasing over time.
- The concentrations of total iron in samples collected from monitoring wells GW-1 through GW-5 during the January 14, 2015 monitoring event exceeded the TOGS standard of 0.3 mg/l. However, the concentrations of total iron detected in samples collected from monitoring wells GW-1 through GW-5 during the reporting period are generally consistent with historic concentrations. Historically, the concentrations of total iron measured in samples from groundwater monitoring wells GW-1 through GW-5 fluctuate with no apparent trend evident, although the iron concentrations since about December 2008 have exhibited relatively stabilized conditions.
- With the exception of the total magnesium concentration measured in the sample collected from GW-1 (i.e., 57.6 mg/l), concentrations of total magnesium in samples collected from monitoring wells GW-1 through GW-5 during the January 14, 2015 sample event were below the TOGS standard of 35 mg/l. The results from the reporting period represent a general increase in total magnesium as compared to the results during recent sampling events. However, the concentrations of total magnesium measured in samples collected from monitoring wells GW-1 through GW-5 fluctuate historically, and the increase measured during the reporting period appears consistent with historic trends.
- Concentrations of total manganese in samples collected from monitoring wells GW-1 through GW-5 during the January 15, 2014 sample event were below the TOGS standard of 0.3 mg/l. The concentrations of total manganese detected in samples collected from monitoring wells GW-1 through GW-5 during the reporting period are generally consistent with historic concentrations. Historically the concentrations of total manganese measured in samples from groundwater monitoring wells GW-1 through GW-5 fluctuate with no apparent trend evident.

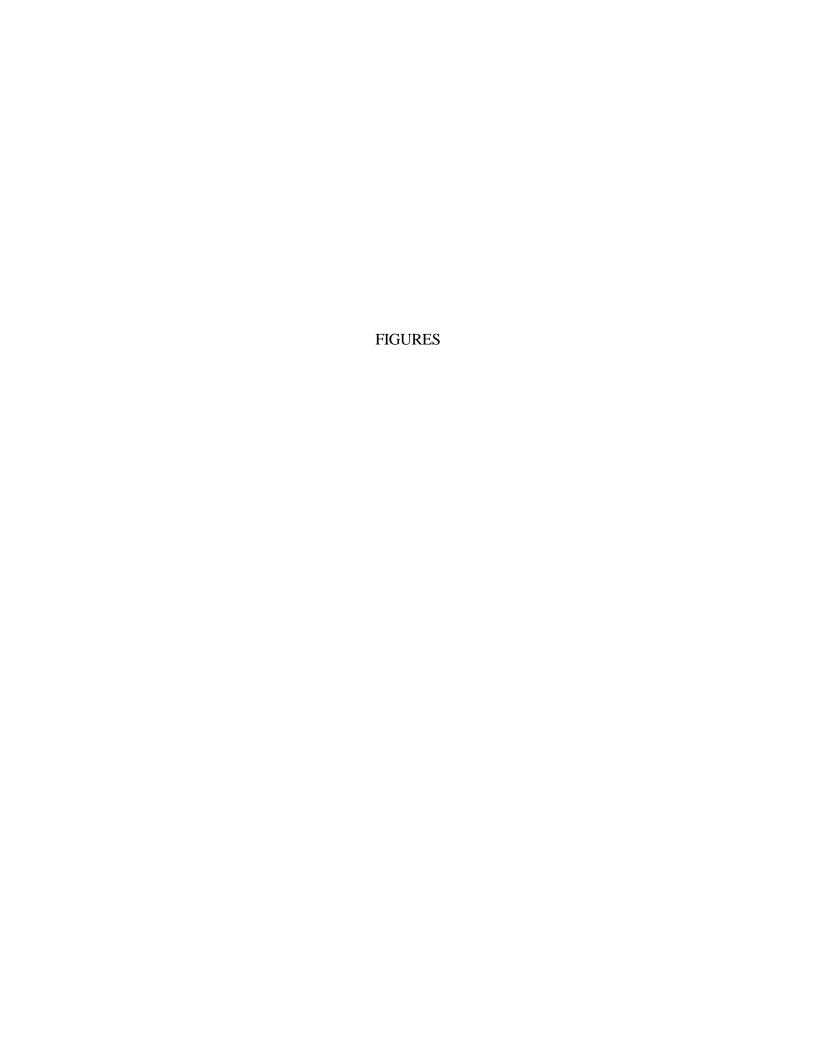

Based upon the monitoring conducted during the reporting period, the Engineering Controls implemented at the Site are functioning as designed and modifications are not required at this time. However, the water seepage on the northeast side of the landfill and the cracking in the north face of the landfill cover should continue to be monitored during the upcoming landfill inspection events. [Note: The cracking on the north face should be observed before the growing season (i.e., in March or April 2015) to assess the extent of the cracking and determine if repairs are warranted.] In addition, although surface water drainage exiting the landfill area does not appear to be restricted, it is recommended that the retention basin be cleared of vegetation to preclude potential flow obstructions in the future.

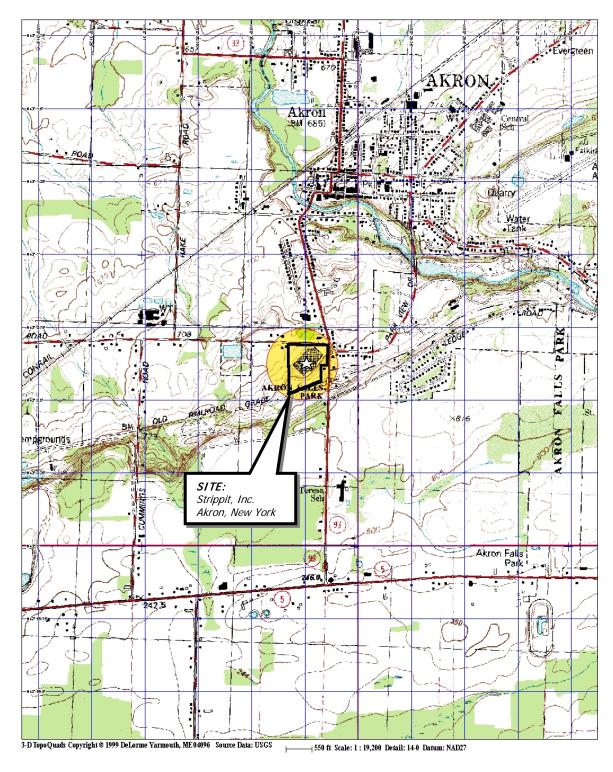

With the exception of the pH levels in monitoring well GW-3, the pH levels measured in each monitoring well during the reporting period were lower than the levels measured in the previous reporting period, and were generally below the respective historic average pH value calculated for samples collected from these monitoring wells. However, pH levels were measured at concentrations greater than 8.5 s.u. during the reporting period in samples collected from monitoring wells GW-2, GW-4 and GW-5. The pH of groundwater in the monitoring wells at the Site should be measured biannually to determine additional monitoring and/or remediation is warranted.

While the concentrations of metals detected in select groundwater samples collected during the reporting period are higher than the concentrations measured during recent reporting periods, the current levels are generally within the range of concentrations observed during historic monitoring

events. Remedial actions are not recommended at this time to address possible groundwater impacts.

The next monitoring event is scheduled for around July 9, 2015. The next sampling event would occur on or around January 14, 2016. In addition to the above, the cracks on the northern face of the landfill should be monitored prior to the growing season (i.e., in March or April 2015) to confirm that the cracking has not increased or determine if remediation is warranted.

SITE INSPECTION REPORTS: JULY 9, 2014 AND JANUARY 14, 2015

# LONG-TERM MONITORING REPORT INTERIM REMEDIAL MEASURE STRIPPIT, INC. AKRON, NEW YORK

Date of Inspection: July 9, 2014
Inspected By: C. Hampton
Summary of Observation:  Generally in good condition - Cracking in North  Slope observed - some supage @ toe of slope
Evidence of Erosion, sloughing or other degradation:  Yes No
Explain (include measurement & site sketch):
Evidence of cracking: Yes No
Explain (include measurements and site sketch):
Area I- (previously marked) - Observed cracking , but unable to determine if cracked were larger to observed on 3/18/14.  Area 2- previously marked) - Craking not observed ibe to vegetitue cover.
Evidence of water seepage: X Yes No
Explain: Standing water observed at the base of the north slope of the kind fill, in
3 below lepossions + 15-20 feet in extent, water observed sceping from kind fill to e adjacen W/slight organic type shown - 2ft from edge of parking area (-1ft above parking class
Evidence of Settlement: Yes No
Explain: 2010 repair area appears flattened but dow to animals bedding in the aven
which has flattened the vegetative court

S/fieldforms/strippit.log

Condition of monitoring wells and gas wells: 600 Condition - Carges on
cas wells suggest working order
Condition of Vegetative Cover: Abundant - vegetative cover obscures view of the landfill surface - grasses growing to ~5fffell - No dead patches or here ground observed.
Condition of drainage ways (discuss amount of water/sediments present, vegetative
growth unusual staining, blockage, etc.). ~ 1 mch of standing water in drainage ways  Partial blockage of drainage ways and burned culvert located  along NW elge of landfill from growing vegetative over-small  trees growing in disch to NW of landfill
Additional Comments:
Action Item(s) Required: - Clear ditch of vegetation  - Continue to meniter Areas of cracking on North  Slope of handfill
Action Item(s) completed since last inspection: replaced rope a parter in 600-1
Signatures:

# LONG-TERM MONITORING REPORT INTERIM REMEDIAL MEASURE STRIPPIT, INC. AKRON, NEW YORK

Date of Inspection: January 14, 2015
Inspected By: Charles Hampton
Summary of Observation:  General Condition of Cover: Not Observed - land fill cover had  - 3"-12" Snow cover at time of Site visit  and croundwater sampling event that oucured 1/14/15
Evidence of Erosion, sloughing or other degradation:   Yes   No   NA
Explain (include measurement & site sketch):  Not observed due to Snow cover
Evidence of cracking: Yes No No
Explain (include measurements and site sketch):
Not observed due to Snow Cover
Evidence of water seepage: Yes No
Explain: No Standing/pooled water or frozen pooles
were observed in the parking lot, on the worth edge of the landfull area
Evidence of Settlement: Yes No
Explain: Not observed due to Snow Cover

S/fieldforms/strippit.log

Condition of monitoring wells and gas wells: Good - Functioning Bailer rope
in Mw-1 and Mw-3 due for replacement at next Groundwater
Condition of Vegetative Cover: N/A - Not observed due to Snow cover
Condition of drainage ways (discuss amount of water/sediments present, vegetative growth unusual staining, blockage, etc.). Draining Swale & NW corner
and brush growth
Additional Comments: None
Action Item(s) Required: - clear drainage swale (Sitch) of regelation  - Confinue to monitor North-Central portion landfill slope
for Cracking/deterioration replace bailer rope in GW-1 and GW-3
Action Item(s) completed since last inspection:
Signatures: 1/14/15

#### **Analytical Report Appendix**

The reported results relate only to the samples as they have been received by the laboratory.

Each page of this document is part of a multipage report. This document may not be reproduced except in its entirety, without the prior consent of Paradigm Environmental Services, Inc.

All soil/sludge samples have been reported on a dry weight basis, unless qualified "reported as received". Other solids are reported as received.

Low level Volatiles blank reports for soil/solid matrix are based on a nominal 5 gram weight. Sample results and reporting limits are based on actual weight, which may be more or less than 5 grams.

The Chain of Custody provides additional information, including compliance with sample condition requirements upon receipt. Sample condition requirements are defined under the 2003 NELAC Standard, sections 5.5.8.3.1 and 5.5.8.3.2.

NYSDOH ELAP does not certify for all parameters. Paradigm Environmental Services or the indicated subcontracted laboratory does hold certification for all analytes where certification is offered by ELAP unless otherwise specified. Aliquots separated for certain tests, such as TCLP, are indicated on the Chain of Custody and final reports with an "A" suffix.

Data qualifiers are used, when necessary, to provide additional information about the data. This information may be communicated as a flag or as text at the bottom of the report. Please refer to the following list of analyte-specific, frequently used data flags and their meaning:

"<" = Analyzed for but not detected at or above the quantitation limit.

"E" = Result has been estimated, calibration limit exceeded.

"Z" = See case narrative.

"D" = Sample, Laboratory Control Sample, or Matrix Spike Duplicate results above Relative Percent Difference limit.

"M" = Matrix spike recoveries outside QC limits. Matrix bias indicated.

"B" = Method blank contained trace levels of analyte. Refer to included method blank report.

"J" = Result estimated between the quantitation limit and half the quantitation limit.

"L" = Laboratory Control Sample recovery outside accepted QC limits.

"P" = Concentration differs by more than 40% between the primary and secondary analytical columns.

"NC" = Not calculable. Applicable to RPD if sample or duplicate result is non-detect or estimated (see primary report for data flags). Applicable to MS if sample is greater or equal to ten times the spike added. Applicable to sample surrogates or MS if sample dilution is 10x or higher.

"\*" = Indicates any recoveries outside associated acceptance windows. Surrogate outliers in samples are presumed matrix effects. LCS demonstrates method compliance unless otherwise noted.
"(1)" = Indicates data from primary column used for QC calculation.

This report is part of a multipage document and should only be evaluated in its entirety. The Chain of Custody provides additional sample information, including compliance with the sample condition requirements upon receipt.

#### GENERAL TERMS AND CONDITIONS LABORATORY SERVICES

These Terms and Conditions embody the whole agreement of the parties in the absence of a signed and executed contract between the Laboratory (LAB) and Client. They shall supersede all previous communications, representations, or agreements, either verbal or written. between the parties. The LAB specifically rejects all additional, inconsistent, or conflicting terms, whether printed or otherwise set forth in any purchase order or other communication from the Client to the LAB. The invalidity or unenforceability in whole or in part of any provision, term or condition hereof shall not affect in any way the validity or enforceability of the remainder of the Terms and Conditions. No waiver by LAB of any provision, term, or condition hereof or of any breach by or obligation of the Client hereunder shall constitute a waiver of such provision, term, or condition on any other occasion or a waiver of any other breach by or obligation of the Client. This agreement shall be administered and interpreted under the laws of the state which services are procured.

Warranty.

Recognizing that the nature of many samples is unknown and that some may contain potentially hazardous components, LAB warrants only that it will perform testing services, obtain findings, and prepare reports in accordance with generally accepted analytical laboratory principles and practices at the time of performance of services. LAB makes no other warranty, express or implied.

Scope and Compensation. LAB agrees to perform the services described in the chain of custody to which these terms and conditions are attached. Unless the parties agree in writing to the contrary, the duties of LAB shall not be construed to exceed the services specifically described. LAB wi use LAB default method for all tests unless specified otherwise on the Work Order.

Payment terms are net 30 days from the date of invoice. All overdue payments are subject to an interest charge of one and one-half percent (1-1/2%) per month or a portion thereof. Client shall also be responsible for costs of collection, including payment of reasonable attorney fees if such expense is incurred. The prices, unless stated, do not include any sale, use or other taxes. Such taxes will be added to invoice prices when required.

Prices.

Compensation for services performed will be based on the current Lab Analytical Fee Schedule or on quotations agreed to in writing by the parties. Turnaround time based charges are determined from the time of resolution of all work order questions. Testimony, court appearances or data compilation for legal action will be charged separately.

Limitations of Liability.

In the event of any error, omission, or other professional negligence, the sole and exclusive responsibility of LAB shall be to reperform the deficient work at its own expense and LAB shall have no other liability whatsoever. All claims shall be deemed waived unless made in writing and received by LAB within ninety (90) days following completion of services.

LAB shall have no liability, obligation, or responsibility of any kind for losses, costs, expenses, or other damages (including but not limited to any special, direct, incidental or consequential damages) with respect to LAB's services or results.

All results provided by LAB are strictly for the use of its clients and LAB is in no way responsible for the use of such results by clients or third parties. All reports should be considered in their entirety, and LAB is not responsible for the separation, detachment, or other use of any portion of these reports. Client may not assign the lab report without the written consent of the LAB.

Client covenants and agrees, at its/his/her sole expense, to indemnify, protect, defend, and save harmless the LAB from and against any and all damages, losses, liabilities, obligations, penalties, claims, litigation, demands, defenses, judgments, suits, actions, proceedings, costs, disbursements and/or expenses (including, without limitation attorneys' and experts' fees and disbursements) of any kind whatsoever which may at any time be imposed upon, incurred by or asserted or awarded against client relating to, resulting from or arising out of (a) the breach of this agreement by this client, (b) the negligence of the client in handling, delivering or disclosing any hazardous substance, (c) the violation of the Client of any applicable law, (d) non-compliance by the Client with any environmental permit or (e) a material misrepresentation in disclosing the materials to be tested.

Hazard Disclosure.

Client represents and warrants that any sample delivered to LAB will be preceded or accompanied by complete written disclosure of the presence of any hazardous substances known or suspected by Client. Client further warrants that any sample containing any hazardous substance that is to be delivered to LAB will be packaged, labeled, transported, and delivered properly and in accordance

Sample Handling.

Prior to LAB's acceptance of any sample (or after any revocation of acceptance), the entire risk of loss or of damage to such sample remains with Client. Samples are accepted when receipt is acknowledged on chain of custody documentation. In no event will LAB have any responsibility for the action or inaction of any carrier shipping or delivering any sample to or from LAB premises. Client authorizes LAB to proceed with the analysis of samples as received by the laboratory, recognizing that any samples not in compliance with all current DOH-ELAP-NELAP requirements for containers, preservation or holding time will be noted as such on th final report.

Disposal of hazardous waste samples is the responsibility of the Client. If the Client does not wish such samples returned, LAB may add storage and disposal fees to the final invoice. Maximum storage time for samples is 30 days after completion of analysis unless modified by applicable state or federal laws. Client will be required to give the LAB written instructions concerning disposal of these samples.

LAB reserves the absolute right, exercisable at any time, to refuse to receive delivery of, refuse to accept, or revoke acceptance of any sample, which, in the sole judgment of LAB (a) is of unsuitable volume, (b) may be or become unsuitable for or may pose a risk in handling, transport, or processing for any health, safety, environmental or other reason whether or not due to the presence in the sample of any hazardous substance, and whether or not such presence has been disclosed to LAB by Client or (c) if the condition or sample date make the sample unsuitable for analysis.

Legal Responsibility. LAB is solely responsible for performance of this contract, and no affiliated company, director, officer, employee, or agent shall have any legal responsibility hereunder, whether in contract or tort including negligence.

Assignment.

LAB may assign its performance obligations under this contract to other parties, as it deems necessary. LAB shall disclose to Client any assignee (subcontractor) by ELAP ID # on the submitted final report.

Force Majeure.

LAB shall have no responsibility or liability to the Client for any failure or delay in performance by LAB, which results in whole or in part from any cause or circumstance beyond the reasonable control of LAB. Such causes and circumstances shall include, but not limited to, acts of God, acts or orders of any government authority, strikes or other labor disputes, natural disasters, accidents, wars, civil disturbances, difficulties or delays in transportation, mail or delivery services, inability to obtain sufficient services or supplies from LAB's usual suppliers, or any other cause beyond LAB's reasonable control.

Law.

This contract shall be continued under the laws of the State of New York without regard to its conflicts of laws provision.

This report is part of a multipage document and should only be evaluated in its entirety. The Chain of Custody provides additional sample information, including compliance with the sample condition requirements upon receipt.

#### Annual Certification Report SPDES Multi-Sector General Permit for Stormwater Discharges Associated with Industrial Activity (GP-12-01-001)

The owner/operator shall complete this Annual Certification Report form by answering the following questions, describing improvements to the facility's Stormwater Pollution Prevention Plan (SWPPP), providing copies of monitoring results on appropriate Discharge Monitoring Reports forms and signing the certification at the end of this form. This completed report is to be submitted each calendar year by February 28th of the following year to:

MSGP Permit Coordinator NYSDEC, Bureau of Water Compliance 625 Broadway, Albany, NY, 12233-3506

SECTION I: FACILITY INFORMATION:		
Permit I.D. No.: NYR00 Report for Calendar Year:		
Owner Name		
Facility Name		
SECTION II: GENERAL INFORMATION:		
1. List the number of stormwater outfalls at the facility that are from areas of industrial activity		
2. Is the facility claiming any monitoring waiver(s)?	○ Yes	○ No
If yes, which waiver(s) are you claiming?		
○ Adverse Climatic Conditions*		
○ Alternate Certification of "Not Present" or "No Exposure"		
○ Inactive or Unstaffed Site*		
O Representative Outfall*		
* If you are claiming a monitoring waiver the appropriate monitoring waiver form must be included with your Disch Monitoring Report form.	ıarge	
3. Is the information provided in your original Notice of Intent (NOI) submission still accurate and up to date? If		
not, please submit a Notice of Modification (NOM) to update the facility information	O Yes	O No
4. Has a comprehensive Site Compliance Inspection and Evaluation been conducted at the facility in the past year?	○ Yes	O No
5. Is the facility's Stormwater Pollution Prevention Plan (SWPPP) kept up to date and modified when necessary?	○ Yes	○ No
SECTION III: QUARTERLY VISUAL MONITORING:		
1. Have the required quarterly visual examinations of stormwater at the facility been performed during this reporting		
period (See Part.IV.1.a of the MSGP)?	○ Yes	О Мо
2. Did any of the quarterly visual examinations result in observations of color, odor, clarity, floating solids, settled		
solids, suspended solids, foam, oil sheen, or other indicators of stormwater pollution and contamination? (If yes,		
question 2.A, 2.B, and 2.C below must be answered)	O Yes	O No
A. Were corrective and follow up actions taken (See Part IV.B.1.a.(5) of the MSGP)?	○ Yes	O No
B. Has the facility's SWPPP been updated to include modification to existing BMPs or installation of new BMPs to prevent stormwater pollution and contamination from reoccurring (See Part IV.B.1.a.(5)(c) of the MSGP)?	○ Yes	○ No
C. Was a follow up visual inspection conducted to ensure corrective and follow up actions were successful (See	O 11	O

#### SECTION IV: ANNUAL DRY WEATHER FLOW MONITORING:

1. Was the annual dry weather flow inspection performed during this reporting period (See Part IV.B.1.b of the MSGP)?	. () У	es	○ No
2. Were any non-stormwater dischargers or indicators of non-stormwater discharges identified? (If no, proceed to Section IV)	O Y	es	○ No
3. Was the source of the non-stormwater discharge identified? (If no, proceed to question 5)	. О У	es	○ No
4. Is the source an allowable non-stormwater discharge (i.e., discharge covered by another SPDES permit or an allowable non-stormwater discharge covered in Part I.C.3 of the MSGP)? (If yes, question 4.A. below must be answered; if no, proceed to question 5)	. О У	es	○ No
A. Has the facility's SWPPP been updated to address the newly identified allowable non-stormwater discharge(s) (See Part IV.B.1.b.(3)(d) of the MSGP)?	() Y	es	○ No
5. Were corrective and follow up actions taken to eliminate the unauthorized non-stormwater discharge (See Part IV.B.1.b.(3) of the MSGP)?	. О У	es	○ No
6. Were corrective and follow up actions successful in eliminating the unauthorized non-stormwater discharge?	. () У	es	○ No
<b>Note:</b> If it is not possible to eliminate the non-authorized stormwater discharge the owner/operator must notify the Department with 14 days.			
SECTION V: STORMWATER MONITORING - BENCHMARK PARAMETERS:			
1. Is the owner/operator required to monitor stormwater at the facility for benchmark parameters (See Part IV.B.1.c)? (If no, proceed to Section V)	ОЧ	es	○ No
2. Were there any monitoring problems? (Answer "Yes" if storm event criteria was not met or if the laboratory indicated quality assurance/quality control problems)	. () Ч	es	O No
3. Were any of the sampling results from this year higher than the benchmark cut-off concentrations listed in the permit? (If yes, questions 3.A and 3.B below must be answered)	. О Х	es	O No
A. Were corrective and follow up actions taken (See Part IV.B.1.c.(6) of the MSGP)?	ОЧ	es	O No
B. Has the facility's SWPPP been updated to include modification to existing BMPs or installation of new BMPs to prevent the benchmark exceedance from reoccurring (See Part IV.B.1.c.(6)(c) of the MSGP)?	. () Х	es	O No
<b>Note:</b> If you had a benchmark exceedance your Corrective Action Form with follow up sample results are due by July 31 (See Part IV.B.1.c.(6)(d)(iii) of the MSGP).			
SECTION VI: STORMWATER MONITORING - COAL PILE RUNOFF:			
1. Is the owner/operator required to conduct compliance monitoring for storm water discharges from coal piles (See Part IV.B.1.d of the MSGP? (If no, proceed to Section VI)	. () У	es	O No
2. Were there any monitoring problems? (Answer "Yes" if storm event criteria was not meet or if the laboratory indicated quality insurance assurance/quality control problems)	. () У	es	O No
3. Were any of the sampling results from this year higher than the effluent limitations listed in Table IV-1 of the MSGP? (If yes, questions 3.A and 3.B. below must be answered)	. () Y	es	○ No
A. Were corrective and follow up actions taken (See Part IV.B.1.d.(6) of the MSGP)?	O Y	es	O No
B. Has the facility's SWPPP been updated to include modification to existing BMPs or installation of new BMPs to prevent the effluent limitation exceedance from reoccurring (See Part IV.B.1.d.(6) of the MSGP)?	. () Ч	es	○ No
<b>Note:</b> If you had a effluent limitation exceedance your Corrective Action Form with follow up sample results are by July 31 (See Part IV.B.1.e.(5)(e)(ii) of the MSGP).	due		

#### SECTION VII: STORMWATER MONITORING - COMPLIANCE MONITORING

1. Is the owner/operator required to conduct compliance monitoring for storm water discharges subject to Point Source Category Effluent Limitations (See Part IV.B.1.e of the MSGP)? (If no, proceed to Section VII)	O Yes	O N
2. Were there any monitoring problems? (Answer "Yes" if storm event criteria was not meet of if the laboratory indicated quality insurance assurance/quality control problems)	○ Yes	O N
3. Were any of the sampling results from this year higher than the effluent limitations listed in the permit? (If yes, questions 3.A and 3.B. below must be answered)	○ Yes	O N
A. Were corrective and follow up actions taken (See Part IV.B.1.e.(5) of the MSGP)?	○ Yes	O N
B. Has the facility's SWPPP been updated to include modification to existing BMPs or installation of new BMPs to prevent the effluent limitation exceeding from reoccurring (See Part IV.B.1.e.(5)(c) of the MSGP?	○ Yes	Ои
<b>Note:</b> If you had an effluent limitation exceedance your Corrective Action Form with follow up sample results are due by July 31 (See Part IV.B.1.e.(5)(e)(ii) of the MSGP).		
SECTION VIII: STORMWATER MONITORING - DISCHARGES TO IMPAIRED WATERBODIES:		
1. Is the owner/operator required to conduct compliance monitoring for discharges to impaired waterbodies (See Part IV.B.1.g of the MSGP)? (If no, proceed to Section VIII)	○ Yes	O N
2. Were there any monitoring problems? (Answer "Yes" if storm event criteria was not meet of if the laboratory indicated quality insurance assurance/quality control problems)	○ Yes	O N
3. Were any of the sampling results from this year higher than the benchmark cut-off concentrations or effluent limitations listed in the permit? (If yes, questions 3.A and 3.B below must be answered).	○ Yes	O N
A. Were corrective and follow up actions taken (See Part IV.B.1.g.(6) of the MSGP)?	○ Yes	O N
B. Has the facility's SWPPP been updated to include modification to existing BMPs or installation of new BMPs to prevent the benchmark cutoff concentrations or effluent limitations exceedance from reoccurring (See Part IV.B.1.g.(6)(c) of the MSGP)?	() Yes	O N
C. Did the follow-up quarterly sample show the corrective and follow up actions to be successful?	Ü	O N
SECTION IX: SUMMARY:		
Provide a brief description of any facility changes; problems identified during comprehensive compliance evaluation visual observations or monitoring results; and actions taken to improve the quality of the stormwater discharge.	ıs, quarter	ly
