Groundwater and Surface Water Sampling Field Summary Report
Former Westinghouse Site (NYSDEC Site No. 915066) Buffalo Niagara International Airport, Cheektowaga, New York

Dear Mr. Locey,

On behalf of Paramount Global (f/k/a ViacomCBS Inc., f/k/a Westinghouse Electric Corporation [Westinghouse]), GHD is presenting this Groundwater and Surface Water Sampling Field Summary Report for the groundwater and surface water sampling event conducted on November 15 and 16, 2021 at the Former Westinghouse Manufacturing Facility (Site) at the Buffalo Niagara International Airport in Cheektowaga, New York. The sampling event was conducted in general accordance with the Letter Work Plan for Proposed Groundwater and Surface Water Sampling at the Former Westinghouse Site (Work Plan) prepared by GHD on behalf of Westinghouse, dated November 14, 2019, approved by the New York State Department of Conservation (NYSDEC) in a letter dated September 15, 2021. This letter presents a summary of the methodologies and results of the sampling event. The field paperwork generated during the sampling event is included as Attachment A.

1. Groundwater Sampling

GHD sampled existing monitoring wells MW-2, MW-5, MW-28, MW-30, MW-31, MW-32, MW-33, MW-34, MW-34D, and MW-35 during the sampling event using a peristaltic pump and low-flow methods. Well locations are shown on Figure 1. Field parameters (pH, specific conductance, temperature, oxidation-reduction potential, dissolved oxygen, and turbidity) were measured in approximate 5-minute intervals during the well purging and are presented in Attachment B. All field measurements and observations are indicated on the field forms included in Attachment A. Initial water levels measured at each well prior to purging the well are presented in Table 1 below.

Table 1

Well	Depth to Water (ft. BTOR)
MW-2	7.05
MW-5	2.35
MW-28	5.74

Well	Depth to Water (ft. BTOR)
MW-30	3.69
MW-31	2.76
MW-32[1]	1.26
MW-33	4.81
MW-34	2.40
MW-34D	0.28
MW-35	11.08

Notes:

Ft. BTOR – Feet below top of riser

[1] MW-32 is located 1,400 feet away from the Site

Purge water was disposed directly to the ground surface as directed by the Niagara Frontier Transportation Authority (NFTA) Environmental Manager and Brian McDonald, NFTA Project Manager.

Following completion of purging, GHD collected groundwater samples from the ten wells for analysis of the following Site-specific volatile organic compounds (VOCs) via United States Environmental Protection Agency (USEPA) Standard Method 624.1: cis-1,2-dichloroethylene; 1,1,1-trichloroethane; trichloroethylene (TCE); vinyl chloride; and toluene; and for the following Site-specific metals via USEPA Method 200.7: total lead and total cadmium. One blind field duplicate sample was collected from MW-5 and analyzed for all parameters, and one matrix spike/matrix spike duplicate (MS/MSD) sample was collected from MW-34D. The samples were shipped on ice by overnight courier under standard chain of custody procedure to Eurofins TestAmerica in Pittsburgh, Pennsylvania, a New York State Department of Health (NYSDOH) Environmental Laboratory Approval Program (ELAP) certified laboratory. A trip blank prepared by the laboratory accompanied the sample bottles at all times and was also analyzed for VOCs.

2. Surface Water Sampling

GHD collected grab samples from the manholes and catch basins identified as MH-1A, MH-1B, MH-1C, MH-2A, MH-2B, MH-2C, MH-2D, MH-3A, MH-3B, and MH-3C during the sampling event using dedicated and disposable dipper cups and bailers. Sample locations are shown on Figure 1. Indications of flow and sediment presence were noted during sample collection. Flow measurements were not performed. Field measurements for pH were performed as part of sample collection. All field measurements and observations are indicated on the field forms included in Attachment A. Water levels measured at each location prior to sample collection are presented in Table 2 below.

Table 2

Location	Depth to Water (ft. $BTOR_f$)
MH-1A	12.98
MH-1B	7.10
MH-1C	7.95
MH-2A	8.18
MH-2B	8.18
MH-2C	5.13
MH-2D	4.03
MH-3A	3.52
MH-3B	4.73
MH-3C	5.82

Notes:

Ft. BTOR – Feet below top of reference point

GHD collected surface water samples from the ten locations for analysis of the following Site-specific VOCs via USEPA Standard Method 624: cis-1,2-dichloroethylene; TCE; tetrachloroethylene (PCE); vinyl chloride; methylene chloride; 1,2-dichlorobenzene; and toluene; and for the following Site-specific metals via USEPA Method 200.7: total lead, total chromium, and total cadmium. One blind field duplicate sample was collected from MH-2C and analyzed for all parameters, and one MS/MSD sample was collected from MH-3B. Additional samples were collected from each location for analysis of total suspended solids and pH. The samples were shipped on ice by overnight courier under standard chain of custody procedure to Eurofins TestAmerica in Pittsburgh, Pennsylvania. A trip blank prepared by the laboratory accompanied the sample bottles at all times and was also analyzed for VOCs.

3. Analytical Results and Closing

The laboratory analytical data reports for the groundwater and surface water samples collected and submitted for analysis are included as Attachment C. Tables 3 and 4 (following the text) present the analytical results for the groundwater and surface water samples, respectively

A GHD chemist completed a reduced data validation on the laboratory analytical data package from the sampling event. The chemist concluded that the laboratory data are acceptable with the noted qualifications. The data validation memo is included as Attachment D.

The following is a brief discussion on the results of this sampling event.

Groundwater Results

From the 10 groundwater samples collected in 2021, no analytes were detected at concentrations above the NYSDEC Class GA Groundwater Standards. In fact, VOC concentrations were non-detect, with the exception of trace concentrations (less than 2 ug/L) for three of the VOCs at monitoring well MW-32 which is located 1,400 feet north of the former manufacturing plant area (Site). The 2021 results are consistent with the historic sampling performed at the Site. These results confirm the conclusions of the previous reports for the former facility in that the overall overburden groundwater regime has not been impacted by the operations at the former Westinghouse facility. The only significant impact to the groundwater regime is the isolated chemical presence pockets identified in the trenches that have been excavated into the fine-grained overburden soils for installation of the various sewer systems.

Storm Sewer Results

GHD performed a Mann-Kendall trend test on the storm water data collected in the sewer conveyance system from 2008 through 2021 to update the results of the Mann-Kendall trend test included in the 2017 post-closure report. The storm water data for samples collected from 2008 through 2021 is presented in Table 5 (following the text). The results of the updated statistical analysis are presented in Attachment E and demonstrate that concentrations of total VOCs, TCE, PCE, chromium, lead, and cadmium (where detected) have predominantly been stable exhibiting no significant trends over time following Site closure. The only exceptions to this are the statistically significant trends that were identified at the following locations:

– There were decreasing trends for TCE and PCE at MH 2B and 3A.
– There was an increasing trend in lead concentrations in water collected from MH-3A, albeit at fairly low concentrations below the remedial action objective of 25 µg/L for lead in groundwater and below the groundwater effluent limitation of 50 µg/L for discharge of lead to Class GA waters.

As noted in Attachment E, the Mann-Kendall trend test does have some limitations (due to the frequency and time period of testing and the number of non-detects). Consequently, a closer review of the specific VOC storm water quality data has been performed. Based on this review, the following observations are evident:

- **1,2 Dichlorobenzene –** All of the 2021 sample results were non-detect. In fact, all the sample results measured since 2014 have been non-detect.
- **Methylene Chloride –** All of the 2021 sample results were non-detect, as have most of the sample results measured since 2014.
- **Toluene –** All of the 2021 sample results were non-detect, as have most of the sample results measured since 2014.
- **Vinyl Chloride –** Eight of the ten sample results from 2021 were non-detect or detected at concentrations less than 1 ug/L. The remaining two samples had concentrations of 1.1 and 1.5 ug/L, which are below NYSDEC Class GA Groundwater Standards.
- **cis-1,2-Dichloroethylene –** Of the 10 samples collected in 2021, five were non-detect or at concentrations less than 1 ug/L. Three samples were at their lowest detected level ever for those specific locations indicating that concentrations of cis-1,2-dichloroethylene are continuing to decrease. The concentrations in the remaining two samples (MH 2A and 2D) were higher than the results in the next most recent sampling event (2016) but are well within the range of values in the post-shutdown era and are well below the highest concentrations measured in the post-shutdown era for these two manhole locations (at 18 percent of the peaks). As a further note, the presence of cis-1,2-dichloroethylene in the sewers indicates that the original TCE released at the Site is continuing to naturally degrade in place. This is an encouraging factor in the overall remediation of the Site.
- **PCE –** Of the 10 samples collected in 2021, six were non-detect or at concentrations less than 1 ug/L. One sample had the same concentration as in 2016. The remaining three samples were at their lowest detected level ever for those specific locations indicating that concentrations of PCE are continuing to decrease.
- **TCE –** Of the 10 samples collected in 2021, five were non-detect. Three samples were at their lowest detected level ever for those specific locations indicating that concentrations of TCE are continuing to decrease. The concentrations in the remaining two samples (MH 2A and 2D) were higher than the results in the next most recent sampling event (2016) but are well within the range of values in the post-shutdown era and are well below the highest concentrations measured in the post-shutdown era for these two manhole locations (at 10 percent of the peaks).

These results show that the sewer water quality is continuing to improve, with 16 of 30 samples for cis-1,2-dichloroethylene, PCE, and TCE at non-detect or less than 1 ug/L, with nine of the 30 sample results for cis-1,2-dichloroethylene, PCE, and TCE now at their lowest concentrations ever, and with 4 of the remaining 5 samples for these compounds at lower than 10% for two and 18% for the other two of the peak concentrations.

To put the remaining chemical presence in the sewers into perspective, consider the following:

- The highest concentration measured in the 2021 sampling event was 81 ug/L of TCE in MH 2A. Upon checking with the field crew who performed the sampling, the flow in MH 2A where this sample was collected, was only a trickle (as was the case at most of the sampled manholes). Although specific flow measurements were not made at the time of the sample collection, it was estimated by the field crew that the trickle of flow was on the order of 1 gallon/minute. At this flow rate, the discharge of TCE from the sewer system into U Crest Ditch is estimated to be as follows:

  81 µg/L X lb/4.53E+8 µg X 3.78 L/gal x 1 gal/min X 525600 min/yr = **0.36 Pounds/Year**
- At less than a pound / year of TCE discharge from the sewer system to the receiving stream (U Crest Ditch), the environmental significance of such a discharge is minimal. In fact, the slightest increase in flow in the sewer system due to precipitation inflow would dilute the TCE concentration in the sewer to less than the New York State Class B, C, or D surface water criteria of 40 ug/L. Coupling this with the dilution that would occur when the sewer flow enters the flow in the ditch ensures that the resulting concentration of TCE would be significantly reduced. Further, the half-life of TCE in a stream due to volatilization is only 1.2 hours to 4.6 days and the biodegradation half-life is only around 6 days (Agency for Toxic Substances & Disease Registry).

Based on the results of this sampling event, the following conclusions are evident:

1. The overall overburden groundwater flow regime meets Class GA groundwater standards and will continue to do so into the future.
2. The chemical concentrations in the sewer system are continuing to decrease.
3. Even the highest concentrations measured in the 2021 sampling event pose no significant environmental or public health risk.
4. It is not expected that future threats / risks due to the storm water quality would be any different.
5. The data provide ample evidence that closure of the groundwater collection and treatment system for OU2 at the Site has not resulted in any rebound of concentrations and expectations are that the concentrations will continue to reduce with time.
6. The investigations have shown that the operations associated with OU2 have been successful and are no longer necessary and OU2 should be considered complete.

Should you have any questions or wish to discuss the work completed, please do not hesitate to contact Maggie Popek at 716-205-1973 or margaret.popek@ghd.com.

Multi-parameter meter 08848
Turbidimeter 08803
Signature D. Tyran

Notes:
(1) The pump intake will be placed at the well screen mid-point or at a minimum of 2 ft above any sediment accumulated at the well bottom.
(2) The well screen volume will be based on a 5-foot screen length (L). For Imperial units, Vs=π*(r")*L* (2.54)", where r and L are in inches.
(3) The drawdown from the initial water level should not exceed 0.3 ft. The pumping rate should not exceed 600 mL/min.
(4) Purging will continue until stabilization is achieved or until 20 well screen volumes have been purged (unless purge water remains visually turbid and appears to be clearing, or unless stabilization parameters are varying slightly outside of the stabilization criteria and appear to be stabilizing). No. of Well Screen Volumes Purged= Vp/Vs.

Water Level Meter 08844

Multi-parameter meter 08848

Turbidimeter 08803

Signature Dave J Tyran

Notes:

(1) The pump intake will be placed at the well screen mid-point or at a minimum of 2 ft above any sediment accumulated at the well bottom.

(2) The well screen volume will be based on a 5-foot screen length (L). For Imperial units, $Vs=\pi*(r^2)*L*(2.54)^3$, where r and L are in inches.

(3) The drawdown from the initial water level should not exceed 0.3 ft. The pumping rate should not exceed 600 mL/min.

(4) Purging will continue until stabilization is achieved or until 20 well screen volumes have been purged (unless purge water remains visually turbid and appears to be clearing, or unless stabilization parameters are varying slightly outside of the stabilization criteria and appear to be stabilizing). No. of Well Screen Volumes Purged= Vp/Vs.

MONITORING WELL RECORD FOR LOW-FLOW PURGING

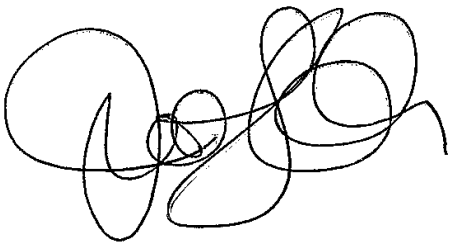
ANALYTICAL REPORT

Job Number: 180-130105-1

Job Description: 0018036 Westinghouse

For:
GHD Services Inc.
2055 Niagara Falls Blvd., Suite 3
Niagara Falls, NY 14304

Attention: Mr. Paul McMahon



Approved for release.
Jill L Colussy
Project Manager I
11/30/2021 2:50 PM

Jill L Colussy, Project Manager I
301 Alpha Drive, Pittsburgh, PA, 15238
(412)963-2444
Jill.Colussy@Eurofinset.com
11/30/2021

The test results in this report meet all NELAP requirements for parameters for which accreditation is required or available. Any exceptions to the NELAP requirements are noted in this report. Pursuant to NELAP, this report may not be reproduced, except in full, without the written approval of the laboratory. This report is confidential and is intended for the sole use of TestAmerica and its client. All questions regarding this report should be directed to the TestAmerica Project Manager or designee who has signed this report.

The test results in this report relate only to the samples as received by the laboratory and will meet all requirements of the methodology, with any exceptions noted. This report shall not be reproduced except in full, without the express written approval of the laboratory. All questions should be directed to the Eurofins TestAmerica Project Manager.

This report has been electronically signed and authorized by the signatory. Electronic signature is intended to be the legally binding equivalent of a traditionally handwritten signature.

CASE NARRATIVE

Client: GHD Services Inc.

Project: 0018036 Westinghouse

Report Number: 180-130105-1

With the exceptions noted as flags or footnotes, standard analytical protocols were followed in the analysis of the samples and no problems were encountered or anomalies observed. In addition all laboratory quality control samples were within established control limits, with any exceptions noted below. Each sample was analyzed to achieve the lowest possible reporting limit within the constraints of the method. In some cases, due to interference or analytes present at high concentrations, samples were diluted. For diluted samples, the reporting limits are adjusted relative to the dilution required.

Calculations are performed before rounding to avoid round-off errors in calculated results.

All holding times were met and proper preservation noted for the methods performed on these samples, unless otherwise detailed in the individual sections below.

RECEIPT

The samples were received on 11/17/2021 10:00 AM. Unless otherwise noted below, the samples arrived in good condition, and where required, properly preserved and on ice. The temperatures of the 3 coolers at receipt time were 2.3º C, 3.0º C and 3.6º C.

VOLATILES

The laboratory control sample (LCS) for batch 180-380188 recovered below the control limits for 1,1,1-Trichloroethane. A low-level LCS (LLCS), spiked at the reporting limit (RL), was prepared with this batch. The affected target analytes recovered within acceptance limits; therefore, the LLCS demonstrates the analytical system had sufficient sensitivity to detect the compounds had they been present. Since the affected target compounds were not detected in the samples, the data have been reported and qualified.

The continuing calibration verification (CCV) analyzed in batch 180-380188 was outside the method criteria for the following analyte(s): 1,1,1-Trichloroethane and Carbon tetrachloride. (LOW). A CCV standard at or below the reporting limit (RL) was analyzed with the affected samples and found to be acceptable. As indicated in the reference method, sample analysis may proceed; however, any detection for the affected analyte(s) is considered estimated.

The continuing calibration verification (CCV) analyzed in batch 180-379675 was analyzed to establish Internal Standard Area Counts.

METALS

Sample WG-11201415-111521-SG-008 (180-130105-8) was analyzed at a dilution due to matrix interference on the internal standard. The reporting limits have been adjusted accordingly.

Qualifiers

GC/MS VOA

Qualifier	Qualifier Description
*-	LCS and/or LCSD is outside acceptance limits, low biased.
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

Metals

Qualifier	Qualifier Description
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
¤	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CFU	Colony Forming Unit
CNF	Contains No Free Liquid
DER	Duplicate Error Ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL	Detection Limit (DoD/DOE)
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision Level Concentration (Radiochemistry)
EDL	Estimated Detection Limit (Dioxin)
LOD	Limit of Detection (DoD/DOE)
LOQ	Limit of Quantitation (DoD/DOE)
MCL	EPA recommended "Maximum Contaminant Level"
MDA	Minimum Detectable Activity (Radiochemistry)
MDC	Minimum Detectable Concentration (Radiochemistry)
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
MPN	Most Probable Number
MQL	Method Quantitation Limit
NC	Not Calculated
ND	Not Detected at the reporting limit (or MDL or EDL if shown)
NEG	Negative / Absent
POS	Positive / Present
PQL	Practical Quantitation Limit
PRES	Presumptive
QC	Quality Control
RER	Relative Error Ratio (Radiochemistry)
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)
TNTC	Too Numerous To Count

Accreditation/Certification Summary

Client: GHD Services Inc. Job ID: 180-130105-1
Project/Site: 0018036 Westinghouse

Laboratory: Eurofins TestAmerica, Pittsburgh

Unless otherwise noted, all analytes for this laboratory were covered under each accreditation/certification below.

Authority	Program	Identification Number	Expiration Date
Virginia	NELAP	10043	09-15-22

The following analytes are included in this report, but the laboratory is not certified by the governing authority. This list may include analytes for which the agency does not offer certification.

Analysis Method	Prep Method	Matrix	Analyte
