TABLE OF CONTENTS

SECTION I
EXECUTIVE SUMMARY

This report, prepared for the New York State Department of Environmental Conservation (NYSDEC) presents the results of the Phase I investigation for the Village of Depew Landfill (NYS Site Number 915105, no EPA Site Number given) located in the Village of Depew, Erie County, New York (see Figure I-1).

SITE BACKGROUND

From approximately 1940 to 1961, approximately 10,000 tons per year of municipal wastes were disposed of in the Village of Depew landfill (ECDEP, Hazardous Waste Site Profile Report, 2/85; Domino, 12/10/85). The Village of Depew owned the landfill during the period when the landfill was operated. In 1983, the landfill was purchased by Erie County and approximately 60,000 cubic yards of municipal wastes were excavated from the landfill site and an overflow retention facility (ORF) was constructed on-site (ECDEP, Hazardous Waste Site Profile Report, 2/85; Domino, 12/10/85).

Hazardous wastes are not known to have been disposed of at the Village of Depew Landfill site (ECDEP, Hazardous Waste Site Profile Report, 2/85; Domino, 12/10/85). An inspection of the site conducted in April 1985 by the ECDEP did not find waste materials protruding from the landfill or evidence of leachate runoff at the site (Voell, 4/29/85). However, foundry sand from Dresser Industries was used as cover material for the landfill (Labensiki, 1/17/86). Foundry sands disposed of by Dresser Industries have previously been found to contain phenol (Landcaster Reclamation, 5/85; Land Reclamation, 5/85). Monitoring to determine if phenol is present on-site has not been conducted to date (Labenski, 1/17/86).

Environmental monitoring of the groundwater, surface water or soil has not been conducted at the site (NYSDEC, Registry Sheet, 1/10/85). In 1982, soil characterization work (borings) was conducted at the landfill site as part of the assessment work for the construction of the overflow retention facility; however, the soil samples collected during the on-site drilling were not analyzed for hazardous constituents (Drill & Test, Inc., 3/83).

During the Engineering-Science and Dames & Moore site inspection conducted in April 1986, HNu meter readings were taken upwind and downwind at the site. Volatile organics were not detected on-site in concentrations exceeding background levels of 1 ppm (ES/D&M, 4/86).

ASSESSMENT

In an attempt to quantify the risk associated with this site, we applied the Hazard Ranking System (HRS) currently being used by the New York State DEC to evaluate abandoned hazardous waste sites in New York state. This system takes into account the types of wastes at the site, receptors and transport routes to apply a numerical ranking of the site. As stated in 40CFR Subpart H Section 300.81, the HRS scoring system was developed to be used in evaluating the relative potential of uncontrolled hazardous disposal substances to cause health or safety problems or ecological or environmental damage. It is assumed by the EPA that a uniform application of the ranking system in each state will permit EPA to identify those releases of hazardous substances that pose the greatest hazard to humans or the environment.

Under the HRS, three numerical scores are computed for each site to express the relative risk or danger from the site, taking into account the population at risk; the hazardous potential of the substances at a facility; the potential for contamination of drinking water supplies; for direct human contact; and for destruction of sensitive ecological systems and other appropriate factors. The three scores are:

- S_M reflects the potential for harm to humans or the environment from migration of a hazardous substance away from the facility by routes involving groundwater, surface water or air. It is a composite of separate scores for each of the three routes (S_{GW} = groundwater route score, S_{SW} = surface water route score, and S_A = air route score).

- S_{FE} reflects the potential for harm from substances that can explode or cause fires.

- S_{DC} reflects the potential for harm from direct contact with hazardous substances at the facility (i.e., no migration need be involved).

The preliminary HRS score is:

S_M	= 0	S_A	= 0
S_{GW}	= 0	S_{FE}	= 0
S_{SW}	= 0	S_{DC}	= 0

RECOMMENDATIONS

The following recommendations are made for the completion of Phase II:

- Geophysical Survey Study consisting of electrical resistivity and magnetometer surveys

- Groundwater monitoring system consisting of one upgradient and two downgradient wells based on results of geophysical surveys

- Surface water and sediment monitoring consisting of two monitoring stations in Cayuga Creek

- Waste samples consisting of 6 samples (2 per bore hole) collected from two locations where landfilled materials remain

on-site and one background location. Samples will be composite samples of soil collected at the following depths: 6-12 inches, and 18-24 inches.

- Analyses to include phenols and Hazardous Substance List (HSL) metals.

The estimated man-hour requirements to complete Phase II are 1,378, while the estimated cost is $86,744.

SECTION II
PURPOSE

The purpose of the Phase I investigation at the Village of Depew Landfill site was to assess the hazard to the environment caused by the present condition of the site. This assessment is based on the Hazard Ranking System, which involves the compilation and rating of numerous geological, toxicological, environmental, chemical, and demographic factors and the calculation of an HRS score. Details of HRS implementation are included in Section V. During the initial portion of the investigation, available data and records, combined with information collected from a site inspection, were reviewed and evaluated. The investigation at this site focused on the burial of municipal wastes in the Village of Depew landfill and the use of foundry sand potentially containing phenolic compounds as cover material at the site. Based on this initial evaluation of the Village of Depew Landfill site, a Phase II Work Plan has been prepared for collecting any additional data needed to complete the HRS score. In addition, a cost estimate for the recommended Phase II work is provided.

SECTION III
SCOPE OF WORK

The scope of work for the New York State Inactive Site Investigation Program (Phase I) was to collect and review available information necessary for the documentation and preparation of a Hazard Ranking System score and a Phase II work plan and cost estimate if required. The work activities performed included data collection and review, a site inspection, and interviews with individuals knowledgeable of past and present disposal activities at the site.

The sources contacted during this Phase I investigation included government agencies (federal, state and local), present site owners and operators, and any other individuals that may have knowledge of the site, as identified during the performance of the investigation. These sources are listed in Appendix A. The intent of this list is to identify all persons, departments, and/or agencies contacted during the fourth round of the Phase I investigation even though useful information may not have been collected from each source contacted.

SECTION IV

SITE ASSESSMENT

SITE HISTORY

The Village of Depew Landfill, approximately five acres in size, was owned by the Village of Depew from 1940 to 1961 and was used for the disposal of municipal waste (Domino, 12/10/85; ECDEP, Hazardous Waste Site Profile Report, 2/19/85). In 1983, the Village of Depew sold the site to Erie County which excavated approximately 60,000 cubic yards of municipal waste from the landfill and constructed an overflow retention facility at the site. Excavated wastes were disposed of in the BFI landfill (Niagara Landfill) located in Tonawanda (Domino, 12/85). Based on inspections conducted by ECDEP, it appears that not all municipal wastes were not excavated (Voell, 4/29/85; ECDEP, Hazardous Waste Site Profile Report, 2/85).

SITE TOPOGRAPHY

The Village of Depew site is located at 315 Borden Road, Village of Depew, Erie County, New York. Prior to construction of the Overflow Retention Facility, the ground surface was slightly elevated rising from the site access road, and sloping to the west into Cayuga Creek. The Erie County Overflow Retention Facility occupies approximately a 3/4 acre area of this site. Excavation and construction of the facility has changed the site topography in the vicinity of the Overflow Retention Facility (ES and D&M site visit, 1985 and ECDEP Hazardous Waste Site Profile Report, 2/85).

The 5-acre site is located in the north side of an oxbow bend in Cayuga Creek. The area is primarily suburban/rural. Areas to the

immediate east and west are open fields. North of the site is residential; south of the site is Cayuga Creek. South of Cayuga Creek are residential areas (ES and D&M Site Inspection, 12/10/85; USGS Topographic Map: Lancaster Quadrangle, 1965).

Surface runoff is primarily to the south, west and east into the Cayuga Creek. An overflow basin outfall is channeled into the Cayuga Creek on the east side of the site. The site is located within a 100 year floodplain (ES and D&M site visit, 1985; ECDEP Hazardous Waste Site Profile Report, 2/85).

Local Sensitive Environments

A NYS registered wetland is located approximately 0.8 miles northwest of the site. The wetland is designated as LA-7 (NYS Wetlands Map, 1984; McMurry, 1/3/86).

SITE HYDROLOGY

Regional Geology and Hydrology

The site is located in the Erie-Ontario lowlands physiographic province. The bedrock of this region is predominantly limestone, dolostone, and shale. Most of the rocks are deep aquifers with regional flow to the south (NYS Museum and Science Service Bedrock Geology Map, 1970).

In the recent past, most of New York State, including the site, has been repeatedly covered by a series of continental ice sheets. The activity of the glacier widened pre-existing valleys and deposited widespread accumulations of till. The melting of ice, ending approximately 12,000 years ago, produced large volumes of meltwater; this water subsequently shaped channels and deposited thick accumulations of stratified, granular sediments.

As glacial ice retreated from the region, meltwater formed lakes in front of the ice margin. The Erie County region is covered by lake sediments resulting from these glacial lakes; the most recent being from Lake Warren (a larger predecessor to Lake Ontario and Lake Erie). The sediments consist of blanket sands and beach ridges which are occasionally underlain by lacustrine silts and clays (indicating quiet, deeper water deposition).

Granular deposits in this region frequently act as shallow aquifers, whereas lacustrine clays, as well as tills, often inhibit groundwater movement. However, fine-grained, water-lain sediments, such as silts and clays, frequently contain horizontal laminations and sand seams. These internal features facilitate lateral groundwater movement through otherwise low permeability materials (LaSala, 1968; Johnston, 1964).

Site Hydrogeology

The site is underlain by Devonian-aged Onondaga Limestone. Depth to top of bedrock was measured at 19 feet and 25 feet at the northern and southern site boundaries respectively. The limestone unit is generally fractured and jointed forming a deep aquifer (Drill & Test, Inc., 3/83).

Boring logs indicate that the bedrock is overlain by a silty, clayey till unit which is in turn overlain by lenses of alluvial sand and gravel deposits from Cayuga Creek. The overburden is variable in sand and gravel content, therefore, permeability across the site would be variable. The alluvium grades upward to fine sand and silt (Drill & Test, Inc., 3/83). Approximately ten feet of waste material was placed on top of the alluvium.

Although the fine-grained character of the upper alluvium sediment may have a low permeability (assumed to be 10^{-3} cm/sec to 10^{-5} cm/sec for HRS scoring) its uneven thickness and distribution allows for the probable hydraulic connection between the seasonally high water tables

occuring within the overburden and the bedrock aquifer (Freeze, R.A. and J.A. Cherry, 1979). Observation wells installed prior to the construction of the overflow retention facility indicate that the water table ranged from a depth of approximately 3 to 17 feet below ground surface (Drill & Test, Inc., 3/83).

SITE CONTAMINATION

From approximately 1940 to 1961, municipal wastes were disposed of in the Village of Depew Landfill. Based on the information available for the site and interviews of ECDEP personnel, no hazardous wastes are known to be disposed of in the landfill (ECDEP, Hazardous Waste Site Profile Report, 2/85; Voell, 4/29/85). In 1983, approximately 60,000 cubic yards of municipal wastes were excavated from the site to allow the construction of the overflow retention facility. Municipal wastes excavated from the landfill were disposed of in the BFI Landfill on River Road in Tonawanda, New York (Domino, 12/10/85).

An estimated 10,000 tons per year of municipal solid wastes were reported to be disposed of at the Village of Depew landfill (Domino, 12/10/85). Although wastes have been excavated from the landfill to enable the construction of the overflow retention facility, municipal wastes remain on-site based on review of aerial photographs of the site (ECDEP, Hazardous Waste Site Profile Report, 3/83).

Foundry sands obtained from Dresser Industries were used as cover material at the Village of Depew landfill, although the quantity of foundry sand at the landfill is unknown (Domino, 12/10/85; Labenski, 1/17/86). The foundry sands that were used as cover at the landfill are suspected of containing phenolic compounds; however, the foundry sands at the landfill have not been analyzed to determine if phenols are present in significant concentrations (Domino, 12/10/85; Labenski, 1/17/86). Note that Phase I investigations of other sites which accepted foundry sand from Dresser Industries, contained phenol (Lancaster Reclamation, 5/85); Land Reclamation, 5/85). Also, Dresser Industries

confirmed that foundry sands generated after approximately 1950, contained phenolic binders (Martin, 1/17/86).

Environmental monitoring of the groundwater, surface water or soil has not been conducted at the Village of Depew Landfill site (NYSDEC, Registry Sheet, 1/10/85). In 1982, soil borings were dug at the site to characterize on-site soils as part of the construction of the overflow retention facility. The soil samples collected during this work were not analyzed for hazardous constituents (Drill & Test, Inc., 3/83).

During the Engineering-Science and Dames & Moore site inspection conducted in April 1986, HNu meter readings were taken upwind and downwind at the site. Volatile organics were not detected on-site in concentrations exceeding background levels of 1 ppm (ES/D&M, 4/86).

FIGURE IV-1

NARRATIVE SUMMARY

The five-acre Village of Depew Landfill is a municipal landfill located in the Village of Depew, Erie County, New York. The landfill was operated from approximately 1940 until 1961 for the disposal of municipal solid wastes. An estimated 10,000 tons per year of solid waste was disposed of in the landfill. No hazardous wastes were known to be disposed of in the landfill (ECDEP, Hazardous Waste Site Profile Report, 2/85). In 1983, Erie County purchased the landfill and excavated a portion of the wastes for purposes of constructing an Overflow Retention Facility. Excavated wastes were not tested for hazardous constituents and were disposed of in the BFI landfill located in Tonawanda (Domino, 12/10/85).

Foundry sand from Dresser Industries was used as cover material at the landfill. The foundry sand is suspected of containing phenolic binders, as Dresser Industries confirmed that foundry sands generated after approximately 1950 contained phenol (Martin, 1/17/86). However, the foundry sands at the landfill have not been analyzed to determine if phenols are present (Domino, 12/10/85; Labenski, 1/17/86).

No environmental monitoring of groundwater, surface water or soil has been conducted to date at the landfill site (NYSDEC, Registry Sheet, 1/85). Soil samples collected from borings drilled as part of the installation of the retention facility were not analyzed for hazardous constituents (Drill & Test, Inc.).

HNu meter readings were taken upwind and downwind at the site during the ES/D&M site inspection conducted in April, 1986. Volatile organics were not detected on-site in concentrations exceeding background levels of 1 ppm (ES/D&M, 4/86).

FACILITY NAME: Village of Depew Landfill

LOCATION: Village of Depew, Erie County, New York

GROUND WATER ROUTE

1. OBSERVED RELEASE

Contaminants detected (5 maximum):

No groundwater monitoring has been conducted at the site.
(Erie County DEP, 2/85)

Rationale for attributing the contaminants to the facility:

No observed release. No ground water monitoring conducted at site.
(ECDEP, 2/85)

* * *

2. ROUTE CHARACTERISTICS

Depth to Aquifer of Concern

Name/description of aquifer(s) in concern:

Overburden and bedrock aquifer suspected to be hydraulically connected.
(Drill & Test, Inc., Site Investigation, 3/83)

Depth(s) from the ground surface to the highest seasonal level of the saturated zone [water table(s)] of the aquifer of concern:

Seasonally high water table - approximately 3 to 17 feet.
(Drill & Test, Inc., Site Investigation, 3/83;
Hazardous Waste Site Profile Report, 2/85)

Depth from the ground surface to the lowest point of waste disposal/ storage:

Approximately 14 feet.
(Boring Logs A-27 through A-30, Drill & Test, Inc., 12/82)

Net Precipitation

Mean annual or seasonal precipitation (list months for seasonal):

Mean annual precipitation is 32".
(USDOC, Climatic Atlas of the United States, 1979)

Mean annual lake or seasonal evaporation (list months for seasonal):

Mean annual lake evaporation is 27".
(USDOC, Climatic Atlas of the United States, 1979)

Net precipitation (subtract the above figures):

32" - 27" = 5".
(USDOC, Climatic Atlas of the United States, 1979)

Permeability of Unsaturated Zone

Soil type in unsaturated zone:

Clayey silt with interbedded sand and gravel layers.
(Drill & Test, Inc., 3/83)

Permeability associated with soil type

$> 10^{-5} < 10^{-3}$ cm/sec.
(Freeze, R.A. and J.A. Cherry, Groundwater, 1979)

Physical State

Physical state of substances at time of disposal (or at present time for generated gases):

Paper, dust, wood, and municipal solid waste - unconsolidated solid waste.
(NYSDEC Registry Sheet, 1/85; ECDEP, Hazardous Waste Site Profile Report, 2/85)

3. CONTAINMENT

Containment

Method(s) of waste or leachate containment evaluated:
Unlined landfill, no run-on control.
(ES/D&M Site Visit, 12/85; Subsurface Investigations, Drill & Test, Inc., 1983; and ECDEP Hazardous Waste Site Profile Report, 1985)

Method with highest score:
Unlined landfill, no run-on control - 3.
(ES/D&M Site Visit, 12/85; Subsurface Investigations, Drill & Test, Inc., 1983; and ECDEP Hazardous Waste Site Profile Report, 1985)

4. WASTE CHARACTERISTICS

Toxicity and Persistence

Compound(s) evaluated:
No environmental monitoring of groundwater, surface water or soil has been conducted at the site (NYSDEC, Registry Sheet 1/85). However, foundry sands suspected of containing phenolic based binders were used as a cover material at the site (Domino, 12/10/85; Martin, 1/17/86).

Compound with highest score:
For purposes of scoring the site, phenol is not used because monitoring has not been conducted to determine if phenol is present at the site (Labenski, 1/20/86). Therefore, the toxicity/persistence score is zero.

Hazardous Waste Quantity

Total quantity of hazardous substances at the facility, excluding those with a containment score of 0 (Give a reasonable estimate even if quantity is above maximum):
No hazardous wastes known to be disposed of on-site. Foundry sands suspected of containing phenol was used as cover material at the landfill. Monitoring has not been conducted to determine if phenols are present on-site (NYSDEC Registry Sheet, 1985; ECDEP, Hazardous Waste Site Profile Report, 1/85)

Basis of estimating and/or computing waste quantity:
The landfill was used for the disposal of municipal solid wastes and hazardous wastes are not known to be disposed of on-site (ECDEP, Hazardous Waste Site Profile Report, 1/85; Domino, 12/10/85; and Labenski, 1/20/86) An unknown quantity of foundry sand, suspected of containing phenolic-based binders, was used as cover material at the landfill. For HRS scoring, the hazardous waste quantity score is zero because the presence of phenol has not been confirmed.

5. TARGETS

Ground Water Use

Uses(s) of aquifer(s) of concern within a 3-mile radius of the facility:

Groundwater is not used as a source of drinking water within 3 miles of the site. Potable water is obtained from a municipal water system **(Domino, 12/10/85)**.

Distance to Nearest Well

Location of nearest well drawing from aquifer of concern or occupied building not served by a public water supply:

Not applicable, there are no groundwater wells drawing water from the aquifer of concern within 3 miles of the site **(Domino, 12/10/85)**.

Distance to above well or building:

Not applicable, there are no groundwater wells drawing water from the aquifer of concern within 3 miles of the site **(Domino, 12/10/85)**.

Population Served by Ground Water Wells Within a 3-Mile Radius

Identified water-supply well(s) drawing from aquifer(s) of concern within a 3-mile radius and populations served by each:

There are no water-supply wells drawing water from the aquifer of concern within 3 miles of the site **(NYSDOH, NYS Atlas of Community Water System Sources, 1982; Domino, 12/10/85)**.

Computation of land area irrigated by supply well(s) drawing from aquifer(s) of concern within a 3-mile radius, and conversion to population (1.5 people per acre):

Water withdrawn from the aquifer of concern is not used for irrigation within 3 miles of the site **(NYSDOH, NYS Atlas of Community Water System Sources, 1982; Domino, 12/10/85)**.

Total population served by ground water within a 3-mile radius:

Residents within a 3-miles radius of the site obtain water from municipal water supply. Therefore, the total population served = 0 **(NYSDOH, NYS Atlas of Community Water System Sources, 1982; Domino, 12/10/85)**.

SURFACE WATER ROUTE

1. OBSERVED RELEASE

Contaminants detected in surface water at the facility or downhill from it (5 maximum):

No surface water monitoring has been conducted at the site **(ECDEP, Hazardous Waste Site Profile Report, 2/1985; NYSDEC, Registry Sheet, 1/10/85).**

Rationale for attributing the contaminants to the facility:

No surface water monitoring has been conducted at the site **(ECDEP, Hazardous Waste Site Profile Report, 2/1985; NYSDEC, Registry Sheet, 1/10/85).**

* * *

2. ROUTE CHARACTERISTICS

Facility Slope and Intervening Terrain

Average slope of facility in percent:

2 percent
(Drill & Test, Inc., 1983)

Name/description of nearest downslope surface water:

Cayuga Creek
(USGS Topographic Map, Lancaster Quandrangle, 1965; ES/D&M Site Inspection, 12/110/85)

Average slope of terrain between facility and above-cited surface water body in percent:

Approximately 9%
(USGS Topographic Map, Lancaster Quandrangle, 1965)

Is the facility located either totally or partially in surface water?

No.
(ES and D&M Site Visit, 12/85)

Is the facility completely surrounded by areas of higher elevation?

No.
(ES and D&M Site Visit, 12/10/85)

1-Year 24-Hour Rainfall in Inches

2.1".
(USDOC, Rainfall Frequency Atlas of the United States, Technical Paper No. 40, 1963)

Distance to Nearest Downslope Surface Water

Approximately 100 feet to Cayuga Creek
(ES and D&M Site Visit, 12/10/85)

Physical State of Waste

Paper, dust, wood and municipal solid waste - unconsolidated solid waste
(NYSDEC, Registry, 1/10/85; ECDEP, Hazardous Waste Site Profile Report, 2/85)

3. CONTAINMENT

Containment

Method(s) of waste or leachate containment evaluated:

Landfill not adequately covered and unsound diversion system.
(ES and D&M Site Visit and Interviews with Village of Depew and Krehbiel Associates, 12/85; Subsurface Investigation, Drill & Test, Inc., 1983)

Method with highest score:

Inadequate cover, unsound diversion system. -3
(ES and D&M Site Visit and Interviews with Village of Depew and Krehbiel Associates, 12/85; Subsurface Investigation, Drill & Test, Inc., 1983)

4. WASTE CHARACTERISTICS

Toxicity and Persistence

Compound(s) evaluated:

No environmental monitoring has been conducted at the site (NYSDEC, Registry Sheet, 1/85). However, foundry sands suspected of containing phenolic based binders were used as a cover material at the site (Domino, 12/10/85; Martin, 1/17/86).

Compound with highest score:

For purposes of scoring the site, phenol is not used because monitoring has not been conducted to determine if phenol is present at the site (Labenski, 1/20/86). Therefore, the toxicity/persistence score is zero.

Hazardous Waste Quantity

Total quantity of hazardous substances at the facility, excluding those with a containment score of 0 (Give a reasonable estimate even if quantity is above maximum):

No hazardous wastes are known to be disposed of on-site. Foundry sands suspected of containing phenol were used as cover material at the landfill. Monitoring has not been conducted to determine if phenols are present on-site (NYSDEC, Registry Sheet, 1985; ECDEP Site Profile Report, 1985).

Basis of estimating and/or computing waste quantity:

The landfill was used for the disposal of municipal solid waste and hazardous wastes are not known to be disposed of on-site. An unknown quantity of foundry sand, suspected of containing phenolic-based binders, was used as cover material at the landfill. For HRS scoring, the hazardous waste quantity score is zero because the presence of phenol has not been confirmed.

* * *

5. TARGETS

Surface Water Use

Use(s) of surface water within 3 miles downstream of the hazardous substance:

Cayuga Creek is used for fishing by local residents. Surface water is not used for drinking water within 3 miles of the site (Domino et al, 12/10/85).

Is there tidal influence?

Site is not located in a coastal area **(ES/D&M Site Visit, 1985).**

Distance to a Sensitive Environment

Distance to 5-acre (minimum) coastal wetland, if 2 miles or less:

Site is not located in a coastal area.
(USGS Topographic Map: Lancaster Quadrangle, 1965)

Distance to 5-acre (minimum) fresh-water wetland, if 1 mile or less:

A New York State designated wetland is located 0.8 miles northwest - LA-7.
(McMurry, NYSDEC - Region 9, 1/3/86)

Distance to critical habitat of an endangered species or national wildlife refuge, if 1 mile or less:

There are no Federally-designated critical habitats in New York State.
(OZARD, 1986)

Population Served by Surface Water

Location(s) of water-supply intake(s) within 3 miles (free-flowing bodies) or 1 mile (static water bodies) downstream of the hazardous substance and population served by each intake:

Water supply intakes are not located within 3 miles of the site.
(NYS Atlas of Community Water System Sources, 1982; Domino, 12/10/85).

Computation of land area by above-cited intake(s) and conversion to population (1.5 people per acre):

Not applicable. No known water supply intakes are located within 3 miles of the site (**NYS Atlas of Community Water System Sources, 1982; Domino, 12/10/85**).

Total population served:

Not applicable. No known water supply intakes are located within 3 miles of the site (**NYS Atlas of Community Water System Sources, 1982; Domino, 12/10/85**).

Name/description of nearest of above water bodies:

Not applicable. No known water supply intakes are located within 3 miles of the site (**NYS Atlas of Community Water System Sources, 1982; Domino, 12/10/85**).

Distance to above-cited intakes, measured in stream miles:

Not applicable. No known water supply intakes are located within 3 miles of the site (**NYS Atlas of Community Water System Sources, 1982; Domino, 12/10/85**).

AIR ROUTE

1. OBSERVED RELEASE

Contaminants detected:

HNu meter readings were taken upwind and downwind of the site. All readings for volatile organics were below background levels of 1 ppm **(ES/D&M Site Visit, April 1986).**

Date and location of detection of contaminants:

Not applicable, no observed release **(ES/D&M Site Inspection, 1986).**

Methods used to detect the contaminants:

HNu meter.

Rationale for attributing the contaminants to the site:

Not applicable, no hazardous waste with the potential to impact the air pathway are known to exist on-site. **(ECDEP Hazardous Waste Site Profile Report, 2/85; NYSDEC, Registry Sheet, 1/10/85).**

* * *

2. WASTE CHARACTERISTICS

Reactivity and Incompatibility

Most reactive compound:

No reactive compounds are known to exist on-site **(ECDEP Hazardous Waste Site Profile Report, 2/85; NYSDEC, Registry Sheet, 1/10/85).**

Most incompatible pair of compounds:

No incompatible pair of compounds is known to exist on-site **(ECDEP Hazardous Waste Site Profile Report, 2/85; NYSDEC, Registry Sheet, 1/10/85).**

Toxicity

Most toxic compound:

No hazardous wastes with the potential to impact the air pathway are known to exist on-site **(ECDEP Hazardous Waste Site Profile Report, 2/85; NYSDEC, Registry Sheet, 1/10/85).**

Hazardous Waste Quantity

Total quantity of hazardous waste:

The hazardous waste quantity score is zero because no hazardous wastes with the potential to impact the air pathway are known to exist on-site **(ECDEP Hazardous Waste Site Profile Report, 2/85; NYSDEC, Registry Sheet, 1/10/85).**

Basis of estimating and/or computing waste quantity:

Not applicable, see above comment.

* * *

3. TARGETS

Population Within 4-Mile Radius

Underline radius used, give population, and indicate how determined:

0 to 4 mi	0 to 1 mi	0 to 1/2 mi	0 to 1/4 mi
	1,090 people		
	(1980 U.S. Census Data)		

Distance to a Sensitive Environment

Distance to 5-acre (minimum) coastal wetland, if 2 miles or less:

None within 2 miles. (Western NYS is not a coastal area.)

Distance to 5-acre (minimum) fresh-water wetland, if 1 mile or less:

A NYS designated wetland is located 0.8 miles NW of the site - LA-7 **(McMurry, NYSDEC Region 9, 1/3/86).**

Distance to critical habitat of an endangered species, if 1 mile or less:

There are no federally designated critical habitats in New York State **(Ozard, 1986)**.

Land Use

Distance to commerical/industrial area, if 1 mile or less:

Approximately 1/2 mile **(ES/D&M Site Visit, 1985)**.

Distance to national or state park, forest, or wildlife reserve, if 2 miles or less:

There are no parks or wildlife reserves within 2 miles of the site **(USGS Topographic Map - Lancaster Quadrangle)**.

Distance to residential area, if 2 miles or less:

< 1/4 mile across Cayuga Creek **(ES/D&M Site Visit, 1985)**.

Distance to agricultural land in production within past 5 years, if 1 mile or less:

1/2 mile **(ES/D&M Site Visit, 1985; USGS Topographic Map - Lancaster Quadrangle)**.

Distance to prime agricultural land in production within past 5 years, if 2 miles or less:

None **(ES/D&M Site Visit, 1985; USGS Topographic Map - Lancaster Quadrangle)**.

Is a historic or landmark site (National Register of Historic Places and National Natural Landmarks) within view of the site?

There are no historic landmarks within view of the site **(USGS Topographic Map - Lancaster Quadrangle)**.

FIRE AND EXPLOSION

1. CONTAINMENT

Hazardous substances present:

No information was discovered during the Phase I study which indicates that a fire and explosion situation existed or presently exists at the site.

Type of containment, if applicable:

N/A

* * *

2. WASTE CHARACTERISTICS

Direct Evidence

Type of instrument and measurements:

No measurements were taken to determine the fire and explosion potential on-site.

Ignitability

Compound used:

No ignitable compounds are known to exist on-site **(ECDEP, Site Profile Report, 1985; NYSDEC, Registry Sheet, 1/10/85).**

Reactivity

Most reactive compound:

No reactive compounds are known to exist on-site **(ECDEP, Site Profile Report, 1985; NYSDEC, Registry Sheet, 1/10/85).**

Incompatibility

Most incompatible pair of compounds:

No incompatible compounds are known to exist on-site **(ECDEP, Site Profile Report, 1985; NYSDEC, Registry Sheet, 1/10/85).**

Hazardous Waste Quantity

Total quantity of hazardous substances at the facility:

No hazardous waste with the potential to create a fire or explosion hazard is known to exist on-site **(NYSDEC Registry Sheet, 1/10/85)**.

Basis of estimating and/or computing waste quantity:

See comment above.

* * *

3. TARGETS

Distance to Nearest Population

Less than 1/4 mile across Cayuga Creek
(ES/D&M Site Visit, December, 1985)

Distance to Nearest Building

Less than 1/4 mile
(ES/D&M Site Inspection, December, 1985)

Distance to Sensitive Environment

Distance to wetlands:

A New York State designated wetland is located 0.8 miles NW of the site - LA-7 **(McMurry, NYSDEC Region 9, 1/3/86)**.

Distance to critical habitat:

There are no federally designated critical habitats in New York State **(Ozard, 1986)**.

Land Use

Distance to commercial/industrial area, if 1 mile or less:

Less than 1/2 mile **(ES/D&M Site Visit, 1985)**.

Distance to national or state park, forest, or wildlife reserve, if 2 miles or less:

There are no historic landmarks within view of the site **(ES/D&M Site Visit, 1985).**

Distance to residential area, if 2 miles or less:

Less than 1/4 mile across Cayuga Creek **(ES/D&M Site Visit, 1985).**

Distance to agricultural and in production within past 5 years, if 1 mile or less:

1/2 mile **(ES/D&M Site Visit, 1985; USGS Topographic Map - Lancaster Quadrangle).**

Distance to prime agricultural land in production within past 5 years, if 2 miles or less:

None **(ES/D&M Site Visit, 1985; USGS Topographic Map - Lancaster Quadrangle).**

Is a historic or landmark site (National Register or Historic Places and National Natural Landmarks) within the view of the site?

There are no historic landmarks within view of the site **(USGS Topographic Map - Lancaster Quadrangle, 1965).**

Population with 2-Mile Radius

37,343 people **(U.S. Bureau of Census, 1980).**

Buildings Within 2-Mile Radius

9,827 buildings (estimate based 37,343 people ÷ 3.8 people per house).

DIRECT CONTACT

1. OBSERVED INCIDENT

Date, location, and pertinent details of incident:

No observed incident. Information reviewed during the Phase I investigation has not identified any previous incident related to contact with waste disposed of on-site that may cause injury, illness or death to humans or animals **(Phase I Record Search, 1985).**

* * *

2. ACCESSIBILITY

Describe type of barrier(s):

Fenced area, and access is controlled either by a locked gate or personnel from Erie County Sewerage Management **(ES/D&M Site Visit, 1985).**

* * *

3. CONTAINMENT

Type of containment, if applicable:

There are no hazardous wastes known to be landfilled on-site. An unknown quantity of foundry sand, suspected of containing phenols, was used as cover material at the landfill. For HRS scoring, hazardous wastes are not accessible to direct contact because the presence of phenol has not been confirmed **(ES/D&M Site Visit, December, 1985; and ECDEP Site Profile Report, 1985).**

* * *

4. WASTE CHARACTERISTICS

Toxicity

Compounds evaluated:

The landfill was used for the disposal of municipal solid wastes and no hazardous wastes are known to exist on-site. An unknown quantity of foundry sand, suspected of containing phenolic base binders, was used as cover material at the landfill. Because the presence of phenol has not been determined, phenol is not used to score the site.

Compound with highest score:

See above comment.

5. TARGETS

Population within one-mile radius

1,090 people **(U.S. Bureau of Census, 1980).**

Distance to critical habitat (of endangered species)

There are no federally designated critical habitats in New York State **(Ozard, 1986).**

INTERVIEW FORM

INTERVIEWEE/CODE Mayor Domino/Vincent LiPuma - Village of Depew
Robert Labinski/Gerald Devlin - Consulting Engineer/Erie County

TITLE - POSITION

ADDRESS Borden Road

CITY Depew STATE NY ZIP

PHONE ( ) RESIDENCE PERIOD TO

LOCATION Depew INTERVIEWER Cathy J. Bosma

DATE/TIME 12/10/85 / 10:30

SUBJECT: Village of Depew Phase I site investigations

REMARKS: Site owned by Village of Depew until 1983 when it was sold to Erie County to develop an overflow retention facility. The site was inactive as of 1962, and consisted of 5 acres. Only residential refuse (household) were disposed in site (10,000 tons yr). Trash Pickup was about 3 times/ week. Excavated matl was taken to BFI landfill site on River Road in Tonawanda. Residence are on municipal water, also piped sewers. No drums were placed on site or discovered during excavation. No information on groundwater or surface water monitoring data is available. Foundry sands was used for cover material, when excavated Dresser Industries (where foundry sand was obtained) stated that it contained no phenols but mat'l was not tested. There were monitoring wells on site but are presently destroyed. Drill & Test, Inc. did soils test. No test of excavated materials has been done to their knowledge. Filter fabric & gravel were placed before retention facility was constr.

I AGREE WITH THE ABOVE SUMMARY OF THE INTERVIEW:

HAZARDOUS WASTE SITE PROFILE REPORT FOR VILLAGE OF DEPEW 315 BORDEN ROAD, DEPEW SITE #915105

Prepared by:
Erie County D.E.P.
February 1985
Melvin H. Szymanski
Principal Env. Quality
Technician

REF. 3

ADVISORY NOTE

The information contained in this document is presented to show environmental conditions, comparisons to ambient environmental standards and criteria and compliance status relative to applicable environmental regulations.

Any use of this information to assess the risks to personal or public health, identify potential personal or public liability or to estimate the costs of remedial activity should only be done after consultation with appropriate government agencies or private consultants.

VILLAGE OF DEPEW
315 BORDEN ROAD
DEPEW, NEW YORK 14043
SITE #915105

The site is listed on page 9-311 in the December 1983 Appendix Volume 3 of Hazardous Waste Sites in New York State prepared by N.Y.S. D.E.C.. The site was described as formerly used by the Village of Depew and Arcata Graphics for disposal of paper, dust, wood and general refuse. "There is no evidence of any significant environmental problem," according to the report.

This profile report was prepared for the New York State D.E.C. in accordance with the State/County agreement.

Location

The site is located at 315 Borden Road, Depew, New York adjacent to the north bank of Cayuga Creek.

Background

From conversations with Village of Depew and County of Erie personnel, it was learned the site was used as a landfill for general refuse until 1961. A file review of state and county inspections performed in the 1970's indicate that there was no evidence of landfill activity during that period.

In 1983 ownership of the landfill area was transferred from the Village of Depew to the County of Erie for the purpose of constructing an Overflow Retention Facility (ORF) for the County Sewer District #4. During excavation for ORF construction, a portion of the buried refuse was removed and hauled to Niagara Landfill in the Town of Tonawanda. A survey by Krehbiel Associates, project engineers, estimated that 59,785 cubic yards of material was removed from the site.

NYSDEC, ECDEP and ECHD files do not have any record of any landfill permits issued for this site.

Aerial Photography

Aerial photographs for 1950 and 1960 show a disturbed area in the oxbow bend of Cayuga Creek. The active area did not extend much beyond this bend. In the 1972 photo the area appeared to be covered and graded, but not much vegetation was in evidence.

Field Inspection

A site inspection was conducted on February 13, 1985. The walls of the retention basin had been completed and backfilled. There was no refuse visible on the surface of the backfill material. There was no evidence of leachate running into the creek.

Project progress photos which the contractor provided the county, were reviewed. These photos showed that the excavation went right down to clean earth. A fabric liner was placed on the bottom of the excavation. Crushed stone and gravel were placed on top of the liner to serve as a base for the concrete floor of the basin.

The ORF project should be completed in June of 1985. The area will then be graded and seeded.

Environmental Data

Soil - the soil is sandy and coarse textured with a ph less than 6.5. The soil contains less than 30% sand and less than 18% clay. Permeability is moderately slow.

Bedrock - Limestone bedrock is at depth's greater than 4'.

Water - The natural water table is 3' to 10' below the surface. Surface water will runoff into Cayuga Creek. Although the site is located in the 100 year floodplain, information provided by the Village of Depew Superintendent of Public Works indicated that the Creek rarely overflowed its banks in the site area.

Landuse - Areas immediately to the east and west are open fields. To the north and south areas are residential.

Sampling - There is no record of any soil or groundwater sampling at this site.

Conclusion

There was no evidence to indicate that any hazardous or toxic material was landfilled at this site. This site does not pose any known threat to the environment.

Recommendation

Upon completion of the ORF project, when grading and seeding is done, a final inspection of the landfill will be conducted. At that time it can be determined if the site should be recommended for removal from the hazardous waste site list.

A copy of this report should be sent to the Secretary of the Erie County Sewer District #4, the current owner of the site.

US CENSUS DATA, 1980

US Census Data used in the HRS scoring was obtained from various County Planning Offices. This data was not obtained from a report. The raw census data combined with County Planning Maps was used to estimate the population within 1, 2, 3, and 4 miles of the Phase I site being investigated. Because of the voluminous amount of data used, the data is not provided in this Appendix.

Re: Village of Depew
Overflow Retention Facility

Dear Ms. Bosma:

This letter is to confirm our telephone conversation of Wednesday, January 15, 1986 regarding the dump site in the Village of Depew.

We have reviewed our files on the Overflow Retention Facility project and they indicate that phenol was present in the foundry sand used for cover materials and that the Buffalo Office of the New York State Department of Environmental Conservation was made aware of this. No tests were made of this material and to the best of our knowledge, no records are available as to the quantity on that site.

If you have any questions or comments, please feel free to call.

Very truly yours,

KREHBIEL ASSOCIATES, INC.

SITE CONTAMINATION

The 13-acre Lancaster Reclamation, Inc. site has been used as an industrial waste landfill since 1976. The waste types and quantities of waste disposed at the site are presented in Table IV-1. Also shown are hazardous constituents of concern. A detailed constituent analysis of each waste is given in the Appendix.

Beginning in 1976, Lancaster Reclamation, Inc. landfilled on-site, bentonite clay slurry and foundry sand in four excavated lagoons on the southern portion of the site (see Figure IV-1). The bentonite slurry contained 90% water; 96,000 cubic yards were placed in the lagoons and dewatered by evaporation prior to burial. Foundry sand was also used to thicken the slurry. In the 1980's the clay slurry was thickened before landfilling (Ferry, 1985). Analytical data on filtrate (i.e., water fraction) of the slurry indicates the presence of zinc, chlorides and TOC (see Appendix). The concentration of zinc exceeds the limits for discharge to groundwaters in New York State. A leachate test also found significant concentrations of phenol in the foundry sand that was landfilled with the clay slurry. Both the bentonite slurry and the foundry sand wastes were generated by Dresser Industries (Wendel Engineers, 1976).

Beginning in 1978, approximately 1.7 million gallons of foundry sand slurry were placed in the lagoon (Ferry, 1985). The slurry consisted of sand fines produced from foundry wastewater treatment at the Chevrolet Division of General Motors in Tonawanda, New York. The slurry contained 65% water and dewatering was accomplished by (1) injecting air into the waste to promote evaporation, or (2) decanting the liquid and applying it on the land by spray irrigation (Wendel Engineers, 1979). An analysis of several waste streams contained in the slurry found significant amounts of oil (up to 21,000 ppb) and detectable amounts of PCBs. Leachate tests also revealed concentrations of selenium, cadmium, and lead in excess of New York State's discharge limits to groundwaters; however, concentrations in leachate did not exceed the levels established for EP toxicity.

Beginning in January 1979, an asbestos-containing waste slurry consisting of 20% portland cement, 5% asbestos, 10% glass fibers and 65% water was pumped into the waste lagoons. The slurry was dewatered using the same techniques described for the bentonite and foundry sand slurries. Aware that the spray irrigation and air sparging methods could potentially increase the potential for airborne entrainment of asbestos, the Town Board of the Town of Lancaster restricted the disposal of the asbestos slurry in June 1979. By then, a total of 7,000 gallons of the asbestos slurry had been disposed at the facility (Ferry, 1985).

In October 1980, Lancaster Reclamation, Inc. began accepting shot blast dust generated from steel casting operations at Dresser Industries. Prior to disposal, the shot blast was mixed with foundry sand. The estimated quantity of this shot blast dust is included in the estimated for the foundry sand presented in Table IV-1. A leachate analysis of the shot blast dust found concentrations of phenol in excess of NYS limits for discharge to groundwaters.

Starting in June 1981, Lancaster Reclamation, Inc. received 120,000 gallons of wallpaper production wastes from Reed Holdings, Inc. (Ferry, 1985). The wastes included surface print waste, prepaste polymer and prepaste alkali. A description of the compostiion of each waste type is presented in the Appendix. EP Toxicity tests were also conducted on each waste and results of the tests show that the contaminants analyzed for were below the test limits. However, other organic pollutants which may be present (e.g., solvents) in these wastes were not tested for.

In 1982 and 1983, Lancaster Reclamation, Inc. disposed 9,000 cubic yards of oil sludge from bus garage catch basins (Ferry, 1985). These sludges were received from the Sweet Home Central School and Ormsby Vocational School bus garages. The oil and grease content of the Sweet Home Central School sludge was 3.07%. To prevent oil from leaching from the waste, the NYSDEC requested that Lancaster Relcamation, Inc. mix the oily sludge with diatomaceous earth (NYSDEC, 1982).

Since 1980, Lancaster Reclamation, Inc. has conducted semi-annual water analyses of surface water and groundwater. Surface waters from the southeast lagoon and an aerated basin in the northeast portion of the site called the "green machine" were included. During these sampling efforts, groundwater samples were collected from a monitoring well in the eastern portion of the site and a deep water supply well located in an on-site barn. Samples were sent to ARO Corporation Environmental Laboratory for analysis of conductivity, pH, phenols, TOC and iron.

Presented in Table IV-2 are the analytical results for phenol and TOC of the groundwater monitoring conducted at the Lancaster Reclamation site from January 1980 until March 1984. The concentrations of phenols in the west well are below the water quality standards for Class GA groundwater standards with the exception of one sampling event conducted in February 1981 (0.003 mg/l). However, the west well occurs in the deep bedrock aquifer which may not be hydraulically connected to the lagoon waters containing higher concentrations of phenols (see Table IV-3).

The concentrations of phenol in the east well are higher as compared to the west well. Phenol concentrations have exceeded the Class GA groundwater standards for all but one of the sampling events over the same period of time. However, the east well occurs in a shallow aquifer which is more likely to be hydraulically connected to the contaminated cell and surface waters.

Presented in Table IV-3 are the results for phenols and TOC of surface water monitoring conducted at the Lancaster Reclamation site. As indicated in the table, the concentration of phenols in all of the surface impoundments has exceeded the water quality standards for Class GA waters in New York State on several of the sampling events. However, with the exception of these excursions, the concentrations of phenols are low. TOC concentrations are also generally found at insignificant concentrations in the surface impoundments.

In Association With
DAMES & MOORE

heavy metals (i.e., lead, cadmium, and manganese) in several of the samples collected exceeded the effluent water quality standards for Class GA groundwater in the State of New York. Furthermore, all of the samples analyzed had phenol concentrations which exceeded the groundwater standards.

Surface water samples were collected from seven sampling sites at the Land Reclamation Landfill site. Table IV-5 shows those parameters that were found at concentrations exceeding the NYS effluent standards for Class GA surface waters. These include chloride, sodium, arsenic, chromium, lead, and mercury. Phenols and PCBs (Aroclor 1248) also exceeded state standards. The remaining surface water data collected during the hydrogeologic investigation are presented in the Appendix.

Table IV-6 lists the location of each sampling point, the potential sources of contamination at that point, and the contaminants which exceed NYS standards. As can be seen from the table, interpretation of surface water data is limited by the fact that the landfill is not the only potential source of the metals and organic compounds listed in Table IV-4. These additional sources include the Depew Sewage Treatment Plant, located upstream of SP1, and stormwater runoff from Indian Road (transported by a sewer pipe that underlies the landfill site). Therefore, without sufficient background data that further defines the nature of these potential sources, it is not possible to definitively attribute the observed contaminants to a source.

Routine Monitoring

Groundwater and surface water monitoring has been conducted at the Land Reclamation Landfill since the hydrogeologic investigation was completed in 1979. For approximately one and one-half years, the surface water points and the groundwater monitoring wells were monitored and analyzed for an expanded list of parameters. This monitoring effort was conducted to establish baseline water quality data. With the exception of December 1983 and March 1984, the landfill has since been monitored on a quarterly basis for indicator parameters only (pH, chloride, con-

HAZARDOUS WASTE SITE PROFILES

ADDENDUM TO PROFILE REPORT FOR DEPEW LANDFILL SITE #915105

FIELD INSPECTION

The initital inspection of the site was conducted on February 13, 1985. Due to snow cover in some areas, it was decided to reinspect under more favorable weather conditions.

A reinspection was conducted on April 10, 1985. The following observations were made:

(1) There was no evidence of leachate or discoloration of soil along the creek bank.

(2) There was no trash or refuse observed protruding through the cover material.

(3) From this inspection, the actual landfill area appeared smaller than originally believed (see attached revised field sketch).

(4) There was a small amount of construction debris on the site area, but this will be cleaned up when ORF Project is completed.

RECOMMENDATION

There is no visible evidence that any significant amount of material was landfilled at this site. A further check should be made with information obtained from companies in response to the New York State DEC 1984 Community Right-To-Know Survey. If this data supports the above finding then this site should be reclassified to a Class 5 site. It should be retained on the registry as a disposal site with no further action required.

EPA FORM 2070-13 (7-81)

SECTION VI

ASSESSMENT OF DATA ADEQUACY AND RECOMMENDATIONS

ASSESSMENT OF DATA ADEQUACY

A summary assessment of the adequacy of existing data for completion of the HRS score is presented in Table VI-1. Insufficient information is presently available to complete an HRS score for this site.

PHASE II WORK PLAN

Objectives

The objectives of the Phase II activities are:

- To collect additional field data necessary to identify the occurrence and extent of contamination and to determine if any imminent health hazard exists.

- To perform a conceptual evaluation of remedial alternatives and estimate budgetary costs for the most likely alternative.

- To prepare a site investigation report including final HRS score.

The additional field data required to complete this investigation are described as follows:

Geophysical Survey - A geophysical study consisting of electrical resistivity and magnetometer surveys is recommended. The electrical resistivity survey will be performed at various locations within and beyond the perimeter of the site to investigate site

stratigraphy, delineate significant discontinuities and assess the presence and location of contaminant plumes. A magnetometer survey will be conducted as necessary on a grid system to aid in delineating the limits of the contaminated area.

Groundwater - A groundwater monitoring system consisting of 3 wells is recommended. Borings will be drilled to a maximum depth of 30 feet; soil samples will be taken every 5 feet or more frequently if a change in soil lithology is encountered. The wells will be placed in the aquifer of concern and constructed of 2" PVC pipe. The groundwater samples will be analyzed for phenols and HSL metals.

Surface Water - A surface water monitoring system consisting of 2 monitoring stations is recommended. One station (S-1) will be upgradient of the site, and the second station (S-2) will be downgradient. The surface water samples will be analyzed for phenols and HSL metals.

Waste - A waste sampling consisting of 6 samples collected from two locations where landfilled materials remain on-site and one background location is recommended. Composite samples of the soil collected at 6-12 inches and 18-24 inches will be made. Samples will be analyzed for phenols and HSL metals.

Air - An air monitoring survey with an HNu meter is recommended to test the air quality above the site.

TASK DESCRIPTION

The proposed Phase II tasks are described in Table VI-2. The proposed sampling locations are presented in Figure VI-1.

COST ESTIMATE

The estimated man-hours required for the Phase II project are presented in Table VI-3 and the estimated project costs are presented by task in Table VI-4.

HEALTH AND SAFETY PLAN

The Health and Safety Plan will be submitted as a separate document.

QUALITY ASSURANCE PLAN

The Quality Assurance Plan will be submitted as a separate document.

TABLE VI-1

ASSESSMENT OF DATA ADEQUACY

HRS Data Requirement	Comments on Data
Observed Release	
Groundwater	Inadequate data to score an observed release
Surface Water	Inadequate data to score an observed release
Air	Adequate data for HRS score
Route Characteristics	
Groundwater	Adequate data for HRS score
Surface Water	Adequate data for HRS score
Air	Adequate data for HRS score
Containment	Adequate data for HRS score
Waste Characteristics	Inadequate data for HRS score
Targets	Adequate data for HRS score
Observed Incident	Adequate data for HRS score
Accessibility	Adequate data for HRS score

TABLE VI-2

PHASE II WORK PLAN - TASK DESCRIPTION

	Task	Description of Task
II-A	Update Work Plan	Review the information in the Phase I report, conduct a site visit, and revise the Phase II work plan.
II-B	Conduct Geophysical Studies	Conduct resistivity and magnetometer surveys.
II-C	Conduct Boring/Install Monitoring Wells	Install 1 upgradient and 2 downgradient wells. The wells are to be located at a depth of approximately 30 feet and constructed of 2" PVC pipe.
II-D	Construct Test Pits/Auger Holes	Install 3 auger holes, one background location and two where wastes remain landfilled on-site.
II-E	Perform Sampling & Analysis	
	Soil samples from borings	Soil samples collected at 5 foot intervals during drilling and at changes in subsurface lithologies. Perform one grain size analysis and permeability test per subsurface lithology change.
	Soil samples from surface soils	No further studies necessary.
	Soil samples from auger holes/test pits	No further studies necessary.
	Sediment samples from surface water	No further studies necessary.
	Groundwater samples	3 groundwater samples are to be collected and analyzed for phenols and HSL metals.

TABLE VI-2, Continued

PHASE II WORK PLAN - TASK DESCRIPTION

Task		Description of Task
	Surface water samples	2 surface water samples are to be collected and analyzed for phenols and HSL metals.
	Air samples	Using the HNU, determine the presence of organics.
	Waste samples from auger holes	2 composite soil samples are to be collected from each auger hole and analyzed for phenols and HSL metals.
II-F	Calculate Final HRS	Based on the field data collected in Tasks II-B - II-E, complete the HRS form.
II-G	Conduct Site Assessment	Prepare final report containing Phase I report, additional field data, final HRS and HRS documentation records, and site assessments. The site assessment will consist of a conceptual evaluation of alternatives and a preliminary cost estimate of the most probable alternative.
II-H	Project Management	Project coordination, administration and reporting.

(Originator: John Zambrano)

I. Purpose

The purpose of this document is to provide a compilation of water quality standards and guidance values for toxic and non-conventional pollutants to be used in the Department's regulatory programs, including the SPDES permit program.

II. Discussion

This substantial revision of TOGS 85-W-38 is the result of the promulgation of amendments to 6 NYCRR Part 701-702, effective on August 2, 1985, governing the development and use of surface water quality standards and guidance values. This revision uses a new format in the tabulation and does not include the methodologies for the development of standards and guidance values. The user is referred to the regulations for a description of the methodologies.

III. Guidance

The Quality Evaluation Section will use the attached list in developing SPDES permit water quality-based effluent limits. The Criteria and Standards Section will maintain and revise the list on a regular basis.

DIVISION OF SOLID AND HAZARDOUS WASTE
INACTIVE HAZARDOUS WASTE DISPOSAL SITE REPORT

CLASSIFICATION CODE: 2a **REGION:** 9 **SITE CODE:** 915105

NAME OF SITE : Village of Depew
STREET ADDRESS: 315 Borden Road

TOWN/CITY:	**COUNTY:**	**ZIP:**
Depew (Village)	Erie	14043

SITE TYPE: Open Dump- Structure- Lagoon- Landfill-X Treatment Pond-
ESTIMATED SIZE: 5 Acres

SITE OWNER/OPERATOR INFORMATION:
CURRENT OWNER NAME....: Village of Depew
CURRENT OWNER ADDRESS.: Gould Ave., Depew, NY 14043
OWNER(S) DURING USE...: Village of Depew
OPERATOR DURING USE...: Village of Depew
OPERATOR ADDRESS.....: Gould Ave., Depew, NY 14043
PERIOD ASSOCIATED WITH HAZARDOUS WASTE: From 1940's TO 1962.

SITE DESCRIPTION:
This site was formerly used by the Village of Depew and Arcata Graphics to dispose of paper, dust, wood and general refuse. (1940-1962)

Foundry sands from Dresser Industries were used as cover material during the operating period. Foundry sands during this time contained phenols.

In 1983, approximately 5 acres of this site were sold to Erie County for the construction of an Overflow Retention Facility for the waste water treatment process. The construction involved the excavation of 60,000 yd^3 of soil. This excavated waste contained phenols but the concentration is unknown.

The Overflow Retention Facility is completed. The only visible evidence of prior landfilling is miscellaneous debris along the banks of Cayuga Creek. Additional waste are suspected to remain buried on-site.

HAZARDOUS WASTE DISPOSED: Confirmed- Suspected -X

GEOLOGY AND TOPOGRAPHY

The Erie-Niagara basin is underlain by layers of sedimentary bedrock which are largely covered with unconsolidated deposits. Descriptions of the various bedrock units are given in figure 2. The bedrock consists mainly of shale, limestone, and dolomite; the Camillus Shale contains a large amount of interbedded gypsum. All the bedrock units were built up by fine-grained sediments deposited in ancient seas during the Silurian and Devonian Periods and, therefore, are bedded or layered. The dip of the rocks (inclination of the bedding planes) is gently southward at from 20 to 60 feet per mile, but the average dip is between 30 and 40 feet per mile. The dip is so gentle that it is hardly perceptible in outcrops.

The unconsolidated deposits are mostly glacial deposits formed during Pleistocene time about 10,000-15,000 years ago when an ice sheet covered the area. The glacial deposits consist of: (1) till, which is a nonsorted mixture of clay, silt, sand, and stones deposited directly from the ice sheet; (2) lake deposits, which are bedded clay, silt, and sand that settled out in lakes fed by the melting ice; and (3) sand and gravel deposits, which were laid down in glacial streams. The glacial sand and gravel deposits are of both the ice-contact and outwash types, as will be explained later in the report. The glacial deposits generally are less than 50 feet thick in the northern part of the basin. They are considerably thicker in some valleys in the southern part and reach a maximum known thickness of 600 feet near Chaffee. Other unconsolidated deposits are alluvium formed by streams in Recent times and swamp deposits formed by accumulation of decayed plant matter in poorly drained areas.

Relief of the present land surface is due to preglacial erosion of the bedrock and subsequent topographic modification by glaciation. In contrast to the southward dip of the rocks, the land surface rises to the south largely because preglacial erosion was more vigorous in the northern part of the basin. The shale in the southern part of the basin is somewhat more resistant to erosion than the rocks in the northern part of the basin but not significantly so. Figure 3 shows the relationship of the topography and rock structure and delineates the two topographic provinces of the basin: the Erie-Ontario Lowlands and the Appalachian Uplands. The rocks crop out in belts which trend generally east-west. The bedrock geologic map, plate 2, shows that the outcrop belts bend around to the southwest near Lake Erie. They assume this direction mainly because relatively intense erosion in the Erie-Ontario Lowland near Lake Erie has exposed the rock at lower elevations than farther east. The Lockport Dolomite and the Onondaga Limestone, because they are relatively resistant to erosion, form low ridges in the northern part of the basin. Tonawanda, Murder, and Ellicott Creeks descend the escarpment of the Onondaga at falls and cataracts.

In the hilly southern half of the basin (the Appalachian Uplands), preglacial valleys, deepened by glacial erosion, are cut into the shale. The valleys are partly filled with glacial deposits so that some of the present streams flow 200 to 600 feet above the bedrock floors of the valleys as shown in figure 3.

Depew, N. Y.
November 14, 1950

New York State
Department of Health and Sanitation
Albany, New York

Gentlemen:

I am writing to complain of an intolerable condition that has taxed the patience of all the people of this area for the past ten years. It is in regards to the disposition of the garbage and refuse within the village of Depew.

Ten years ago the village dump was located on the north bank of Cayuga Creek at the Bordon road bridge. This particular spot is about ½ mile down stream from my property and about 1½ miles down stream from the recently completed Federal Government Flood Control Project through the village of Lancaster. Dispite complaints and local public petitions to the village board the dump has spread over the valley destroying the only scenic asset that the village possesses. It now occupies an area about ½ mile square and out of all proportion to requirements. Until recently fires were burning constantly. Fortunately this evil has been corrected. However, the village authority promised faithfully, or rather in bad faith to keep the garbage covered at all times with the following result:

Not once through-out the entire summer was the garbage covered, but was left open to breed flies and rats, and to contaminate the air. The air reeked with the odors of decaying garbage throughout the summer. It is fortunate that a Polio Epidemic was not started from the result of this contamination.

Recently the village took upon itself the exploitation of the top soil on this village property which consists of sedimentary soil lying on bed rock about seven feet in depth. Just this past week they have completed a contract with a private concern to remove ten thousand yards of soil with the result that a hole remains about 500 x 100 feet in area. A levy about 50 feet wide remains between this excavation and the stream bed proper. An earlier digging is being filled with garbage which is about six feet higher than the original surface dispite a town ordinance requiring the removal of top soil to be refilled to the original surface, six inches of soil replaced and subsequently planted.

With the advent of a fall rain and the melting snow in Spring, the flood waters leave the Lancaster Flood Control Project, which ends at Penora Street and fans out into this broad low valley west of Transit Road where the dumping area is located, forming a vast lake with the waters rising at least ten feet high on our

REF
25

southern bank. The result in that the above superinposed rubbish forms an island in the center of the lake with the obvious result that much of this refuse is flushed out, thereby further poluting the stream and spreading the contamination further. Last fall the earlier excavation remained filled with water after a flood resulting in a lake which became a potential danger for any children who might have ventured out on the thin ice which formed during the winter months. No drainage has yet been provided for this excavation or the recent one.

This past week my neighbor upon complaint was again promised that the garbage would be covered. This will be impossible unless soil is brought in for that purpose. There is no segregating of garbage which might faciletate coverage material. Are they to continue piling rubbish higher than the natural flood plain? What action can be taken to compel the authorities to build a much needed incenerator?

The village of Depew lies in two townships. The major part and dense population lies in the township of Lancaster. Transit Road is the dividing line with the smaller part of the village and sparcely populated area lying in the Township of Cheektowaga. The township of Cheektowaga has a large modern incenerator located on Union Road. Is it possible to force the town to use this incenerator? The Township of Lancaster is at this moment planning on building an incenerator. Between the two townships, can it not be possible to remove this blight and contamination from this area.

Yours truly,

Edward M Stucht

P.S. Pictures & map need not be returned.
