1.0 EXECUTIVE SUMMARY

Beginning approximately in 1960 and continuing to 1982, Ameron (or its predecessors) operated a protective coatings manufacturing facility at 111-113 Colgate Avenue, Buffalo, New York (the "site"). During 1983 and 1984, environmental investigations revealed the presence of certain chemicals in soil and in perched water beneath the western most portion of the former manufacturing building. As a result, in 1986 Ameron entered into an Order on Consent with the New York Department of Conservation (DEC) whereby Ameron installed, maintained, and operated a sub-floor vapor-phase GAC for a ten-year period. The system was constructed and installed in 1988, DEC approval received in 1989, and Ameron operated the system through 1999.

At the conclusion of these remedial activities, Ameron sought delisting of the site from the DEC's Registry of Inactive Hazardous Waste Sites ("Registry"). DEC responded by stating that although the terms of the Order on Consent were completed to their satisfaction, insufficient data existed to establish that the remedial action goals had been attained to allow the property to be delisted from the Registry. DEC required further investigation.

In November 2001, Ameron retained AFI to conduct a limited subsurface site investigation consisting of 6 subsurface soil samples and 1 groundwater sample from an existing monitoring well. Four soil samples exhibited petroleum-type volatile organic chemical contamination (toluene, ethylbenzene, and xylene) in excess of DEC criteria. Elevated levels of semi-volatile organic chemicals, presumed to be associated with diesel fuels, were also found in one soil sample and benzene was found in excess of groundwater standards in MW-2. The investigation results were reported in *AFI's Subsurface Soil Investigation and Water Analysis for MW2*, dated November 2001 that was filed with DEC. As required by statute, this report included discussion of the site's closed in place USTs.

In April 2002, the DEC informed Ameron that it had no record of USTs for the site concluding that the site was in violation of New York State Regulations 6 NYCRR 596 and Federal Regulations 40 CFR 280 and therefore subject to all applicable fines and penalties as such. The DEC further required Ameron to submit a plan to decommission the USTs and mitigate any environmental impacts from the tanks. The decommissioning included closure of the site's USTs.

In June 2004, Ameron retained AFI to conduct a supplemental site investigation for the purposes of delisting the property prior to closing the USTs. The investigation work plan, approved by DEC, required 4 subsurface soil samples and 1 groundwater sample and the completion of an Electromagnetic (EM-61) Survey to identify any potential USTs that remained on-site. No chemicals of concern in excess of the cleanup goals set out in TAGM 4046 were identified in any of the four soil borings. Two of the soil borings, however, exhibited petroleum-type volatile organic chemical contamination (xylenes) in

excess of TAGM 4046 guidance values. The EM-61 Survey identified twelve (12) anomalies that were considered "suspected USTs". The results of this investigation were reported in *AFI's Supplemental Site Investigation and Closure Report for Ameron Site* that was filed with DEC.

Because no RCRA substances, listed hazardous substances, or contaminants of concern (other than petroleum) were identified on site, Ameron once again requested that the site be delisted. The DEC refused to delist the property until the UST closure project was complete.

In August 2004, AFI prepared and submitted to the DEC a Remedial Action Work Plan ("RAWP") for the Investigation and Removal of USTs. The RAWP was approved by DEC. The implementation and completion of that RAWP is described herein.

Implementation of the RAWP resulted in the removal of eleven (11) USTs and excavation and off-site landfill disposal of 2839 tons of impacted soils from the site's western portion. Post-excavation confirmatory sampling confirms that TAGM 4046 cleanup guidance goals have been met and this area of the site should be closed, no further action required.

2.0 SITE AND SITE HISTORY

Beginning approximately in 1960 and continuing to 1982, Ameron (or its predecessors) operated a protective coatings manufacturing facility at 111-113 Colgate Avenue, Buffalo, New York (the "site"). During 1983 and 1984, environmental investigations revealed the presence of certain chemicals in soil and in perched water beneath the western most portion of the former manufacturing building. As a result, in 1986 Ameron entered into an Order on Consent with the New York Department of Conservation (DEC) whereby Ameron installed, maintained, and operated a sub-floor vapor-phase GAC for a ten-year period. The system was constructed and installed in 1988, DEC approval received in 1989, and Ameron operated the system through 1999.

The property is bordered by industrial properties to the south (these industrial properties front Okell Street) and Colgate Street to the north. Residential properties are located to the east along the south side of Colgate. Commercial and industrial properties lie to the west and on the north side of Colgate Street, to the east of the site. Colgate Street ends at the western gate of the Ameron facility (See Vicinity Map Figure #1).

3.0 REMEDIAL ACTION COMPLETED FOR ALL AREAS

3.1 Excavation Summary

Removal of the UST's and impacted soil was completed during the months of October to December of 2004.

AFI divided the UST removal area into three (3) distinct areas referred to as Areas A, B, and C. Four USTs were located in Area A, three in Area B, and four in Area C. All

USTs were removed, cleaned and recycled, and all associated impacted soils removed to the extent practicable or feasible. All USTs and soils were excavated, scanned, stockpiled and ultimately disposed of; beginning with the soils around and beneath the USTs as they were unearthed.

Each excavation started with the removal of the target UST, the evacuation of any fluids, the removal of any concrete contained therein, and the removal and scrapping of the UST. Any tank contents (liquids and concrete slurry) and all visually impacted soil and fluids (visual signs of staining, odor, or elevated PID readings) identified beneath the tank and along the walls of the excavation were removed and stockpiled for later disposal. Each tank pit excavation was then expanded; generally east, west, south, and north until the boundaries or limits of impacted soils were reached and clean soils encountered. In all cases the excavation was completed to the top of bedrock, to the top of any concrete collars, or to a minimum depth of 12 to 14 feet below grade (BG). As field conditions changed, the DEC instructed Ameron to expand removal activities to include not only removal, cleaning and disposal of the tanks that were empty but also to open the tanks that were previously closed with concrete slurry. AFI removed the concrete slurry and exposed the tank bottoms to assure that no residual chemicals were trapped at the bottom of the tanks or within voids. This work was completed with each tank.

Confirmatory, post-excavation soil samples were obtained prior to backfilling the excavations, the results of which are discussed in section 5.0. Confirmatory soil samples were collected from the four side walls and floors of each excavation subsequent to the removal of the tanks and visually impacted soils (See Table 3 for Confirmatory Testing Results). In some situations side wall sampling did not occur if the side wall was shared with a previously cleaned and sampled excavation area or if the excavation of a new excavation pit broke through a wall shared by an adjoining excavation area or pit (e.g. Area 'B' and excavation pit 10 and 11 in Area 'C'). All excavation sidewalls and floors were below NYSDEC TAGM 4046 Recommended Soil Cleanup Objectives (RSCO) or non-detect.

In Area B; the excavation was closed by initially placing 6 mil black plastic at the bottom of the excavation, covered by a layer of number 6 inch 'shot rock' which was covered by clean compactable fill. The plastic and shot rock were placed so as to allow easy recognition of the transition layer of 'clean fill' at the base of the excavation.

Soils from each of Areas A, B, & C were excavated, staged, sampled, characterized and disposed of separately. All approvals were processed under separate landfill disposal application approval forms. A total quantity of soil excavated and properly disposed of at Modern Landfill was 2839.35 tons. This was the sum of Area 'A' soils (479.05 tons), plus area 'B' soils (1120.09 tons), and area 'C' soils (1240.21 tons) all which were excavated, tested, manifested and removed from the site.

All impacted fluids encountered within the excavation and also fluids contained within the USTs were pumped into one of three, 20,000 gallon Baker tanks. The final holding

tank was dependant on the source and its initial analytical results. All fluids were treated as impacted water and were discharged to the Buffalo Sewer system after passing through a double carbon-filter filtration system (see Figure #7) and undergoing continuous (hourly) and routine field monitoring during the discharge process' to assure filter efficiency and discharge permit compliance.

The NYSDEC routinely visited the site throughout most of this remedial work. Soil disposal receipts are included in the Appendix of this report. Headspace readings of the final boundaries of the excavations are included in table at the end of this section. The final boundaries of the excavation areas are shown on the site map included with this report.

3.1.1 Excavation of Area A

The Area A excavation included the removal of USTs 1, 2, and 3 and impacted soils. Area A was located just north of the western building annex, at the eastern portion of a courtyard created by the fence to the north and the western building which formed a wall to the east and south (See Site Map Figure # 3). USTs 1, 2, and 3 were uncovered in this area. Some of these tanks contained some petroleum impacted water, concrete slurry, or both. Soils in the general vicinity of the USTs and near the western building foundation (which made up the south wall of the tank excavation pit) found to be impacted were removed and stockpiled for characterization and disposal.

The excavation of Area A was advanced to depths ranging from 12 to 14 feet below grade where tight, tan clayey silt was encountered which did not exhibit any visual signs of significant residual impacts. Significant quantities (5000 to 6000 gallons) of impacted excavation water were encountered in Area A and are discussed separately below. This water was mostly surface runoff that had entered the excavation due to the natural contours of the surrounding terrain, however, in some instances, liquids were observed flowing from beneath the building foundation to the south and east. Some of this water may have been ponded under the building or resulted from the poor condition of the building and roof drainage system, which was severely damaged. (The section of the building located just east of the excavation was in extremely poor condition and the roof had collapsed allowing rainwater to flow inside the building.)

Excavation of Area A soils continued to the building wall and foundation on the east, the building wall and foundation to the south, the fence and right-of-way along Colgate Street to the north and to a distance of 45 feet to the west. USTs No.1 and No.2 were removed immediately, vented, cleaned, and shipped to Diamond Hurwitz scrap yard for disposal.

UST No.3 was exposed, inspected and found to contain concrete slurry mounded into a pyramid shape at the tank openings leaving voids at either end of the tank. The voids were found to contain some impacted liquids (low PID readings 25-95 PPM) and a concrete-slurry. This liquid was pumped into Baker Tank Number 1, positioned just outside the fence-line along Colgate Street, for storage, testing and treatment. UST No. 3 was originally approved to be left 'in-place' since it had been previously closed by

others. AFI removed all impacted soil from the sides of the tank and beneath the tank by excavating one side of the tank to a depth of 3 feet below then allowing the tank to slip into the lower elevation, and excavating the other side to the same depth.

Confirmatory soil samples were collected from the east, north, and south walls, and from the floor of the excavations beneath the tanks. Due to the heavy and continuous rain events, a decision was made by the Ameron to close the excavation, after it was pumped dry, scraped clean, and sampled. This was to reduce the amount of additional water that was continuously collecting in the pit.

The Area A soils were stockpiled on 6 mil black plastic, laid out on top of the asphalt driveway, just west of the Colgate Street entry gate. The soils were covered daily and temporary, protective, orange safety fence was erected around the piles. The total quantity of Area A soils disposed of at Modern Landfill was 479.05 tons.

3.1.2 Excavation of Area B Soils

The Area B excavation included the removal of USTs No. 4, No. 5, No. 6 and No. 7 and impacted soils. Area B soils were impacted by the almost continuous flow of liquid and soils flowing into the excavation from beneath the concrete slab and foundation of the building to the south. There was a series of pipes, which ran under the foundation and also under the tank farm that provided a conduit for a slurry of soil and water to enter the excavation. The final depth of the excavation ranged from 12 to 14 feet below grade.

Large quantities of groundwater were encountered during the excavation of Area B. This water was stored in Baker Tank #1(BT1) and Baker Tank #2 (BT2). BT2 was placed on the building's south side along the rail tracks. A third Baker Tank (BT3) was placed just west of BT2 along the same building and tracks. BT3 was initially used to hold de-con water. Approximately 35,000 gallons of water originated from Area B.

Area B soils totaled 1120.09 tons. These soils were stockpiled on the south side of the southern most building and also to the west of the excavation pit for USTs No. 10 & 11. A total of 1120.09 tons of soil were disposed at Modern Landfill.

3.1.3 Excavation of Area C Soils

The Area C excavation included the removal of USTs No. 8A, 8B, 10, 11 and impacted soils. The stockpiles for Area C soils were just north of the Area B soils on the west side of the site. Excavation in each of the UST tank pit areas continued until the boundary limits of contamination were reached and until a tight tan clayey silt layer with no apparent visual impacts was observed. The final depth ranged from 14 to 15 feet below grade. Groundwater was encountered during the excavation Area C. This water was pumped into BT1 and BT3. The Area C soils totaled 1240.21 tons.

4.0 POST-EXCAVATION CONFIRMATORY SAMPLING

Upon the removal of impacted soil from each of the designated soil areas, post-excavation confirmatory soil samples were obtained from the sidewalls and bottom of each area. Based on the field headspace readings, the post-excavation soil samples were obtained from the areas exhibiting the greatest impacts of each sidewall and bottom location. The soil samples were obtained using clean, new sample jars provided by the laboratory, and sealed using Teflon-lined lids. The samples were then properly packaged and transported to Paradigm Laboratories of Rochester for analysis.

Post-excavation soil samples from each area were analyzed using EPA method 8260 for the STARS list of compounds (volatiles). The post-excavation soil samples for the areas were also analyzed using method 8270 for the STARS list of compounds (semi-volatiles) based on previous data indicating that there was the presence of a distillate in that localized area.

Soil samples were collected and transported to Paradigm Environmental Services, Inc., 179 Lake Avenue, Rochester, New York Certified lab (ELAP 10958) for analysis. Analytical results for soil samples were compared to NYSDEC TAGM 4046 "*Recommended Soil Cleanup Objectives for VOCs - Table #1, SVOCs Table #2, and Heavy Metals Table # 4.*" The confirmatory analytical data for each area is contained in Table #3.

All post-excavation confirmatory sampling results indicated levels below TAGM 4046 RSCO. Although a detectable level of butanone (a chemical of concern) was found in Area B and Area C Excavation Pit 10 & 11, these levels too were below TAGM 4046 levels.

Summaries of the analytical results are included in **Tables 3A, 3B and 3C** of the Appendix.

5.0 BACKFILL: PROCEDURE AND QUALITY

During the excavation of impacted soil in Areas A, B and C, compacted backfill and 4" – 6" inch shot rock was delivered to and staged on site. Any fill that was stored on-site was covered with plastic to avoid storm water erosion and/or cross-contamination from excavated material. Once excavation was complete within each area; confirmatory soil samples were collected and the area was backfilled. All equipment transporting clean fill was de-contaminated with pressure and steam prior to hauling 'clean fill'. All delivery trucks were separate from waste hauling trucks. All vendors provided AFI with letters affirming that their fill was clean and 'DOT-approved'. The excavations were filled with a lift of approximate one foot to 18 inches of shot rock. The shot rock was then over-laid with a 6 mil plastic. The final step entailed covering the remaining area with compacted backfill in 6 inch to 1 foot lifts, compacting the fill with the loader and excavator, and filling in this fashion to grade. In some situations the last 12 to 18 inches of the

excavation was covered with shot rock and 2 inch crusher-run to create a hard base for truck and trailer traffic.

The excavation was backfilled with certified 'clean' DOT approved backfill. All fill material was virgin material and from certified DOT suppliers. The sources of the fill material were Buffalo Crushed Stone, and McEwan Trucking and Gravel products. The fill material used on site consisted of four types:

- 4" to 6" shot rock
- 2" crusher run
- 2" screened stone
- Compactable fill

Fill material was delivered to the site under manifest using LCA development trucks and McEwan Trucking and Gravel trucks. The Buffalo Crushed Stone, Inc. material was NYSDOT certified as Source Number 5-3R. The McEwan fill material is certified clean under NYSDOT guidelines, (See McEwan and Buffalo Crushed Stone Affirmation letter in the Appendix).

6.0 WASTE MANIFEST AND APPROVED LANDFILLS

All soils were transported to Modern Landfill located at Harold and Pletcher Roads, Lewiston, New York 14107 under generator # 17806.004 by LCA Development, a NYSDEC permitted 9-A waste hauler. A total of 2839.35 tons was transported and disposed of at this site. A copy of all waste manifests are found in Appendix B.

7.0 POST-EXCAVATION WATER TREATMENT

Approximately 60,000 gallons of excavation water was removed from the designated soil areas during the impacted soil removal activities. Three Baker Tanks were delivered to the site and stored water throughout remediation process. The impacted water in the tanks, labeled Baker Tank One, Two and Three (BT1, BT2, BT3) was treated using an on site double-carbon filtering system (see Figure #7) as proposed in the approved Remedial Action Plan. A confirmatory sample of the treated water was obtained as proposed in the Consent Order and also as required by the City of Buffalo Sewer Authority Discharge Permit No. 04-12-TP109. The analytical results, which show pre and post filter values are included in the Appendix. The filtered water, once cleaned to acceptable levels was discharged to the sewer in compliance with permit conditions. Upon completion of the on site treatment of excavation water, the Baker tanks used to temporarily store the excavation water, were cleaned and removed from the site. A disposal receipt for the cleaning of the tanks is included in the Appendix.

The following figures relate to site water treatment activities:

- Figures #6 showing Baker Tank Locations
- Figure #7 Baker Tank-Carbon Filtration System -Typical
- Tables showing Baker tank Sampling Results and Flow Rates

8.0 SENSITIVE RECEPTORS DESCRIBED

The sensitive receptors appears to be the sewer lines that exist along Colgate Street and run east, towards South Park Avenue, the line originates/terminates at a point midway across the Ameron Property and flows east into a main trunk-line running along South Park. No impacts have been detected in these areas during remediation activities conducted.

All homes in the area are serviced by a public water supply.

8.1 Industrial/Potable Wells

There are three monitoring wells, MW1, MW2, and MW3, located on the property. The closest monitoring well to the excavation is monitoring well MW2. This well is located on the north property line, near the chain-link, security fence, just west of the excavation area. The houses and businesses in the area are supplied municipal water by City of Buffalo Water Authority. See Figure #2 for well locations.

8.2 Nearest Body of Water

There is no significant body of water within 1/8 mile of the site. The general flow of ground water and surface water is to the southwest towards Lake Erie. The area directly west of the site exhibits wetland characteristics.

11.0 CONCLUSIONS

All USTs and associated impacted soils have been removed from the site. Post-excavation confirmatory sampling confirms that cleanup target goals established in TAGM 4046 have been met in all sidewall and floor areas, and the site area should be closed and no further action required in this portion of the property.

Exploratory Test pits installed south of the railroad tanks and west of the loading dock where EM31/61 test results showed magnetic anomalies were negative for tanks. In addition, analytical samples collected from the spoil material removed from the excavation were within acceptable ranges and below RSCO guidance values. The same was true for exploratory test Pits installed in Tank Pit area 9. No tanks or soil contamination was encountered.

Re: Colgate Street, AFI Environmental Job

Dear Valerie:

This is to certify that the Onondaga Limestone, surge material supplied to the above referenced project is produced without contaminants. The quarry is a NYSDOT approved source; the Source Number is 5-3R.

Sincerely,

Curt Resetarits

Volatile Analysis Report for Soils/Solids/Sludges

Client: AFI Environmental

Client Job Site: Ameron
Client Job Number: R1015
Field Location: Tank Pit 3 - East Wall
Field ID Number: N/A
Sample Type: Soil

Lab Project Number: 04-3665
Lab Sample Number: 12241

Date Sampled: 12/08/2004
Date Received: 12/09/2004
Date Analyzed: 12/10/2004

Halocarbons	Results in ug / Kg
Bromodichloromethane	ND< 6.68
Bromomethane	ND< 6.68
Bromoform	ND< 6.68
Carbon Tetrachloride	ND< 6.68
Chloroethane	ND< 6.68
Chloromethane	ND< 6.68
2-Chloroethyl vinyl Ether	ND< 6.68
Chloroform	ND< 6.68
Dibromochloromethane	ND< 6.68
1,1-Dichloroethane	ND< 6.68
1,2-Dichloroethane	ND< 6.68
1,1-Dichloroethene	ND< 6.68
cis-1,2-Dichloroethene	ND< 6.68
trans-1,2-Dichloroethene	ND< 6.68
1,2-Dichloropropane	ND< 6.68
cis-1,3-Dichloropropene	ND< 6.68
trans-1,3-Dichloropropene	ND< 6.68
Methylene chloride	ND< 16.7
1,1,2,2-Tetrachloroethane	ND< 6.68
Tetrachloroethene	ND< 6.68
1,1,1-Trichloroethane	ND< 6.68
1,1,2-Trichloroethane	ND< 6.68
Trichloroethene	ND< 6.68
Trichlorofluoromethane	ND< 6.68
Vinyl chloride	ND< 6.68

Aromatics	Results in ug / Kg
Benzene	ND< 6.68
Chlorobenzene	ND< 6.68
Ethylbenzene	ND< 6.68
Toluene	ND< 6.68
m,p-Xylene	ND< 6.68
o-Xylene	ND< 6.68
Styrene	ND< 6.68
1,2-Dichlorobenzene	ND< 6.68
1,3-Dichlorobenzene	ND< 6.68
1,4-Dichlorobenzene	ND< 6.68

Ketones	Results in ug / Kg
Acetone	ND< 33.4
2-Butanone	ND< 16.7
2-Hexanone	ND< 16.7
4-Methyl-2-pentanone	ND< 16.7

Miscellaneous	Results in ug / Kg
Carbon disulfide	ND< 16.7
Vinyl acetate	ND< 16.7

Volatile Analysis Report for Non-potable Water

Client: AFI

Client Job Site: Ameron
Client Job Number: R1015
Field Location: Tank 11 Liquid
Field ID Number: N/A
Sample Type: Water

Lab Project Number: 04-3401
Lab Sample Number: 113666
Date Sampled: 11/11/2004
Date Received: 11/12/2004
Date Analyzed: 11/15/2004

Halocarbons	Results in ug / L
Bromodichloromethane	ND< 2,000
Bromomethane	ND< 2,000
Bromoform	ND< 2,000
Carbon Tetrachloride	ND< 2,000
Chloroethane	ND< 2,000
Chloromethane	ND< 2,000
2-Chloroethyl vinyl Ether	ND< 2,000
Chloroform	ND< 2,000
Dibromochloromethane	ND< 2,000
1,1-Dichloroethane	ND< 2,000
1,2-Dichloroethane	ND< 2,000
1,1-Dichloroethene	ND< 2,000
cis-1,2-Dichloroethene	ND< 2,000
trans-1,2-Dichloroethene	ND< 2,000
1,2-Dichloropropane	ND< 2,000
cis-1,3-Dichloropropene	ND< 2,000
trans-1,3-Dichloropropene	ND< 2,000
Methylene chloride	ND< 5,000
1,1,2,2-Tetrachloroethane	ND< 2,000
Tetrachloroethene	ND< 2,000
1,1,1-Trichloroethane	ND< 2,000
1,1,2-Trichloroethane	ND< 2,000
Trichloroethene	ND< 2,000
Trichlorofluoromethane	ND< 2,000
Vinyl chloride	ND< 2,000

Aromatics	Results in ug / L
Benzene	ND< 700
Chlorobenzene	ND< 2,000
Ethylbenzene	42,200
Toluene	2,000
m,p-Xylene	126,000
o-Xylene	4,180
Styrene	ND< 2,000
1,2-Dichlorobenzene	ND< 2,000
1,3-Dichlorobenzene	ND< 2,000
1,4-Dichlorobenzene	ND< 2,000

Ketones	Results in ug / L
Acetone	ND< 10,000
2-Butanone	ND< 5,000
2-Hexanone	ND< 5,000
4-Methyl-2-pentanone	ND< 5,000

Miscellaneous	Results in ug / L
Carbon disulfide	ND< 5,000
Vinyl acetate	ND< 5,000

ELAP Number 10958 Method: EPA 8260B Data File: 25910.D

Permit No.:04-12-TP109

EPA CATEGORY 40 CFR 403
Expiration Date: Jan. 31, 2005
Date Paid: Dec 7, 2004

BUFFALO SEWER AUTHORITY

TEMPORARY DISCHARGE PERMIT

Permittee: AFI ENVIRONMENTAL

Location Address: 7815 BUFFALO AVENUE, NIAGARA FALLS, NEW YORK 14304

The above named Permittee is hereby approved to discharge **pretreated stormwater** only, from:

AMERON INT., 111 COLGATE AVENUE BUFFALO, N.Y. 14220

to the Buffalo Sewer Authority facilities in accordance with the Buffalo Sewer Authority Regulations, Article VI, Section 14, and subject to the following conditions:

ARTICLE 1 CONDITIONS OF ACCEPTANCE

The discharge of the approved waste by the Permittee shall be subject to the following conditions:

a. Times, Location & Rate

The following location is designated for discharge during the hours listed and subject to the limit for rate of discharge specified:

Location: (see attached map)

Time Discharge is Permitted: 07:00 AM to 07:00 PM Monday thru Friday

Limit on Rate of Discharge: 20,000 gallons per day, dry weather only.

b. Operations

The Permittee shall maintain cleanliness, minimize odors and protect the Buffalo Sewer Authority facilities during the permittee's operations. The Permittee shall not permit any condition to arise which may pose a threat to public health, safety or welfare.

c. Samples and Analyses

The Buffalo Sewer Authority may from time to time, require the Permittee to sample and analyze its waste discharges. Such sampling and analyses shall be performed and results submitted by a New York State Dept. of Health certified laboratory. The analyses required shall be as specified by the Buffalo Sewer Authority, which also reserves the right, at its convenience, to sample wastes discharged by the Permittee.

d. Refusal to Discharge

The Buffalo Sewer Authority may refuse the Permittee permission to discharge wastes at any time and for any reason whatsoever, for the protection of sewer facilities against damage or flooding; to assure the proper operation and maintenance of said facilities; or to protect public health, safety or welfare.

e. Local Limits

Except as otherwise specified in this permit, the permit holder shall comply with all specific prohibitions, limits on pollutants or pollutant parameters set forth in the Buffalo Sewer Authority Sewer Use Regulations, as amended from time to time, and such prohibitions, limits and parameters shall be deemed pretreatment standards for purposes for the Clean Water Act.

ARTICLE 2 REGULATIONS

The Permittee must conform to all Buffalo Sewer Authority regulations and appropriate Federal, State and County Statutes, rules, mandates, directives, and orders concerning the collection, transportation, treatment and disposal of wastewaters.

ARTICLE 3 INSURANCE AND INDEMNIFICATION

The Permittee, agrees to indemnify and hold harmless the Buffalo Sewer Authority and its agents and employees against any and all claims resulting from work performed under this permit. The permittee shall be solely responsible for any and all injury or damage to its employees or property arising from use of Buffalo Sewer Authority facilities under this permit.

In the event of any alteration, non-renewal or cancellation of these policies, at least (45) forty-five days advance notice shall be given to the Industrial Waste Section, Bird Island Treatment Plant, 90 West Ferry Street, Buffalo, New York 14213 - before such change shall be effective.

Permit No.:04-12-TP109

ARTICLE 4 TERMINATION FOR VIOLATION OF AGREEMENT

In the event of a violation of any of the terms and conditions of this permit by the Permittee or upon the failure to pay the charges herein specified, the Buffalo Sewer Authority shall terminate the permit by service of notice of termination by registered mail at the Permittee's office address as set forth above.

ARTICLE 5 PERMITTEE APPROVAL

Official William Littler (Print Name) Title President/Consultant (Print)

Signature [signature] Date 12/7/01

Permit Number: 898

Buffalo, New York October 26, 2004

Buffalo Water / AAET

HYDRANT PERMIT

Permission is hereby granted to the following:

AFI ENVIRONMENTAL
7815 BUFFALO AVE.
NIAGARA FALLS , NEW 14304
(716) 283-7645

to connect to and open the fire hydrant at:

111 COLGATE

Hydrant Number:

for the purpose of:

TANK REMOVAL, CLEANING, ETC.

This permit is effective: November 01, 2004 **and expires:** November 30, 2004

It is understood and agreed that the party securing this permit is liable for any damage to this hydrant during the life of this permit and until party has reported to BuffaloWater/AAET that usage of this hydrant has ceased and an inspection is made.

Also, this permit is issued with the understanding that a properly functioning RPZ backflow preventer is required when using this hydrant. This device will be provided by the permit holder. An annual test report (Form DOH-1013) is required for each device and MUST be on file at Buffalo Water/AAET. For further info about backflow devices, call 851-4710.

Permit Number: 898 **Buffalo, New York** Date: 10-26-2004

Buffalo Water / AWS
HYDRANT PERMIT

The following hydrant permit is hereby granted to the following: AFI ENVIRONMENTAL
283-7645 OFFI

111 COLGATE

(circle one) Type:	Daily	Weekly	Monthly	Seasonal (4/15 - 10/31)
Cost:	$107.00	$249.00	$714.00	$2,858.00

for the purpose of: TANK REMOVAL, CLEANING, + ETC. PLUS 1 PUMP OUT ON 11-30-04

The permit is effective: From: 11-1-2004 To: 11-30-2004

RPZ Information: Type: _____ Date of test report: _____

This permit is for use on all City hydrants, however only one (1) hydrant can be used at one time. The use of more than one (1) hydrant at the SAME TIME requires a separate permit for each hydrant. The permit must be available at the active hydrant location.

Permit holders are required to notify Buffalo Water/AWS at 851-4747 on a daily basis of all hydrants being used under this permit prior to the use of those hydrants.
It is understood and agreed that the party securing the permit is responsible to take any and all precautions to prevent any damage to the hydrant(s) during the life of this permit and until party has reported to Buffalo Water/AWS that usage of each hydrant has ceased and an inspection is made.

A properly functioning RPZ backflow preventer is required when using any hydrant. This device shall be provided by the permit holder. An annual test report (Form DOH-1013) is required for each device and MUST be on file at Buffalo Water/AWS.

Failure to have a permit or to comply with the permit conditions (this includes, but is not limited to: not using an approved backflow prevention device; not notifying the Dispatch office when a hydrant is used) will result in a **$1,072.00** fine per occurrence. All fines must be paid before a hydrant permit is issued or renewed.

★ **For permits issued between November 1 and April 15, the charge for pumping out each hydrant is $107.00 per occurrence and an additional $107.00 shall be charged to thaw a hydrant if necessary.**
