1 INTRODUCTION

This workplan has been prepared by GES in order to document the proposed field activities intended to implement the Remedial Design Contract Drawings (**Appendix A**) provided by AECOM (URS Corporation) the project engineer for the remediation and restoration of the Lackawanna Incinerator Site located at 2960 South Park Avenue in Lackawanna, New York (Site). The Remedial Design Contract Drawings (**PLAN**) and this work plan were completed in order to implement the selected remedy as described in the Record of Decision (**ROD**) issued in June, 2017, by the New York State Department of Environmental Conservation (NYSDEC). A Site Location Map, as well as a Site Plan illustrating the site layout, has been included as page 2 of **Appendix A**.

The site consists of two areas of concern, the Incinerator Area and the Smokes Creek Corridor Area. This phase of work will address the Incinerator Area only.

2 PREVIOUS INVESTIGATIONS

During April 2005, Malcolm Pirnie conducted an environmental investigation at the subject property. Specifically, the purpose of this study was to determine the overall environmental conditions of the subject property. During this study a total of three sediment, three incinerator ash, and seven subsurface soil/fill samples were collected to characterize the conditions on-site. Three shallow groundwater monitoring wells were installed and sampled as well. The investigation results indicated the presence of high levels of heavy metals in the incinerator ash, elevated metals and PAHs in soil/fill on-site.

EA Engineering, P.C. and its affiliates conducted RI field activities between October 2012 and February 2014. In total five phases of study were completed by EA Engineering. The study compiled data from the onsite subsurface soils, groundwater, sediment, and storm water outfalls. Laboratory analysis included TCL VOCs, TCL SVOCs, TAL metals, TCL pesticides, TCL PCBs, and total cyanide. During the RI, TCL VOCs, TCL SVOCs, TCL pesticides, TCL PCBs, and total cyanide were not detected in exceedance of 6 NYCRR Part 375 criteria. Analytical results indicated that arsenic and lead were present exceeding 6 NYCRR Part 375 Unrestricted Use, Restricted Residential, and Commercial SCOs. Specifically, lead was detected up to 6,820 ppm, and Arsenic was detected up to 28 ppm.

Groundwater sampling was conducted during the RI field activities. Seven Monitoring wells were installed and sampled in November 2012 and April 2013. Multiple analytes were identified in exceedance of Class GA SCGs. All other inorganic constituents that exceeded Class GA criteria in the monitoring wells sampled were also detected at similar or lesser concentrations in groundwater from the up gradient monitoring wells. These similar analytical results suggest those constituents are unlikely to be related to on-site contamination.

A FWRIA was conducted to identify existing and potential impacts from the site to fish and wildlife receptors. Based on results reviewed under the FWRIA, surface water serves as a potential exposure pathway to fish and wildlife near the site. However, the creek does not appear to have been impacted by site-related contamination, based on the RI sampling results.

3 EXCAVATION ACTIVITIES

The purpose of this work plan is to address lead and arsenic contaminated soils at the former Lackawanna Incinerator property. GES proposes to complete a focused soil excavation in the areas outlined by engineer in the **PLAN**. **Figure 5** (Proposed Area of Excavation Map) depicts the approximate limits of the proposed excavation. No outstanding on-site limitations appear to inhibit the progress of this project.

The following sections expand in more detail the steps that will be implemented to accomplish the objectives of the proposed remedial action.

3.1 Extent of Impact

The engineer for this project provided a proposed area of excavation to address soil contamination (**PLAN Figure 5**). The approximate limits of the excavation have been provided to address the most feasible removal of impacted soil from the subject property to meet the objective. The previous studies identified elevated heavy metals impact within the on-site soils. Based on the laboratory analytical results impact identified in the soils exceeds NYCRR Part 375 criteria.

Based on the previous studies and discussions with the NYSDEC it had been determined the best approach to remediating this contamination is to excavate approximately one foot of impacted soil across the entire property and place a cap above a layer of geotextile/demarcation layer. Once soils have been excavated they will be disposed of properly at an NYSDEC approved landfill.

3.2 Health and Safety Plan

GES will have a site specific health and safety plan on-site and available to all parties pertaining to applicable onsite activities and hazards. The health and safety plan will have safety sheets, emergency contacts, route to the nearest hospital, and safety procedures. (**Appendix B**)

3.3 Permitting

If required, a permit will be obtained by the general contractor (**GC**) hired by GES, from the local municipality. Any permit will be available at the commencement of the work until such time that the permit is properly closed.

3.4 Security Fencing

An exclusion zone will be established prior to the start of activities to ensure the safety of both project personal and the general public. The exclusion zone will consist of safety cones, orange snow fencing placed around the proposed excavation, along with the existing chain link fencing extending along portion of the property boundary. Signage will also be placed to identify the work area. Work areas will be set up in a manner to allow City of Lackawanna access as needed to the north incinerator building, and to ensure that remedial activities effect on City operations are minimal.

3.5 Utility Mark Out

Dig Safely New York will be contacted to conduct a public utility mark out a minimum of three (3) days prior to the commencement of remedial activities. Dig Safely New York will contact all pertinent utilities companies to conduct a locate around the site. A positive response from the utility companies or visual observation of the utilities marked by Dig Safely New York will be obtained prior to conducting any intrusive activities. Additionally, a private utility mark out may be completed in the area targeted for excavation prior to the commencement of remedial activities if the client feels it is warranted.

3.6 Waste Management

On the first day of excavation additional waste characterization samples will be collected and submitted for laboratory analysis to ensure the receiving facility requirements are met. Russo Development (**GC**) has contracted with Waste Management to dispose of project derived wastes at their Chaffee, NY landfill facility. Waste transport will be completed by Russo under their waste transport permit to the landfill, and following the transportation plan provided by Russo and submitted to AECOM for approval. Waste profiles will be submitted to AECOM and the NYSDEC for approval before any material is transported to the Landfill for disposal.

3.7 Japanese Knotweed Removal

Japanese knotweed (fallopian japonica) is an invasive species in the state of New York, this invasive species is located at the subject property. Due to how easily the invasive species can spread it will be handled to specification per the **PLAN**. Knotweed will be cut to an approximate height of 6 inches above ground surface or less. All cut material will be placed into black contractor bags with a minimum thickness of 4 mil, and tied or taped so that no material cannot escape. Soil from the knotweed areas will be excavated separately and transported to the landfill for disposal to prevent the spreading of root material on-site. Following knotweed excavation the excavator will be cleaned to prevent transfer of plant material. Russo Development (**GC**) has contracted with Waste Management to dispose of project derived wastes at their Chaffee, NY landfill facility. Waste transport will be completed by Russo under their waste transport permit to the landfill, and following the transportation plan provided by Russo and submitted to AECOM for approval. Waste profiles will be submitted to AECOM and the NYSDEC for approval before any material is transported to the Landfill for disposal.

3.8 Tree Removal

All trees within the limits of the work area will be removed so that soil excavation can be completed. All trees within the limits of the excavation will be cut into manageable sized pieces (less than 10 ft. in length), wood that has been cut will be moved and placed in the onsite Town of Lackawanna wood pile. Tree stumps will not be grubbed, if significant soil remains on the roots they will be removed from site with the impacted soil and disposed of at the approved landfill.

Tree stumps may be cut below ground surface and buried at AECOMs discretion where applicable to aid in supporting slopes.

3.9 Working On Slopes

The east and west sides of the site have steeply sloped areas that will require tree and/or knotweed removal. Workers that need to work on the slope will wear a harness attached to a rope secured at the top of the slope. Safety equipment will be OSHA approved and inspected daily before use.

3.10 Erosion Control Plan

Rolled erosion control will be installed at minimum in the areas designated by **PLAN**. This includes areas were sloped is greater than 25% that are to be vegetated, as well as surrounding the onsite sediment trap. Erosion control will be inspected daily and placement will be modified as needed. All erosion control products must meet the specification in the **PLAN** and will be approved by AECOM before installation.

3.11 Decontamination Plan

Decontamination pads will be installed (if necessary) in two separate locations of the subject property per the **PLAN**. Decontamination pads will be boxed in areas lined with poly and filled with stone. A sump will be placed in the corner of the decontamination pad for dewatering if necessary. To avoid problems with freezing equipment and potentially dangerous icy areas, trucks will be loaded on existing site access roads to prevent tires from coming in contact with contaminated materials. If conditions do not allow clean access for trucks, an area of stone will be installed to allow trucks to be loaded while remaining clean. Trucks will be tarped with poly (essentially a drop cloth) for preventing any impacted soil from getting on the exterior of the truck or trailer during loading of material. If trucks and/or tires are visually impacted they will be cleaned with water. GC will have a water truck on call in case it is required for decontamination. Due to the time of year of fieldwork, using water to clean trucks is discouraged unless deemed necessary by the project team.

All equipment will be decontaminated before leaving the Japanese knotweed area, as well as before the equipment leaves the project. Equipment that was in the area of the invasive species will be power-washed with a minimum of a 1,000 psi. No soaps or chemicals will be used while cleaning equipment. A designated equipment cleaning station will be constructed or a commercial portable cleaning station with a rack is required.

Decon water will be pumped to 55-gallon drums or totes for sampling and disposal at a NYSDEC approved facility. Water containers will be left with sufficient headspace to allow expansion if freezing occurs.

3.12 Soil Excavation

Prior to using mechanical excavation methods, pre-clearing/hand digging to identify any known utilities previously identified will be completed. Following pre-clearing activities, excavation of soils will be accomplished using an excavator. The excavator will be sized appropriately to excavate the soils in a timely manner and to the appropriate depth.

The excavation will begin with the knotweed area to minimize the chance of spreading the invasive species. Excavation sequencing following the knotweed removal will follow the ramp from the north incinerator building down towards the Lackawanna DPW to try to use the existing broken asphalt drive for truck loading and contamination reduction. Refer to **PLAN Figure 5** for an approximate extent of the excavation. Hand clearing will take place around the structures and in sensitive areas as determined by the on-site GES representative and AECOM.

Impacted soils will either be temporarily staged on-site on non-excavated impacted soil, placed on poly proximate to the decontamination areas, or live-loaded into trucks for proper disposal at a licensed waste disposal facility. All backfill material will have had laboratory analyses completed on it as required in accordance with NYSDEC Division of Environmental Remediation (DER)-10 requirements.

The terminal depth of the proposed excavation will vary throughout the subject property but will generally remain approximately 1 ft. bgs. Demarcation fabric will be placed on top of the undisturbed soil in the excavation before backfill is placed back in the excavated area.

On the west side of the south incinerator, excavation will be greater than one ft. bgs in two select areas to uncover the two existing openings/windows referred to as debris holes in the **PLAN**. Once the subsurface openings/windows are free of surrounding soils steel plates will be placed over the openings/windows to prevent additional soils from entering the building as shown in **Detail 4, Page 13** of the **PLAN**. During excavation of the subsurface windows/openings sidewalls of the excavation will be stabilized by Russo. Russo will implement stepping, shoring, or trench boxes to stabilize the surrounding soils. The subcontractors stabilization method will be an efficient means to provide soil support while the steel plates area being placed over the subsurface windows/openings so that there will be no undermining hazards.

3.13 Trucking

Dump trucks will attempt to be staggered so that there is not multiple trucks on site at one time. If multiple trucks are onsite at once the trucks will be staged to the West side of the property. Trucks will be staged so that they are not disturbing the Highway department operations. Trucks will pull onto the constructed decontamination pad, existing roadway, or stone pad for loading. Loaded dump trucks will be inspected to ensure decontamination is not required, tarped, and driven to the approved landfill facility following the approved route plan.

3.14 Dewatering

Dewatering of the excavation is not anticipated to be necessary during excavation activities. Dewatering, if necessary, will be accomplished through the installation of sump(s) at appropriate locations and as the excavation expands. The sump(s) will be installed in a bed of crushed stone and will be utilized for the temporary installation of a groundwater depression pump(s). Recovered groundwater will be directed to on-site holding tanks and transported off-site to a licensed and permitted waste disposal facility, or groundwater could potentially be treated on-site and discharged to the local storm or sanitary sewer system under appropriate permitting.

3.15 Catch Basin Replacement

On-site catch basins and piping will be inspected during excavation activities for damage. If catch basins are compromised they will be replaced. Piping if not damaged will not be traced, if piping is discovered to be damaged it will be excavated and replaced until the pipe is found to be unbroken/satisfactory shape or leaves the property. If catch basins or piping needs to be replaced it will be completed to specification of the **PLAN**. Materials for the catch basin and pipe replacement may be provided by the city of Lackawanna or can be provided by the subcontractor at price plus markup provided in their bid.

3.16 Work Zone Air Monitoring

Air shall be monitored during the excavation activities. While monitoring, no visual dust may be visible in the air. If visual dust is observed work will be stopped until water can be added or similar methods can be employed to mitigate the dust issue. Once visual dust is dispersed, excavation activities will resume and the soil disturbance will be adjusted to minimize to release of dust.

Air monitoring shall be performed as described in the Community Air Monitoring Plan (**CAMP**) (**Appendix C**). Volatile organic compound vapors are not anticipated during this excavation; however, GES personnel will have a PID on-site to ensure safe working conditions during excavation.

4 RESTORATION ACTIVITIES

4.1 Backfilling and Site Restoration

The excavation will be backfilled once the impacted material has been removed. Backfill materials will be to specification provided by the **PLAN**. All backfilling will be accomplished in lifts no greater than 1-foot. A roller, excavator, or bulldozer will be used to compact backfill material to acceptable levels per the **PLAN** specification.

4.2 Geotextile Separation Fabric

A layer of geotextile fabric will be installed above all excavated areas before the commencement of backfilling operations. The **PLAN** provides specifications for the geotextile material and a cut

sheet for the fabric will be submitted to AECOM for approval before material is ordered or installed. Fabric will be installed with overlapping seams as described in the **PLAN**. Fabric installation will be inspected and photographed by GES before any fill is placed.

4.3 Groundwater Monitoring Wells

On-site groundwater monitoring wells will remain undisturbed during excavation activities. Soils will be hand cleared adjacent to the monitoring wells to ensure that the wells are not compromised during remediation.

4.4 Backfill

All general fill material will meet the requirements of the public health soil cleanup objectives for Part 375 unrestricted use as set in table 375-6.8(b), and ASTM testing will be performed to meet the requirements set in the **PLAN**. Aggregate will be imported from a New York State Department of Transportation (NYSDOT) approved material source, and an NYSDOT approval certificates will be provided for the imported backfill material. All imported backfill material will meet the specifications provided by the **PLAN** and required analytical data will be provided to AECOM for approval before purchase or placement on-site. General fill will be placed in a maximum of 12-inch lifts (measured after compaction) and compacted to an unyielding state with approved equipment (bulldozer or roller). Topsoil will be installed in the spring to allow for hydroseeding immediately following installation. General fill will be scarified prior to topsoil installation. Topsoil will be installed in a uniform 4-inch layer across the site.

4.5 Final Grade

Final grade of the subject property will be relative to what the subject property was prior to mobilization. Some areas may be reshaped to promote positive drainage per the **PLAN**. Areas above the retention walls may be shaved/re-shaped so that ground surface is flush or below the face of the concrete retention walls. Grade marks/stakes will be provided by the surveyor contracted by AECOM to confirm that final grade is set back to preexisting where required.

4.6 Stone Access Roads

Stone roadways that have been removed during remediation will be replaced per specification of the **PLAN** after excavation has been completed at the subject property. Stone will be installed in 6-inch lifts and compacted thoroughly to an unyielding state via roller. Stone will a minimum of 6” thick and will be the full 12-inch of cover in stone access roads.

4.7 Paved Access Roads

Paved access roads that have been removed during remediation will be replaced per specification per the **PLAN**. All handling and compaction of bituminous materials shall be in accordance with the NYSDOT standards. All preparations for paving will be in place upon completion of excavation activities during winter 2020. Subbase will be installed to 6-inch compacted layer to allow site

access and to cover the geotextile fabric until weather allows for asphalt paving. Subbase will be regraded and filled if needed prior to paving. Asphalt paving activities will take place in the spring of 2020 with cooperative weather.

4.8 Topsoil

Topsoil will be distributed in a uniform approximate 4 inch thick layer across the subject property. Topsoil will not be placed onto excessively muddy areas, or over standing water. Topsoil placed on slopes greater than five percent will be stabilized as deemed necessary. All imported topsoil and topsoil distribution methods will be to specification of the **PLAN**. Topsoil will not be placed until the spring of 2020 due to wintery conditions at the time of field work.

4.9 Seeding

Upon completion of topsoil distribution in the spring of 2020 hydroseeding will take place. The subcontractor will determine the means and methods to employ seeding activities at the subject property. All seeding activities will be to specification provided by the **PLAN**. Seed mix and fertilizer/additive material specifications will be submitted to AECOM for approval before purchase or application of hydroseed. Seeding will be scheduled, if weather permitting, prior to May 15th to minimize the need for irrigation of the seed. If required, irrigation will be coordinated with the Lackawanna DPW or be performed via water truck by Russo.

4.10 Survey

All surveying activities throughout the entirety of the project will be completed by the engineer or an entity appointed by the engineer.

5 Reporting

Following completion of excavation activities, a summary report will be prepared including a summary of the daily project tracking sheets, weekly progress reports, photo logs, all manifests, weight tickets, etc. will be published for the NSDEC and the Engineer.

REVIEW COMMENTS:

1. The proposed backfill materials are acceptable, pending a review of the Particle Size Distribution Report and ASTM Test Results.

2. PFAS in the lab report do not show ND in the result column for non-detects. It is assumed that the result values that equal the RL column values are non-detect. Please have the lab resubmit the report with non-detect PFAS results either called "ND" in the result column or a "U" in the qualifier column.

Review is for general compliance with contract documents. Sole responsibility for correctness of dimensions, details, quantities, and compliance with performance specifications, and safety during fabrication and construction shall remain with the Contractor.

GC/MS VOA
Method 8260C: The laboratory control sample (LCS) for preparation batch 480-493565 and analytical batch 480-493547 recovered outside control limits for the following analyte: 1,1,1-Trichloroethane. This analyte was biased high in the LCS and was not detected in the associated samples; therefore, the data have been reported. The following samples are impacted: RUSSO-TS-GRAB 1 (480-159547-1), RUSSO-TS-GRAB 2 (480-159547-2), RUSSO-TS-GRAB 3 (480-159547-3), RUSSO-TS-GRAB 4 (480-159547-4), RUSSO-TS-GRAB 5 (480-159547-5), RUSSO-TS-GRAB 6 (480-159547-6), RUSSO-CF-GRAB 1 (480-159547-9), RUSSO-CF-GRAB 2 (480-159547-10), RUSSO-CF-GRAB 3 (480-159547-11), RUSSO-CF-GRAB 4 (480-159547-12), RUSSO-CF-GRAB 5 (480-159547-13), RUSSO-CF-GRAB 6 (480-159547-14), RUSSO-CF-GRAB 7 (480-159547-15), RUSSO-CF-GRAB 8 (480-159547-16), RUSSO-CF-GRAB 9 (480-159547-17), GERNATT-CF-GRAB 1 (480-159547-21), GERNATT-CF-GRAB 2 (480-159547-22) and GERNATT-CF-GRAB 3 (480-159547-23).

Method 8260C: Surrogate recoveries for the following samples were outside the upper control limit: RUSSO-TS-GRAB 1 (480-159547-1) and RUSSO-TS-GRAB 6 (480-159547-6). The samples did not contain any target analytes; therefore, re-extraction and/or re-analysis was not performed.

Method 8260C: Surrogate recovery for the following samples was outside the upper control limit: GERNATT-TS-GRAB 2 (480-159547-34), GERNATT-TS-GRAB 4 (480-159547-36) and GERNATT-TS-GRAB 6 (480-159547-38). This sample did not contain any target analytes above the reporting limit; therefore, re-extraction and/or re-analysis was not performed.

Method 8260C: The continuing calibration verification (CCV) associated with batch 480-493944 recovered above the upper control limit for Carbon tetrachloride. The sample associated with this CCV was non-detect for the affected analyte; therefore, the data has been reported. The following sample is impacted: GERNATT-CF-GRAB 4 (480-159547-24).

Method 8260C: The matrix spike / matrix spike duplicate (MS/MSD) recoveries for preparation batch 480-493988 and analytical batch 480-493944 were outside control limits. Sample matrix interference and/or non-homogeneity are suspected because the associated laboratory control sample (LCS) recovery was within acceptance limits. The following samples are impacted: (480-159547-A-24-C MS) and (480-159547-A-24-D MSD).

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

GC/MS Semi VOA
No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

GC Semi VOA
Method 8082A: The following sample is associated with a continuing calibration verification (CCV 480-494086/29) that had recoveries for the surrogate Tetrachloro-m-xylene that were above acceptance limits: RUSSO-CF-COMP 3 (480-159547-20). The secondary surrogate Decachlorobiphenyl is within limits. Therefore, the data has been reported.

Method 8082A: The continuing calibration verification (CCV 480-494086/29) associated with batch 480-494086 recovered above the upper control limit for PCB-1016 and PCB-1260. The samples associated with this CCV were non-detects for the affected analytes; therefore, the data have been reported. The following sample is impacted: RUSSO-CF-COMP 3 (480-159547-20).

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

Metals
Method 6010C: The serial dilution (480-159547-E-7-A SD ^5) associated with batch 480-494449, exhibited results outside the quality control limits for Total Barium and Zinc. However, the post digestion spike (PDS) was compliant, therefore no corrective action was necessary.

Job ID: 480-159547-1 (Continued)

Laboratory: Eurofins TestAmerica, Buffalo (Continued)

Method 6010C: The recovery of post spike, (480-159547-E-7-A PDS), associated with batch 480-494449, exhibited a result outside quality control limits for Total Manganese. However, the serial dilution (SD) of this sample was compliant, therefore no corrective action was necessary.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

LCMS

Method 537 (modified): Due to a shortage in the marketplace for 13C3-PFBS, the target analyte PFBS and/or Perfluoropentanesulfonic acid (PFPeS) could not be quantitated against 13C3-PFBS (its labeled variant) as listed in the SOP. PFBS and Perfluoropentanesulfonic acid (PFPeS) was quantitated versus 18O2-PFHxS instead. (ICV 320-326599/11)

Method 537 (modified): The “I” qualifier means the transition mass ratio for the indicated analyte(s) was outside of the established ratio limits. The qualitative identification of the analyte(s) has/have some degree of uncertainty. However, analyst judgement was used to positively identify the analyte(s).

RUSSO-TS-COMP 2 (480-159547-8)

Method 537 (modified): The “I” qualifier means the transition mass ratio for the indicated analyte was outside of the established ratio limits. The qualitative identification of the analyte has some degree of uncertainty. However, analyst judgment was used to positively identify the analyte.

Dear Steve,

The crushed limestone 2" Crusher Run Subbase and Clean #1 stone to be supplied to the above referenced project was extracted, crushed and screened at our Lancaster, NY facility. The material is produced from a virgin stone source, un-impacted by hazardous materials or contaminants and free of loom, organic matter including clay. The quarry is a NYSDOT approved source; the source number is 5-3R and our mining permit # is 90018.

Sincerely,

Robert Warrington

The samples were received on 9/16/2019 4:10 PM; the samples arrived in good condition, properly preserved and, where required, on ice. The temperatures of the 4 coolers at receipt time were 2.8º C, 2.9º C, 3.0º C and 3.1º C.

GC/MS VOA
Method 8260C: The laboratory control sample (LCS) for preparation batch 480-493565 and analytical batch 480-493547 recovered outside control limits for the following analyte: 1,1,1-Trichloroethane. This analyte was biased high in the LCS and was not detected in the associated samples; therefore, the data have been reported. The following samples are impacted: RUSSO-TS-GRAB 1 (480-159547-1), RUSSO-TS-GRAB 2 (480-159547-2), RUSSO-TS-GRAB 3 (480-159547-3), RUSSO-TS-GRAB 4 (480-159547-4), RUSSO-TS-GRAB 5 (480-159547-5), RUSSO-TS-GRAB 6 (480-159547-6), RUSSO-CF-GRAB 1 (480-159547-9), RUSSO-CF-GRAB 2 (480-159547-10), RUSSO-CF-GRAB 3 (480-159547-11), RUSSO-CF-GRAB 4 (480-159547-12), RUSSO-CF-GRAB 5 (480-159547-13), RUSSO-CF-GRAB 6 (480-159547-14), RUSSO-CF-GRAB 7 (480-159547-15), RUSSO-CF-GRAB 8 (480-159547-16), RUSSO-CF-GRAB 9 (480-159547-17), GERNATT-CF-GRAB 1 (480-159547-21), GERNATT-CF-GRAB 2 (480-159547-22) and GERNATT-CF-GRAB 3 (480-159547-23).

Method 8260C: Surrogate recoveries for the following samples were outside the upper control limit: RUSSO-TS-GRAB 1 (480-159547-1) and RUSSO-TS-GRAB 6 (480-159547-6). The samples did not contain any target analytes; therefore, re-extraction and/or re-analysis was not performed.

Method 8260C: Surrogate recovery for the following samples was outside the upper control limit: GERNATT-TS-GRAB 2 (480-159547-34), GERNATT-TS-GRAB 4 (480-159547-36) and GERNATT-TS-GRAB 6 (480-159547-38).
