Issued April 01, 2024

CERTIFICATE OF APPROVAL FOR LABORATORY SERVICE

Issued in accordance with and pursuant to section 502 Public Health Law of New York State

MR. MARCO SOARES
ALPHA ANALYTICAL LLC
8 WALKUP DR
WESTBOROUGH, MA 01581-1019

NY Lab Id No: 11148

is hereby APPROVED as an Environmental Laboratory in conformance with the National Environmental Laboratory Accreditation Conference Standards (2016) for the category ENVIRONMENTAL ANALYSES SOLID AND HAZARDOUS WASTE
All approved analytes are listed below:

Polynuclear Aromatic Hydrocarbons

Fluorene	EPA 8270E
Indeno(1,2,3-cd)pyrene	EPA 8270E
Naphthalene	EPA 8270E
Phenanthrene	EPA 8270E
Pyrene	EPA 8270E

Priority Pollutant Phenols

2,3,4,6 Tetrachlorophenol	EPA 8270E
2,4,5-Trichlorophenol	EPA 8270E
2,4,6-Trichlorophenol	EPA 8270E
2,4-Dichlorophenol	EPA 8270E
2,4-Dimethylphenol	EPA 8270E
2,4-Dinitrophenol	EPA 8270E
2-Chlorophenol	EPA 8270E
2-Methyl-4,6-dinitrophenol	EPA 8270E
2-Methylphenol	EPA 8270E
2-Nitrophenol	EPA 8270E
3-Methylphenol	EPA 8270E
4-Chloro-3-methylphenol	EPA 8270E
4-Methylphenol	EPA 8270E
4-Nitrophenol	EPA 8270E
Pentachlorophenol	EPA 8270E
Phenol	EPA 8270E

Semi-Volatile Organics

1,1'-Biphenyl	EPA 8270E
1,2-Dichlorobenzene, Semi-volatile	EPA 8270E
1,3-Dichlorobenzene, Semi-volatile	EPA 8270E

Serial No.: 68691

Property of the New York State Department of Health. Certificates are valid only at the address shown and must be conspicuously posted by the laboratory. All approved analytes are listed below:

Semi-Volatile Organics

1,4-Dichlorobenzene, Semi-volatile	EPA 8270E
2-Methylnaphthalene	EPA 8270E
Acetophenone	EPA 8270E
Benzaldehyde	EPA 8270E
Benzoic Acid	EPA 8270E
Benzyl alcohol	EPA 8270E
Caprolactam	EPA 8270E
Dibenzofuran	EPA 8270E

Volatile Aromatics

1,2,4-Trichlorobenzene, Volatile	EPA 8260D
1,2,4-Trimethylbenzene	EPA 8260D
1,2-Dichlorobenzene	EPA 8260D
1,3,5-Trimethylbenzene	EPA 8260D
1,3-Dichlorobenzene	EPA 8260D
1,4-Dichlorobenzene	EPA 8260D
2-Chlorotoluene	EPA 8260D
4-Chlorotoluene	EPA 8260D
Benzene	EPA 8260D
Bromobenzene	EPA 8260D
Chlorobenzene	EPA 8260D
Ethyl benzene	EPA 8260D
Isopropylbenzene	EPA 8260D
m/p-Xylenes	EPA 8260D
Naphthalene, Volatile	EPA 8260D
n-Butylbenzene	EPA 8260D
n-Propylbenzene	EPA 8260D
o-Xylene	EPA 8260D

Quality Manual Approval Signatories - Asheville

The following individuals represent the PAS corporate and local management team responsible for implementing the PAS Quality Management System (QMS) and upholding the requirements of this manual at the location(s) for which this manual was prepared, at the time this version of the manual was made effective, and that correlate with the electronic signatures shown on the title page of this manual.

If these persons(s) change positions, leave the company, or are on extended leave of absence, the approval of this manual automatically transfers to the person replacing the signatory or to the signatory's primary or alternate deputy until the manager is replaced and/or the manager returns to work. The individual replacing the signatory automatically accepts the responsibilities associated with the original signatory's attestation. Refer to Section 4.1.5.1.1 of this manual for the deputies assigned to key personnel job titles.

The manual is not revised and released under an updated version for the sole purpose of updating personnel change(s). Personnel information is updated when the next revision of the manual is released. See manual Sections 1.2.1 and 1.2.2 for more information about how this manual is maintained.

1.0 PURPOSE AND SCOPE

1.1 Purpose

This quality manual (manual) outlines the quality management system (QMS) and management structure of Pace® Analytical Services, LLC. Pace® Analytical Services, LLC is referred to by brand name Pace® Analytical Services and by the acronyms PAS or ENV. The acronyms PAS and ENV are interchangeable.

The PAS QMS is also referred to as the quality program throughout this manual and other PAS documents. The phrases "quality management system" and "quality program" are synonymous and are referred to by the acronym QMS.

The QMS is the collection of policies and processes established by the senior leaders of PAS (top management) to ensure the service and products provided by PAS consistently meet relevant requirements and achieves the goal of Pace® to provide customers with high quality, cost-effective, analytical measurements, and services.

The QMS is also planned to establish conformance[1] and compliance with the current published versions of the following international and national quality system standards:

- ISO/IEC 17025: *General requirements for the competence of testing and calibration laboratories*
- NELAC/TNI Standard Volume 1: *Management and Technical Requirements for Laboratories Performing Environmental Analysis*

[1]The statement of conformity to these Standards pertains only to testing and sampling activities carried out by the laboratory at its physical address, in temporary or mobile facilities, in-network, or by laboratory personnel at a customer's facility.

In addition to the international and national standards, the QMS is planned to achieve regulatory compliance with the various federal and state programs for which PAS locations provide compliance testing and/or holds certification or accreditation. Federal or state requirements that do not apply to all PAS locations, are provided in addendum to this manual or in other documents that supplement the manual. Customer-specific project and program requirements are not included in the manual in order to maintain client confidentiality.

- A list of accreditation and certifications held by each location associated with this manual is provided in Appendix A.
- A list of analytical testing capabilities offered by each location associated with this manual is provided in Appendix B.

1.2 Scope and Application

This manual applies to each location listed on the Title Page of this manual, including PAS laboratories, satellite laboratories, service centers, and supporting business functions.

For purposes of the PAS QMS:

- The term "location" used in this manual refers to laboratories and/or service centers.
- The term "laboratory" refers to any PAS location, however named by Pace® that provides testing, collects samples (sampling), or conducts field measurement services in a fixed building, mobile unit, or in-situ (field).

COPYRIGHT © 2019-2022 Pace® Analytical Services, LLC.

- The phrase "service center" refers to any PAS location, however named by Pace® that does not perform any testing, sampling, or field measurements.
- The phrase "satellite laboratory" refers to a limited-service laboratory affiliated to a larger business unit or location. Some PAS business groups, such as accounting, may refer to a satellite laboratory as a "service center." Irrespective of internal jargon or reference by any group, any PAS location that generates a test result for external use is a "laboratory" and must comply with the requirements specified in this manual for all analytical testing services.

PAS locations are defined by physical address. Laboratories are defined by physical address and certification/accreditation ID except mobile units which may be defined by the address of the location to which they are assigned, by VIN (vehicle identification number), or by certification/accreditation ID. Laboratories that provide sampling and field testing are defined by the physical address of the PAS location to which they are affiliated and that manages these activities.

1.2.1 Quality Manual Template

This manual was prepared using the PAS Quality Manual Template (template) created by the PAS Corporate Quality Director (CQD).

The template, known as document ID ENV-TMP-CORQ-0007, specifies the minimum requirements that every PAS location must abide by, regardless of scope of services or number of personnel, to maintain a quality program that achieves the objectives of the PAS Quality Policy (See Section 4.2.2).

The template is the mechanism used by top management to communicate to PAS personnel their commitment to continuously develop and improve the QMS for effectiveness, to meet customer expectations, and to comply with any statutory and regulatory requirements. Their signature of approval on this template is the mechanism used to document this responsibility.

"Top Management" is the phrase used by the TNI Standard to refer to the leaders of an organization that develop and/or release the PAS Quality Policy Statement and QMS under their authority

For PAS, these managers include the Chief Executive Officer (CEO) and Chief Compliance Officer (CCO) of Pace® and the President, CQD, Senior Vice President of Operations (Sr. VPO), and the Chief Technical Officer (CTO) of PAS.

The template and instructions for use of the template are released by corporate quality personnel to local quality managers responsible for each location (Local QM). The local QM uses the template to prepare the location manual by following the instructions provided to them. The local QM may not alter the font, structure, or content of the template, except where specified by instruction to do so. As previously stated, program specific requirements unique to each location are provided in addendum or in documents that supplement the manual.

The template is reviewed by corporate quality personnel annually and updated, if needed. More frequent review and revision may occur to manage change, to maintain conformance and compliance to relevant standards or to improve the QMS.

See standard operating procedure (SOP) ENV-SOP-CORQ-00015 *Document Management and Control* for more information

COPYRIGHT © 2019-2022 Pace® Analytical Services, LLC.

1.2.2 Quality Manual

The quality manual is created from template ENV-TMP-CORQ-0007 by local quality personnel, who are also responsible for maintenance and management of the document.

- PAS locations are not permitted to alter content of the template when preparing their manual, except where specified in the template. Control of content in the manual is necessary to ensure consistency of implementation of the PAS quality program across the network.
- If additions or changes to the manual are needed to maintain regulatory compliance or conformance to relevant standards and these changes cannot be covered by addendum to the manual, the need for change must be raised to the PAS Corporate Quality Director, who will decide how to resolve the need.

The manual is approved for release by the management team listed on the Quality Manual Approval Signatory Page. The manager's electronic signature on the Title Page of the manual affirms their commitment to implement and uphold the requirements, processes, and procedures of the PAS QMS at each location for which the manual was prepared.

The manual is reviewed annually and updated with each release of a new version of the template, and as needed to update appendices and addendum. More frequent review and revision may be necessary when there are significant changes to the capabilities, and resources of the laboratory during the calendar year

See SOP ENV-SOP-CORQ-00015 *Document Management and Control* for more information.

1.2.3 References to Supporting Documents

The template and the manual include references to other organization documents that support the QMS such as policies and standard operating procedures (SOPs).

These references may include the document's document control number (DC#) and the document title. This information is subject to change at the discretion of PAS. The manual and/or template are updated to reflect the editorial change during the manual's next scheduled review/revision cycle or the next time a version of the manual is released, whichever is sooner.

Each location maintains a current list of documents used by the location to support the QMS. This list, known as the "Master List", is readily available to personnel for their use and it provides a cross reference to the legacy document ID, where applicable. Parties external to PAS may contact the location of interest to obtain the most current version of the Master List for their use as needed.

3.0 TERMS AND DEFINITIONS

Refer to Appendix C for terms, acronyms, and definitions used in this manual and in other documents used by PAS to support the QMS.

COPYRIGHT © 2019-2022 Pace® Analytical Services, LLC.

4.0 MANAGEMENT REQUIREMENTS

4.1 Organization

4.1.1 Legal Identity

Pace® Analytical Services, LLC (Pace® Analytical Services) is the responsible entity authorized by the State of Minnesota to do business as a limited liability company, under the parent company, PAS Parent, Inc.

4.1.1.1 Change of Ownership

If there is a change of ownership, if a location goes out of business, or if the entire organization ceases to exist, PAS management is responsible to notify regulatory authorities of the change within the timeframe required by each state agency for which the location is certified or accredited.

Requirements for records and other business information are addressed in the ownership transfer agreement or in accordance with appropriate regulatory requirements, whichever takes precedence.

4.1.2 Compliance Responsibility

PAS management has the responsibility and authority to establish and implement procedures and to maintain resources necessary to assure its activities are carried out in such a way to meet the federal and statutory requirements in addition to the requirements of the PAS QMS. Also See Section 1.1.

4.1.3 Scope of the Quality Management System

The QMS applies to work carried out at each location covered by this manual including permanent facilities, at sites away from its permanent facilities, or in associated temporary or mobile facilities.

The permanent and mobile facilities to which this manual applies are listed on the Title Page of this manual.

4.1.4 Organization History and Information

Founded in 1978, Pace® Analytical Services, LLC (PAS) is a privately held scientific services firm operating one of the largest full-service contract laboratory and service center networks in the United States.

The business purpose of PAS is to deliver the highest standard of testing and scientific services in the market. We offer the most advanced solutions in the industry, backed by transparent data, a highly trained team, and the service and support that comes from over four decades of experience.

4.1.4.1 Organization Structure

Each PAS location is led by a management team referred to as local management[1]. Local management is responsible for making day-to-day decisions regarding the operations of the facility and implementing, and sustaining the requirements, policies, and procedures of the PAS quality program.

COPYRIGHT © 2019-2022 Pace® Analytical Services, LLC.

The roles that make up the local management team include a Vice President of Operations (VPO), a General Manager (GM) or Director of Laboratory Operations (DLO), a Quality Program Manager (QPM), and the Quality Manager (QM).

[1] The term "local management" does not mean "on-site" management. Some of the roles that make up the local management team, work off site or from a different PAS location. Refer to the Quality Manual Approval page at the beginning of this manual for the physical address of each manager that comprises the local management team.

The local management team is supported by department specific supervisors and in some PAS locations, a site supervisor or operations manager.

Local management and supervisors are supported by personnel from functional groups that support the division, such as HR, IT, Sales & Marketing, Finance, and EHS (Environmental Health & Safety).

Technical oversight for each location is provided by local personnel with support and guidance from the PAS Chief Technical Officer (CTO), PAS corporate quality personnel, and the Pace® compliance team. Locations that hold TNI accreditation, also have personnel appointed to serve as the "acting technical manager for TNI, however named" to perform the duties and responsibilities of this designation per the TNI Standard. See Section 4.1.5.2.1 for more information on this TNI requirement.

The reporting relationships and responsibilities of quality personnel are independent of operations in order to safeguard impartiality. See Section 4.1.5.2 for more information.

Refer to the organization charts provided in Appendix D to view the organization structure, reporting relationships, and the interrelationships between positions.

4.1.5 Management Requirements

4.1.5.1 Personnel

Each PAS location is staffed with administrative and/or technical personnel who perform and verify work under the supervision of their direct line supervisor.

All personnel are expected to perform their duties in accordance with the policies and processes outlined in this manual and in accordance with standard operating procedures (SOPs) and other quality system documents. PAS policies and procedures are designed for impartiality and integrity. When these procedures are fully implemented, personnel remain free from undue pressure and other influences that adversely impact the quality of their work or data.

4.1.5.1.1 Key Personnel

Key personnel are management positions that have the authority and responsibility to plan, direct, and control activities related to the QMS for the entire division (PAS Corporate), or for one or more PAS locations (Local).

COPYRIGHT © 2019-2022 Pace® Analytical Services, LLC.

PAS Key Personnel Positions & Deputy Assignments by Role

Job Title	Acronym	Primary / Alternate Deputy
Chief Executive Officer	CEO	President
Chief Compliance Officer	CCO	CQD
President	NA	CEO / Sr. VPO
Corporate Quality Director	CQD	CCO
Quality Program Manager	QPM	CQD / Peer QPM
Chief Technical Officer	CTO	CQD / CCO
Sr. VP of Operations	Sr. VPO	President / VPO
Vice President of Operations	VPO	Sr. VPO / Peer VPO
Director of Lab Operations[1]	DLO	VPO / Peer GM or Sr. VPO
Health and Safety Director	NA	CCO
IT Director	NA	CTO
Quality Manager	QM	Direct QPM / Peer QPM
General Manager[1]	GM	VPO / Sr. VPO or Peer GM
Operations Manager[1]	OM	GM / DL or VPO
Technical Manager[1]	TM	CTO / Peer TM
TNI Approved TM[2]	TNI TM	Another Qualified Employee

[1.] Position is not in place at all locations.
[2.] The TNI TM is not a PAS position. See Section 4.1.5.2.1 for more information.

Some certification and accreditation programs require notification when there is a change in key personnel. Notification requirements and timeframes by agency, are tracked and upheld by the local QM, when these requirements apply.

4.1.5.2 Roles and Responsibilities

The qualifications, duties, and responsibilities for each position at Pace® are detailed in job descriptions maintained by the Pace® Human Resource personnel (HR).

The following sections provide a general overview of various management and supervisory roles and are presented in no particular order.

Chief Executive Officer (CEO): Provides leadership for overall operations; oversight of regulatory and compliance standards; development of growth strategies; and long-range capital and strategic planning for Pace®.

Chief Compliance Officer (CCO): Has overall responsibility for statutory and regulatory compliance and the environmental health and safety programs (EHS) for Pace®.

President: Provides leadership for overall operations; oversight of regulatory and compliance standards; development of growth strategies; and long-range capital and strategic planning for PAS.

Chief Technical Officer (CTO): Provides technical oversight and leadership to all PAS locations. Responsible for innovation and standardization of technical activities.

Corporate Director of Quality (CQD): Responsible for developing the PAS quality program and the policies and procedures that support the QMS. The CQD leads the

COPYRIGHT © 2019-2022 Pace® Analytical Services, LLC.

quality team, establishing functions, responsibilities, duties, and organization structure for PAS.

Corporate Quality Program Manager (QPM): Responsible for helping local management implement, monitor, maintain and improve the PAS quality program for one or more locations in the network and for direct supervision of Quality Manager(s).

Director of Information Technology: Oversees and delivers the systems and processes of information technology used by PAS. These systems include Laboratory Information Management Systems (LIMS); data acquisition, reduction, and reporting software; virus-protection, communication tools, and ensuring the integrity, security of electronic data, and associated policies and procedures.

Sr. Vice President of Operations (Sr VPO): Provides leadership, direction, and insight necessary to achieve strategic initiatives. Develops and improves processes, structure, and allocation of resources for operations for all of PAS.

Vice-President of Operations (VPO): Provides leadership, guidance, and resources, including allocation of personnel, necessary to achieve the strategic goals of the organization and the PAS quality program to one or more PAS locations.

Director of Laboratory Operations (DLO): See description for General Manager.

General Manager (GM): The GM is responsible for overall administration and operation of one or more PAS locations and service centers. Although task duties associated with this responsibility may be delegated, the GM is responsible for ensuring all duties and activities of the locations they oversee comply with the PAS QMS, the PAS EHS program, and with any applicable statutory, regulatory requirements or program requirements.

Any GM of a NELAC/TNI Accredited laboratory is also responsible for the designation of technical personnel to serve as acting technical managers for TNI for the fields of accreditation held by the laboratory (See Section 4.1.5.2.1) and for notifying the accreditation body (AB) of any extended absence or reassignment of these designations.

Quality Manager (QM): The QM oversees and monitors the implementation, compliance, and improvement of the QMS and communicates gaps, deviations, and opportunities for improvement to local and corporate laboratory management. The QM is independent of the operation and analytical activities for which they provide oversight and has the authority to carry out the roles and responsibilities of their position without outside influence.

The QM:

- serves as the focal point for QA/QC protocol decisions and oversees review of QC data for trend analysis;
- evaluates data objectively and performs assessments without outside influence;

COPYRIGHT © 2019-2022 Pace® Analytical Services, LLC.

- has documented training and experience in QA/QC procedures and the PAS quality system;
- has a general knowledge of the analytical methods offered by the laboratory;
- coordinates and conducts internal systems and technical audits;
- notifies laboratory management of deficiencies in the quality system;
- monitors corrective actions;
- provides support to technical personnel and may serve as the primary deputy for the acting TNI Technical Manager(s).

Manager-Client Services (CSM): This position is responsible for the training and supervision of project manager(s) and/or shipping, receiving and courier personnel. The primary responsibility of the CSM is to ensure projects are successfully managed to meet the expectations and needs of PAS customers.

Department Managers / Supervisors / Team Lead: These positions are responsible for administrative and operations management and implementation of the QMS in the work area he/she oversees. These responsibilities include but are not limited to: training and supervision of personnel, monitoring work activity to maintain compliance with this manual, SOPs, policies and other instructional documents that support the QMS; method development, validation and the establishment and implementation of SOPs to assure regulatory compliance and suitability for the intended purpose; monitoring QA/QC performance, proper handling and reporting of nonconforming work, purchasing of supplies and equipment adequate for use, maintaining instrumentation and equipment in proper working order and calibration, and general maintenance of administrative and technical processes and procedures established by the laboratory.

Operations Manager (OM): The OM is responsible for management of production and/or other duties assigned by the GM.

4.1.5.2.1 Approved Technical Manager (TNI Accreditation Only):

The requirements in this subsection apply to only to PAS locations that are NELAC/TNI accredited.

The TNI Standard specifies requirements for the qualification and duties of technical personnel. The TNI Standard lists these duties under the reference "technical manager(s), however named."

At PAS, these duties closely correlate with the responsibilities and duties outlined in the PAS job descriptions for managers, supervisors, team leads, and/or scientist. However, these duties do not need to be associated with any specific job title and can be assigned to any one or more PAS employees that meets the qualifications specified in the TNI Standard.

COPYRIGHT © 2019-2022 Pace® Analytical Services, LLC.

Refer to the applicable version of the TNI Standard to view the required qualifications for each discipline.

PAS locations that are TNI accredited must designate one or more employees to perform these duties and submit these qualifications to the TNI accreditation body (AB) for approval.

Employees approved by the TNI AB, to perform these duties retain their Pace® assigned job title.

When TNI Accreditation Bodies (AB) refer to these employees as 'technical manager' or 'technical director' on the official certificate or the scope of accreditation, this reference is referring to their approval to perform duties of the 'technical manager, however named' as specified in the TNI Standard and not to a PAS job title.

The duties of any approved technical manager for TNI, however named, can be completed in person or remotely. If an employee that is an approved technical manager for TNI is completely absent from work or on a leave of absence for more than 15 calendar days, the duties and responsibilities specified in the TNI Standard are temporarily reassigned to another employee that meets the qualifications for the technology or field of accreditation. If the employee's absence exceeds 35 calendar days, the local QM must formally notify the TNI primary AB of the absence and the details of reassignment of duties in writing.

4.1.5.3 Conflict of Interest

A conflict of interest is a situation where a person has competing interests that may affect impartiality. It is the policy of Pace® to ensure business relationships, decisions and transactions do not place personal interest ahead of the organization, customers, colleagues, job responsibilities or the public we serve. Conflict of interest is avoided by making personnel aware of circumstances that conflict or appear to conflict with impartiality and/or designing process and procedures to include checks and balances to prevent conflict and ensure impartiality.

See the current version of policy COR-POL-0004 *Code of Ethics and Professional Conduct* for more information.

4.1.5.4 Confidentiality

PAS management is committed to preserving the confidentiality of Pace® customers and confidentiality of Pace® business information.

Client information obtained or created during work activities is considered confidential and is protected from intentional release to any person or entity other than the client or the client's authorized representative, except when Pace® is required by law to release confidential information to another party, such as a regulatory agency or for litigation purposes. In which case, Pace® will notify the client

COPYRIGHT © 2019-2022 Pace® Analytical Services, LLC.

of the release of information and the information provided, unless notification is prohibited by law.

When Pace® obtains information about the customer from a source other than the customer, Pace® will keep the source of the information confidential unless disclosure is agreed upon by the source.

The terms of client confidentiality are included in PAS Standard Terms and Conditions (T&C). With the acceptance of the T&C and/or the implicit contract for analytical services that occurs when the client sends samples to PAS for testing, the client authorizes Pace® to release confidential information when required. Other procedures used by PAS to maintain confidentiality include:

- A Code of Ethics and Professional Conduct policy that covers this topic (COR-POL-0004):
- A Confidentiality Agreement which supervisory and sales personnel and other positions are required to sign at the time of employment and abide by the conditions of throughout employment;
- Record retention and disposal procedures that assure confidentiality is maintained; and
- Physical access controls and encryption of electronic data; and

See policy COR-POL-0004 *Code of Ethics and Professional Conduct* for more information.

4.1.5.5 Communication

Communication is defined as the imparting or exchanging of news and information. Effective (good) communication occurs when the people included in the communication gets the point and understands it.

4.1.5.5.1 Workplace Communication

Effective communication in the workplace is necessary to assure work is performed correctly, efficiently, and in accordance with client specifications.

Instructions for how to conduct testing and other work activities are communicated to personnel via written policies, standard operating procedures, and other work instructions.

Information about PAS performance (positive and negative) and ideas for improvement are communicated to personnel using various communication channels such as face to face meetings, video conferencing, conference calls, email, memoranda, written reports, and posters.

4.1.5.5.2 External Communication

Communication with external parties such as customers, vendors, business partners, and regulatory agencies takes place every day.

COPYRIGHT © 2019-2022 Pace® Analytical Services, LLC.

PAS management is responsible for training personnel to communicate in professional and respectful ways to build strong relationships and to avoid misunderstanding.

4.2 Quality Management System

4.2.1 Quality Management System Objectives

The objectives of the PAS QMS are to provide clients with consistent, exemplary professional service, and objective work product that is of known and documented quality that meets their requirements for data usability and regulatory compliance.

Objective work product is analytical services, data, test results, and information that is not influenced by personal feeling or opinions. The quality of being objective is also known as 'impartiality.'

4.2.1.1 Impartiality

PAS achieves and maintains impartiality by establishing an organizational structure that safeguards impartiality (See 4.1.4.1) and implementing and adhering to the policies and processes of the QMS outlined in this manual, which are based on industry accepted standards and methodologies.

PAS procedures for handling nonconforming work (See 4.9), corrective and preventive actions (See 4.11, 4.12) and management review (See 4.15) are the primary mechanisms used to identify risk to impartiality and to prompt actions necessary to eliminate or reduce the threat when risk to impartiality is suspected or confirmed.

4.2.1.2 Risk and Opportunity Assessment

Risks are variables that make achieving the goals and objectives of the QMS uncertain.

An opportunity is something that has potential positive consequences for the organization.

PAS personnel manage risks and opportunities on a daily basis by following policies, procedures and processes that support the QMS. Some ways in which the QMS is designed to identify, minimize, or eliminate risk on a daily basis include but are not limited to:

- Capability and capacity reviews of each analytical service request to assure the laboratory can meet the customer's requirements;
- Maintenance of accreditation and certification for test methods in multiple states and programs to cover a broad range of jurisdiction for regulatory compliance;
- SOPs and other controlled instructional documents are provided to personnel to eliminate variability in the process. These documents include actions to counter risk factors inherent in the process and are reviewed on a regular basis for on-going suitability and relevancy;
- Participation in proficiency testing programs and auditing activities to verify on-going competency and comparability in performance;

COPYRIGHT © 2019-2022 Pace® Analytical Services, LLC.

- Provision of on-the-job training and established protocol for quality control (QC) corrective action for nonconforming events;
- An established program for ethics, and data integrity;
- Tiered data review process;
- Culture of continuous improvement;
- Monitoring activities to assess daily and long-term performance; and
- Annual critical review of the effectiveness of the QMS.

PAS also promotes a continuous improvement culture based on the principles of lean manufacturing. These principles include 3P (Process, Productivity, Performance) and Kaizen. 3P is a platform used by PAS to share best practices and standardization across the network to achieve operational excellence. Kaizen is a team-based process used to implement tools and philosophies of lean to reduce waste and achieve flow with the purpose of improving both external and internal customer satisfaction. The PAS lean program and activities help to mitigate risk because they generate a collective understanding of vulnerabilities and utilize group-effort to develop and implement solutions at all levels.

Risk and opportunities may also be formally identified using specific risk and opportunity assessment methods such as SWOT Analysis (Strength, Weakness, Opportunity, Threats) and 3-Stage Impact/Probability Grids.

4.2.1.3 Communication of the Quality Management System

This manual is the primary mechanism used by PAS management to communicate the QMS to personnel.

To assure personnel understand and implement the quality program outlined in the manual:

- PAS personnel are required to sign a Read and Acknowledgement Statement to confirm the employee has:

  1) been informed of the manual by management,

  2) has access to the manual,

  3) has read the manual

  4) understands the content of the manual, and

  5) agrees to abide by the requirements, policies, and procedures therein.
- Personnel are informed that the manual provides the "what" of the QMS. The "how to" implementation of the QMS is provided in policy, SOPs, standard work instructions, and other instructional documents.
- This manual and supporting policies and procedures are made readily accessible to personnel in the area where the work activity is performed.

COPYRIGHT © 2019-2022 Pace® Analytical Services, LLC.

4.2.2 Quality Policy Statement

The quality policy of PAS is to provide customers with data of known and documented quality fit for their intended purpose. PAS achieves this policy by implementing the QMS defined in this manual, by following industry accepted protocol for analytical testing and quality assurance and quality control (QA/QC) activities, by conformance with published and industry accepted testing methodologies, and by compliance with international and national standards for the competency and/or accreditation of testing laboratories.

Intrinsic to this policy statement is each of the following principles:

- PAS will provide customers with reliable, consistent, and professional service. This is accomplished by making sure each PAS location has the resources necessary to maintain capability and capacity; that staff are trained and competent to perform the tasks they are assigned; that client-facing staff are trained and prepared to find solutions to problems and to assist customers with their needs for analytical services. Customer feedback, both positive and negative, is shared with personnel and used to identify opportunities for improvement.
- PAS maintains a quality program that complies with applicable state, federal, and industry standards for analytical testing and competency.
- PAS management provides training to personnel so that all personnel are familiar with the QMS outlined in this manual and that they understand that implementation of the QMS is achieved by adherence to the Pace® and PAS policies and procedures.
- PAS management continuously evaluates and improves the effectiveness of the QMS by responding to customer feedback, and other measures of performance, such as but not limited to the results of internal/external audits, proficiency testing, metrics, trend reports, and annual and periodic management reviews.

4.2.2.1 Ethics Policy / Data Integrity Program

Pace® has established a comprehensive ethics and data integrity program that is communicated to all Pace® employees so that they understand what is expected of them. The program is designed to promote a mindset of ethical behavior and professional conduct that is applied to all work activities.

The key elements of the Pace® Ethics / Data Integrity Program include:

- Ethics Policy (COR-POL-0004);
- Ethics Officer (Chief Compliance Officer);
- Standardized data integrity training course taken by all new employees on hire and a yearly refresher data integrity training course for all existing employees;
- Policy Acknowledgement Statements that all Pace® personnel, including contract and temporary, are required to sign at the time of employment and again during annual refresher training to document the employee's commitment and

COPYRIGHT © 2019-2022 Pace® Analytical Services, LLC.

obligation to abide by the company's standards for ethics, data integrity and confidentiality;

- SOPs that provide instructions for how to carry out a test method or process to assure tasks are done correctly and consistently by each employee;
- On the Job Training;
- Data integrity monitoring activities which include, but are not limited to, primary, secondary and completeness data reviews, internal technical and system audits, data audits, data surveillance, and proficiency testing; and
- Confidential reporting process for alleged ethics and data integrity issues.

All PAS managers and supervisors are expected to provide a work environment where personnel feel safe and can report unethical or improper behavior in complete confidence without fear of retaliation. Retaliation against any employee that reports a concern is not tolerated.

Pace® has engaged Lighthouse Services, Inc. to provide personnel with an anonymous reporting process available to them 24 hours per day/7 days per week. The alert line may be used by any employee to report potential violations of the company's ethics and data integrity program. Reports are forwarded to the Pace® Ethics Compliance Officer to investigate and resolve the matter. Investigations concerning data integrity are kept confidential.

See COR-POL-0001 *Compliance Alertline* for more information.

Posters and flyers with the compliance alert line information must be prominently posted in each PAS location for personnel reference.

4.2.3 Management Commitment: Quality Management System

Evidence of management's commitment for the development, maintenance, and on-going improvement of the QMS is provided by the application of their signature of approval to the template and/or manual. Their signature confirms they understand their responsibility to implement the QMS outlined in this manual, to communicate the quality program to personnel, and to uphold requirements of the program during work activities.

4.2.4 Management Commitment: Customer Service

Management communicates the importance of meeting customer and regulatory requirements to personnel by training personnel on the QMS outlined in this manual, implementing the QMS outlined in this manual, and upholding these requirements for all work activities.

COPYRIGHT © 2019-2022 Pace® Analytical Services, LLC.

4.2.5 Supporting Procedures

References to processes and procedures that support the QMS are included throughout this manual. The structure of the document management system is outlined in SOP ENV-SOP-CORQ-0015 *Document Management and Control* and summarized in the following subsections.

4.2.5.1 Quality Management System Document Structure

Documents associated with the QMS are classified into document types that identify the purpose of the document and establish how the document is managed and /or controlled.

Examples: Types of PAS Internally Created Documents

Document Type	Purpose
Quality Manual	Outlines the PAS QMS and structure and how it works for a system including policy, goals, objectives and detailed explanation of the system and the requirements for implementation of system. Includes roles and responsibilities, relationships, procedures, systems, and other information necessary to meet the objectives of the system described.
Policy	Provide requirements and rules for a process and is used to set course of actions and to guide and influence decisions. Policy describes the "what," not the "how".
Standard Operating Procedure	Provide written and consistent set of instructions or steps for execution of a routine process, method, or set of tasks performed. Assures that activities are performed properly in accordance with applicable requirements.
Standard Work Instruction	Provide step by step visual and/or written instruction to perform a specific task to improve competency, minimize variability, reduce work injury and strain, or to boost efficiency and quality of work (performance). SWI are associated with an SOP unless the task described is unrelated to generation of or contribution to environmental data or analytical results.
Template	Pre-formatted document that serves as a starting point for a new document.
Guide	Assists users in using a particular product; or a technical interpretation of a method or process by which PAS locations must abide.
Form	Used for a variety of purposes such as to provide a standardized format to record observations, to provide information to supplement an SOP.
Guidance	Non-binding advice used to explain internal policies, procedures, or practices.

Example: Types of External Documents used by PAS

Certificate	Lists parameters, methods, and matrices for which the location is certified/accredited to perform within the jurisdiction of the issuing regulatory agency or accreditation body.
Reference Document	Provide information, protocol, instructions, and/or requirements. Issued by the specifier. Examples include ISO/IEC, TNI, DoD and published referenced methods such as Standard Methods, ASTM, SW846, EPA, and federal and state regulatory bodies.
Project Document	Provides requirements necessary to meet individual client expectations for intended use of data. Examples include project quality assurance plans (QAPP), client-program technical specifications, contracts, and other agreements.

These document types are ranked to establish which documents takes precedence when there is an actual or perceived conflict between documents and to establish the hierarchal relationships between documents. The ranking system also provides information to document writers and reviewers to assure downline documents agree with documents of higher rank.

COPYRIGHT © 2019-2022 Pace® Analytical Services, LLC.

PAS Document Hierarchy

Rank	Document
1	Corporate Manual
2	Corporate Policy
3	Corporate SOP
4	Corporate SWI, Templates, Guides, Forms, Guidance
5	Local Manual
6	Local SOP
7	Local SWI, Templates, Guide, Forms, Guidance

Information and requirements from project documents are not incorporated into PAS policy or SOPs in order to maintain client confidentiality. These documents are managed as external documents and any requirements for work specified is followed when work for the project is performed. Project Documents are reviewed and maintained as part of the contract/incoming work review process (See Section 4.4). If the project document is less stringent than the PAS QMS, policies, or SOPs, and/or is less stringent than applicable federal or state requirements, PAS locations are still required to meet the minimum requirements of the PAS QMS and any applicable statutory or federal requirements in addition to the requirements specified in the project document.

Reference documents are not ranked because all PAS created documents, processes and procedures must be consistent with the applicable reference document(s) in addition to higher-ranking PAS documents.

See SOP ENV-SOP-CORQ-0015 *Document Management and Control* for more information.

4.2.6 Roles and Responsibilities

The roles and responsibilities for technical management and the quality manager are provided in section 4.1.5.2.

4.2.7 Change Management

When significant changes to the PAS QMS are planned, these changes are managed by corporate quality personnel to assure that the integrity of the QMS is maintained.

4.3 Document Control

4.3.1 General

PAS procedures for document control are provided in SOP ENV-SOP-CORQ-0015 *Document Management and Control.*

PAS locations use electronic document management software (eDMS) to perform the document control procedures of the SOP. This system provides centralized access to all documents used by PAS locations across the network. All PAS locations are required to use the eDMS system established for PAS (presently Qualtrax) unless an exemption has been granted by the PAS Corporate Quality Director.

eDMS automates the process for unique document identification, version control, approval, access, and archival and restricts access to archived documents except to authorized users to prevent the use of obsolete documents.

COPYRIGHT © 2019-2022 Pace® Analytical Services, LLC.

The local QM maintains a master list of controlled documents used at each location. The master list minimally includes the document control number, document title, and current revision status and is made available to personnel for their reference.

See SOP ENV-SOP-CORQ-0015 *Document Management and Control* for more information.

4.3.2 Document Approval and Issue

Documents that support the QMS are reviewed by qualified personnel and approved by management prior to release for use.

Only the approved versions of documents are available to personnel for use unless use of a draft document is authorized by management.

The managers responsible for authorization of each document is situation specific.

See SOP ENV-SOP-CORQ-0015 *Document Management and Control* for more information.

4.3.3 Document Review and Change

Unless a more frequent review is required by regulatory, certification or accreditation program documents are reviewed at least every two years to ensure the documents remains current, appropriate, and relevant.

Documents are also informally reviewed every time the document is used. Personnel are expected to refer to and follow instructions in controlled documents when they conduct their work activities. Consequently, any concerns or problems with the document should be caught and brought to the attention of management on an on-going basis.

Documents are revised whenever necessary to ensure the document remains usable and correct. Older document versions and documents no longer needed are made obsolete and archived for historical purposes.

PAS does not allow hand-edits to documents. If an interim change is needed pending re-issue of the document, the interim change is communicated to those that use the document using a formal communication channel, such as change in progress form, email, or memorandum.

The document review, revision, and archival process is managed by quality personnel at the location from which the document was released using the procedures established in SOP ENV-SOP-CORQ-0015 Document Management and Control.

4.4 Analytical Service Request, Tender, and Contract Review

PAS management and/or client service personnel perform thorough reviews of requests and contracts for analytical services to verify the location(s) performing the work has the capability, capacity, and resources necessary to successfully meet the customer's needs. These review procedures are described in SOP ENV-SOP-ASHE-0033 *Review of Analytical Requests.*

The procedures in this SOP(s) are established to ensure that:

- The PAS locations performing the work understand the purpose of data collection in order to ensure the test methods requested are appropriate for the intended use of the data and capable of meeting the client's data quality objectives;

COPYRIGHT © 2019-2022 Pace® Analytical Services, LLC.

- PAS locations and any external subcontractor(s) have the capability, capacity, and resources to meet the project requirements and expectations within the requested time frame for delivery of work product;
- Any concerns that arise from review are discussed and resolved with the client;
- Any discrepancies between the PAS QMS, statutory or regulatory requirements and the client request are resolved; and
- The results of review and any correspondence with the client related to this process and/or any changes made to the contract are recorded and retained for historical purposes.

Capability review confirms that the PAS locations contracted to perform the work and any internal or external subcontractors hold required certification/accreditation for the test method, matrix, and analyte and verifies the location can achieve the client's target compound list and data quality objectives (DQOs) for analytical sensitivity and reporting limits, QA/QC protocol, and hardcopy test report and electronic data deliverable (EDD) formats.

Capacity review verifies that the in-network locations and any potential subcontractors are able to manage the sample load and deliver work production within the delivery timeframe requested.

Resource review verifies that the location and any potential subcontractors have adequate qualified personnel with the skills and competency to perform the test methods and services requested and sufficient and proper equipment and instrumentation needed to perform the services requested.

4.5 Subcontracting (Internal and External)

The terms 'subcontract' and 'subcontracting' refers to analytical work done by an organization external to Pace® (External Subcontracting) or by a Pace® location with an address different than the address listed on the cover page of the test report (Internal Subcontracting).

The PAS network offers comprehensive analytical capability and capacity to ensure Pace® can meet a diverse range of client needs for any type of project. If a PAS laboratory receives a request for analytical services and it cannot fulfill the project specifications, the location's client services team will collaborate with the client to place the work within the PAS network.

When it is not possible to place the work within network, the location will, with documented client approval, subcontract the work to a subcontractor that has the capabilities to meet the project specifications and can meet the same commitment agreed on between the location and the client.

Whenever work is subcontracted, the PAS location responsible for management of the project verifies each of these qualifications:

- The internal or external subcontractor has the proper accreditation/certifications required for the project and these are current; and
- The use of the internal or external subcontractor is approved by the client and/or regulatory agency when such approval is required by the customer. Record of customer approval is retained in the project record.

External subcontractors selected by Pace® must be pre-qualified by quality personnel to verify their QMS is similar to Pace® and complies with all relevant Standards such, as ISO/IEC 17025 and the TNI Standard(s) and/or federal and state regulatory requirements. The list of approved

COPYRIGHT © 2019-2022 Pace® Analytical Services, LLC.

subcontractors for each location is maintained by local quality personnel. Pre-qualification of a subcontractor does not eliminate the requirement for the PAS location placing work to verify the subcontractor has the certifications, capability, capacity, and resources to perform work on behalf of Pace® on a project-specific basis.

For all subcontracted work, the PAS location placing the work internally or externally is responsible to ensure project specifications are always communicated to and understood by the subcontractor.

4.6 Purchasing Services and Supplies

Vendors that provide services and supplies to PAS are qualified to meet the needs of Pace®. These needs include but are not limited to competitive pricing, capacity to fill purchase orders, quality of product, customer service, and business reputation and stability. Evidence of this qualification is the availability to purchase services and supplies from the vendor in the corporate purchasing system.

PAS locations may purchase goods and services from any supplier in the purchasing system.

The specifications (type, class, grade, tolerance, purity, etc.) of supplies, equipment, reagents, standard reference materials and other consumables used in the testing process are specified in SOPs. The SOP specifications are based on the governing requirements of the approved reference methods and any additional program driven regulatory specification, such as drinking water compliance.

All requisitions for materials and consumables are approved by local management who is responsible to ensure the services and supplies procured and received are fit for intended use.

4.7 Customer Service

Project details and management is managed by PAS client services personnel.

4.7.1 Commitment to Meet Customer Expectations

PAS personnel collaborate closely with our customers to ensure their needs are met and to establish their confidence in the capability of PAS to meet their needs for analytical services and expectations for service.

The project manager (PM) is the customer's primary point of contact for each analytical service request (work order). The PM gathers information from the customer to ensure the details of their request are understood. After samples are received, the PM monitors the progress of the project and alerts the customer of any delays or excursions that may adversely impact data usability. Supervisors are expected to keep the PM informed of project status and any delays or key issues, so that the PM can keep the client informed.

PAS encourages customers to visit our locations to learn more about the capabilities, observe performance and to meet personnel.

PAS customers expect confidentiality. Personnel will not divulge or release information to a third party without proper authorization unless the information is required for litigation purposes. See Section 4.1.5.4 of this manual and policy COR-POL-0004 *Code of Ethics and Professional Conduct* for more information on the policy for client confidentiality.

4.7.2 Customer Feedback

PAS actively seeks positive and negative feedback from customers through surveys and direct communication. Information from the client about their experience working with PAS and

COPYRIGHT © 2019-2022 Pace® Analytical Services, LLC.

their satisfaction with work product is used to enhance processes and practices and to improve decision making. Customer feedback is reviewed to identify risk and opportunity. Corrective, preventive, or continuous improvement actions are taken based on nature of and/or feedback trends.

Also see sections 4.9, 4.10, 4.11, 4.12, 4.14, and 4.15 for more information about how customer feedback is managed by PAS and used to enhance the QMS.

4.8 Complaints

A complaint is a formal expression of dissatisfaction with the performance of a service or product originating from a party external to Pace®. Complaints provide opportunities to improve processes and/or build stronger working relationships with clients.

The PAS complaint resolution process depends on the situation and the nature of the complaint.

Each complaint received is reviewed to determine if it is valid. If the complaint is valid, it is either addressed immediately by the person receiving the complaint or the nature of the complaint is further reviewed and investigated prior to resolution and follow up with the customer.

Complaints (and compliments) are recorded and reviewed during Annual Management Review (See Section 4.15).

4.9 Nonconforming Work

4.9.1 Definition of Nonconforming Work

Nonconforming work is work that does not conform to customer requirements, standard specifications, policies, and procedures, or that does not meet acceptance criteria.

The discovery of non-conforming work comes from various sources which include, but are not limited to:

- results of quality control samples and instrument calibrations;
- quality checks on consumables and materials;
- general observations of personnel;
- data review;
- proficiency testing;
- internal and external audits;
- complaints and feedback;
- management review and reports; and
- regulatory and certification and accreditation actions.

The way in which the laboratory or service center manages nonconforming work depends on the significance and impact (risk) of the issue. Some issues may simply require correction, others may require investigation, corrective action (See 4.11) and/or data recall (See 4.16). When the location releases data and test results associated with nonconforming QC and acceptance criteria, test results are qualified, or non-conformances are noted in the final analytical report to apprise the data user of the situation. (See 5.10)

COPYRIGHT © 2019-2022 Pace® Analytical Services, LLC.

Nonconforming work also includes unauthorized departure from policies, procedures, and test methods. Authorized departures are explained in the following subsections. Situations that do not conform to these conditions are considered unauthorized departure(s).

4.9.1.1 Authorized Departure from SOPs

Departures from an SOP may sometimes be necessary to correct for an error in an SOP or to resolve a complex problem. For example, to mitigate a complex matrix interference.

An authorized departure from a test method SOP is one that has been reviewed and approved by the department leader, however named, of the work area in which the test method is performed. The leader, when authorizing a departure from an SOP, accepts full responsibility to ensure the departure does not conflict with Pace® or PAS policy or procedure, does not affect statutory, regulatory or program compliance and does not adversely affect data integrity or usability.

Departure from administrative or process-oriented SOPs must be approved by the local QM.

Documentation of the reason for the SOP departures must be retained with management approval. Approved departures from test method SOPs should be noted in the final test report to advise the data user.

See SOP ENV-SOP-CORQ-0016 *SOP for SOPs and SWI*, for more information.

4.9.1.2 Authorized Departure from Test Methods (Method Modifications)

When test results are associated to a published reference test method, the location's test method SOP must be consistent with the test method. If the test method is mandated for use by a specific regulatory program such as drinking water, wastewater or a certification or accreditation program, such as TNI/NELAC, the SOP must comply with or include these requirements, or the resulting data and test results cannot be used for regulatory compliance purposes.

If the procedures in the SOP are modified from the test method, these modifications must be clearly identified in the SOP. The conditions under which the location may establish an SOP that is modified from these reference method or regulatory program and what is considered a modification are specified in ENV-SOP-CORQ-0011 *Method Validation and Instrument Verification*.

Client requests to deviate from the test method are managed as client requests to depart from the test method SOP since it is the SOP that the location follows when performing work.

4.9.1.3 Stop Work Authority

Stop Work Authority provides PAS personnel with capability to stop work when there is a perceived unsafe condition or behavior that may result in an unwanted event.

All personnel have the authority to request a stop work order when necessary to preserve data integrity or safety of workers.

COPYRIGHT © 2019-2022 Pace® Analytical Services, LLC.

The need for the stop work order and resolution of the problem must be confirmed by subject matter experts and resumption of work must be approved as follows:

- For stop work orders related to environmental health and safety (EHS) and/or waste management, the decision to stop work may be made by any employee. These decisions must often be made in real-time to protect the safety of the worker. The decision to correct the problem, how, and/or to resume work after stop work has been initiated may be made by the Chief Compliance Officer or the EHS Director, or the deputies assigned to these positions.

- Any employee may recommend a stop work order for concerns related to data integrity. The need to stop work must be reviewed and affirmed by quality personnel to confirm the concern is valid. The decision to uphold the stop work order must minimally include the local QM, the QPM, and the Corporate Quality Director. The President, the Sr. VPO, the VPO, the Chief Compliance Officer and Chief Technical Officer may also be included in the decision making and resolution process depending on the situation and/or needs for correction to ensure protocols for investigation are followed. Resumption of work after correction may be made by the Corporate Quality Director, or the Quality Program Manager assigned to the location for which the stop work order was issued or by the deputies assigned to these positions.

4.10 Continuous Improvement

The PAS QMS is designed to achieve continuous improvement through the implementation of the quality policy and objectives outlined in this manual. Information about laboratory and service center activities and performance is gained from sources such as customer feedback, audits, QC, trend analysis, business analytics, management reports, proficiency testing, and management systems review. This information is subsequently used during the corrective action (see section 4.11) and preventive action (see section 4.12) processes and during annual review of the management system (see section 4.15) to establish goals and objectives for improvement.

PAS also promotes a continuous improvement culture based on the principles of lean manufacturing. These principles include 3P (Process, Productivity, Performance) and Kaizen. 3P is a platform used by Pace to share best practices and standardization across the network to achieve operational excellence. Kaizen is a team-based process used to implement tools and philosophies of lean to reduce waste and achieve flow with the purpose of improving both external and internal customer satisfaction. All activities of 3P and Lean must conform with the requirements of this quality manual and supporting policies and procedures.

4.11 Corrective Action

Corrective action is a process used to eliminate the cause of a detected nonconformity. It is different from a correction. A correction is an action taken to fix an immediate problem but that does not resolve the underlying cause of why the problem occurred. The objective of corrective action is to find the underlying cause(s) of the problem and to put in place fixes to prevent the problem from happening again. The corrective action process, referred to as CAPA, is one of the most effective tools used by PAS to prevent nonconforming work, identify risk and opportunity, and improve service to our customers.

COPYRIGHT © 2019-2022 Pace® Analytical Services, LLC.

PAS has two general processes for corrective action, the application of which process is used depends on the type of nonconformity:

Quality control (QC) exceptions (nonconformance) that occur during routine testing are investigated through troubleshooting and required actions for correction is specified in policies and SOPs. When action is not taken, cannot be taken, or is not successful, test results associated with the nonconforming work are qualified in the final test report. Documentation of the nonconformance and corrective action taken is documented in the analytical record.

A 7-stage corrective action process is used when there is a recurring problem. These problems are identified through various activities such as but not limited to quality control trends, internal and external audits, management review, customer feedback, and general observation.

The 7 Stage CAPA Process for PAS includes:

1) Identification and Containment
2) Evaluation
3) Investigation
4) Cause Analysis
5) Action Plan
6) Implementation
7) Follow Up and Effectiveness Review

PAS procedures for corrective action, are specified in corporate SOP ENV-SOP-CORQ-0018 *Procedure for Corrective and Preventive Action.* Some key concepts and activities related to the PAS corrective action process is provided in the next three subsections.

4.11.1 Cause Analysis (AKA Root Cause Analysis)

Cause analysis is the process of investigation used to identify the underlying cause(s) of the problem. After causal factors are identified, ways to mitigate the causal factors are identified and action(s) most likely to eliminate these factors are taken.

PAS uses different methods to conduct cause analysis. The most common approach is 5-Why, 4M, Fishbone Diagrams, or brainstorming may be appropriate depending on the situation. The method used is case specific and is documented in the CAPA record.

4.11.2 Effectiveness Review

Monitoring corrective actions taken for effectiveness is an essential part of the corrective action process. Effectiveness means the actions taken were appropriate and sustainable. Appropriate means the action(s) taken prevented recurrence of the problem since the time corrective action was taken and sustainable means the actions taken are still in place.

The data from CAPA records are used by PAS to identify opportunities for preventive action or to gain lessons learned when actions taken were not adequate to solve the problem. See Section 4.12 (Preventive Action) and 4.15 (Management Review) for more information.

4.11.3 Additional Audits

When cause analysis and investigation of a problem casts doubt on compliance with PAS policies, procedures, or to regulatory requirements; a special audit of the area of activity may be performed as part of the corrective action process. These special audits are used to

COPYRIGHT © 2019-2022 Pace® Analytical Services, LLC.

determine the scope of the problem and to provide information for the CAPA process. Additional full-scale audits are done when a grave issue or risk to the business is identified.

4.12 Preventive Action

Preventive action(s) are actions taken to eliminate the cause of a potential nonconformity before it happens.

Some examples of preventative action include, but are not limited to:

- Routine instrument maintenance (Preventative maintenance)
- Addition of Staff and Equipment
- Professional Development Activities
- Implementation of New Technology

PAS looks for opportunities for preventive action from a variety of sources including employee idea's, customer feedback, business partners input, trend analysis, business analytics, management reviews, proficiency testing results, and risk-benefit analysis.

PAS management evaluates the success of preventive actions taken in any given year during annual management review. See Section 4.15 for more information.

4.12.1 Change Management

Preventive actions may sometimes result in significant changes to processes and procedures used by PAS locations. PAS management evaluates the risks and benefits of change and includes in its implementation of change process, actions to minimize or eliminate any risk. The types of changes for which risk are considered and managed include infrastructure change, change in analytical service offerings, certification or accreditation status, instrumentation, LIMS changes, and changes in key personnel.

4.13 Control of Records

A record is a piece of evidence about the past, especially an account of an act or occurrence kept in writing or another permanent form. PAS records document activities and provide evidence of conformity to the requirements established in the QMS. These records may be hardcopy or electronic on any form of media.

4.13.1 General Requirements

4.13.1.1 Procedure

PAS requirements for control of records are specified in corporate policy ENV-POL-CORQ-0013 *Record Managemen*t.

The policy is established to assure quality and technical records are identified, retained, indexed, and filed to allow for retrieval during the entire retention timeframe. During storage, records are kept secure and protected from deterioration. At the end of the retention time, the records are disposed of properly in order to maintain client confidentiality and to protect the interests of the company.

COPYRIGHT © 2019-2022 Pace® Analytical Services, LLC.

In general, records fall into three categories: quality, technical, and administrative.

Examples of each are provided in the following table:

Record Type	Includes Records of:
Quality	Document Types listed in SOP ENV-SOP-CORQ-0015 Audits: Internal and External Certificates and Scopes of Accreditation Corrective & Preventive Action Management Review Data Investigations Method Validation Instrument Verification Training Records
Technical	Raw Data Logbooks Certificates of Traceability Analytical Record Test Reports & Project Information Technical Training Records & Demonstration of Capability
Administrative	Personnel Records Finance/Business

4.13.1.2 Record Legibility and Storage

Records are designed to be legible and to clearly identify the information recorded. Manual entries are made in indelible ink; automated entries are in a typeface and of sufficient resolution to be read. The records identify personnel that performed the activity or entered the information. Records are archived and stored in a way that they are retrievable. Access to archived records is controlled and managed.

For records stored electronically, the capability to restore or retrieve the electronic record is maintained for the entire retention period. Hardcopy records are filed and stored in a suitable environment to protect from damage, deterioration, or loss. Hardcopy records may be scanned to PDF for retention. Scanned records must be checked against the hardcopy to verify the scan is complete and legible.

Administrative records are kept for a minimum of 5 years and technical and quality records are kept for 10 years unless otherwise specified by the client or regulatory program.

The date from which retention time is calculated depends on the record. In general, the retention time of technical records of original observation and measurement is calculated from the date the record is created. If the technical record is kept in a chronological logbook, the date of retention may be calculated from the date the logbook is archived. The retention time of test reports and project records, which are considered technical records, is calculated from the date the test report was issued. The retention time of quality records is usually calculated from the date the record is archived.

Refer to the record management policy and the location specific SOP for more information.

COPYRIGHT © 2019-2022 Pace® Analytical Services, LLC.

4.13.1.3 Security

PAS locations are secure facilities and access to records is restricted to authorized personnel.

4.13.1.4 Electronic Records

The data systems used to store electronic records is backed up in accordance with SOP ENV-SOP-ASHE-0058 *Data and Records Archival*. Access to archived records stored electronically is maintained by personnel responsible for management of the electronic system.

4.13.1.5 Electronic Signature Policy

Work done by PAS locations include activities that require the application of a signature. Some work product is in electronic format and signatures are applied electronically.

The Electronic Signatures in Global and National Commerce Act (E-Sign Act) clarifies that electronic signatures are legally valid and enforceable under United States law.

The PAS policy for use and application of electronic signatures is specified in corporate policy ENV-POL-CORQ-0014 *Electronic Signature Policy*.

All employees of PAS including temporary and contract personnel, must sign an Electronic Signature Agreement to acknowledge that they understand and accept that work activities performed by them may be authenticated with application of an electronic signature and that electronic signature has the same validity as a handwritten signature. Their signed agreement also confirms the individual has read and understands the policy and agrees to abide by the requirements for use of electronic signature stated in the policy.

4.13.2 Technical Records

In addition to the requirements specified in subsections 4.13.1.1 through 4.13.1.5, the requirements in the following subsections also apply to technical records.

4.13.2.1 Description

Technical records are the accumulation of data and information generated from the analytical process. These records may include forms, worksheets, workbooks, checklists, notes, raw data, calibration records, final test reports, and project record. The accumulated record needs to provide adequate detail to historically reconstruct the process and identify the personnel that performed the tasks associated with a test result.

4.13.2.2 Real Time Recordkeeping

Personnel are instructed and expected to always record observations, data, and calculations at the time they are made. PAS managers are responsible to assure that data entries, whether made electronically or on hardcopy, are identifiable to the task.

COPYRIGHT © 2019-2022 Pace® Analytical Services, LLC.

4.13.2.3 Error Correction

Errors in records must never be erased, deleted, or made illegible. Use of correction fluid, such as white-out is prohibited. In hardcopy records, the error is corrected by a single strike through the original entry and the new entry recorded alongside or footnoted to allow for readability. Corrections are initialed and dated by the person making the correction. If the correction is not self-explanatory, a reason for the correction is recorded.

For electronic records, equivalent measures of error correction or traceability of changes made is kept. For example, audit trails provide records of change.

Maintenance of proper practices for error correction is monitored through the tiered data review process described in Section 5.9.3. Records are reviewed throughout the data review process. Individuals performing these reviews flag errors that are not properly corrected and bring these to the attention of the department manager or supervisor of the work area in which the record was generated so that the problem may be addressed and corrected with the individual(s) that did not make the correction properly.

4.14 Audits

Quality personnel, or their designees, perform internal systems and technical audits to assess implementation of the QMS, compliance to this manual, policy, and procedures that make up the QMS. Since the processes in this manual are based on the requirements from relevant and applicable Standards for the operation and management of laboratories when operations are assessed against the PAS QMS, compliance with regulatory program requirements and accreditation/certification program requirements are also assessed.

PAS locations are also audited by external parties such as regulatory agencies, customers, consultants, and non-government assessment bodies (NGAB).

Information from internal and external audits is used by local and corporate management to address deficiencies and to identify opportunities to improve customer service and quality of work, including reliability and usability of data and test results.

Deficiencies, observations, and recommendations from audits are managed by the local QM using the CAPA process. See Section 4.11 for more information.

4.14.1 Internal Audit

The PAS internal audits are conducted to ensure practice matches what we say we do and what we say we do is compliant with the PAS QMS and relevant standards and requirements.

The internal audit program is managed by the local QM who prepares an audit plan at the beginning of each calendar year. The schedule is prepared to assure that all work areas are reviewed over the course of the year and test methods are audited every two years, unless a more frequent test method audit is required by program. Conformance to the schedule is monitored on a monthly basis.

PAS management is responsible to ensure the audit schedule is maintained. PAS supervisors are expected to cooperate with the quality personnel to provide them with complete access to the work area, personnel, and records needed to conduct the audit.

COPYRIGHT © 2019-2022 Pace® Analytical Services, LLC.

Internal audits may be performed by non-quality personnel when the auditor is approved by the local QM. Non-quality personnel may not audit their own work activities unless it can be demonstrated that an effective and objective audit will be conducted. The person conducting the audit should be trained, qualified, and familiar enough with the objectives and policies of the PAS QMS and knowledgeable with process and test method SOPs related to the activities audited. The auditors should be trained in auditing practices in order to perform a thorough and effective evaluation.

Test method audits include reviews of test reports to verify the product is consistent with customer/project requirements, the work was conducted in accordance with policy and SOPs, the SOP complies with the cited reference method, test results are accurate, and of known and documented quality and properly qualified, when necessary.

Special audits are performed as needed to follow up on a specific issue such as a client complaint, negative feedback, concerns of data integrity or ethics, or a problem identified through other audits. Special audits may be scheduled or unscheduled. Unscheduled internal audits are conducted whenever doubts are cast on compliance with regulatory requirements or its own policies and procedures. These unscheduled internal audits may be conducted at any time and may be performed without an announcement to the location or work area audited.

When observations and findings from any audit (internal or external) cast doubt on the validity of testing results, the location takes immediate action to investigate the problem and take corrective action. (Also see 4.11 and 4.16)

4.14.1.1 Corporate Compliance Audit

PAS locations may also be audited by corporate personnel at discretion. The purpose of the corporate compliance audit is to assess whether the location's practices, processes and procedures conform with the PAS QMS and to identify risk and opportunity.

4.15 Management Review

Local management conducts an annual business review of each location under their purview to assess performance and to establish goals, objectives, and action plans for the upcoming year.

The procedure used to conduct this review is specified in corporate SOP ENV-SOP-CORQ-0005 *Management Review*.

At a minimum, the following topics are reviewed and discussed during annual management review:

- Changes in internal and external issues relevant to the location;
- Fulfillment of objectives and initiatives;
- Suitability of policies and procedures, including EHS and waste management;
- Status of actions from previous performance reviews;
- The outcome of recent internal audits;
- Corrective and preventive actions;

COPYRIGHT © 2019-2022 Pace® Analytical Services, LLC.

- Assessments by external bodies;
- The results of interlaboratory comparisons or proficiency tests;
- Changes in the volume and type of the work;
- Customer and personnel feedback, including complaints;
- Effectiveness of improvements / preventive actions made since last review;
- Adequacy of resources;
- Results of risk identification;
- Proficiency testing performance and other measures related to the assurance of validity of test results; other relevant factors, such as QC trends and training status.

The discussion and results of this review are documented in a report prepared by local management. This report includes a determination of the effectiveness of the management system and its processes, goals, and objectives for improvements in the coming year with timelines and responsibilities, and any other need for change.

Goals and action items from annual management systems review are shared with local employees and with corporate management to highlight focus areas for improvement in addition to areas in which the location has excelled.

4.16 Data Integrity

PAS procedures for the investigation and response to events that may affect data integrity are described in the corporate SOPs for data inquiries and data recall and corrective and preventive action, however named.

Customers whose data are affected by these events are notified in a timely manner, usually within 30 days after the impact of the problem is understood. Some accreditation programs also require notification to the accreditation body (AB) within a certain timeframe from date of discovery when the underlying cause of the issue impacts accreditation. PAS locations must follow any program or project specific client notification requirements for notification, when applicable.

5.0 TECHNICAL REQUIREMENTS

5.1 General

Multiple factors contribute to the correctness and reliability of the technical work performed by PAS. These factors fall under these broad categories:

- Human Performance
- Facility and Environmental Conditions
- Test Method Performance and Validation
- Measurement Traceability
- Handling of Samples

COPYRIGHT © 2019-2022 Pace® Analytical Services, LLC.

The impact of each of these factors varies based on the type of work performed. To minimize negative effects from each of these factors, PAS accounts for the contribution from each of these categories when developing test method and process (administrative) SOPs, evaluating personnel qualifications and competence, and in the selection of equipment and supplies used.

5.2 Personnel

5.2.1 Personnel Qualifications

The PAS program for personnel management is structured to ensure personnel are selected, qualified, and competent to perform the roles and responsibilities of their position based on education, experience, and training.

Qualifications, duties, responsibilities, and authorities of each position are specified in job descriptions maintained by corporate HR (See Section 5.2.4). These job descriptions provide the general basis for the selection of personnel for hire and are used by the location to communicate to personnel the duties, responsibilities, and authorities of their position. Qualification records may include but are not limited to diploma, transcripts, and curriculum vitae (CV).

The term "personnel" refers to individuals employed by PAS directly as full-time, part-time, or temporary, and individuals employed by PAS by contract, such as through an employment agency. The term "personnel" is used interchangeably with the term "employee" throughout this manual. For purposes of this manual, these terms are equivalent.

The personnel management program is structured to establish and maintain records for each of the following:

- Selection of personnel;
- Training of personnel;
- Supervision of personnel;
- Authorization of personnel; and
- Monitoring Competence of personnel.

5.2.1.1 Competence

Competence is the ability to apply a skill or series of skills to complete a task or series of tasks correctly within defined expectations.

Competence for technical personnel authorized by PAS to provide opinion and interpretation of data to customers also includes the demonstrated ability to:

- Apply knowledge, experience, and skills needed to safely and properly use equipment, instrumentation, and materials required to carry out testing and other work activities in accordance with manufacturer specifications and location SOPs;
- Understand and apply knowledge of general regulatory requirements necessary to achieve regulatory compliance in work product; and

COPYRIGHT © 2019-2022 Pace® Analytical Services, LLC.

- Understand the significance of departures and deviations from procedure that may occur during the analytical testing process and the capability and initiative to troubleshoot and correct the problem, document the situation and decision-making process, and to properly qualify the data and analytical results.

PAS requirements for the competence of personnel (education, qualification, work experience, technical skills, and responsibilities) are specified in job descriptions created by management and kept by human resources (HR). The job description provides the basis for the selection of personnel for each position.

An employee is considered competent when he/she has completed the required training specified in Section 5.2.2 and documentation of training is complete.

5.2.2 Training (Required)

Pace® training requirements are outlined in Pace® policies COR-POL-0023 *Mandatory Training Policy* and COR-POL-0004 *Code of Ethics and Professional Conduct.*

5.2.2.1 Required Training Requirements

The PAS training program includes these elements:

- Scheduling
- Execution
- Documentation and Tracking
- Evaluation of Effectiveness

Required training is scheduled by corporate training personnel, local quality personnel, and the employee's direct supervisor.

Training on required topics, processes and procedure is delivered using various methods that incorporate techniques that appeal to the main learning styles: visual, aural, linguistic, and kinesthetic. Techniques include, on-the-job, instructor-led, self-study, eLearning, and blended.

The employee's direct supervisor is responsible for oversight of completion of the employee's required training and for providing adequate time to the employee to complete training assignments. The supervisor and employee are responsible to make sure the employee's training status and training records for all required training is current, complete, and documentation of training is available.

Training status is tracked by the local QM, who provides the status to local management at least monthly or more frequently, as necessary, to ensure required training for personnel is complete and up to date.

The following subsections further describe the required PAS training program for new hire training and on-going training.

5.2.2.1.1 New Hire Required Training

New hire training requirements apply to new personnel and to existing employees starting in a new position or different work area.

COPYRIGHT © 2019-2022 Pace® Analytical Services, LLC.

Required new hire training includes training on each of the following:

- Ethics and Data Integrity (See 5.2.2.1.3)
- Quality Manual / Quality Management System (See 5.2.2.1.4)
- Safety Manual and any training requirements specified in the manual.
- Policies & SOPs relevant to their job tasks
- Technical personnel that prepare and test samples must also successfully complete an initial demonstration of capability (IDOC) for the test methods performed before independently testing customer samples. (See 5.2.2.1.5). Independent testing means without direct supervision of the work activity by the supervisor or a qualified trainer.

All required training must be documented and verified complete by the local QM before the employee is authorized to work independently on client samples. Until then, the employee's direct supervisor is responsible for all work produced by the new employee under their supervision.

5.2.2.1.2 On-Going Required Training

Personnel receive on-going training in each of the following topics:

- Ethics and Data Integrity (See 5.2.2.1.3)
- Quality Manual / Quality Management System (See 5.2.2.1.4)
- Safety
- Changes to Policies & SOPs, relevant to their job activities.
- New Policies & SOPS, relevant to their job activities.
- Technical personnel must also successfully complete on-going demonstration of capability (CDOC) for all test methods performed on an annual basis. (See 5.2.2.1.5)

All required training must be documented and verified complete by the local QM with training records readily accessible in accordance with the corporate policy for Record Management (ENV-POL-CORQ-0013).

5.2.2.1.3 Ethics and Data Integrity Training

Data integrity training is provided to all new personnel and refresher data integrity training is provided to all employees on an annual basis. Personnel are required to acknowledge they understand that any infractions of the PAS data integrity procedures will result in a detailed investigation that could lead to profound consequences

COPYRIGHT © 2019-2022 Pace® Analytical Services, LLC.

including immediate termination, debarment, or civil/criminal prosecution.

Completion of data integrity training is documented using the mechanism established by Pace® to provide evidence that the employee has participated in training on this topic and understand their obligations related to data integrity.

The following topics and activities are covered:

- Policy for honesty and full disclosure in all analytical reporting;
- Prohibited Practices;
- How and when to report data integrity issues;
- Record keeping. The training emphasizes the importance of proper written documentation on the part of the analyst with respect to those cases where analytical data may be useful, but are in one sense or another partially nonconforming;
- Training Program, including discussion regarding all data integrity procedures;
- Data integrity training documentation;
- In-depth procedures for data monitoring; and
- Specific examples of breaches of ethical behavior such as improper data manipulations, adjustments of instrument time clocks, and inappropriate changes in concentrations of standards.

All PAS personnel, including contract and temporary, are required to sign an "Attestation of Ethics and Confidentiality" at the time of hire and/or during annual refresher training or as specified in the ethics policy. This document clearly identifies inappropriate and questionable behavior. Violations of this document result in profound consequences, including prosecution and termination, if necessary.

Also see SOP-ENV-COR-POL-0004 *Code of Ethics and Professional Conduct* for more information.

5.2.2.1.4 Management System Documents Training

The Quality Manual policies, and SOPs are the documents used by regulatory bodies and Pace® customers to verify capability, competency, and compliance with their requirements and expectations.

In addition to on-the-job training, employees must have a signed Read and Acknowledgement Statement (R&A) on record for the quality manual, and the policies and SOPs relating to his/her job

COPYRIGHT © 2019-2022 Pace® Analytical Services, LLC.

responsibilities. This statement, whether signed by the employee electronically or by wet signature, confirms that the employee has received, read, and understands the content of the document, that the employee agrees to follow the document when carrying out their work tasks; and the employee understands that unauthorized change to procedures in an SOP is not allowed except in accordance with the SOP departure policy (See 4. 9.1).

See SOP ENV-CORQ-0016 *Standard Operating Procedures and Standard Work Instructions* for more information.

5.2.2.1.5 Demonstration of Capability (DOC) Requirements

An initial demonstration of capability (IDOC) must be completed and validated prior to authorization for the employee to work independently on client samples for the test method. After successful IDOC, the employee must demonstrate continued proficiency (CDOC) for the test method on an annual basis. If more than a year has passed since the employee last performed the method; then capability must be re-established with an IDOC.

Successful DOC is one where the DOC replicate data has been compiled, reviewed, and verified by the employee's supervisor and/or manager to be complete and to have met acceptance criteria and the DOC record has been validated by quality personnel for completeness and compliance, and placed in the employee's training file for accessibility and reference.

Demonstration of capability (DOC) procedures and requirements vary by technology.

For example, a DOC for chemistry test methods where spiking is appropriate, is based on the employee's capability to achieve acceptable precision and accuracy for each analyte reported by the laboratory for the test method using the laboratory's test method SOP.

DOC procedures and requirements must be specified in the laboratory's test method SOP or a stand-alone SOP. Refer to these SOPs for more information.

5.2.2.1.6 Effectiveness of Training

Effectiveness of individual employee training is measured by their demonstrated ability to comprehend the training material and apply knowledge and skills gained to their job task. Measurements include but are not limited to:

- Testing of the employee's knowledge of the QMS, policies, and technical and administrative procedures through various mechanisms, such as quizzes, observation, and interviews.

COPYRIGHT © 2019-2022 Pace® Analytical Services, LLC.

- Demonstrated ability to convey information correctly and factually in written and verbal communication to internal and external parties.
- Demonstrated ability to carry out tasks in accordance with SOPs and other work instructions.
- Demonstrated ability to make sound decisions based on guidance and information available.
- Demonstrated initiative to seek help or guidance when the employee is unsure of how to proceed.

5.2.2.2 Supplemental Learning

Supplemental learning objectives may be established for newly hired personnel to aid in their development of administrative and technical skills. These learning objectives and materials, referred to as Learning Plans (LP), are created and maintained by the PAS 3P program and managed by the employee's direct supervisor.

Pace® also offers a wide variety of supplemental learning courses that are made available to all employees for professional development. These learning materials, maintained by Pace® corporate training personnel, are accessed via the company's employee portal, PaceConnect. The learning may be self-initiated based on an employee's interest or may be assigned to the employee at the discretion of management as professional development as part of an employee's annual goals.

Supplemental learning courses and learning plan activities are not prerequisites for competency (Section 5.2.1.1) and are not considered part of the required PAS QMS training program.

5.2.3 Personnel Supervision

Every employee is assigned a direct supervisor, however named, who is responsible for their supervision.

General supervisory responsibilities may include but are not limited to:

- Hiring Employees
- Training Employees
- Performance Management
- Development, oversight, and execution of personnel training plans
- Monitoring personnel work product to assure the work is conducted in accordance with this quality manual, policies, SOPs, and other documents that support the QMS.

5.2.4 Job Descriptions

Job Descriptions that define the required education, qualifications, experience, skills, roles and responsibilities, and reporting relationships for each Pace® position are established by top management and kept by corporate HR. The job descriptions apply to employees who are

COPYRIGHT © 2019-2022 Pace® Analytical Services, LLC.

directly employed by Pace®, part-time, temporary, technical, and administrative and by those that are under contract with Pace® through other means.

The job descriptions include the education, expertise, and experience required for the position and the responsibilities and duties, including any supervisory or managerial duties assigned to the position.

5.2.5 Authorization of Technical Personnel

Technical personnel are authorized by local quality personnel to perform the technical aspects of their position after quality personnel have verified that the employee meets the qualifications for the position, has successfully completed required training (Section 5.2.2.1), and the employee has completed initial demonstrated capability (Section 5.2.2.1.5). After initial authorization, technical personnel are expected to maintain a current and complete training record, demonstrate on-going capability at least annually for each test method performed, and produce reliable results through accurate analysis of certified reference materials, proficiency testing samples, and/or routine quality control samples in order to remain authorized to continue to perform their duties.

Records to support authorization including, education, experience, training, and other evaluations are kept by the location where the employee works.

5.3 Accommodations and Facilities

5.3.1 Facilities

PAS laboratories and service centers are designed to support the correct performance of procedures and to not adversely affect measurement integrity or safety. Access to PAS facilities is controlled by various measures, such as card access, locked doors, staffed main entry.

5.3.2 Environmental Conditions

Each location is equipped with energy sources, lighting, heating, and ventilation necessary to facilitate proper performance of calibrations and tests. The location ensures that housekeeping, electromagnetic interference, humidity, line voltage, temperature, sound, and vibration levels are appropriately controlled to ensure the integrity of specific measurement results and to prevent adverse effects on accuracy or increases in the uncertainty of each measurement.

Environmental conditions are monitored, controlled, and recorded as required by the relevant specifications, methods, and procedures. Operations are stopped if it is discovered that the environmental conditions would jeopardize the integrity of analytical results or other work product.

5.3.3 Separation of Incompatible Activities

The layout and infrastructure of each work area including air handling systems, power supplies, and gas supplies of each work area is specifically designed for the type of analytical activity performed. Effective separation between incompatible work activities is maintained. For example, sample storage, preparation, and chemical handling for volatile organic analysis (VOA) is kept separate from semi-volatile organic (SVOA).

COPYRIGHT © 2019-2022 Pace® Analytical Services, LLC.

Samples known or suspected to contain high concentration of analytes are separated from other samples to avoid the possibility for cross-contamination. If contamination is found, the source of contamination is investigated and resolved in accordance with applicable SOPs.

5.3.4 Security

Security is maintained by controlled access to the building and by surveillance of work areas by authorized personnel. Access is controlled to each area depending on the required personnel, the sensitivity of the operations performed, and potential safety concerns.

5.3.5 Good Housekeeping

PAS locations must maintain good housekeeping practices in work areas to maintain a standard of cleanliness necessary for analytical integrity and personnel health and safety.

5.4 Test Methods

5.4.1 General Requirements

The laboratory uses test methods and procedures that are appropriate for the scope of analytical services the laboratory offers.

Instructions on the use and operation of equipment and sample handling, preparation, and analysis of samples are provided in SOPs. The instructions in SOPs may be supplemented with other documents including, but not limited to, standard work instructions (SWI), manuals, guides, project documents and reference documents.

These documents are managed using the procedures described in SOP ENV-SOP-CORQ-0015 *Document Management and Control* and SOP ENV-SOP-CORQ-0016 *Standard Operating Procedures and Standard Work Instructions.*

5.4.2 Method Selection

The test methods and protocols used by the laboratory are selected to meet the needs of the customer, are appropriate for the items tested, for the intended use of the data, and to conform with applicable federal, statutory, or program requirements.

The test methods offered by PAS are industry accepted methods published by international, regional, or national standards. Each PAS laboratory bases its procedure on the latest approved edition of a method unless it is not appropriate or possible to do so, or unless regulatory requirements specify otherwise.

The laboratory confirms that it can perform the test method and achieve desired outcome before analyzing samples (see section 5.4.5). If there is a change in the published analytical method, then the confirmation is repeated.

When a customer does not specify the test method(s) to be used, the laboratory may suggest test methods that are appropriate for the intended use of the data and the type of samples to be tested. The laboratory will also inform customers when test methods requested are considered inappropriate for their purpose and/or out of date. This discourse takes place during review of analytical service requests (See Section 4.4).

COPYRIGHT © 2019-2022 Pace® Analytical Services, LLC.

5.4.3 PAS Developed Methods

A PAS developed method is a method developed from scratch (no published source method), a procedure that modifies the chemistry from the source method, or a procedure that exceeds the scope and application of the source method.

PAS developed methods must be validated prior to use (see section 5.4.5) and the procedure documented in a test method SOP.

The requirements for non-standard methods (Section 5.4.4) also apply to PAS developed methods.

5.4.4 Non-standard Methods

A non-standard method is a method that is not published or approved for use by conventional industry standards for the intended purpose of the data. Non-standard methods must be validated prior to use (see section 5.4.5) and the procedure developed and documented in a test method SOP.

At a minimum, the following information must be included in the procedure:

- Title / Identification of Method;
- Scope and Application;
- Description of the type of item to be analyzed;
- Parameters or quantities and ranges to be determined;
- Apparatus and equipment, including technical performance requirements;
- Reference standards and reference materials required;
- Environmental conditions required and any stabilization period needed; and
- Description of the procedure, including:
    - Affixing identification marks, handling, transporting, storing, and preparing of items;
    - Checks to be made before the work is started;
    - Verifying equipment function and, where required, calibrating and/or adjusting the equipment before each use;
    - Method of recording the observations and results;
    - Any safety measures to be observed;
    - Criteria and/or requirements for approval/rejection;
    - Data to be recorded and method of analysis and presentation; and
    - Uncertainty or procedure for estimating uncertainty.

Use of a non-standard method for testing must be agreed upon with the customer. The agreement, which is retained by the laboratory in the project record, must include the specifications of the client's requirements, the purpose of testing, and their authorization for use of the non-standard method.

COPYRIGHT © 2019-2022 Pace® Analytical Services, LLC.

5.4.5 Method Validation

5.4.5.1 Validation Description

Validation is the process of confirmation and the provision of objective evidence that the stated requirements for a specific method/procedure are fulfilled.

The laboratory's requirements and procedures for method validation are outlined in SOP ENV-SOP-CORQ-0011 *Method Validation and Instrument Verification.*

5.4.5.2 Validation Summary

All test methods offered by the laboratory are validated before use to confirm the procedure works and the data and results achieved meet the goals for the method and repeated when there are major changes to the laboratory procedure.

Results of validation are retained are kept in accordance with method validation SOP and the corporate policy ENV-CORQ-POL-0013 *Record Management*.

5.4.5.3 Validation of Customer Need

The validation process includes review of accuracy, precision, sensitivity, selectivity, linearity, repeatability, reproducibility, robustness, and cross-sensitivity of the procedure against general customer needs to ensure the laboratory's procedure will meet those needs.

The following subsections explain some concepts as they are applied to chemistry. The applications of these same concepts may differ for other technologies such as microbiology, radiochemistry, whole effluent toxicity (WET), and asbestos or other validation concepts may apply to these disciplines. Refer to the laboratory's test method SOPs for more information.

5.4.5.3.1 Accuracy

Accuracy is the degree to which the result of a measurement, calculation, or specification conforms to the correct value or a standard. When the result recovers within a range from the known value (control limit); the result generated using the laboratory's test method SOP is considered accurate.

5.4.5.3.2 Precision

Precision refers to the closeness of two or more measurements to each other. It is measured by calculating the relative percent difference (RPD) or relative standard deviation (RSD) from results of separate analysis of the same sample. Precision provides information about repeatability, reproducibility, and robustness of the laboratory's procedure.

5.4.5.3.3 Limits of Detection (LOD) (Chemistry)

The LOD is the minimum result which can be reliably discriminated from a blank with a predetermined confidence level. The LOD

COPYRIGHT © 2019-2022 Pace® Analytical Services, LLC.

establishes the limit of method sensitivity and is also known as the detection limit (DL) or the method detection limit (MDL).

Values below the LOD cannot be reliably measured and are not reported by the laboratory unless otherwise specified by regulatory program or test method.

The LOD is established during method validation and after major changes to the analytical system or procedure that affect sensitivity are made.

The laboratory's procedure for LOD determination is specified in SOP ENV-SOP-ASHE-0045 *Determination of LOD and LOQ*.

For chemistry methodology, the local SOP must comply with the current version of each of the following documents:

- EPA document EPA-821-R-16-006 *Definition and Procedure for the Determination of the Method Detection Limit;*
- 2016 TNI Standard V1M4; and
- TNI GUID-3-109-Rev. 0, *V1M4 2016 Standard Update Guidance on Detection and Quantitation.*

5.4.5.3.4 Limits of Quantitation (LOQ) and Reporting Limit (RL)

This section describes these concepts for chemistry. For non-chemistry technologies, such as microbiology, refer to laboratory SOPs.

The LOQ is the minimum level, concentration, or quantity of a target analyte that can be reported with a specified degree of confidence.

The LLOQ is the value of the lowest calibration standard included in the calibration curve. The LLOQ establishes the lower limit of quantitation; it is not the same concept as the LOQ, however, the LOQ and LLOQ may be the same value.

The LOQ and LLOQ represent quantitative sensitivity of the test method.

- The LOQ must always be equal to or greater than the LLOQ and the LLOQ must always be greater than the LOD.
- Any reported value (detect or non-detect) less than the LLOQ is a qualitative value.

The RL is the value to which the presence of a target analyte is reported as detected or not detected. The RL is project-defined based on project data quality objectives (DQO). In the absence of

COPYRIGHT © 2019-2022 Pace® Analytical Services, LLC.

project specific requirements, the RL is usually set to the LOQ or the LLOQ.

The laboratory's procedures for LOQ determination must be specified in the same SOP for LOD determination, (See Section 5.4.5.3.3) The LLOQ for each method must be specified in the test method SOP.

5.4.5.3.5 Linearity

Linearity is a mathematical concept applied to calibration models that employ multiple points to establish a calibration range used for quantitative analysis. Linearity is measured differently based on the calibration model. In general, if linearity is demonstrated then the slope of the response of standards are sufficiently close to one another. The accuracy of the linear regression and non-linear curves is verified by checking percent error or relative standard error (RSE), which is the process of refitting calibration data back to the model to determine if the results are accurate. For linear curves that use average calibration or response factor, error is measured by relative standard difference (RSD).

Linearity also establishes the range of quantitation for the test method used which directly impacts the sensitivity of the test method and uncertainty in measurement results. As previously noted, the LLOQ establishes the lower limit of quantitation. Similarly, the upper range of linearity establishes the upper limit of quantitation. In general, results outside of this range are considered qualitative values. However, inorganic test methods sometimes allow for extension of the linear range above the upper limit of quantitation when accuracy at this value is verified.

Linearity can also be used to establish repeatability, reproducibility, and robustness of the laboratory's test method. When linearity is demonstrated using a specific calibration model during method validation, then use of this same calibration model to achieve linearity on a day-to-day basis confirms the laboratory's method is repeatable, reproducible, and robust.

5.4.5.3.6 Demonstration of Capability (DOC)

The DOC performed during method validation confirms that the procedure demonstrated acceptable precision and accuracy.

5.4.6 Measurement Uncertainty

The location provides an estimate of uncertainty in testing measurements with analytical results on request, or when required. For example, for radiochemistry uncertainty is always reported with the test result

For chemistry methodologies, the uncertainty of the test method is reflected in the control limits used to evaluate QC performance for the test method. (See 5.9.1.1.9). ISO/IEC states

COPYRIGHT © 2019-2022 Pace® Analytical Services, LLC.

that when a well-recognized test method specifies limits to the values of the major source of uncertainty of measurement and specifies the form of presentation of calculated results, the laboratory has satisfied the requirements on analytical uncertainty by following the test method and reporting instructions.

When measurement uncertainty cannot be satisfied through control limits, the location will provide a reasonable estimation of uncertainty. A reasonable estimation is based on knowledge of method performance and previous experience. When estimating the analytical uncertainty, all uncertainty components which are of importance in the given situation are considered.

5.4.7 Control of Data

PAS has policies and processes in place to assure that reported data is free from calculation and transcription errors, that quality control is reviewed and evaluated before data is reported, and to address manual calculation and integration.

5.4.7.1 Calculations, Data Transfer, Reduction and Review

Whenever possible, calculations, transfer of data, and data reduction are performed using validated software programs (See 5.4.7.2).

If manual calculations are performed, the results of these calculations are verified during the data review process outlined in section 5.9.3.

5.4.7.1.1 Manual Integration

The PAS policy and procedures for manual integration are provided in corporate SOP ENV-SOP-CORQ-0006 *Manual Integration*.

This SOP includes the conditions under which manual integration is allowed and the requirements for documentation.

Required documentation of manual integration includes:

- complete audit trail to permit reconstruction of before and after results;
- identification of the analyst that performed the integration and the reason the integration was performed; and
- identification of the individual(s) that reviewed the integration and verified the integration was done and documented in compliance with the SOP.

5.4.7.2 Use of Computers and Automated Acquisition

Whenever possible, PAS uses software and automation for the acquisition, processing, recording, reporting, storage, and/or retrieval of data.

Software applications developed by PAS are validated by corporate IT for adequacy before release for routine use. Commercial off the shelf software is considered sufficiently validated when the location follows the manufacturer or vendor's manual for set-up and use. Records of validation are kept by the corporate information technology (IT) group or by the group that performed the validation.

COPYRIGHT © 2019-2022 Pace® Analytical Services, LLC.

The PAS process for the protection of data stored in electronic systems includes:

- Individual usernames and passwords for Laboratory Information Management Systems (LIMS) and auxiliary systems used to store or process data.
- Employee Training in Computer Security Awareness
- Validation of spreadsheets used for calculations to verify formulas and logic yield correct results and protection of these cells to prevent unauthorized change.
- Operating system and file access safeguards
- Protection from Computer Viruses
- Regular system backup; and testing of retrieved data
- Verification the software application works as expected and is adequate for use and fulfills compliance requirements, such as the need to record date/time of data generation.
- Change control to assure requests for changes are reviewed and approved by management before the change is made.
- Communication channels to assure all staff are aware of changes made.
- Version Control and maintenance of historical records.

5.5 Equipment

5.5.1 Availability of Equipment

Each PAS location is furnished with all equipment and instrumentation necessary to correctly perform the tests offered in compliance with the specifications of the test method and to achieve the accuracy and sensitivity required.

When a regulation, program, or reference test method requires Class A glassware for quantitative measurements, only Class A glassware may be used. Plastic graduated cylinders, even if marketed by the vendor as comparable to Class A glassware, may not be used when Class A glassware is specified because ASTM's definition and tolerances for Class A glass cannot be applied to other materials.

5.5.2 Calibration

Equipment and instrumentation are checked prior to use to verify it performs within tolerance for its intended application.

5.5.2.1 Support Equipment

The location confirms support equipment is in proper working order, uniquely identified, and meets the specifications for use prior to placement in service. Periodic checks are performed to verify tolerance and accuracy are performed thereafter in accordance with a support equipment maintenance scheduled maintained by local quality personnel. Equipment that does not meet specifications is removed from

COPYRIGHT © 2019-2022 Pace® Analytical Services, LLC.

service until repaired or replaced. Records of repair and maintenance activities are maintained.

Procedures used to conduct and record these checks are outlined in SOP ENV-SOP-ASHE-0048 *Support Equipment*.

5.5.2.2 Analytical Instruments

Analytical instruments are checked prior to placement in service in accordance with SOP ENV-SOP-CORQ-0011 *Method Validation and Instrument Verification*. After the initial service date, the calibration of instruments and verification calibration is performed in accordance with local test method SOPs.

The calibration procedures in the test method SOPs comply with the requirements for acceptable calibration practices outlined in corporate policy ENV-POL-CORQ-0005 *Acceptable Calibration Practices*, the reference methods, and any applicable regulatory or program requirements.

5.5.3 Equipment Use and Operation

Equipment is operated and maintained by personnel that are trained on the test method SOP. Up-to-date instructions and procedures for the use and maintenance of analytical equipment are included in SOPs and/or supplemental documents such as standard work instructions (SWI) or instrument manuals which are made readily accessible in the work area to all laboratory personnel.

5.5.4 Equipment Identification

Each piece of equipment must be uniquely identified by serial number or any other unique ID system. The identifier is included in the equipment list maintained by the quality department and may not be reused or used interchangeably. New equipment and replacement equipment must be assigned a new unique ID.

5.5.5 Equipment Lists and Records

5.5.5.1 Equipment List

Each PAS location maintains a list of equipment that includes information about the equipment including a description, manufacturer, serial number, date placed in service, condition when received, identity, and the work area where the equipment is used. The date of purchase is tracked by the procurement record. The equipment list(s) for each location covered by this manual is provided in Appendix E.

5.5.5.2 Equipment Records

In addition to the equipment list, the location maintains records of equipment that include:

- Verification that equipment conforms with specifications.
- Calibration records including dates, results, acceptance criteria, and next calibration dates.
- Maintenance plan and records

COPYRIGHT © 2019-2022 Pace® Analytical Services, LLC.

- Records of damage, malfunction, or repair

The laboratory follows an equipment maintenance program designed to optimize performance and to prevent instrument failure which is described in SOP ENV-SOP-ASHE-0061 *Preventative, Routine, & Non-routine Maintenance* or in individual test method SOPs.

The maintenance program includes routine maintenance activities which are performed as recommended by the manufacturer at the frequency recommended and non-routine maintenance, which is performed to resolve a specific problem such as degradation of peak resolution, shift in calibration relationship, loss of sensitivity, or repeat failure of instrument performance checks and quality control samples.

Maintenance is performed by PAS personnel or by outside service providers.

All maintenance activities performed by PAS personnel are recorded by the individual(s) that performed the activity at the time the maintenance was performed in an instrument maintenance log.

The maintenance record minimally includes the date of maintenance, the initials of the person(s) performing maintenance, a description of the activity performed, why (when the maintenance is non-routine), and the return to analytical control. When maintenance is performed by an external vendor, the service must be maintained and accessible for easy retrieval. The location must provide personnel with unrestricted access to instrument maintenance logs in order to promote good instrument maintenance and recordkeeping practices.

If an instrument must be moved, the location will use safe practices for handling and transport to minimize damage and contamination.

5.5.6 Out of Service Protocol

Equipment that has been subjected to overloading, mishandling, gives suspect results, has been shown to be defective, or is performing outside of specified limits is taken out of service and either removed from the work area or labeled to prevent accidental use until it has been repaired and verified to perform correctly.

When analytical equipment is taken out of service because it no longer meets tolerance specifications, the potential effect of the nonconformance may have had on previously reported analytical results should be evaluated. (See section 4.9).

5.5.7 Calibration Status

The location labels support equipment to indicate calibration status, whenever practicable or otherwise maintains the calibration status in a visible location in the work area. These procedures are described in SOP ENV-SOP-ASHE-0048 *Support Equipment*.

The calibration status of analytical instruments is documented in the analytical record. Analysts verify on-going acceptability of calibration status prior to use and with instrument performance check standards. These procedures are described in test method SOPs.

COPYRIGHT © 2019-2022 Pace® Analytical Services, LLC.

5.5.8 Returned Equipment Checks

When equipment or an instrument is sent out for service, the location using the equipment ensures that the function and calibration status of the equipment is checked and shown to be satisfactory before the equipment is returned to service.

5.5.9 Intermediate Equipment Checks

The location performs intermediate checks on equipment to verify the on-going calibration status. For example, most test methods require some form of continuing calibration verification check, and these procedures are included in the test method SOP. Periodic checks of support equipment are also performed; see SOP ENV-SOP-ASHE-0048 *Support Equipment* for more information.

5.5.10 Safeguarding Equipment Integrity

The location safeguards equipment integrity using a variety of mechanisms that include but are not limited to:

- Adherence to manufacturer's specification for instrument use so that settings do not exceed manufacturer's recommendation or stress the performance of the equipment.
- Established maintenance programs.
- Transparent maintenance records and unrestricted access to maintenance logs.
- Validation and approval of software before use.
- Audits to confirm instrument settings are consistent with SOPs.
- On-the-job training for safe and proper use of laboratory equipment.

5.6 Measurement Traceability

5.6.1 General

Measurement traceability refers to a property of a measurement result whereby the result can be related to a reference through an unbroken chain of calibration, each contributing to the measurement uncertainty. Traceability requires an established calibration hierarchy of equipment (instruments) used during testing including equipment used for subsidiary measurements. The location assures this equipment is calibrated prior to being put into service and that the reference standard and materials used for calibration are traceable to the international standard of units (SI) or national measurement standard.

When strict traceability to SI units cannot be made, the location establishes traceability with the use of reference standards and equipment obtained from competent suppliers that provide calibration certificates and/or certificates of analysis (COA).

5.6.2 Equipment Correction Factors

When correction factors are used to adjust results the PAS personnel will assure that results in computer software are also updated.

COPYRIGHT © 2019-2022 Pace® Analytical Services, LLC.

5.6.3 Specific Requirements

5.6.3.1 Requirements for Calibration Laboratories

The laboratory does not offer calibration services to customers; therefore, ISO/IEC and TNI requirements for calibration laboratories do not apply.

5.6.3.2 Requirements for Testing Laboratories

The laboratory has procedures in place to verify equipment is calibrated prior to being put into service (See 5.5.2) and ensures the reference standard and materials used for calibration are traceable to the international standard of units (SI) or national measurement standard. When strict traceability to SI units cannot be made, the laboratory establishes traceability with the use of reference standards and equipment obtained from competent suppliers that provide calibration certificates and/or certificates of analysis (COA).

5.6.4 Reference Standards and Reference Materials

5.6.4.1 Reference Standards

The laboratory uses reference standards of measurement to verify adequacy of working weights and thermometers. The working weights are the weight(s) used for daily balance calibration checks and the working thermometers are used for daily temperature measurements.

Working weights and thermometers must be periodically checked to verify on-going adequacy for use between calibrations performed by an external calibration laboratory using reference standards traceable to SI or a national standard and that are used solely for verification purposes.

For example:

- An acceptable reference standard to check working thermometers against include a NIST Certified Thermometer or a NIST Traceable Thermometer that is not used for any other purpose than to check the adequacy of the working thermometer.
- An acceptable reference standard for the working weights is a set of Class S weights that is not used for any other purpose than to verify the weights used daily.

The working weights must be checked against the reference standard annually and all weight sets must be recertified by an ISO accredited calibration body every 5 years. In this application, "annually" means within thirteen (13) months from the date of the last check.

Working thermometers must be checked against the reference thermometer prior to placement in service to establish a correction factor (CF)[1] and then re-checked annually (±13 months from date of last check) or if battery operated, every three (3) months (±100 days from date of last check).

COPYRIGHT © 2019-2022 Pace® Analytical Services, LLC.

Exceptions to the 3-month recheck for battery operated sensors are allowed when the sensor is embedded in a unit and the manufacturer/vendor has evidence to show that the accuracy of the sensor is not affected by battery life.

Liquid in Glass NIST Certified reference thermometers must be recertified by an ISO/IEC accredited calibration laboratory every 5 years. If the reference thermometer is NIST Traceable or is a digital NIST Certified thermometer, the reference thermometer must be recertified annually by an ISO/IEC 17025 accredited calibration laboratory or service provider that provides traceability to a national standard.

If criteria for the intermediate checks or recertification is not acceptable, the impact on previously reported results is evaluated using the process for evaluation of nonconforming work (See 4.9).

See SOP ENV-SOP-ASHE-0048 *Support Equipment* for more information.

5.6.4.2 Reference Materials

The location purchases chemical reference materials (also known as stock standards) from vendors that are accredited to ISO 17034 or Guide 34. Purchased reference materials must be received with a Certificate of Analysis (COA) where available. If a reference material cannot be purchased with a COA, it must be verified by analysis and comparison to a certified reference material and/or there must be a demonstration of capability for characterization. COA are reviewed for adequacy and retained by the laboratory for future reference.

All prepared standards, reference materials, and reagents are verified to meet the requirements of the test method through routine analyses of quality control samples.

The laboratory procedure for traceability and use of these materials is provided in SOP ENV-SOP-ASHE-0059 *Laboratory Supply Procedure*.

This SOP includes each of the following requirements:

- Procedures for documentation of receipt and tracking. The record of entry includes name of the material, the lot number, receipt date, and expiration date.
- Storage conditions and requirements. Reference materials must be stored separately from samples, extracts, and digestates.
- Requirements to assure that preparations of intermediate or working solutions are recorded and assigned a unique identification number for tracking. Records of preparation include the lot number of the stock standard(s) used, the type and lot number of the solvent, the formulation, date, expiration date, and the preparer's initials. The lot number of the working standards is recorded in the analytical record to provide traceability to the standard preparation record. The preparation record provides traceability to the COA, which is traceable to SI or the national measurement standard.
- A requirement that the expiration dates of prepared standards may not exceed the expiration date of the parent standard. Standards, reference materials, and

COPYRIGHT © 2019-2022 Pace® Analytical Services, LLC.

reagents are not used after their expiration dates unless it is not possible to procure a new standard and the reliability of the expired material is verified and documented by the location using a procedure approved by corporate quality personnel. Otherwise, the expired material is promptly removed from the work area or clearly labeled as acceptable for qualitative/troubleshooting purposes only.

- The second source materials used for verification of instrument calibration are obtained from a different manufacturer or may be a different lot from the same manufacturer.
- Procedures to check reference materials for degradation and replacement of material if degradation or evaporation is suspected.
- Procedures for labeling. At a minimum, the container must identify the material, the ID of the material and the expiration date. Original containers should also be labeled with date opened.

5.6.4.3 Intermediate Checks

Checks to confirm the calibration status of reference standards and materials must be included in test method SOPs. These checks include use of second source standards and reference materials reserved only for the purpose of calibration checks.

5.6.4.4 Transport and Storage

The location handles and transports reference standards and materials in a manner that protects the integrity of the materials. Reference standard and material integrity is protected by separation from incompatible materials and/or minimizing exposure to degrading environments or materials. Standards and reference materials are stored separately from samples, extracts, and digestates. All standards are stored according to the manufacturer's recommended conditions. Temperatures colder than the manufacturer's recommendation are acceptable if it does not compromise the integrity of the material (e.g., remains in liquid state and does not freeze solid). In the event a standard is made from more than a single source with different storage conditions, the standard will be stored according to the conditions specified in the analytical method.

See the applicable analytical SOPs for specific reference material storage and transport protocols.

5.7 Sampling

Sampling refers to the field collection of samples and to subsamples taken by the laboratory for analysis from the field collected sample.

Subsampling procedures are included in each test method SOP or a stand-alone SOP to assure the aliquot used for testing is representative of the field collected sample.

The requirements in the following subsections apply when field sampling is performed by PAS.

COPYRIGHT © 2019-2022 Pace® Analytical Services, LLC.

5.7.1 Sampling Plans and SOPs

When PAS performs field collection of samples, sampling is carried out in accordance with a written sampling plan and sampling SOPs. These documents are made readily accessible at the sampling location. Sampling plans and SOPs are, whenever reasonable, based on appropriate governing methods and address the factors to be controlled to ensure the validity of the analytical results.

5.7.2 Customer Requested Deviations

When the customer requires deviations, additions, or exclusions from the documented sampling plan and/or procedure, the laboratory records the client's change request in detail with the sampling record, communicates the change to sampling personnel, and includes this information in the final test report.

5.7.3 Recordkeeping

PAS assures the sampling record includes the sampling procedure used, any deviations from the procedure, the date and time of sampling, the identification of the sampler, environmental conditions (if relevant), and the sampling location.

5.8 Sample Management & Handling

5.8.1 Procedures

The location's procedures for sample management and handling are outlined in SOP ENV-SOP-ASHE-0030 S*ample Management*.

The procedures in these SOPs are established to maintain the safe handling and integrity of samples from transport, storage, to disposal and during all processing steps to maintain client confidentiality, and to protect the interests of PAS and its customers.

5.8.1.1 Chain of Custody

All samples received by the location must be accompanied with a Chain of Custody (COC) record. The COC provides information about the samples collected and submitted for testing and documents the possession of samples from time of collection to receipt by the location.

The COC record must minimally include the following information:

- Client name, address, phone number;
- Project Reference;
- Client Sample Identification (Client ID);
- Date, Time, and Location of Sampling;
- Sampler's Name or Initials;
- Matrix;
- Type of container, and total number collected for each sample;
- Preservatives;

COPYRIGHT © 2019-2022 Pace® Analytical Services, LLC.

- Analyses Requested;
- Mode of collection;
- Any special instructions; and
- The date and time and signature of each sample transfer from time of collection to receipt in the location. When the signature field on CoC includes company. Personnel relinquishing and/or receiving samples are expected to record this information. When the COC is transported inside the cooler, independent couriers do not sign the COC and the shipping manifests and/or air bills are the records of possession during transport. The shipping manifest must be retained as part of the COC record and included in the test report when required (See Section 5.10.3).

A complete and legible COC is required. If the location observes that the COC is incomplete or illegible, the client is contacted for resolution. The COC must be filled out in indelible ink. Personnel correct errors by drawing a single line through the initial entry, so the entry is not obscured, entering the correct information, and initialing, and dating the change.

5.8.1.2 Legal Chain of Custody

Legal chain of custody is a chain of custody protocol used for evidentiary or legal purposes. The protocol is followed by the location when requested by customer or when mandated by a regulatory program.

Legal chain of custody (COC) protocol establishes an intact, continuous record of the physical possession*, storage, and disposal of "samples" which includes sample aliquots, and sample extracts/digestates/distillates.

Legal COC records account for all time periods associated with the samples and identifies all individuals who physically handled individual samples. Legal COC begins at the point established by legal authority, which is usually at the time the sample containers are provided by the location for sample collect or when sample collection begins.

*A sample is in someone's custody if:

- It is in one's physical possession;
- It is in one's view after being in one's physical possession;
- It has been in one's physical possession and then locked or sealed so that no one can tamper with it; and/or
- It is kept in a secure area, restricted to authorized personnel only.

Refer to SOP ENV-SOP-ASHE-0030 S*ample Management* for more information.

5.8.2 Unique Identification

Each sample is assigned a unique identification number (Lab ID) after the sample has been checked and accepted by PAS in accordance with the PAS sample acceptance policy (See 5.8.3). The Lab ID is affixed to the sample container using a durable label.

COPYRIGHT © 2019-2022 Pace® Analytical Services, LLC.

The unique identification of samples also applies to subsamples, and prepared samples.

The lab ID is linked to the field ID (client ID) in the receipt and log-in record. Both IDs are linked to the testing activities performed on the sample and the documentation records of the test.

Also see 5.8.4.

5.8.3 Sample Receipt Checks and Sample Acceptance Policy

The location checks the condition and integrity of samples on receipt and compares the labels on the sample containers to the COC record. Any problem or discrepancy is recorded. If the problem impacts the suitability of the sample for analysis or if the documentation is incomplete, the client is notified for resolution. Decisions and instructions from the client are maintained in the project record.

5.8.3.1 Sample Receipt Checks

The following checks are performed:

- Verification that the COC is complete and legible.
- Verification that each sample's container label includes the client sample ID, the date and time of collection and the preservative in indelible ink.
- The container type and preservative are appropriate for each test requested.
- Adequate volume is received for each test requested.
- Visual inspection for damage or evidence of tampering.
- Visual inspection for presence of headspace in VOA vials. (VOA = volatile organic analysis).
- Thermal Preservation: For chemical testing methods for which thermal preservation is required, temperature on receipt is typically considered acceptable if the measurement is above freezing but <6°C unless otherwise specified by federal, statutory, program or test method requirements. Refer to the location's SOP for sample receipt for specific thermal preservation requirements.

  For samples that are hand-delivered to the location immediately after sample collection, there must be evidence that the chilling process began immediately after sample collection and prior to delivery of the samples to the laboratory or service center, such as arrival of the samples on ice.
- Chemical Preservation
- Holding Time: Sample receiving personnel are trained to recognize tests where the holding time is 48 hours or less and to expedite the log-in of these samples. Except for tests with immediate holding times (15 minutes from time of collection or less), when samples are received out of hold, the location will notify the client and request instruction. If the decision is made to proceed with analysis, the final test report will include notation of this instruction.

COPYRIGHT © 2019-2022 Pace® Analytical Services, LLC.

5.8.3.2 Sample Acceptance Policy

PAS maintains a sample acceptance policy in accordance with regulatory guidelines to clearly establish the circumstances in which sample receipt is accepted or rejected.

When receipt does not meet criteria for any one of these conditions, the location must document the noncompliance, contact the customer, and either reject the samples or fully document any decisions to proceed with testing. In accordance with regulatory specifications, test results associated with receipt conditions that do not meet criteria are qualified in the final test report.

All samples received must meet each of the following criteria:

- Be listed on a complete and legible COC;
- Be received in properly labeled sample containers;
- Be received in appropriate containers that identify preservative;
- The COC must include the date and time of collection for each sample;
- The COC must include the test method requested for each sample;
- Be in appropriate sample containers with clear documentation of the preservatives used;
- Be received within holding time. Any samples received beyond the holding time will not be processed without prior customer approval;
- Have sufficient sample volume to proceed with the analytical testing. If insufficient sample volume is received, analysis will not proceed without customer approval; and
- Be received within appropriate temperature ranges unless program requirements or customer contractual obligations mandate otherwise.

  Samples that are delivered to the location immediately after collection are considered acceptable if there is evidence that the chilling process has been started. For example, by the arrival of the samples on ice. If samples arrive that are not compliant with these temperature requirements, the customer will be notified. The analysis will NOT proceed unless otherwise directed by the customer. If less than 72 hours remain in the hold time for the analysis, the analysis may be started while the customer is contacted to avoid missing the hold time. Data associated with any deviations from the above sample acceptance policy requirements will be appropriately qualified.

5.8.4 Sample Control and Tracking

The samples are controlled and tracked using the Laboratory Information Management System (LIMS). The LIMS stores information about the samples and project. The process of entering information into the LIMS is called log-in and these procedures are described in SOP ENV-SOP-ASHE-0030 S*ample Management*. After log-in, a label is generated and affixed to

COPYRIGHT © 2019-2022 Pace® Analytical Services, LLC.

each sample container. Information on this label, such as the lab ID, links the sample container to the information in LIMS.

At a minimum, the following information is entered during log-in:

- Client Name and Contact Information;
- The laboratory ID linked to the client ID;
- Date and time of sample collection;
- Date and time of sample receipt;
- Matrix; and
- Tests Requested.

5.8.5 Sample Storage, Handling, and Disposal

The location procedures for sample storage, handling and disposal are detailed in SOPs ENV-SOP-ASHE-0030 S*ample Management.*

5.8.5.1 Sample Storage

The samples are stored according to method and regulatory requirements as per test method SOPs. Samples are stored away from all standards, reagents, or other potential sources of contamination and stored in a manner that prevents cross contamination. Volatile samples are stored separately from other samples. All sample fractions, extracts, leachates, and other sample preparation products are stored in the same manner as actual samples or as specified by the analytical method.

Refrigerated storage areas are maintained at ≤6°C (but not frozen) and freezer storage areas are maintained at <-10°C, unless otherwise required per method or program. The temperature of each storage area is checked and documented at least once for each day of use. If the temperature falls outside the acceptable limits, then corrective actions are taken and appropriately documented.

The location is operated under controlled access protocols to ensure sample and data integrity. Visitors must register at the front desk and be properly escorted while on-site. Samples are taken to the appropriate storage location immediately after sample receipt and log-in procedures are completed. All sample storage areas have limited access. Samples are removed from storage areas by designated personnel and returned to the storage areas as soon as possible after the required sample quantity has been taken.

5.8.5.2 Sample Retention and Disposal

The procedures used by the location for sample retention and disposal are detailed in SOP ENV-SOP-ASHE-0030 S*ample Management* and ENV-SOP-ASHE-0014 *Waste Handling and Management.*

In general, unused sample volume and prepared samples such as extracts, digestates, distillates and leachates (samples) are retained by the location for the timeframe necessary to protect the interests of the location and the customer.

COPYRIGHT © 2019-2022 Pace® Analytical Services, LLC.

Samples may be stored at ambient temperature when all analyses are complete, the hold time is expired, the report has been delivered, and/or when allowed by the customer or program. Samples requiring storage beyond the minimum sample retention time due to special requests or contractual obligations may be stored at ambient temperature unless the location has a capacity, and their presence does not compromise the integrity of other samples.

After this period expires, non-hazardous samples are properly disposed of as non-hazardous waste. The preferred method for disposition of hazardous samples is to return the excess sample to the customer.

5.9 Assuring the Quality of Test Results

5.9.1 Quality Control (QC) Procedures

The location monitors the validity and reliability of test results using quality control (QC) samples that are prepared and analyzed concurrently with field samples in the same manner as field samples. QC results are always associated to and reported with the field samples they were prepared and analyzed with from the same preparation or analytical batch. See the glossary for definition of preparation and analytical batch.

The results of QC performed during the testing process are used by the location to assure the results of analysis are consistent, comparable, accurate, and/or precise within a specified limit. When the results are not within acceptance criteria or expectations for method performance, correction and corrective action(s) are taken. These actions may include retesting or reporting of data with qualification to alert the end user of the situation.

Other QC measures performed include the use of certified reference materials (see 5.6.4), participation in interlaboratory proficiency testing (see 5.9.1.2), verification that formulae used for reduction of data and calculation of results is accurate (see 5.9.3), on-going monitoring of environmental conditions that could impact test results (see 5.3.2), and evaluation and verification of method selectivity and sensitivity (see 5.4.5).

QC results are also used by the location to monitor performance statistical trends over time and to establish acceptance criteria when no method or regulatory criteria exist. (See 5.9.1.1.9)).

5.9.1.1 Essential QC

Although the general principles of QC for the testing process apply to all testing, the QC protocol used for each test depends on the type of test performed.

QC protocol used by the location to monitor the validity of the test are specified in test method SOPs. The SOP includes QC type, frequency, acceptance criteria, corrective actions, and procedures for reporting of nonconforming work.

These requirements in the SOP conform to the reference method and any applicable regulations or certification and accreditation program requirement for which results of the test are used. When a project requires more stringent QC protocol than specified in the SOP, project specification is followed. When the project requires less stringent QC protocol, the project specification may be followed as an authorized departure from the SOP when the project specifications meet the requirements in the

COPYRIGHT © 2019-2022 Pace® Analytical Services, LLC.

mandated method and any regulatory compliance requirements for which the data will be used.

The following are examples of essential QC for chemistry. These concepts may not apply to other technologies and disciplines such as microbiology, radiochemistry, whole effluent toxicity, and/or asbestos. For essential QC for these disciplines, refer to test method SOPs.

5.9.1.1.1 Second Source Standard (ICV/QCS)

The second source standard is a standard obtained from a different vendor than the vendor of the standards used for calibration, or from a different lot from the same vendor, when only one vendor is available. It is a positive control used to verify the accuracy of instrument calibration relative to the purity of the standards used for calibration. This check may be referred to in published test methods and quality system standards as the initial calibration verification (ICV) or a quality control sample (QCS). The second source standard is analyzed immediately after the calibration and before analysis of any samples. When the ICV is not within acceptance criteria, a problem with the purity or preparation of the standards may be indicated. The source of the problem should be investigated and corrected prior to further use of the calibration/instrument for sample analysis.

5.9.1.1.2 Continuing Calibration Verification (CCV)

The CCV is used to determine if the analytical response has significantly changed since calibration. If the response of the CCV is within criteria, the calibration is considered valid. If not, there is a problem that requires further investigation and correction. Actions taken are technology and method specific.

5.9.1.1.3 Method Blank (MB) / Other Blanks

The MB is a negative control used to assess for contamination during the prep/analysis process. The MB consists of a clean matrix, similar to the associated samples that is known to be free of analytes of interest. The MB, unless otherwise specified by the test method, is processed with, and carried through all preparation and analytical steps as the associated samples.

The criteria used to assess for contamination depends on the intended use of data. In general, detections in the MB above the RL or ½ the RL indicate contamination. When contamination is evident, the source is investigated, and corrections are taken to reduce or eliminate it. Analytical results associated with MB that does not meet criteria are qualified in the final test report.

Other types of blanks that serve as negative controls in the process may include:

COPYRIGHT © 2019-2022 Pace® Analytical Services, LLC.

- Trip Blanks (VOA)
- Storage Blanks
- Equipment Blanks
- Field Blanks
- Calibration Blanks
- Cleanup Blanks
- Instrument Blanks

5.9.1.1.4 Laboratory Control Sample (LCS)

The LCS is a positive control used to measure the accuracy of process in a blank matrix. The LCS is spiked by the laboratory with a known amount of analyte. The spike is a standard solution that is pre-made or prepared from a certified reference standard. Like the MB, unless otherwise specified in the test method, the LCS is processed with and carried through all preparation and analytical steps as the associated samples.

When the percent recovery (%R) of the LCS is within the established control limit, sufficient accuracy has been achieved. If not, the source of the problem is investigated and corrected, and the procedure may be repeated. Analytical results associated with LCS that does not meet criteria are qualified in the final test report.

5.9.1.1.5 Matrix Spike (MS) and Matrix Spike Duplicate (MSD)

The MS and MSD are replicates of a client sample that is spiked with known amount of target analyte. Matrix spikes measure the effect the sample matrix has on precision and accuracy of test results.

Matrix spike results mostly provide information on the effect of the matrix to the client whose sample was used and on samples of the same matrix from the same sampling site, during the same sampling event. Consequently, matrix spikes should be client designated. When there is not a client-specified MS for any sample in the batch, the location randomly selects a sample from the batch; the sample selected at random is called a "batch" matrix spike.

The MS/MSD results for percent recovery and relative percent difference are checked against control limits. However, because the performance of matrix spikes is matrix-dependent and specific to the customer whose sample was used as the MS/MSD, the results of matrix spikes are not used for quality control on the batch.

5.9.1.1.6 Sample Duplicate (SD)

A sample duplicate is a second replicate of sample that is used to measure precision.

The relative percent difference between replicates are evaluated against the established acceptance criteria for relative percent

COPYRIGHT © 2019-2022 Pace® Analytical Services, LLC.

difference (RPD) when this criterion is applicable. If RPD is not met, associated test results are reported with qualification.

5.9.1.1.7 Surrogates

Surrogates are compounds that mimic the chemistry of target analytes but are not expected to occur naturally in real world samples. Surrogates are added to each sample and matrix QC samples (MS, MSD, SD) at known concentration to measure the impact of the matrix on the accuracy of method performance. Surrogates are also added to the positive and negative control samples (MB, LCS) to evaluate performance in a clean matrix, and included in the calibration standards and calibration check standards.

The percent recovery of surrogates is evaluated against method-specified limits or statistically derived in-house limits. Project-specific limits and/or program-specific limits are used when required. Results with surrogate recovery out of limits in samples are reported with qualification. Samples with surrogate failures can also be re-extracted and/or re-analyzed to confirm that the out-of-control value was caused by the matrix of the sample and not by some other systematic error.

5.9.1.1.8 Internal Standards

Internal Standards are compounds not expected to occur naturally in field samples. They are added to every standard and sample at a known concentration prior to analysis for the purpose of adjusting the response factor used in quantifying target analytes. The location follows specific guidelines for the treatment of internal standard recoveries and further information can be found in the applicable test method SOP.

5.9.1.1.9 QC Acceptance Criteria and Control Limits

The QC acceptance criteria are specified in test method SOPs. The criteria in the SOP are based on the requirements in the published test method or regulatory program. When there are no established acceptance criteria, the location develops acceptance criteria in accordance with recognized industry standards.

Some methods and programs require the location to establish control limits for LCS, MS/MSD, and surrogate evaluation using historical data. PAS developed limits are referred to as "in-house" control limits. In-house control limits represent ± 3 Standard Deviations (99% confidence level) from the average recovery of at least 20 data points generated using the same preparation and analytical procedure in a similar matrix.

COPYRIGHT © 2019-2022 Pace® Analytical Services, LLC.

See SOP ENV-SOP-ASHE-0054 *Control Chart Generation and Analysis* for more information about the procedures used to establish in-house control limits.

5.9.1.2 Proficiency Testing (PT)

PAS locations participate in interlaboratory proficiency testing (PT) studies to measure performance of the test method and to identify or solve analytical problems. PT samples measure location performance through the analysis of unknown samples provided by an external source.

The frequency of PT participation is based on the certification and accreditation requirements held by the laboratory. The PT samples are obtained from accredited proficiency testing providers (PTP) and treated as field samples which means they are included in the location's normal analytical processes and do not receive extraordinary attention due to their nature.

PAS locations do not share PT samples with other PAS locations, does not communicate with other PAS locations regarding current PT sample results during the duration of the study, and does not attempt to obtain the assigned value of any PT sample from the PT provider.

PT results scored unacceptable are investigated and correction action taken, when necessary.

Refer to corporate policy ENV-POL-CORQ-0002 *PT Policy* for more information.

5.9.2 QC Corrective Action

When the results of QC are not within acceptance criteria or expectations for method performance, correction and corrective action(s) are taken per the specifications in the test method SOP. These actions may include retesting or reporting of data with qualification to alert the end user of the situation.

5.9.3 Data Review

PAS locations use a tiered system for data review. The tiered process provides sequential checks to verify data transfer is complete; manual calculations, if performed, are correct, manual integrations are appropriate and documented, calibration and QC requirements are met, appropriate corrective action was taken when required, test results are properly qualified, process and test method SOPs were followed, project specific requirements were met, when applicable, and the test report is complete.

The sequential process includes three tiers referred to as primary review, secondary review, and administrative/completeness review.

Detailed procedures for the data review process are described in SOP ENV-SOP-ASHE-0056 *Data Review Process*. The general expectations for the tiered review process are described in the following sections:

COPYRIGHT © 2019-2022 Pace® Analytical Services, LLC.

5.9.3.1 Primary Review

Primary review is performed by the individual that performed the task. All PAS personnel are responsible for review of their work product to assure it is complete, accurate, documented, and consistent with policy and SOPs.

Checks performed during primary review include but are not limited to:

- Verification that data transfer and acquisition is complete
- Manual calculations, if performed, are documented and accurate
- Manual integrations, if performed, are documented, and comply with SOP ENV-SOP-CORQ-006 *Manual Integration*
- Calibration and QC criteria were met, and/or proper correction and corrective actions were taken, and data and test results associated with QC and criteria exceptions are properly qualified
- Work is consistent with SOPs and any other relevant instructional document such as SWI, program requirements, or project QAPP

5.9.3.2 Secondary Review

Secondary review is performed by a qualified peer or supervisor. Secondary review is a repeat of the checks performed during primary review by another person. In addition to the checks of primary review, secondary review includes chromatography review to check the accuracy of quantitative analyte identification.

5.9.3.3 Completeness Review

Completeness review is an administrative review performed prior to release of the test report to the customer. Completeness review verifies that the final test report is complete and meets project specification. This review also assures that information necessary for the client's interpretation of results are explained in the case narrative or footnoted in the test report.

5.9.3.4 Data Audits

Test reports may be audited by local quality personnel to verify compliance with SOPs and to check for data integrity, technical accuracy, and compliance with the PAS QMS and any applicable federal, statutory, and program requirements. The reports chosen for the data audits are selected at random and these audits are not usually done prior to issuance of the test report to the customer.

If any problems with the data or test results are found during the data audit, the impact of the nonconforming work is evaluated using the process described in Section 4.9.

Also see Section 4.14 for internal audits.

5.9.4 Calibration Certificates

PAS does not perform calibration activities for its customers and calibration certificates are not offered or issued.

COPYRIGHT © 2019-2022 Pace® Analytical Services, LLC.

5.9.5 Opinions and Interpretations

The location provides objective data and information to its customers of sufficient detail for their interpretation and decision making. Objective data and information are based solely on fact and does not attempt to explain the meaning (interpret) or offer a view or judgement (opinion). Sometimes the customer may request the location provide opinion or interpretation to assist them with their decisions about the data.

When opinions and interpretations are included in the test report, the location will document the basis upon which the opinions and interpretations have been made and clearly identify this content as opinion or interpretation in the test report.

Examples of opinion and interpretation include but are not limited to:

- A viewpoint on how a nonconformance impacts the quality of the data or usability of results.
- Recommendations for how the customer should use the test results and information.
- Suggestions or guidance to the customer for improvement.

5.9.6 Subcontractor Reports

When analytical work has been subcontracted to an organization external to PAS, the test report from the subcontractor is included in its entirety as an amendment to the final test report.

Test results performed by multiple locations within the PAS network (internal subcontracting) may be merged into a single test report so long as the test report issued clearly identifies the location and address of each network location that performed testing, and which tests each PAS location performed. (See 5.10.2)

5.9.7 Electronic Transmission of Results

When test results and/or reports are submitted to the customer through electronic transmission, the procedures established in this manual for confidentiality and protection of data apply.

5.9.8 Format of Test Reports

The test formats offered by PAS are designed to accommodate each type of analytical test method performed and to minimize the possibility of misunderstanding or misuse of analytical results. The format of electronic data deliverables (EDD) follows the specifications for the EDD.

5.9.9 Amendments to Test Reports

Test reports that are revised or amended by the location after date of release of the original final test report to the customer are issued as a new test report that is clearly identified as an amendment or revision and that includes a reference to the originally issued final test report.

The customer is the organization doing business with PAS external to PAS.

Changes made to test results and data before the final test report is issued to the customer are not amendments or revisions, these are corrections to errors found during the location's data verification and review process.

COPYRIGHT © 2019-2022 Pace® Analytical Services, LLC.

The procedure for report amendments and revision are outlined in SOP ENV-SOP-ASHE-0035 *Final Report and Data Deliverable Contents*.

5.10 Reporting

5.10.1 General Requirements

PAS offers a wide variety of test report formats to meet project needs of Pace® customers and that comply with federal and state regulatory programs.

The type and level of deliverable, including the electronic data deliverable (EDD) format are established between PAS and the customer during the contracting process. The report specifications include the test report format, protocol for the reporting limit (RL), conventions for the reporting of results less than the limit of quantitation (LOQ), and specification for the use of project or program specific data qualifiers. Information about review of analytical service requests is provided in Section 4.4.

5.10.2 Test Reports: Required Items

Regardless of deliverable or report requested, every test report issued by the location includes each of the following items:

a) A Title

b) The name and address of the location issuing the test report and for each location where testing was performed if different than address of the location issuing the report. When testing is done at multiple PAS locations, the report must clearly identify which PAS location performed each test method;

c) Unique identification of the test report and on each page an identification number to link each page to the test report, and clear identification of the end of the report.

d) The name and address of the customer

e) Identification of test methods used

f) Cross reference between client sample identification number (Sample ID) and the identification number for the sample (Lab ID) to provide unambiguous identification of samples.

g) The date of receipt of samples, condition of samples on receipt, and identification of any instance where receipt of the samples did not meet sample acceptance criteria.

h) Date and times of sample collection, receipt, preparation, and analysis.

i) Test results and units of measurement, and qualification of results associated with QC criteria exceptions, and identification of reported results outside of the calibration range.

j) All chains of custody (COC) including records of internal transfer between locations within PAS,

k) Name, title, signature of the person(s) authorizing release of the test report and date of release.

l) A statement that the results in the test report relate only to the items tested.

COPYRIGHT © 2019-2022 Pace® Analytical Services, LLC.

m) Statement that the test report may not be reproduced except in full without written approval from PAS.

5.10.3 Test Reports: Supplemental Items

5.10.3.1 Supplemental Requirements

The following items are included in the test report when required or relevant:

a) Shipping manifests / bill of ladings as applicable when common couriers are utilized for shipment of samples,

b) Explanation of departure from test method SOPs including, what the departure was and why it was necessary.

c) Statistical methods used. (Required for Whole Effluent Toxicity)

d) For solid samples, specification that results are reported on a dry weight or wet weight basis.

e) Signed Affidavit, when required by client or regulatory agency.

f) A statement of compliance / non-compliance with requirements or specifications (client, program, or standard) that includes identification of test results that did not meet acceptance criteria.

g) When requested by the client, statement of estimated measurement uncertainty. In general, for environmental testing, estimated uncertainty of measurement is extrapolated from LCS control limits. Control limits incorporate the expected variation of the data derived from the laboratory's procedure. When the control limits are specified by the test method or regulatory program, the control limits represent the expected variation of the test method and/or matrices for which the test method was designed.

h) Opinions and Interpretations

i) If a claim of accreditation/certification is included in the test report, identification of any test methods or analytes for which accreditation/certification is not held by the location if the accrediting body offers accreditation/certification for the test method/analyte. The fields of accreditation/certification vary between agencies, and it cannot be presumed that because accreditation/certification is not held that it is offered or required.

j) Certification Information, including certificate number and issuing body.

For PAS locations accredited to ISO/IEC 17025:2017:

- Data included in the test report provided by a customer should be clearly identified. The test report should also include a statement that the test results apply only to the samples as received.

5.10.3.2 Test Reports: Sampling Information

The following items are included in the test report when samples are collected by PAS or when this information is necessary for the interpretation of test results:

COPYRIGHT © 2019-2022 Pace® Analytical Services, LLC.

a) Date of Sampling.

b) Unambiguous identification of material samples.

c) Location of sampling including diagrams, sketches, or photographs.

d) Reference to the sampling plan and procedures used.

e) Details of environmental conditions at time of sample that may impact test results.

f) Any standard or other specification for the sampling method or procedure, and deviations, additions to or exclusions from the specification concerned.

6.0 REVISION HISTORY

This Version (Version 2):

Section	Description of Change
Header / All	Added registered trademark after Pace as required by branding guidelines
Header	Updated the years associated with the copyright.
Signature Page	Removed Cover Page applied by MasterControl eDMS
Approval Signatory	Changed name of this page to "Management Personnel" and updated Job Titles.
All	Changed references to "laboratory" with PAS or location, where appropriate.
All	Replaced stand-alone acronym "ENV" with "PAS" except where "ENV" is embedded in document control numbers.
All	Corrected spelling, typographical, and format errors.
Various	Added language to clarify the examples in the manual are provided for chemistry, these examples may not apply in the same way to other disciplines such as radiochemistry, microbiology, asbestos, or whole effluent toxicity (WET).
1.0	Corrected Parent Company Information.
1.2	Added definitions for "location," "laboratory" and "service center" for QMS and compliance purposes.
1.2.1	Updated job titles to match current structure.
1.2.2	Revised language for clarity.
1.2.3	Removed specificity to allow for more options
4.1.4	Updated to describe current scope of organization
4.1.4.1	Updated to describe current organization structure
4.1.5.1.1	Updated to match new organization structure and job titles
4.1.5.2	Updated to match new organization structure and job titles
4.1.5.2.1	Updated to clarify qualifications and meaning of "absent"
4.1.5.3	Updated to clarify impartiality
4.1.5.4	Reorganized section for clarity
4.2.1.1	Added statement that the organization structure is designed to safeguard impartiality
4.2.2.1	Added requirement to post compliance alertline posters in work area.
4.2.1.3	Added requirement for policies and procedures to be available in work area (previously implied but not explicitly stated)
4.2.5.1	Clarified hierarchy and application of project documents
4.5	Updated requirements for internal and external subcontracting

COPYRIGHT © 2019-2022 Pace® Analytical Services, LLC.

4.8	Updated complaint handling requirements to clarify that only valid complaints are acted on with corrective action.
4.9.1.3	Added roles responsible for authorizing return to work after stop work order.
4.11	Main and subsections updated for clarity
4.14	Main and subsections updated for clarity
5.2.2 Subsections	Content reorganized and language related to documentation of training and authorization of personnel revised to clarify expectations. Requirements of DOCs modified to clarify procedure described in manual pertains to chemistry methodology; other approaches to DOC acceptable for other disciplines such as microbiology, radiochemistry, asbestos, whole effluent toxicity.
5.4.5.3.3	Added reference documents for which the local SOP for LOD must comply with.
5.5	Added language to clarify existing requirements.
5.6.4	Clarified requirements for reference standards for working weights and thermometers and defined meaning of terms "annual" and "quarterly." Included examples of acceptable reference standards for adequacy checks.
5.8.1	Added recommendation for Pace® personnel to add "Pace®" next to their signature on the CoC when receiving samples since the CoC form has signature/company, implying the company affiliation must be added.
5.10.3.1	Included ISO/IEC 17025:2017 to add disclaimer to test reports (applies to laboratories accredited to ISO/IEC 17025:2017 only).

This document supersedes the following documents:

7.3 Appendix C: Glossary

This glossary provides common terms and definitions used by PAS. **It is not intended to be a complete list of all terms and definitions used.** The definitions have been compiled mostly from the TNI Standard and DoD QSM. Although this information has been reproduced with care, errors cannot be entirely excluded. Definitions for the same term also vary between sources. When the meaning of a term used in a PAS document is different from this glossary or when the glossary does not include the term, the term and definition is included or defined in context in the laboratory document.

Term	Definition
3P Program	The continuous improvement program used by PAS that focuses on Process, Productivity, and Performance.
Absence	Inability to perform assigned duties due to lack of physical presence and connectivity.
Acceptance Criteria	TNI- Specified limits placed on characteristics of an item, process, or service defined in requirement documents.
Accreditation	TNI- The process by which an agency or organization evaluates and recognizes a laboratory as meeting certain predetermined qualifications or standards, thereby accrediting the laboratory. DoD- Refers to accreditation in accordance with the DoD ELAP.
Accreditation Body (AB)	TNI- The organization having responsibility and accountability for environmental laboratory accreditation, and which grants accreditation under this program. DoD- Entities recognized in accordance with the DoD-ELAP that are required to operate in accordance with ISO/IEC 17011, *Conformity assessment: General requirements for accreditation bodies accrediting conformity assessment bodies*. The AB must be a signatory, in good standing, to the International Laboratory Accreditation Cooperation (ILAC) mutual recognition arrangement (MRA) that verifies, by evaluation and peer assessment, that its signatory members are in full compliance with ISO/IEC 17011 and that its accredited laboratories comply with ISO/IEC 17025.
Accuracy	TNI- The degree of agreement between an observed value and an accepted reference value. Accuracy includes a combination of random error (precision) and systematic error (bias) components that are due to sampling and analytical operations; a data quality indicator.
Activity, Absolute	TNI- Rate of nuclear decay occurring in a body of material, equal to the number of nuclear disintegrations per unit time. NOTE: Activity (absolute) may be expressed in becquerels (Bq), curies (Ci), or disintegrations per minute (dpm), and multiples or submultiples of these units.
Activity, Areic	TNI- Quotient of the activity of a body of material and its associated area.
Activity, Massic	TNI- Quotient of the activity of a body of material and its mass; also called specific activity.
Activity, Volumic	TNI- Quotient of the activity of a body of material and its volume; also called activity concentration. NOTE: In this module [TNI Volume 1, Module 6], unless otherwise stated, references to activity shall include absolute activity, areic activity, massic activity, and volumic activity.
Activity Reference Date	TNI- The date (and time, as appropriate to the half-life of the radionuclide) to which a reported activity result is calculated. NOTE: The sample collection date is most frequently used as the Activity Reference Date for environmental measurements, but different programs may specify other points in time for correction of results for decay and ingrowth.
Aliquot	DoD- A discrete, measured, representative portion of a sample taken for analysis.
American Society for Testing and Materials (ASTM)	An international standards organization that develops and publishes voluntary consensus standards for a wide range of materials, products, systems, and services.
Analysis	DoD- A combination of sample preparation and instrument determination.
Analysis Code (Acode)	All the set parameters of a test, such as Analytes, Method, Detection Limits and Price.
Analysis Sequence	A compilation of all samples, standards and quality control samples run during a specific amount of time on a particular instrument in the order they are analyzed.
Analyst	TNI- The designated individual who performs the "hands-on" analytical methods and associated techniques and who is the one responsible for applying required laboratory practices and other pertinent quality controls to meet the required level of quality.

COPYRIGHT © 2019-2022 Pace® Analytical Services, LLC.

Analyte	TNI- A substance, organism, physical parameter, property, or chemical constituent(s) for which an environmental sample is being analyzed. DoD- The specific chemicals or components for which a sample is analyzed; it may be a group of chemicals that belong to the same chemical family and are analyzed together.
Analytical Method	DoD- A formal process that identifies and quantifies the chemical components of interest (target analytes) in a sample.
Analytical Uncertainty	TNI- A subset of Measurement Uncertainty that includes all laboratory activities performed as part of the analysis.
Aliquot	DoD- A discrete, measured, representative portion of a sample taken for analysis.
Annual (or Annually)	Defined by PAS as every 12 months ± 30 days.
Assessment	TNI - The evaluation process used to measure or establish the performance, effectiveness, and conformance of an organization and/or its system to defined criteria (to the standards and requirements of laboratory accreditation). DoD- An all-inclusive term used to denote any of the following: audit, performance evaluation, peer review, inspection, or surveillance conducted on-site.
Atomic Absorption Spectrometer	Instrument used to measure concentration in metals samples.
Atomization	A process in which a sample is converted to free atoms.
Audit	TNI- A systematic and independent examination of facilities, equipment, personnel, training, procedures, record-keeping, data validation, data management, and reporting aspects of a system to determine whether QA/QC and technical activities are being conducted as planned and whether these activities will effectively achieve quality objectives.
Batch	TNI- Environmental samples that are prepared and/or analyzed together with the same process and personnel, using the same lot(s) of reagents. A **preparation batch** is composed of one to 20 environmental samples of the same quality systems matrix, meeting the above-mentioned criteria and with a maximum time between the start of processing of the first and last sample in the batch to be 24 hours or the timeframe specified by the regulatory program. An **analytical batch** is composed of prepared environmental samples (extracts, digestates or concentrates) which are analyzed together as a group. An analytical batch can include prepared samples originating from various quality system matrices and can exceed 20 samples.
Batch, Radiation Measurements (RMB)	TNI- An RMB is composed of 1 to 20 environmental samples that are counted directly without preliminary physical or chemical processing that affects the outcome of the test (e.g., non-destructive gamma spectrometry, alpha/beta counting of air filters, or swipes on gas proportional detectors). The samples in an RMB share similar physical and chemical parameter, and analytical configurations (e.g., analytes, geometry, calibration, and background corrections). The maximum time between the start of processing of the first and last in an RMB is 14 calendar days.
Bias	TNI- The systematic or persistent distortion of a measurement process, which causes errors in one direction (i.e., the expected sample measurement is different from the sample's true value).
Blank	TNI and DoD- A sample that has not been exposed to the analyzed sample stream in order to monitor contamination during sampling, transport, storage, or analysis. The blank is subjected to the usual analytical and measurement process to establish a zero baseline or background value and is sometimes used to adjust or correct routine analytical results (See Method Blank). DoD- Blank samples are negative control samples, which typically include field blank samples (e.g., trip blank, equipment (rinsate) blank, and temperature blank) and laboratory blank samples (e.g., method blank, reagent blank, instrument blank, calibration blank, and storage blank).
Blind Sample	A sub-sample for analysis with a composition known to the submitter. The analyst/laboratory may know the identity of the sample but not its composition. It is used to test the analyst's or laboratory's proficiency in the execution of the measurement process.
BNA (Base Neutral Acid compounds)	A list of semi-volatile compounds typically analyzed by mass spectrometry methods. Named for the way they can be extracted out of environmental samples in an acidic, basic, or neutral environment.
BOD (Biochemical Oxygen Demand)	Chemical procedure for determining how fast biological organisms use up oxygen in a body of water.

COPYRIGHT © 2019-2022 Pace® Analytical Services, LLC.

Calibration	TNI- A set of operations that establish, under specified conditions, the relationship between values of quantities indicated by a measuring instrument or measuring system, or values represented by a material measure or a reference material, and the corresponding values realized by standards. 1) In calibration of support equipment, the values realized by standards are established through the use of reference standards that are traceable to the International System of Units (SI); 2) In calibration according to test methods, the values realized by standards are typically established through the use of Reference Materials that are either purchased by the laboratory with a certificate of analysis or purity, or prepared by the laboratory using support equipment that has been calibrated or verified to meet specifications.
Calibration Curve	TNI- The mathematical relationship between the known values, such as concentrations, of a series of calibration standards and their instrument response.
Calibration Method	A defined technical procedure for performing a calibration.
Calibration Range	DoD- The range of values (concentrations) between the lowest and highest calibration standards of a multi-level calibration curve. For metals analysis with a single-point calibration, the low-level calibration check standard and the high standard establish the linear calibration range, which lies within the linear dynamic range.
Calibration Standard	TNI- A substance or reference material used for calibration.
Certified Reference Material (CRM)	TNI- Reference material accompanied by a certificate, having a value, measurement uncertainty, and stated metrological traceability chain to a national metrology institute.
Chain of Custody	An unbroken trail of accountability that verifies the physical security of samples, data, and records.
Chain of Custody Form (COC)	TNI- Record that documents the possession of the samples from the time of collection to receipt in the laboratory. This record generally includes: the number and type of containers; the mode of collection, the collector, time of collection; preservation; and requested analyses.
Chemical Oxygen Demand (COD)	A test commonly used to indirectly measure the amount of organic compounds in water.
Client (referred to by ISO as Customer)	Any individual or organization for whom items or services are furnished or work performed in response to defined requirements and expectations.
Code of Federal Regulations (CFR)	A codification of the general and permanent rules published in the Federal Register by agencies of the federal government.
Comparability	An assessment of the confidence with which one data set can be compared to another. Comparable data are produced through the use of standardized procedures and techniques.
Completeness	The percent of valid data obtained from a measurement system compared to the amount of valid data expected under normal conditions. The equation for completeness is: % Completeness = (Valid Data Points/Expected Data Points)*100
Confirmation	TNI- Verification of the identity of a component through the use of an approach with a different scientific principle from the original method. These may include but are not limited to second-column confirmation; alternate wavelength; derivatization; mass spectral interpretation; alternative detectors; or additional cleanup procedures. DoD- Includes verification of the identity and quantity of the analyte being measured by another means (e.g., by another determinative method, technology, or column). Additional cleanup procedures alone are not considered confirmation techniques.
Conformance	An affirmative indication or judgment that a product or service has met the requirements of the relevant specifications, contract, or regulation; also, the state of meeting the requirements.
Congener	A member of a class of related chemical compounds (e.g., PCBs, PCDDs).
Consensus Standard	DoD- A standard established by a group representing a cross-section of a particular industry or trade, or a part thereof.
Continuing Calibration Blank (CCB)	A blank sample used to monitor the cleanliness of an analytical system at a frequency determined by the analytical method.
Continuing Calibration Check Compounds (CCC)	Compounds listed in mass spectrometry methods that are used to evaluate an instrument calibration from the standpoint of the integrity of the system. High variability would suggest leaks or active sites on the instrument column.
Continuing Calibration Verification	DoD- The verification of the initial calibration. Required prior to sample analysis and at periodic intervals. Continuing calibration verification applies to both external and internal standard calibration techniques, as well as to linear and non-linear calibration models.
Continuing Calibration Verification (CCV) Standard	Also referred to as a Calibration Verification Standard (CVS) in some methods, it is a standard used to verify the initial calibration of compounds in an analytical method. CCVs are analyzed at a frequency determined by the analytical method.

COPYRIGHT © 2019-2022 Pace® Analytical Services, LLC.

Continuous Emission Monitor (CEM)	A flue gas analyzer designed for fixed use in checking for environmental pollutants.
Continuous Improvement Plan (CIP)	The delineation of tasks for a given laboratory department or committee to achieve the goals of that department.
Contract Laboratory Program (CLP)	A national network of EPA personnel, commercial labs, and support contractors whose fundamental mission is to provide data of known and documented quality.
Contract Required Detection Limit (CRDL)	Detection limit that is required for EPA Contract Laboratory Program (CLP) contracts.
Contract Required Quantitation Limit (CRQL)	Quantitation limit (reporting limit) that is required for EPA Contract Laboratory Program (CLP) contracts.
Control Chart	A graphic representation of a series of test results, together with limits within which results are expected when the system is in a state of statistical control (see definition for Control Limit)
Control Limit	A range within which specified measurement results must fall to verify that the analytical system is in control. Control limit exceedances may require corrective action or require investigation and flagging of non-conforming data.
Correction	DoD- Action taken to eliminate a detected non-conformity.
Corrective Action	DoD- The action taken to eliminate the causes of an existing non-conformity, defect, or other undesirable situation in order to prevent recurrence. A root cause analysis may not be necessary in all cases.
Corrective and Preventative Action (CAPA)	The primary management tools for bringing improvements to the quality system, to the management of the quality system's collective processes, and to the products or services delivered which are an output of established systems and processes.
Critical Value	TNI- Value to which a measurement result is compared to make a detection decision (also known as critical level or decision level). NOTE: The Critical Value is designed to give a specified low probability α of false detection in an analyte-free sample, which implies that a result that exceeds the Critical Value, gives high confidence (1 – α) that the radionuclide is actually present in the material analyzed. For radiometric methods, α is often set at 0.05.
Customer	DoD- Any individual or organization for which products or services are furnished or work performed in response to defined requirements and expectations.
Data Integrity	TNI- The condition that exists when data are sound, correct, and complete, and accurately reflect activities and requirements.
Data Quality Objective (DQO)	Systematic strategic planning tool based on the scientific method that identifies and defines the type, quality, and quantity of data needed to satisfy a specified use or end user.
Data Reduction	TNI- The process of transforming the number of data items by arithmetic or statistical calculation, standard curves, and concentration factors, and collating them into a more usable form.
Definitive Data	DoD- Analytical data of known quantity and quality. The levels of data quality on precision and bias meet the requirements for the decision to be made. Data that is suitable for final decision-making.
Demonstration of Capability (DOC)	TNI- A procedure to establish the ability of the analyst to generate analytical results of acceptable accuracy and precision. DoD- A procedure to establish the ability of the analyst to generate analytical results by a specific method that meet measurement quality objectives (e.g., for precision and bias).
Department of Defense (DoD)	An executive branch department of the federal government of the United States charged with coordinating and supervising all agencies and functions of the government concerned directly with national security.
Detection Limit (DL)	DoD- The smallest analyte concentration that can be demonstrated to be different than zero or a blank concentration with 99% confidence. At the DL, the false positive rate (Type 1 error) is 1%. A DL may be used as the lowest concentration for reliably reporting a detection of a specific analyte in a specific matrix with a specific method with 99% confidence.
Detection Limit (DL) for Safe Drinking Water Act (SDWA) Compliance	TNI- Laboratories that analyze drinking-water samples for SDWA compliance monitoring must use methods that provide sufficient detection capability to meet the detection limit requirements established in 40 CFR 141. The SDWA DL for radioactivity is defined in 40 CFR Part 141.25.c as the radionuclide concentration, which can be counted with a precision of plus or minus 100% at the 95% confidence level (1.96σ where σ is the standard deviation of the net counting rate of the sample).
Deuterated Monitoring Compounds (DMCs)	DoD- SIM specific surrogates as specified for GC/MS SIM analysis.

COPYRIGHT © 2019-2022 Pace® Analytical Services, LLC.

Diesel Range Organics (DRO)	A range of compounds that denote all the characteristic compounds that make up diesel fuel (range can be state or program specific).
Digestion	DoD- A process in which a sample is treated (usually in conjunction with heat and acid) to convert the target analytes in the sample to a more easily measured form.
Document Control	The act of ensuring that documents (and revisions thereto) are proposed, reviewed for accuracy, approved for release by authorized personnel, distributed properly and controlled to ensure use of the correct version at the location where the prescribed activity is performed.
Documents	DoD- Written components of the laboratory management system (e.g., policies, procedures, and instructions).
Dry Weight	The weight after drying in an oven at a specified temperature.
Duplicate (also known as Replicate or Laboratory Duplicate)	The analyses or measurements of the variable of interest performed identically on two subsamples of the same sample. The results of duplicate analyses are used to evaluate analytical or measurement precision but not the precision of sampling, preservation, or storage internal to the laboratory.
Electron Capture Detector (ECD)	Device used in GC methods to detect compounds that absorb electrons (e.g., PCB compounds).
Electronic Data Deliverable (EDD)	A summary of environmental data (usually in spreadsheet form) which clients request for ease of data review and comparison to historical results.
Eluent	A solvent used to carry the components of a mixture through a stationary phase.
Elute	To extract, specifically, to remove (absorbed material) from an absorbent by means of a solvent.
Elution	A process in which solutes are washed through a stationary phase by movement of a mobile phase.
Environmental Data	DoD- Any measurements or information that describe environmental processes, locations, or conditions; ecological or health effects and consequences; or the performance of environmental technology.
Environmental Monitoring	The process of measuring or collecting environmental data.
Environmental Protection Agency (EPA)	An agency of the federal government of the United States which was created for the purpose of protecting human health and the environment by writing and enforcing regulations based on laws passed by Congress.
Environmental Sample	A representative sample of any material (aqueous, non-aqueous, or multimedia) collected from any source for which determination of composition or contamination is requested or required. Environmental samples can generally be classified as follows: • Non-Potable Water (Includes surface water, ground water, effluents, water treatment chemicals, and TCLP leachates or other extracts) • Drinking Water - Delivered (treated or untreated) water designated as potable water • Water/Wastewater - Raw source waters for public drinking water supplies, ground waters, municipal influents/effluents, and industrial influents/effluents • Sludge - Municipal sludges and industrial sludges. • Soil - Predominately inorganic matter ranging in classification from sands to clays. • Waste - Aqueous and non-aqueous liquid wastes, chemical solids, and industrial liquid and solid wastes
Equipment Blank	A sample of analyte-free media used to rinse common sampling equipment to check effectiveness of decontamination procedures.
Extracted Internal Standard Analyte	Isotopically labeled analogs of analytes of interest added to all standards, blanks and samples analyzed. Added to samples and batch QC samples prior to the first step of sample extraction and to standards and instrument blanks prior to analysis. Used for isotope dilution methods.
Facility	A distinct location within the company that has unique certifications, personnel, and waste disposal identifications.
False Negative	DoD- A result that fails to identify (detect) an analyte or reporting an analyte to be present at or below a level of interest when the analyte is actually above the level of interest.
False Positive	DoD- A result that erroneously identifies (detects) an analyte or reporting an analyte to be present above a level of interest when the analyte is actually present at or below the level of interest.
Field Blank	A blank sample prepared in the field by filling a clean container with reagent water and appropriate preservative, if any, for the specific sampling activity being undertaken.
Field Measurement	Determination of physical, biological, or radiological properties, or chemical constituents that are measured on-site, close in time and sPAS to the matrices being sampled/measured, following accepted test methods. This testing is performed in the field outside of a fixed-laboratory or outside of an enclosed structure that meets the requirements of a mobile laboratory.

COPYRIGHT © 2019-2022 Pace® Analytical Services, LLC.

Field of Accreditation	TNI- Those matrix, technology/method, and analyte combinations for which the accreditation body offers accreditation.
Field of Proficiency Testing (FoPT)	TNI- Matrix, technology/method, analyte combinations for which the composition, spike concentration ranges and acceptance criteria have been established by the PTPEC.
Finding	TNI- An assessment conclusion referenced to a laboratory accreditation standard and supported by objective evidence that identifies a deviation from a laboratory accreditation standard requirement. DoD- An assessment conclusion that identifies a condition having a significant effect on an item or activity. An assessment finding may be positive, negative, or neutral and is normally accompanied by specific examples of the observed condition. The finding must be linked to a specific requirement (e.g., this standard, ISO requirements, analytical methods, contract specifications, or laboratory management systems requirements).
Flame Atomic Absorption Spectrometer (FAA)	Instrumentation used to measure the concentration of metals in an environmental sample based on the fact that ground state metals absorb light at different wavelengths. Metals in a solution are converted to the atomic state by use of a flame.
Flame Ionization Detector (FID)	A type of gas detector used in GC analysis where samples are passed through a flame which ionizes the sample so that various ions can be measured.
Gas Chromatography (GC)	Instrumentation which utilizes a mobile carrier gas to deliver an environmental sample across a stationary phase with the intent to separate compounds out and measure their retention times.
Gas Chromatograph/ Mass Spectrometry (GC/MS)	In conjunction with a GC, this instrumentation utilizes a mass spectrometer which measures fragments of compounds and determines their identity by their fragmentation patterns (mass spectra).
Gasoline Range Organics (GRO)	A range of compounds that denote all the characteristic compounds that make up gasoline (range can be state or program specific).
Graphite Furnace Atomic Absorption Spectrometry (GFAA)	Instrumentation used to measure the concentration of metals in an environmental sample based on the absorption of light at different wavelengths that are characteristic of different analytes.
High Pressure Liquid Chromatography (HPLC)	Instrumentation used to separate, identify, and quantitate compounds based on retention times which are dependent on interactions between a mobile phase and a stationary phase.
Holding Time	TNI- The maximum time that can elapse between two specified activities. 40 CFR Part 136- The maximum time that samples may be held prior to preparation and/or analysis as defined by the method and still be considered valid or not compromised. For sample prep purposes, hold times are calculated using the time of the start of the preparation procedure. DoD- The maximum time that may elapse from the time of sampling to the time of preparation or analysis, or from preparation to analysis, as appropriate.
Homogeneity	The degree to which a property or substance is uniformly distributed throughout a sample.
Homologue	One in a series of organic compounds in which each successive member has one more chemical group in its molecule than the next preceding member. For instance, methanol, ethanol, propanol, butanol, etc., form a homologous series.
Improper Actions	DoD- Intentional or unintentional deviations from contract-specified or method-specified analytical practices that have not been authorized by the customer (e.g., DoD or DOE).
Incremental Sampling Method (ISM)	Soil preparation for large volume (1 kg or greater) samples.
In-Depth Data Monitoring	TNI- When used in the context of data integrity activities, a review and evaluation of documentation related to all aspects of the data generation process that includes items such as preparation, equipment, software, calculations, and quality controls. Such monitoring shall determine if the laboratory uses appropriate data handling, data use and data reduction activities to support the laboratory's data integrity policies and procedures.
Inductively Coupled Plasma Atomic Emission Spectrometry (ICP-AES)	Analytical technique used for the detection of trace metals which uses plasma to produce excited atoms that emit radiation of characteristic wavelengths.
Inductively Coupled Plasma- Mass Spectrometry (ICP/MS)	An ICP that is used in conjunction with a mass spectrometer so that the instrument is not only capable of detecting trace amounts of metals and non-metals but is also capable of monitoring isotopic speciation for the ions of choice.
Infrared Spectrometer (IR)	An instrument that uses infrared light to identify compounds of interest.

COPYRIGHT © 2019-2022 Pace® Analytical Services, LLC.

Initial Calibration (ICAL)	The process of analyzing standards, prepared at specified concentrations, to define the quantitative response relationship of the instrument to the analytes of interest. Initial calibration is performed whenever the results of a calibration verification standard do not conform to the requirements of the method in use or at a frequency specified in the method.
Initial Calibration Blank (ICB)	A blank sample used to monitor the cleanliness of an analytical system at a frequency determined by the analytical method. This blank is specifically run in conjunction with the Initial Calibration Verification (ICV) where applicable.
Initial Calibration Verification (ICV)	DoD- Verifies the initial calibration with a standard obtained or prepared from a source independent of the source of the initial calibration standards to avoid potential bias of the initial calibration.
Injection Internal Standard Analyte	Isotopically labeled analogs of analytes of interest (or similar in physiochemical properties to the target analytes but with a distinct response) to be quantitated. Added to all blanks, standards, samples, and batch QC after extraction and prior to analysis.
Instrument Blank	A clean sample (e.g., distilled water) processed through the instrumental steps of the measurement process; used to determine instrument contamination.
Instrument Detection Limits (IDLs)	Limits determined by analyzing a series of reagent blank analyses to obtain a calculated concentration. IDLs are determined by calculating the average of the standard deviations of three runs on three non-consecutive days from the analysis of a reagent blank solution with seven consecutive measurements per day.
Interference, spectral	Occurs when particulate matter from the atomization scatters incident radiation from the source or when the absorption or emission from an interfering species either overlaps or is so close to the analyte wavelength that resolution becomes impossible.
Interference, chemical	Results from the various chemical processes that occur during atomization and later the absorption characteristics of the analyte.
Internal Standard	TNI and DoD- A known amount of standard added to a test portion of a sample as a reference for evaluating and controlling the precision and bias of the applied analytical method.
International Organization for Standardization (ISO)	An international standard-setting body composed of representatives from various national standards organizations.
Intermediate Standard Solution	Reference solutions prepared by dilution of the stock solutions with an appropriate solvent.
International System of Units (SI)	The coherent system of units adopted and recommended by the General Conference on Weights and Measures.
Ion Chromatography (IC)	Instrumentation or process that allows the separation of ions and molecules based on the charge properties of the molecules.
Isomer	One of two or more compounds, radicals, or ions that contain the same number of atoms of the same element but differ in structural arrangement and properties. For example, hexane (C6H14) could be n-hexane, 2-methylpentane, 3-methylpentane, 2,3-dimethylbutane, 2,2-dimethylbutane.
Laboratory	A body that calibrates and/or performs testing.
Laboratory Control Sample (LCS)	TNI- (also known as laboratory fortified blank (LFB), spiked blank, or QC check sample): A sample matrix, free from the analytes of interest, spiked with verified known amounts of analytes or a material containing known and verified amounts of analytes and taken through all sample preparation and analytical steps of the procedure unless otherwise noted in a reference method. It is generally used to establish intra-laboratory or analyst-specific precision and bias or to evaluate the performance of all or a portion of the measurement system.
Laboratory Duplicate	Aliquots of a sample taken from the same container under laboratory conditions and processed and analyzed independently.
Laboratory Information Management System (LIMS)	DoD- The entirety of an electronic data system (including hardware and software) that collects, analyzes, stores, and archives electronic records and documents.
Learning Management System (LMS)	A web-based database used by the laboratories to track and document training activities. The system is administered by the corporate training department and each laboratory's learn centers are maintained by a local administrator.
Legal Chain-of-Custody Protocols	TNI- Procedures employed to record the possession of samples from the time of sampling through the retention time specified by the client or program. These procedures are performed at the special request of the client and include the use of a Chain-of-Custody (COC) Form that documents the collection, transport, and receipt of compliance samples by the laboratory. In addition, these protocols document all handling of the samples within the laboratory.

COPYRIGHT © 2019-2022 Pace® Analytical Services, LLC.

Limit(s) of Detection (LOD)	TNI- The minimum result, which can be reliably discriminated from a blank with predetermined confidence level. DoD- The smallest concentration of a substance that must be present in a sample in order to be detected at the DL with 99% confidence. At the LOD, the false negative rate (Type II error) is 1%. A LOD may be used as the lowest concentration for reliably reporting a non-detect of a specific analyte in a specific matrix with a specific method at 99% confidence.
Limit(s) of Quantitation (LOQ)	TNI- The minimum levels, concentrations, or quantities of a target variable (e.g., target analyte) that can be reported with a specified degree of confidence. DoD- The smallest concentration that produces a quantitative result with known and recorded precision and bias. For DoD/DOE projects, the LOQ shall be set at or above the concentration of the lowest initial calibration standard and within the calibration range.
Linear Dynamic Range	DoD- Concentration range where the instrument provides a linear response.
Liquid chromatography/ tandem mass spectrometry (LC/MS/MS)	Instrumentation that combines the physical separation techniques of liquid chromatography with the mass analysis capabilities of mass spectrometry.
Lot	TNI- A definite amount of material produced during a single manufacturing cycle and intended to have uniform character and quality.
Management	Those individuals directly responsible and accountable for planning, implementing, and assessing work.
Management System	System to establish policy and objectives and to achieve those objectives.
Manager (however named)	The individual designated as being responsible for the overall operation, all personnel, and the physical plant of the environmental laboratory. A supervisor may report to the manager. In some cases, the supervisor and the manager may be the same individual.
Matrix	TNI- The substrate of a test sample.
Matrix Duplicate	TNI- A replicate matrix prepared in the laboratory and analyzed to obtain a measure of precision.
Matrix Spike (MS) (spiked sample or fortified sample)	TNI- A sample prepared, taken through all sample preparation and analytical steps of the procedure unless otherwise noted in a referenced method, by adding a known amount of target analyte to a specified amount of sample for which an independent test result of target analyte concentration is available. Matrix spikes are used, for example, to determine the effect of the matrix on a method's recovery efficiency.
Matrix Spike Duplicate (MSD) (spiked sample or fortified sample duplicate)	TNI- A replicate matrix spike prepared in the laboratory and analyzed to obtain a measure of the precision of the recovery for each analyte.
Measurement Performance Criteria (MPC)	DoD- Criteria that may be general (such as completion of all tests) or specific (such as QC method acceptance limits) that are used by a project to judge whether a laboratory can perform a specified activity to the defined criteria.
Measurement Quality Objective (MQO)	TNI- The analytical data requirements of the data quality objectives are project- or program-specific and can be quantitative or qualitative. MQOs are measurement performance criteria or objectives of the analytical process. Examples of quantitative MQOs include statements of required analyte detectability and the uncertainty of the analytical protocol at a specified radionuclide activity, such as the action level. Examples of qualitative MQOs include statements of the required specificity of the analytical protocol, e.g., the ability to analyze for the radionuclide of interest given the presence of interferences.
Measurement System	TNI- A method, as implemented at a particular laboratory, and which includes the equipment used to perform the test and the operator(s). DoD- A test method, as implemented at a particular laboratory, and which includes the equipment used to perform the sample preparation and test and the operator(s).
Measurement Uncertainty	DoD- An estimate of the error in a measurement often stated as a range of values that contain the true value within a certain confidence level. The uncertainty generally includes many components which may be evaluated from experimental standard deviations based on repeated observations or by standard deviations evaluated from assumed probability distributions based on experience or other information. For DoD/DOE, a laboratory's Analytical Uncertainty (such as use of LCS control limits) can be reported as the minimum uncertainty.
Method	TNI- A body of procedures and techniques for performing an activity (e.g., sampling, chemical analysis, quantification), systematically presented in the order in which they are to be executed.

COPYRIGHT © 2019-2022 Pace® Analytical Services, LLC.

Method Blank	TNI- A sample of a matrix similar to the batch of associated samples (when available) that is free from the analytes of interest and is processed simultaneously with and under the same conditions as samples through all steps of the analytical procedures, and in which no target analytes or interferences are present at concentrations that impact the analytical results for sample analyses.
Method Detection Limit (MDL)	TNI- One way to establish a Detection Limit; defined as the minimum concentration of a substance that can be measured and reported with 99% confidence that the analyte concentration is greater than zero and is determined from analysis of a sample in a given matrix containing the analyte.
Method of Standard Additions	A set of procedures adding one or more increments of a standard solution to sample aliquots of the same size in order to overcome inherent matrix effects. The procedures encompass the extrapolation back to obtain the sample concentration.
Minimum Detectable Activity (MDA)	TNI- Estimate of the smallest true activity that ensures a specified high confidence, 1 – β, of detection above the Critical Value, and a low probability β of false negatives below the Critical Value. For radiometric methods, β is often set at 0.05. NOTE 1: The MDS is a measure of the detection capability of a measurement process and as such, it is an a priori concept. It may be used in the selection of methods to meet specified MQOs. Laboratories may also calculate a "sample specific" MDA, which indicates how well the measurement process is performing under varying real-world measurement conditions, when sample-specific characteristics (e.g., interferences) may affect the detection capability. However, the MDA must never be used instead of the Critical Value as a detection threshold. NOTE 2: For the purpose of this Standard, the terms MDA and minimum detectable concentration (MDC) are equivalent.
Minimum Reporting Limit (MRL)	the lowest concentration of standard used for calibration – Drinking Water Manual
MintMiner	Commercial software program used to scan large amounts of chromatographic data to monitor for errors or data integrity issues.
Mobile Laboratory	TNI- A portable enclosed structure with necessary and appropriate accommodation and environmental conditions for a laboratory, within which testing is performed by analysts. Examples include but are not limited to trailers, vans, and skid-mounted structures configured to house testing equipment and personnel.
National Environmental Laboratory Accreditation Conference (NELAC)	See definition of The NELAC Institute (TNI).
National Institute of Occupational Safety and Health (NIOSH)	National institute charged with the provision of training, consultation, and information in the area of occupational safety and health.
National Institute of Standards and Technology (NIST)	TNI- A federal agency of the US Department of Commerce's Technology Administration that is designed as the United States national metrology institute (or NMI).
National Pollutant Discharge Elimination System (NPDES)	A permit program that controls water pollution by regulating point sources that discharge pollutants into U.S. waters.
Negative Control	Measures taken to ensure that a test, its components, or the environment do not cause undesired effects, or produce incorrect test results.
Nitrogen Phosphorus Detector (NPD)	A detector used in GC analyses that utilizes thermal energy to ionize an analyte. With this detector, nitrogen and phosphorus can be selectively detected with a higher sensitivity than carbon.
Nonconformance	An indication or judgment that a product or service has not met the requirement of the relevant specifications, contract, or regulation; also, the state of failing to meet the requirements.
Not Detected (ND)	The result reported for a compound when the detected amount of that compound is less than the method reporting limit.
Operator Aid	DoD- A technical posting (such as poster, operating manual, or notepad) that assists workers in performing routine tasks. All operator aids must be controlled documents (i.e., a part of the laboratory management system).
Performance Based Measurement System (PBMS)	An analytical system wherein the data quality needs, mandates or limitations of a program or project are specified and serve as criteria for selecting appropriate test methods to meet those needs in a cost-effective manner.
Physical Parameter	TNI- A measurement of a physical characteristic or property of a sample as distinguished from the concentrations of chemical and biological components.

COPYRIGHT © 2019-2022 Pace® Analytical Services, LLC.

Photo-ionization Detector (PID)	An ion detector which uses high-energy photons, typically in the ultraviolet range, to break molecules into positively charged ions.
Polychlorinated Biphenyls (PCB)	A class of organic compounds that were used as coolants and insulating fluids for transformers and capacitors. The production of these compounds was banned in the 1970's due to their high toxicity.
Positive Control	Measures taken to ensure that a test and/or its components are working properly and producing correct or expected results from positive test subjects.
Post-Digestion Spike	A sample prepared for metals analyses that has analytes spike added to determine if matrix effects may be a factor in the results.
Power of Hydrogen (pH)	The measure of acidity or alkalinity of a solution.
Practical Quantitation Limit (PQL)	Another term for a method reporting limit. The lowest reportable concentration of a compound based on parameters set up in an analytical method and the laboratory's ability to reproduce those conditions.
Precision	TNI- The degree to which a set of observations or measurements of the same property, obtained under similar conditions, conform to themselves; a data quality indicator. Precision is usually expressed as standard deviation, variance, or range, in either absolute or relative terms.
Preservation	TNI and DoD- Any conditions under which a sample must be kept in order to maintain chemical, physical, and/or biological integrity prior to analysis.
Primary Accreditation Body (Primary AB)	TNI- The accreditation body responsible for assessing a laboratory's total quality system, on-site assessment, and PT performance tracking for fields of accreditation.
Procedure	TNI- A specified way to carry out an activity or process. Procedures can be documented or not.
Proficiency Testing (PT)	TNI- A means to evaluate a laboratory's performance under controlled conditions relative to a given set of criteria, through analysis of unknown samples provided by an external source.
Proficiency Testing Program (PT Program)	TNI- The aggregate of providing rigorously controlled and standardized environmental samples to a laboratory for analysis, reporting of results, statistical evaluation of the results and the collective demographics and results summary of all participating laboratories.
Proficiency Testing Provider (PT Provider)	TNI- A person or organization accredited by a TNI-approved Proficiency Testing Provider Accreditor to operate a TNI-compliant PT Program.
Proficiency Testing Provider Accreditor (PTPA)	TNI- An organization that is approved by TNI to accredit and monitor the performance of proficiency testing providers.
Proficiency Testing Reporting Limit (PTRL)	TNI- A statistically derived value that represents the lowest acceptable concentration for an analyte in a PT sample, if the analyte is spiked into the PT sample. The PTRLs are specified in the TNI FoPT tables.
Proficiency Testing Sample (PT)	TNI- A sample, the composition of which is unknown to the laboratory, and is provided to test whether the laboratory can produce analytical results within the specified acceptance criteria.
Proficiency Testing (PT) Study	TNI- a) Scheduled PT Study: A single complete sequence of circulation and scoring of PT samples to all participants in a PT program. The study must have the same pre-defined opening and closing dates for all participants; b) Supplemental PT Study: A PT sample that may be from a lot previously released by a PT Provider that meets the requirements for supplemental PT samples given in Volume 3 of this Standard [TNI] but that does not have a pre-determined opening date and closing date.
Proficiency Testing Study Closing Date	TNI- a) Scheduled PT Study: The calendar date by which all participating laboratories must submit analytical results for a PT sample to a PT Provider; b) Supplemental PT Study: The calendar date a laboratory submits the results for a PT sample to the PT Provider.
Proficiency Testing Study Opening Date	TNI- a) Scheduled PT Study: The calendar date that a PT sample is first made available to all participants of the study by a PT Provider; b) Supplemental PT Study: The calendar date the PT Provider ships the sample to a laboratory.
Protocol	TNI- A detailed written procedure for field and/or laboratory operation (e.g., sampling, analysis) that must be strictly followed.
Qualitative Analysis	DoD- Analysis designed to identify the components of a substance or mixture.
Quality Assurance (QA)	TNI- An integrated system of management activities involving planning, implementation, assessment, reporting and quality improvement to ensure that a process, item, or service is of the type and quality needed and expected by the client.
Quality Assurance Manual (QAM)	A document stating the management policies, objectives, principles, organizational structure and authority, responsibilities, accountability, and implementation of an agency, organization, or laboratory, to ensure the quality of its product and the utility of its product to its users.
Quality Assurance Project Plan (QAPP)	A formal document describing the detailed quality control procedures by which the quality requirements defined for the data and decisions pertaining to a specific project are to be achieved.

COPYRIGHT © 2019-2022 Pace® Analytical Services, LLC.

Quality Control (QC)	TNI- The overall system of technical activities that measures the attributes and performance of a process, item, or service against defined standards to verify that they meet the stated requirements established by the customer; operational techniques and activities that are used to fulfill requirements for quality; also the system of activities and checks used to ensure that measurement systems are maintained within prescribed limits, providing protection against "out of control" conditions and ensuring that the results are of acceptable quality.
Quality Control Sample (QCS)	TNI- A sample used to assess the performance of all or a portion of the measurement system. One of any number of samples, such as Certified Reference Materials, a quality system matrix fortified by spiking, or actual samples fortified by spiking, intended to demonstrate that a measurement system or activity is in control.
Quality Manual	TNI- A document stating the management policies, objectives, principles, organizational structure and authority, responsibilities, accountability, and implementation of an agency, organization, or laboratory, to ensure the quality of its product and the utility of its product to its users.
Quality System	TNI and DoD- A structured and documented management system describing the policies, objectives, principles, organizational authority, responsibilities, accountability, and implementation plan of an organization for ensuring quality in its work processes, products (items), and services. The quality system provides the framework for planning, implementing, and assessing work performed by the organization and for carrying out required quality assurance and quality control activities.
Quality System Matrix	TNI and DoD- These matrix definitions shall be used for purposes of batch and quality control requirements and may be different from a field of accreditation matrix: • **Air and Emissions**: Whole gas or vapor samples including those contained in flexible or rigid wall containers and the extracted concentrated analytes of interest from a gas or vapor that are collected with a sorbant tube, impinger solution, filter, or other device • **Aqueous**: Any aqueous sample excluded from the definition of Drinking Water or Saline/Estuarine. Includes surface water, groundwater effluents, and TCLP or other extracts. • **Biological Tissue**: Any sample of a biological origin such as fish tissue, shellfish, or plant material. Such samples shall be grouped according to origin. • **Chemical Waste**: A product or by-product of an industrial process that results in a matrix not previously defined. • **Drinking Water**: Any aqueous sample that has been designated a potable or potentially potable water source. • **Non-aqueous liquid**: Any organic liquid with <15% settleable solids • **Saline/Estuarine**: Any aqueous sample from an ocean or estuary, or other saltwater source such as the Great Salt Lake. • **Solids**: Includes soils, sediments, sludges, and other matrices with >15% settleable solids.
Quantitation Range	DoD- The range of values (concentrations) in a calibration curve between the LOQ and the highest successively analyzed initial calibration standard used to relate instrument response to analyte concentration. The quantitation range (adjusted for initial sample volume/weight, concentration/dilution, and final volume) lies within the calibration range.
Quantitative Analysis	DoD- Analysis designed to determine the amounts or proportions of the components of a substance.
Random Error	The EPA has established that there is a 5% probability that the results obtained for any one analyte will exceed the control limits established for the test due to random error. As the number of compounds measured increases in a given sample, the probability for statistical error also increases.
Raw Data	TNI- The documentation generated during sampling and analysis. This documentation includes, but is not limited to, field notes, electronic data, magnetic tapes, untabulated sample results, QC sample results, print outs of chromatograms, instrument outputs, and handwritten records.
Reagent Blank (method reagent blank)	A sample consisting of reagent(s), without the target analyte or sample matrix, introduced into the analytical procedure at the appropriate point and carried through all subsequent steps to determine the contribution of the reagents and of the involved analytical steps.
Reagent Grade	Analytical reagent (AR) grade, ACS reagent grade, and reagent grade are synonymous terms for reagents that conform to the current specifications of the Committee on Analytical Reagents of the American Chemical Society.
Records	DoD- The output of implementing and following management system documents (e.g., test data in electronic or hand-written forms, files, and logbooks).

COPYRIGHT © 2019-2022 Pace® Analytical Services, LLC.

Reference Material	TNI- Material or substance one or more of whose property values are sufficiently homogenized and well established to be used for the calibration of an apparatus, the assessment of a measurement method, or for assigning values to materials.
Reference Method	TNI- A published method issued by an organization generally recognized as competent to do so. (When the ISO language refers to a "standard method," that term is equivalent to "reference method"). When a laboratory is required to analyze by a specified method due to a regulatory requirement, the analyte/method combination is recognized as a reference method. If there is no regulatory requirement for the analyte/method combination, the analyte/method combination is recognized as a reference method if it can be analyzed by another reference method of the same matrix and technology.
Reference Standard	TNI- Standard used for the calibration of working measurement standards in a given organization or at a given location.
Relative Percent Difference (RPD)	A measure of precision defined as the difference between two measurements divided by the average concentration of the two measurements.
Reporting Limit (RL)	The level at which method, permit, regulatory and customer-specific objectives are met. The reporting limit may never be lower than the Limit of Detection (i.e., statistically determined MDL). Reporting limits are corrected for sample amounts, including the dry weight of solids, unless otherwise specified. There must be a sufficient buffer between the Reporting Limit and the MDL. DoD- A customer-specified lowest concentration value that meets project requirements for quantitative data with known precision and bias for a specific analyte in a specific matrix.
Reporting Limit Verification Standard (RLVS)	A standard analyzed at the reporting limit for an analysis to verify the laboratory's ability to report to that level.
Representativeness	A quality element related to the ability to collect a sample reflecting the characteristics of the part of the environment to be assessed. Sample representativeness is dependent on the sampling techniques specified in the project work plan.
Requirement	Denotes a mandatory specification; often designated by the term "shall."
Retention Time	The time between sample injection and the appearance of a solute peak at the detector.
Revocation	TNI- The total or partial withdrawal of a laboratory's accreditation by an accreditation body.
Sample	Portion of material collected for analysis, identified by a single, unique alphanumeric code. A sample may consist of portions in multiple containers, if a single sample is submitted for multiple or repetitive analysis.
Sample Condition Upon Receipt Form (SCURF)	Form used by sample receiving personnel to document the condition of sample containers upon receipt to the laboratory (used in conjunction with a COC).
Sample Delivery Group (SDG)	A unit within a single project that is used to identify a group of samples for delivery. An SDG is a group of 20 or fewer field samples within a project, received over a period of up to 14 calendar days. Data from all samples in an SDG are reported concurrently.
Sample Receipt Form (SRF)	Letter sent to the client upon login to show the tests requested and pricing.
Sample Tracking	Procedures employed to record the possession of the samples from the time of sampling until analysis, reporting and archiving. These procedures include the use of a chain-of-custody form that documents the collection, transport, and receipt of compliance samples to the laboratory. In addition, access to the laboratory is limited and controlled to protect the integrity of the samples.
Sampling	TNI- Activity related to obtaining a representative sample of the object of conformity assessment, according to a procedure.
Selected Ion Monitoring (SIM)	A mode of analysis in mass spectrometry where the detector is set to scan over a very small mass range, typically one mass unit. The narrower the range, the more sensitive the detector. DoD- Using GC/MS, characteristic ions specific to target compounds are detected and used to quantify in applications where the normal full scan mass spectrometry results in excessive noise.
Selectivity	TNI- The ability to analyze, distinguish, and determine a specific analyte or parameter from another component that may be a potential interferent or that may behave similarly to the target analyte or parameter within the measurement system.
Sensitivity	TNI- The capability of a method or instrument to discriminate between measurement responses representing different levels (e.g., concentrations) of a variable of interest.
Serial Dilution	The stepwise dilution of a substance in a solution.
Shall	Denotes a requirement that is mandatory whenever the criterion for conformance with the specification requires that there be no deviation. This does not prohibit the use of alternative approaches or methods for implementing the specification as long as the requirement is fulfilled.

COPYRIGHT © 2019-2022 Pace® Analytical Services, LLC.

Should	Denotes a guideline or recommendation whenever noncompliance with the specification is permissible.
Signal-to-Noise Ratio (S/N)	DoD- A measure of signal strength relative to background noise. The average strength of the noise of most measurements is constant and independent of the magnitude of the signal. Thus, as the quantity being measured (producing the signal) decreases in magnitude, S/N decreases and the effect of the noise on the relative error of a measurement increases.
Source Water	TNI- When sampled for drinking water compliance, untreated water from streams, rivers, lakes, or underground aquifers, which is used to supply private and public drinking water supplies.
Spike	A known mass of target analyte added to a blank sample or sub-sample; used to determine recovery efficiency or for other quality control purposes.
Standard (Document)	TNI- The document describing the elements of a laboratory accreditation that has been developed and established within the consensus principles of standard setting and meets the approval requirements of standard adoption organizations procedures and policies.
Standard (Chemical)	Standard samples are comprised of a known amount of standard reference material in the matrix undergoing analysis. A standard reference material is a certified reference material produced by US NIST and characterized for absolute content, independent of analytical test method.
Standard Blank (or Reagent Blank)	A calibration standard consisting of the same solvent/reagent matrix used to prepare the calibration standards without the analytes. It is used to construct the calibration curve by establishing instrument background.
Standard Method	A test method issued by an organization generally recognized as competent to do so.
Standard Operating Procedure (SOP)	TNI- A written document that details the method for an operation, analysis, or action with thoroughly prescribed techniques and steps. SOPs are officially approved as the methods for performing certain routine or repetitive tasks.
Standard Reference Material (SRM)	A certified reference material produced by the US NIST or other equivalent organization and characterized for absolute content, independent of analytical method.
Statement of Qualifications (SOQ)	A document that lists information about a company, typically the qualifications of that company to compete on a bid for services.
Stock Standard	A concentrated reference solution containing one or more analytes prepared in the laboratory using an assayed reference compound or purchased from a reputable commercial source.
Storage Blank	DoD- A sample of analyte-free media prepared by the laboratory and retained in the sample storage area of the laboratory. A storage blank is used to record contamination attributable to sample storage at the laboratory.
Supervisor	The individual(s) designated as being responsible for a particular area or category of scientific analysis. This responsibility includes direct day-to-day supervision of technical employees, supply and instrument adequacy and upkeep, quality assurance/quality control duties and ascertaining technical employees have the required balance of education, training, and experience to perform the required analyses.
Surrogate	DoD- A substance with properties that mimic the analyte of interest. It is unlikely to be found in environmental samples and is added to them for quality control purposes.
Suspension	TNI- The temporary removal of a laboratory's accreditation for a defined period of time, which shall not exceed 6 months or the period of accreditation, whichever is longer, in order to allow the laboratory time to correct deficiencies or area of non-conformance with the Standard.
Systems Audit	An on-site inspection or assessment of a laboratory's quality system.
Target Analytes	DoD- Analytes or chemicals of primary concern identified by the customer on a project-specific basis.
Technical Director	Individual(s) who has overall responsibility for the technical operation of the environmental testing laboratory.
Technology	TNI- A specific arrangement of analytical instruments, detection systems, and/or preparation techniques.
Test	A technical operation that consists of the determination of one or more characteristics or performance of a given product, material, equipment, organism, physical phenomenon, process, or service according to a specified procedure. The result of a test is normally recorded in a document sometimes called a test report or a test certificate.
Test Method	DoD- A definitive procedure that determines one or more characteristics of a given substance or product.
Test Methods for Evaluating Solid Waste, Physical/ Chemical (SW-846)	EPA Waste's official compendium of analytical and sampling methods that have been evaluated and approved for use in complying with RCRA regulations.

COPYRIGHT © 2019-2022 Pace® Analytical Services, LLC.

Test Source	TNI- A radioactive source that is tested, such as a sample, calibration standard, or performance check source. A Test Source may also be free of radioactivity, such as a Test Source counted to determine the subtraction background, or a short-term background check.
The NELAC Institute (TNI)	A non-profit organization whose mission is to foster the generation of environmental data of known and documented quality through an open, inclusive, and transparent process that is responsive to the needs of the community. Previously known as NELAC (National Environmental Laboratory Accreditation Conference).
Total Petroleum Hydrocarbons (TPH)	A term used to denote a large family of several hundred chemical compounds that originate from crude oil. Compounds may include gasoline components, jet fuel, volatile organics, etc.
Toxicity Characteristic Leaching Procedure (TCLP)	A solid sample extraction method for chemical analysis employed as an analytical method to simulate leaching of compounds through a landfill.
Traceability	TNI- The ability to trace the history, application, or location of an entity by means of recorded identifications. In a calibration sense, traceability relates measuring equipment to national or international standards, primary standards, basic physical conditions or properties, or reference materials. In a data collection sense, it relates calculations and data generated throughout the project back to the requirements for the quality of the project.
Training Document	A training resource that provides detailed instructions to execute a specific method or job function.
Trip Blank	This blank sample is used to detect sample contamination from the container and preservative during transport and storage of the sample. A cleaned sample container is filled with laboratory reagent water and the blank is stored, shipped, and analyzed with its associated samples.
Tuning	A check and/or adjustment of instrument performance for mass spectrometry as required by the method.
Ultraviolet Spectrophotometer (UV)	Instrument routinely used in quantitative determination of solutions of transition metal ions and highly conjugated organic compounds.
Uncertainty, Counting	TNI- The component of Measurement Uncertainty attributable to the random nature of radioactive decay and radiation counting (often estimated as the square root of observed counts (MARLAP). Older references sometimes refer to this parameter as Error, Counting Error, or Count Error (c.f., Total Uncertainty).
Uncertainty, Expanded	TNI- The product of the Standard Uncertainty and a coverage factor, k, which is chosen to produce an interval about the result that has a high probability of containing the value of the measurand (c.f., Standard Uncertainty). NOTE: Radiochemical results are generally reported in association with the Total Uncertainty. Either if these estimates of uncertainty can be reported as the Standard Uncertainty (one-sigma) or as an Expanded Uncertainty (k-sigma, where $k > 1$).
Uncertainty, Measurement	TNI- Parameter associated with the result of a measurement that characterizes the dispersion of the values that could reasonably be attributed to the measurand.
Uncertainty, Standard	TNI- An estimate of the Measurement Uncertainty expressed as a standard deviation (c.f., Expanded Uncertainty).
Uncertainty, Total	TNI- An estimate of the Measurement Uncertainty that accounts for contributions from all significant sources of uncertainty associated with the analytical preparation and measurement of a sample. Such estimates are also commonly referred to as Combined Standard Uncertainty or Total Propagated Uncertainty, and in some older references as the Total Propagated Error, among other similar items (c.f., Counting Uncertainty).
Unethical actions	DoD- Deliberate falsification of analytical or quality control results where failed method or contractual requirements are made to appear acceptable.
United States Department of Agriculture (USDA)	A department of the federal government that provides leadership on food, agriculture, natural resources, rural development, nutrition, and related issues based on public policy, the best available science, and effective management.
United States Geological Survey (USGS)	Program of the federal government that develops new methods and tools to supply timely, relevant, and useful information about the Earth and its processes.
Unregulated Contaminant Monitoring Rule (UCMR)	EPA program to monitor unregulated contaminants in drinking water.
Validation	DoD- The confirmation by examination and provision of objective evidence that the particular requirements for a specific intended use are fulfilled.

COPYRIGHT © 2019-2022 Pace® Analytical Services, LLC.

Verification	TNI- Confirmation by examination and objective evidence that specified requirements have been met. In connection with the management of measuring equipment, verification provides a means for checking that the deviations between values indicated by a measuring instrument and corresponding known values of a measured quantity are consistently smaller than the maximum allowable error defined in a standard, regulation, or specification peculiar to the management of the measuring equipment.
Voluntary Action Program (VAP)	A program of the Ohio EPA that gives individuals a way to investigate possible environmental contamination, clean it up if necessary and receive a promise from the State of Ohio that no more cleanup is needed.
Whole Effluent Toxicity (WET)	The aggregate toxic effect to aquatic organisms from all pollutants contained in a facility's wastewater (effluent).

Management Approval Page
Local Quality Manual
Pace Analytical Services, LLC (PAS)

Signatory Attestation: The employee's electronic signature on this management approval page affirms the approver's obligation, commitment, and responsibility to uphold the requirements of the PAS Quality Management System (QMS) described in this Quality Manual (manual) at each location for which this manual is prepared.

Refer to the page for Quality Manual Signatories to view the job title and physical address for each approver.

Quality Manual Approver Information

The individuals listed below are approvers of this manual and are responsible for implementing the PAS Quality Management System (QMS) and upholding the requirements of this manual at the location(s) for which this manual was prepared, at the time this version of the manual was made effective.

The manual is not revised and released under an updated version when there is a change to personnel. Personnel information is updated during the manual's normal review and revision cycle.

If an approver changes positions, leave the company, or is on extended leave of absence, the responsibility to implement and uphold the PAS QMS automatically transfers to the primary or alternate deputy for the position until the approver is replaced and/or the approver returns to work. The individual replacing the approver automatically accepts the responsibilities associated with the original approver's attestation. Refer to Section 4.1.5.1.1 of this manual to view the deputies assigned to key personnel job titles.

1.0 PURPOSE AND SCOPE

1.1 Purpose

This quality manual (manual) outlines the quality management system (QMS) and management structure of Pace® Analytical Services, LLC. Throughout this manual, Pace® Analytical Services, LLC is also referred to by the acronyms PAS or ENV. The acronyms PAS and ENV are interchangeable.

The QMS is also called the quality program throughout this manual and other PAS documents. "Quality Management System" and "Quality Program" are synonymous and inferred by the acronym QMS.

The QMS is the collection of policies and processes established by the senior leaders of PAS (top management) to ensure the services and products provided by PAS consistently meet relevant requirements and achieves the goal of Pace® to provide customers with high quality, cost-effective, analytical measurements, and services.

The QMS is planned to establish conformance[1] and compliance with the current published versions of these international and national quality system Standards:

- ISO/IEC 17025: *General requirements for the competence of testing and calibration laboratories*
- NELAC/TNI Standard Volume 1: *Management and Technical Requirements for Laboratories Performing Environmental Analysis*

[1]The statement of conformity to these Standards pertains only to testing and sampling activities carried out by the laboratory at its physical address, in temporary or mobile facilities, in-network, or by laboratory personnel at a customer's facility.

The QMS is also planned to achieve regulatory compliance with the various federal and state programs for which PAS locations provide compliance testing and/or holds certification or accreditation. Federal or state requirements that do not apply to all PAS locations, are provided in addendum to this manual or in other documents that supplement the manual. Customer-specific project and program requirements are not included in the manual in order to maintain client confidentiality.

- A list of accreditation and certifications held by each location associated with this manual is provided in Appendix A.
- A list of analytical testing capabilities offered by each location associated with this manual is provided in Appendix B.

1.2 Scope and Application

This manual applies to each location listed on the Title Page of this manual:

For purposes of the PAS QMS the term "location" refers to laboratories and/or service centers.

- The term "laboratory" refers to any PAS location, however named by Pace® that provides testing, collects samples (sampling), or conducts field measurement services in a fixed building, mobile unit, or in-situ (field).
- The phrase "service center" refers to any PAS location, however named by Pace® that does not perform any testing, sampling, or field measurements.

PAS locations are defined by their physical address and other information:

COPYRIGHT © 2019-2023 Pace® Analytical Services, LLC.

- Laboratories are defined by physical address and certification/accreditation ID.
- Mobile units are defined by the address of the location to which they are assigned, by VIN (vehicle identification number), or by certification/accreditation ID.
- The phrase "satellite laboratory" is used by PAS to refer to a limited-service laboratory affiliated with a larger PAS business unit or location. Some PAS business groups refer to satellite laboratories as service centers for accounting purposes. This designation is not consistent with the definitions specified in this manual or throughout the supporting documents associated with the QMS. Regardless of any internal reference or jargon, any PAS location that generates a test result is a "laboratory" and all laboratories must comply with all requirements specified in this manual for analytical testing services.

1.2.1 Quality Manual Template

This manual was prepared from the PAS Quality Manual Template (template) created by the PAS Corporate Quality Director (CQD).

The template, known as document ID ENV-TMP-CORQ-0007, specifies the minimum requirements that every PAS location must abide by, regardless of scope of services or number of personnel, in order to achieve the objectives of the PAS Quality Policy (See Section 4.2.2).

The template is the mechanism used by top management[1] to communicate their commitment to continuously develop and improve the QMS for effectiveness, to meet customer expectations, and to comply with any statutory and regulatory requirements. Their signature of approval for the template is the mechanism used to document their responsibility.

[1]Top Management is the phrase in the TNI Standard that refers to the leaders of an organization that develop and/or release the PAS Quality Policy Statement and manual under their authority. For PAS, top management includes the Pace® Chief Executive Officer (CEO) and Chief Compliance Officer (CCO) and the PAS President, Corporate Quality Director, Senior Vice President of Operations (Sr. VPO), and the Chief Technical Officer (CTO).

The template and instructions for use of the template are released by corporate quality personnel to the local quality managers responsible for each location (Local QM). The local QM uses the template to prepare the location's manual by following the instructions provided to them. The local QM may not alter the font, structure, or content of the template, except where specified by instruction to do so.

The template is reviewed by corporate quality personnel annually and updated, if needed. More frequent review and revision may occur to manage change, to maintain conformance and compliance to relevant standards or to improve the QMS.

See standard operating procedure (SOP) ENV-SOP-CORQ-00015 *Document Management and Control* for more information.

1.2.2 Quality Manual

The quality manual is created from template ENV-TMP-CORQ-0007 by local quality personnel, who are also responsible for maintenance and management of the local manual.

- PAS locations are not permitted to alter content of the template when preparing their manual, except where specified in the template. Control of content in the manual is

COPYRIGHT © 2019-2023 Pace® Analytical Services, LLC.

necessary to ensure consistency of implementation of the PAS quality program across the network.

- If additions or changes to the manual are needed to maintain regulatory compliance or conformance to relevant standards and these changes cannot be covered by addendum to the manual, the need for change must be raised to the PAS Corporate Quality Director, who will decide how to resolve the need.

The manual is approved for release by the individuals listed on manual approval page. The person's electronic signature affirms their commitment to implement and uphold the requirements, processes, and procedures of the PAS QMS at each location for which the manual was prepared.

The manual is updated with each release of a new version of the template, and as needed to update appendices and addendum. More frequent review and revision may be necessary when there are significant changes to the capabilities, and resources of the laboratory during the calendar year.

See SOP ENV-SOP-CORQ-00015 *Document Management and Control* for more information.

1.2.3 References to Supporting Documents

The template and the manual include references to other organization documents that support the QMS such as policies and standard operating procedures (SOPs).

These references may include the document's document control number (DC#) and the document title. This information is subject to change at the discretion of PAS. The manual and/or template are updated to reflect the editorial change during the manual's next scheduled review/revision cycle or the next time a version of the manual is released, whichever is sooner.

Each location maintains a current list of documents used by the location to support the QMS. This list, known as the controlled document or master list is readily available to personnel for their use and it provides a cross reference to the legacy document ID, where applicable. Parties external to PAS may contact the location of interest to obtain the most current version of controlled document list if desired.

3.0 TERMS AND DEFINITIONS

Refer to Appendix C for terms, acronyms, and definitions used in this manual and in other documents used by PAS to support the QMS.

COPYRIGHT © 2019-2023 Pace® Analytical Services, LLC.

4.0 MANAGEMENT REQUIREMENTS

4.1 Organization

4.1.1 Legal Identity

Pace® Analytical Services, LLC (PAS) is the responsible entity authorized by the State of Minnesota to do business as a limited liability company, under the parent company, PAS Parent, Inc.

4.1.1.1 Change of Ownership

If there is a change of ownership, if a PAS location goes out of business, or if the entire organization ceases to exist, PAS management must notify regulatory authorities of the change within the time required by each state agency for which the location is certified or accredited.

Specifications for retention of records and other business information are addressed in the ownership transfer agreement and in accordance with appropriate regulatory requirements. These details are not included in this manual because each situation is specific to the change event.

4.1.2 Compliance Responsibility

PAS management has the responsibility and authority to establish and implement procedures and to maintain resources necessary to assure its testing activities are carried out in such a way to meet applicable federal and statutory requirements in addition to the requirements specified in this manual and QMS supporting documents.

4.1.3 Scope of the Quality Management System

The QMS applies to work carried out at each location covered by this manual including permanent facilities, at sites away from its permanent facilities, or in associated temporary or mobile facilities.

The permanent and mobile facilities to which this manual applies are listed on the Title Page of this manual.

4.1.4 Organization History and Information

Founded in 1978, Pace® Analytical Services, LLC (PAS) is a privately held scientific services firm operating one of the largest full-service contract laboratory and service center networks in the United States.

The business purpose of PAS is to deliver the highest standard of testing and scientific services in the market. We offer the most advanced solutions in the industry, backed by transparent data, a highly trained team, and the service and support that comes from over four decades of experience.

4.1.4.1 Organization Structure

Each PAS location is led by a management team referred to as local management[1]. Local management is responsible for making day-to-day decisions regarding the operations of the facility and implementing, and sustaining the requirements, policies, and procedures of the PAS quality program.

COPYRIGHT © 2019-2023 Pace® Analytical Services, LLC.

[1] The term "local management" does not mean "on-site" management. Some of the roles included in the local management team, work off site or from a different PAS location.

For purpose of the QMS, the job titles associated with the local management team include Vice President of Operations (VPO), General Manager (GM), Director of Laboratory Operations (DLO), Quality Program Manager (QPM), and Quality Manager (QM).

The local management team is supported by department supervisors and team leaders, and business groups that support the organization such as HR, IT, Sales & Marketing, Finance, and EHS (Environmental Health & Safety).

Technical oversight for each location is provided by local personnel with support and guidance from the PAS Chief Technical Officer (CTO). Locations that hold TNI accreditation, also have personnel appointed to serve as the "acting technical manager for TNI, however named" to perform the duties and responsibilities of this designation per the TNI Standard. See Section 4.1.5.2.1 for more information on this TNI requirement.

The reporting relationships and responsibilities of quality personnel are independent of operations in order to safeguard impartiality. See Section 4.1.5.2 for more information.

Refer to the organization charts provided in Appendix D to view the organization structure, reporting relationships, and the interrelationships between positions.

4.1.5 Management Requirements

4.1.5.1 Personnel

Each PAS location is staffed with administrative and/or technical personnel who perform and verify work under the supervision of their direct line supervisor.

All personnel are required to perform their duties in accordance with the policies and processes outlined in this manual and in accordance with standard operating procedures (SOPs) and other quality system documents. PAS policies and procedures are designed for impartiality and integrity. When these procedures are fully implemented, personnel remain free from undue pressure and other influences that adversely impact the quality of their work or data.

4.1.5.1.1 Key Personnel

Key personnel are management positions that have the authority and responsibility to plan, direct, and control activities related to the QMS for the entire division (PAS Corporate), or for one or more PAS locations (Local).

PAS job titles classified as key personnel are as follows:

COPYRIGHT © 2019-2023 Pace® Analytical Services, LLC.

PAS Key Personnel Positions & Deputy Assignments by Role

Job Title	Acronym	Primary / Alternate Deputy
Chief Executive Officer	CEO	President
Chief Compliance Officer	CCO	CQD / As Assigned
President	NA	CEO / Sr. VPO
Corporate Quality Director	CQD	CCO or CTO
Quality Program Manager	QPM	CQD / Peer QPM / As Assigned
Chief Technical Officer	CTO	CQD / As Assigned
Sr. VP of Operations	Sr. VPO	President / VPO
Vice President of Operations	VPO	Sr. VPO / Peer VPO
Director of Lab Operations[1]	DLO	VPO / Peer DLO or Sr. VPO
Health and Safety Director	NA	As Assigned
IT Director	NA	CIO
Quality Manager	QM	QPM /Peer QM / QAA
General Manager[1]	GM	VPO / Sr. VPO or Peer GM
Operations Manager[1]	OM	GM / DL or VPO
Technical Manager[1]	TM	CTO / Peer TM
TNI Approved TM[2]	TNI TM	Another Qualified Employee

[1:] Position is not in place at all locations.

[2:] The TNI TM is not a PAS position. See Section 4.1.5.2.1 for more information.

Some certification and accreditation programs require notification any time there is a change in key personnel. Notification requirements are tracked and upheld by the local QM, when these requirements apply.

4.1.5.2 Roles and Responsibilities

The qualifications, duties, and responsibilities for each position at Pace® are detailed in job descriptions maintained by the Pace® Human Resource personnel (HR).

The following sections provide a general overview of various management and supervisory roles and are presented in no particular order.

Chief Executive Officer (CEO): Provides leadership for overall operations; development of growth strategies; and long-range capital and strategic planning for Pace®.

Chief Compliance Officer (CCO): Provides leadership for compliance related activities.

President: Provides leadership for overall operations; oversight of regulatory and compliance standards; development of growth strategies; and long-range capital and strategic planning for PAS.

COPYRIGHT © 2019-2023 Pace® Analytical Services, LLC.

Chief Technical Officer (CTO): Provides technical oversight and leadership to all PAS locations. Responsible for innovation and standardization of technical activities.

Corporate Director of Quality (CQD): Responsible for developing the PAS quality program and the policies and procedures that support the QMS. The CQD leads the quality team, establishing functions, responsibilities, duties, and organization structure for PAS.

Corporate Quality Program Manager (QPM): Responsible for helping local management implement, monitor, maintain and improve the PAS quality program for one or more locations in the network and for direct supervision of Quality Manager(s).

Director of Information Technology: Oversees and delivers the systems and processes of information technology used by PAS. These systems include Laboratory Information Management Systems (LIMS); data acquisition, reduction, and reporting software; virus-protection, communication tools, and ensuring the integrity, security of electronic data, and associated policies and procedures.

Sr. Vice President of Operations (Sr VPO): Provides leadership, direction, and insight necessary to achieve strategic initiatives. Develops and improves processes, structure, and allocation of resources for operations for all PAS.

Vice-President of Operations (VPO): Provides leadership, guidance, and resources, including allocation of personnel, necessary to achieve the strategic goals of the organization and the PAS quality program to one or more PAS locations.

Director of Laboratory Operations (DLO): See descriptions for VPO and General Manager. The DLO is an intermediary management position that provides leadership and resources to one or more locations.

General Manager (GM): The GM is responsible for overall administration and operation of one or more PAS locations. Although task duties associated with this responsibility may be delegated, the GM is responsible for ensuring all duties and activities of the locations they oversee comply with the PAS QMS, the PAS EHS program, and with any applicable statutory, regulatory requirements or program requirements. If a GM is not assigned to the location, these responsibilities are transferred to the Operations Manager (OM) or DLO. If no DLO, to the VPO.

Any GM of a TNI Accredited laboratory is also responsible for the designation of technical personnel to serve as acting technical managers for TNI for the fields of accreditation held by the laboratory (See Section 4.1.5.2.1) and for notifying the accreditation body (AB) of any extended absence or reassignment of these designations.

Quality Manager (QM): The QM oversees and monitors the implementation, compliance, and improvement of the QMS and communicates gaps, deviations, and opportunities for improvement to local and corporate laboratory management. The QM is independent of the operation and analytical activities for which they provide oversight and has the authority to carry out the roles and responsibilities of their position without outside influence.

COPYRIGHT © 2019-2023 Pace® Analytical Services, LLC.

The QM:

- serves as the focal point for QA/QC protocol decisions and oversees review of QC data for trend analysis;
- evaluates data objectively and performs assessments without outside influence;
- has documented training and experience in QA/QC procedures and the PAS quality system;
- has a general knowledge of the analytical methods offered by the laboratory;
- coordinates and conducts internal systems and technical audits;
- notifies laboratory management of deficiencies in the quality system;
- monitors corrective actions;
- provides support to technical personnel and may serve as the primary deputy for the acting TNI Technical Manager(s).

Manager-Client Services (CSM): This position is responsible for the training and supervision of project manager(s) and/or shipping, receiving and courier personnel. The primary responsibility of the CSM is to ensure projects are successfully managed to meet the expectations and needs of PAS customers.

Department Managers/Supervisors/Team Lead): These positions are responsible for administrative and operations management and implementation of the QMS in the work area he/she oversees. These responsibilities include but are not limited to: training and supervision of personnel, monitoring work activity to maintain compliance with this manual, SOPs, policies and other instructional documents that support the QMS; method development, validation and the establishment and implementation of SOPs to assure regulatory compliance and suitability for the intended purpose; monitoring QA/QC performance, proper handling and reporting of nonconforming work; purchasing of supplies and equipment adequate for use; maintaining instrumentation and equipment in proper working order and calibration; and general maintenance of administrative and technical processes and procedures established by the laboratory.

Operations Manager (OM): The OM is responsible for management of production and/or other duties assigned by the GM.

4.1.5.2.1 Approved Technical Manager (TNI Accreditation Only)

The requirements in this subsection apply only to PAS locations that are NELAC/TNI accredited.

The TNI Standard specifies requirements for the qualification and duties of technical personnel. The TNI Standard lists these duties under the reference "technical manager(s), however named."

At PAS, these duties closely correlate with the responsibilities and duties outlined in the PAS job descriptions for managers, supervisors, team leads, and/or scientists. However, these duties do not need to be associated with

COPYRIGHT © 2019-2023 Pace® Analytical Services, LLC.

any specific job title and can be assigned to any one or more PAS employees that meets the qualifications specified in the TNI Standard.

Refer to the applicable version of the TNI Standard to view the required qualifications for each discipline.

PAS locations that are TNI accredited must designate one or more employees to perform these duties and submit these qualifications to the TNI accreditation body (AB) for approval.

Employees approved by the TNI AB, to perform these duties retain their Pace® assigned job title.

When TNI Accreditation Bodies (AB) refer to these employees as 'technical manager' or 'technical director' on the official certificate or the scope of accreditation, this reference is referring to their approval to perform duties of the 'technical manager, however named' as specified in the TNI Standard and not to a PAS job title.

The duties of any approved technical manager for TNI, however named, can be completed in person or remotely. If an employee that is an approved technical manager for TNI is completely absent from work or on a leave of absence for more than 15 calendar days, the duties and responsibilities specified in the TNI Standard are temporarily reassigned to another employee that meets the qualifications for the technology or field of accreditation. If the employee's absence exceeds 35 calendar days, the local QM must formally notify the TNI primary AB of the absence and the details of reassignment of duties in writing.

4.1.5.3 Conflict of Interest

A conflict of interest is a situation where a person has competing interests that may affect impartiality. It is the policy of Pace® to ensure business relationships, decisions and transactions do not place personal interest ahead of the organization, customers, colleagues, job responsibilities or the public we serve. Conflict of interest is avoided by making personnel aware of circumstances that conflict or appear to conflict with impartiality and/or designing process and procedures to include checks and balances to prevent conflict and ensure impartiality.

See the current version of policy COR-POL-0004 *Code of Ethics and Professional Conduct* for more information.

4.1.5.4 Confidentiality

PAS management is committed to preserving the confidentiality of Pace® customers and confidentiality of Pace® business information.

Client information obtained or created during work activities is considered confidential and is protected from intentional release to any person or entity other than the client or the client's authorized representative, except when Pace® is required by law to release confidential information to another party, such as a regulatory agency or for litigation purposes. In which case, Pace® will notify the client

COPYRIGHT © 2019-2023 Pace® Analytical Services, LLC.

of the release of information and the information provided, unless notification is prohibited by law.

When Pace® obtains information about the customer from a source other than the customer, Pace® will keep the source of the information confidential unless disclosure is agreed upon by the source.

The terms of client confidentiality are included in PAS Standard Terms and Conditions (T&C). With the acceptance of the T&C and/or the implicit contract for analytical services that occurs when the client sends samples to PAS for testing, the client authorizes Pace® to release confidential information when required. Other procedures used by PAS to maintain confidentiality include:

- A Code of Ethics and Professional Conduct policy that covers this topic (COR-POL-0004);
- A Confidentiality Agreement which supervisory and sales personnel and other positions are required to sign at the time of employment and abide by the conditions of throughout employment;
- Record retention and disposal procedures that assure confidentiality is maintained; and
- Physical access controls and encryption of electronic data.

See policy COR-POL-0004 *Code of Ethics and Professional Conduct* for more information.

4.1.5.5 Communication

Communication is defined as the imparting or exchanging of news and information. Effective (good) communication occurs when the people included in the communication gets the point and understands it.

4.1.5.5.1 Workplace Communication

Effective communication in the workplace is necessary to assure work is performed correctly, efficiently, and in accordance with client specifications.

Instructions for how to conduct testing and other work activities are communicated to personnel via written policies, standard operating procedures, and other work instructions.

Information about PAS performance (positive and negative) and ideas for improvement are communicated to personnel using various communication channels such as face to face meetings, video conferencing, conference calls, email, memoranda, written reports, and posters.

4.1.5.5.2 External Communication

Communication with external parties such as customers, vendors, business partners, and regulatory agencies takes place every day.

COPYRIGHT © 2019-2023 Pace® Analytical Services, LLC.

PAS management is responsible for training personnel to communicate in professional and respectful ways to build strong relationships and to avoid misunderstanding.

4.2 Quality Management System

4.2.1 Quality Management System Objectives

The objectives of the PAS QMS are to provide clients with consistent, exemplary professional service, and objective work product that is of known and documented quality that meets their requirements for data usability and regulatory compliance.

Objective work products are analytical services, data, test results, and information that is not influenced by personal feeling or opinions. The quality of being objective is also known as 'impartiality.'

4.2.1.1 Impartiality

PAS achieves and maintains impartiality by establishing an organizational structure that safeguards impartiality (See 4.1.4.1) and implementing and adhering to the policies and processes of the QMS outlined in this manual, which are based on industry accepted standards and methodologies.

PAS procedures for handling nonconforming work (See 4.9), corrective and preventive actions (See 4.11, 4.12) and management review (See 4.15) are the primary mechanisms used to identify risk to impartiality and to prompt actions necessary to eliminate or reduce the threat when risk to impartiality is suspected or confirmed.

4.2.1.2 Risk and Opportunity Assessment

Risks are variables that make achieving the goals and objectives of the QMS uncertain.

An opportunity is something that has potential positive consequences for the organization.

PAS personnel manage risks and opportunities on a daily basis by following policies, procedures and processes that support the QMS. Some ways in which the QMS is designed to identify, minimize, or eliminate risk on a daily basis include but are not limited to:

- Capability and capacity reviews of each analytical service request to assure the laboratory can meet the customer's requirements;
- Maintenance of accreditation and certification for test methods in multiple states and programs to cover a broad range of authority for regulatory compliance;
- SOPs and other controlled instructional documents are provided to personnel to eliminate variability in the process. These documents include actions to counter risk factors inherent in the process and are reviewed on a regular basis for on-going suitability and relevancy;
- Participation in proficiency testing programs and auditing activities to verify on-going competency and comparability in performance;

COPYRIGHT © 2019-2023 Pace® Analytical Services, LLC.

- Provision of on-the-job training and established protocol for quality control (QC) corrective action for nonconforming events;
- An established program for ethics, and data integrity;
- Tiered data review process;
- Culture of continuous improvement;
- Monitoring activities to assess daily and long-term performance; and
- Annual critical review of the effectiveness of the QMS.

PAS also promotes a continuous improvement culture based on the principles of lean manufacturing. These principles include 3P (Process, Productivity, Performance) and Kaizen. 3P is a platform used by PAS to share best practices and standardization across the network to achieve operational excellence. Kaizen is a team-based process used to implement tools and philosophies of lean to reduce waste and achieve flow with the purpose of improving both external and internal customer satisfaction. The PAS lean program and activities help to mitigate risk because they generate a collective understanding of vulnerabilities and utilize group-effort to develop and implement solutions at all levels.

Risk and opportunities may also be formally identified using specific risk and opportunity assessment methods such as SWOT Analysis (Strength, Weakness, Opportunity, Threats) and 3-Stage Impact/Probability Grids.

4.2.1.3 Communication of the Quality Management System

This manual is the primary mechanism used by PAS management to communicate the QMS to personnel.

To assure personnel understand and implement the quality program outlined in the manual:

- PAS personnel are required to sign a Read and Acknowledgement Statement to confirm the employee has:

  1) been informed of the manual by management;

  2) has access to the manual;

  3) has read the manual;

  4) understands the content of the manual; and

  5) agrees to abide by the requirements, policies, and procedures therein.

- Personnel are informed that the manual provides the "what" of the QMS. The "how to" implementation of the QMS is provided in policy, SOPs, standard work instructions, and other instructional documents.

COPYRIGHT © 2019-2023 Pace® Analytical Services, LLC.

- This manual and supporting policies and procedures are made readily accessible to personnel in the area where the work activity is performed.

4.2.2 Quality Policy Statement

The quality policy of PAS is to provide customers with data of known and documented quality fit for their intended purpose. PAS achieves this policy by implementing the QMS defined in this manual, by following industry accepted protocol for analytical testing and quality assurance and quality control (QA/QC) activities, by conformance with published and industry accepted testing methodologies, and by compliance with international and national standards for the competency and/or accreditation of testing laboratories.

Intrinsic to this policy statement is each of the following principles:

- PAS will provide customers with reliable, consistent, and professional service. This is accomplished by making sure each PAS location has the resources necessary to maintain capability and capacity; that staff are trained and competent to perform the tasks they are assigned; that client-facing staff are trained and prepared to find solutions to problems and to assist customers with their needs for analytical services. Customer feedback, both positive and negative, is shared with personnel and used to identify opportunities for improvement.
- PAS maintains a quality program that complies with applicable state, federal, and industry standards for analytical testing and competency.
- PAS management provides training to personnel so that all personnel are familiar with the QMS outlined in this manual and that they understand that implementation of the QMS is achieved by adherence to the Pace® and PAS policies and procedures.
- PAS management continuously evaluates and improves the effectiveness of the QMS by responding to customer feedback, and other measures of performance, such as but not limited to the results of internal/external audits, proficiency testing, metrics, trend reports, and annual and periodic management reviews.

4.2.2.1 Ethics Policy / Data Integrity Program

Pace® has established a comprehensive ethics and data integrity program that is communicated to all Pace® employees so that they understand what is expected of them. The program is designed to promote a mindset of ethical behavior and professional conduct that is applied to all work activities.

The key elements of the Pace® Ethics / Data Integrity Program include:

- Ethics Policy (COR-POL-0004);
- Standardized data integrity training course taken by all new employees on hire and a yearly refresher data integrity training course for all existing employees;
- Policy Acknowledgement Statements that all Pace® personnel, including contract and temporary, are required to sign at the time of employment and again during annual refresher training to document the employee's commitment and obligation to abide by the company's standards for ethics, data integrity and confidentiality;

COPYRIGHT © 2019-2023 Pace® Analytical Services, LLC.

- SOPs that provide instructions for how to carry out a test method or process to assure tasks are done correctly and consistently by each employee;
- On the Job Training;
- Data integrity monitoring activities which include, but are not limited to: primary, secondary and completeness data reviews, internal technical and system audits, data audits, data surveillance, and proficiency testing; and
- Confidential reporting process for alleged ethics and data integrity issues.

All PAS managers and supervisors are expected to provide a work environment where personnel feel safe and can report unethical or improper behavior in complete confidence without fear of retaliation. Retaliation against any employee that reports a concern is not tolerated.

Pace® has engaged Lighthouse Services, Inc. to provide personnel with an anonymous reporting process available to them 24 hours a day/7 days per week. The alert line may be used by any employee to report potential violations of the company's ethics and data integrity program. Reports are forwarded to Pace® leadership to investigate and resolve the matter. Investigations concerning data integrity are kept confidential.

See COR-POL-0001 *Compliance Alertline* for more information.

Posters and flyers with the compliance alert line information must be prominently posted in each PAS location for personnel reference.

Compliance Alert Line Information:

4.2.3 Management Commitment: Quality Management System

Evidence of management's commitment for the development, maintenance, and on-going improvement of the QMS is provided by the application of their signature of approval to the template and/or manual. Their signature confirms they understand their responsibility to implement the QMS outlined in this manual, to communicate the quality program to personnel, and to uphold requirements of the program during work activities.

4.2.4 Management Commitment: Customer Service

Management communicates the importance of meeting customer and regulatory requirements to personnel by training personnel on the QMS outlined in this manual, implementing the QMS outlined in this manual, and upholding these requirements for all work activities.

COPYRIGHT © 2019-2023 Pace® Analytical Services, LLC.

4.2.5 Supporting Procedures

References to processes and procedures that support the QMS are included throughout this manual. The structure of the document management system is outlined in SOP ENV-SOP-CORQ-0015 *Document Management* and summarized in the following subsections.

4.2.5.1 Quality Management System Document Structure

Documents associated with the QMS are classified into document types that identify the purpose of the document and establish how the document is managed and /or controlled.

Examples: Types of PAS Internally Created Documents

Document Type	Purpose
Quality Manual	Outlines the PAS QMS and structure and how it works for a system including policy, goals, objectives and detailed explanation of the system and the requirements for implementation of system. Includes roles and responsibilities, relationships, procedures, systems, and other information necessary to meet the objectives of the system described.
Policy	Provide requirements and rules for a process and is used to set course of actions and to guide and influence decisions. Policy describes the "what," not the "how."
Standard Operating Procedure	Provide written and consistent set of instructions or steps for execution of a routine process, method, or set of tasks performed. Assures that activities are performed properly in accordance with applicable requirements.
Standard Work Instruction	Provide step by step visual and/or written instruction to perform a specific task to improve competency, minimize variability, reduce work injury and strain, or to boost efficiency and quality of work (performance). SWI are associated with an SOP unless the task described is unrelated to generation of or contribution to environmental data or analytical results.
Template	Pre-formatted document that serves as a starting point for a new document.
Guide	Assists users in using a particular product; or a technical interpretation of a method or process by which PAS locations must abide.
Form / Worksheet	Used for a variety of purposes such as to provide a standardized format to record observations, to provide information to supplement an SOP.

Examples: Types of External Documents used by PAS

Certificate	Lists parameters, methods, and matrices for which the location is certified/accredited to perform within the authority of the issuing regulatory agency or accreditation body.
Reference Document	Provide information, protocol, instructions, and/or requirements. Issued by the specifier. Examples include ISO/IEC, TNI, DoD/DOE and published referenced methods such as Standard Methods, ASTM, SW846, EPA, and federal and state regulatory bodies.
Project Document	Provides requirements necessary to meet individual client expectations for intended use of data. Examples include project quality assurance plans (QAPP), client-program technical specifications, contracts, and other agreements.

Project documents are managed as external documents and any requirements for work specified is followed when work for the project is performed. If the project document is less stringent than the PAS QMS, policies, or SOPs, and/or is less stringent than applicable federal or state requirements, PAS locations are still required to meet the minimum requirements of the PAS QMS and any applicable statutory or federal requirements in addition to the requirements specified in the project

COPYRIGHT © 2019-2023 Pace® Analytical Services, LLC.

document. Information and requirements from project documents are not incorporated into PAS policy or SOPs in order to maintain client confidentiality.

Document types are ranked to identify which documents takes precedence when there is an actual or perceived conflict between documents and to establish the hierarchal relationships between documents. The ranking system also provides information to document writers and reviewers to assure downline documents agree with documents of higher rank.

PAS Document Hierarchy

Rank	Document Type
1	External Reference Documents (Standards, Test Methods)
2	Quality Manual Template
3	Corporate & Division Policy
4	Corporate & Division SOP
5	Division SWI, Guides, Forms/Worksheets
6	Local Quality Manual
7	Local SOP
8	Local SWI, Guides, Forms/Worksheets

4.2.6 Roles and Responsibilities

The roles and responsibilities for technical management and the quality manager is provided in section 4.1.5.2.

4.2.7 Change Management

When significant changes to the PAS QMS are planned, these changes are managed by corporate quality personnel to assure that the integrity of the QMS is maintained.

4.3 Document Control

4.3.1 General

PAS uses electronic document management software (eDMS) to control documents that support the PAS QMS. eDMS provides centralized distribution and access to all documents used by PAS. All PAS locations must use the PAS eDMS system unless an exemption to this requirement has been granted by the PAS Corporate Quality Director.

eDMS automates the process for unique document identification, version control, approval, access, and archival and restricts access to archived documents except to authorized users to prevent the use of obsolete documents.

The local QM maintains a master list of controlled documents used at each location. The master list minimally includes the document control number, document title, and current revision status and is made available to personnel for their reference.

See SOP ENV-SOP-CORQ-0015 *Document Management* for more information.

COPYRIGHT © 2019-2023 Pace® Analytical Services, LLC.

4.3.2 Document Approval and Issue

Documents that support the QMS are reviewed by qualified personnel and approved by management prior to release for use.

Only the approved versions of documents are available to personnel for use unless a draft document is authorized by management.

The managers responsible for authorization of each document is specific to the document type.

See SOP ENV-SOP-CORQ-0015 *Document Management* for more information.

4.3.3 Document Review and Change

Unless a more frequent review is required by regulatory, certification or accreditation program documents are reviewed at least every two years to ensure the documents remain current, appropriate, and relevant.

Documents are also informally reviewed every time the document is used. Personnel are expected to refer to and follow instructions in controlled documents when they conduct their work activities. Consequently, any concerns or problems with the document should be caught and brought to the attention of management on an on-going basis.

Documents are revised whenever necessary to ensure the document remains usable and correct. Older document versions and documents no longer needed are made obsolete and archived for historical purposes.

PAS does not allow hand-edits of documents. If an interim change is needed pending re-issue of the document, the interim change is communicated to those that use the document using a formal communication channel, such as change in progress form, email, or memorandum.

The document review, revision, and archival process is managed by quality personnel at the location from which the document was released using the procedures established in SOP ENV-SOP-CORQ-0015 *Document Management*.

4.4 Analytical Service Request, Tender, and Contract Review

PAS management and/or client service personnel perform thorough reviews of requests and contracts for analytical services to verify the location(s) performing the work has the capability, capacity, and resources necessary to successfully meet the customer's needs. These review procedures are described in SOP ENV-SOP-WES2-0125 Review of Analytical Requests.

The procedures in this SOP(s) are established to ensure:

- The PAS location(s) performing the work understand the purpose of data collection in order to ensure the test methods requested are appropriate for the intended use of the data and capable of meeting the client's data quality objectives;
- PAS locations and any external subcontractor(s) have the capability, capacity, and resources to meet the project requirements and expectations within the requested time for delivery of work product;
- Any concerns that arise from review are discussed and resolved with the client;

COPYRIGHT © 2019-2023 Pace® Analytical Services, LLC.

- Any discrepancies between the PAS QMS, statutory or regulatory requirements and the client request are resolved; and
- The results of review and any correspondence with the client related to this process and/or any changes made to the contract are recorded and retained for historical purposes.

Capability review confirms that the PAS locations contracted to perform the work and any internal or external subcontractors hold required certification/accreditation for the test method, matrix, and analyte and verifies the location can achieve the client's target compound list and data quality objectives (DQOs) for analytical sensitivity and reporting limits, QA/QC protocol, and hardcopy test report and electronic data deliverable (EDD) formats.

Capacity review verifies that the in-network locations and any potential subcontractors are able to manage the sample load and deliver work production within the delivery time requested.

Resource review verifies that the location and any potential subcontractors have adequate qualified personnel with the skills and competency to perform the test methods and services requested and sufficient and proper equipment and instrumentation needed to perform the services requested.

Customers must be notified when there is a deviation from the contract after acceptance of the contract by both parties. Instructions for this notification process must be included in the laboratory's SOP for this process.

4.5 Subcontracting (Internal and External)

The terms 'subcontract' and "subcontracting" refers to analytical work done by an organization external to Pace® (External Subcontracting) or by a Pace® location with an address different than the address listed on the cover page of the test report (Internal Subcontracting).

The PAS network offers comprehensive analytical capability and capacity to ensure Pace® can meet a diverse range of client needs for any type of project. If a PAS laboratory receives a request for analytical services and it cannot fulfill the project specifications, the location's client services team will collaborate with the client to place the work within the PAS network.

When it is not possible to place the work within network, the location will, with documented client approval, subcontract the work to a subcontractor that has the capabilities to meet the project specifications and can meet the same commitment agreed on between the location and the client.

Whenever work is subcontracted, the PAS location responsible for management of the project verifies each of these qualifications:

- The internal or external subcontractor has the proper accreditation/certifications required for the project and these are current; and
- The use of the internal or external subcontractor is approved by the client and/or regulatory agency when such approval is required by the customer. Record of customer approval is retained in the project record.

External subcontractors selected by Pace® must be pre-qualified by quality personnel to verify their QMS is similar to Pace® and complies with all relevant Standards such, as ISO/IEC 17025 and the TNI Standard(s) and/or federal and state regulatory requirements. The list of approved subcontractors for each location is maintained by local quality personnel. Pre-qualification of a subcontractor does not eliminate the requirement for the PAS location placing work to verify the

COPYRIGHT © 2019-2023 Pace® Analytical Services, LLC.

subcontractor has the certifications, capability, capacity, and resources to perform work on behalf of Pace® on a project-specific basis.

For all subcontracted work, the PAS location placing the work internally or externally is responsible to ensure project specifications are always communicated to and understood by the subcontractor.

4.6 Purchasing Services and Supplies

Vendors that provide services and supplies to PAS are qualified to meet the needs of Pace®. These needs include but are not limited to competitive pricing, capacity to fill purchase orders, quality of product, customer service, and business reputation and stability. Evidence of this qualification is the availability to purchase services and supplies from the vendor in the corporate purchasing system.

PAS locations may purchase goods and services from any supplier in the purchasing system.

The specifications (type, class, grade, tolerance, purity, etc.) of supplies, equipment, reagents, standard reference materials and other consumables used in the testing process are specified in SOPs. The SOP specifications are based on the governing requirements of the approved reference methods and any additional program driven regulatory specification, such as drinking water compliance.

All requisitions for materials and consumables are approved by local management who is responsible for ensuring the services and supplies procured and received are fit for intended use.

4.7 Customer Service

Project details and management is managed by PAS client services personnel.

4.7.1 Commitment to Meet Customer Expectations

PAS personnel collaborate closely with our customers to ensure their needs are met and to establish their confidence in the capability of PAS to meet their needs for analytical services and expectations for service.

The project manager (PM) is the customer's primary point of contact for each analytical service request (work order). The PM gathers information from the customer to ensure the details of their request are understood. After samples are received, the PM monitors the progress of the project and alerts the customer of any delays or excursions that may adversely impact data usability. Supervisors are expected to keep the PM informed of project status and any delays or key issues, so that the PM can keep the client informed.

PAS encourages customers to visit our locations to learn more about the capabilities, observe performance and to meet personnel.

PAS customers expect confidentiality. Personnel will not divulge or release information to a third party without proper authorization unless the information is required for litigation purposes. See Section 4.1.5.4 of this manual and policy COR-POL-0004 *Code of Ethics and Professional Conduct* for more information on the policy for client confidentiality.

4.7.2 Customer Feedback

PAS actively seeks positive and negative feedback from customers through surveys and direct communication. Information from the client about their experience working with PAS and their satisfaction with work product is used to enhance processes and practices and to improve decision making. Customer feedback is reviewed to identify risk and opportunity. Corrective,

COPYRIGHT © 2019-2023 Pace® Analytical Services, LLC.

preventive, or continuous improvement actions are taken based on nature of and/or feedback trends.

Also see sections 4.9, 4.10, 4.11, 4.12, 4.14, and 4.15 for more information about how customer feedback is managed by PAS and used to enhance the QMS.

4.8 Complaints

Per ISO/IEC 17025:2017, a complaint is a formal expression of dissatisfaction with the performance of a service or product originating from a party external to the organization. PAS believes complaints provide opportunities to improve processes and/or build stronger working relationships with our clients.

The PAS complaint resolution process is specified in corporate SOP ENV-SOP-CORQ-0020 and all PAS locations are required to use this SOP as their process.

Complaints are thoroughly reviewed to determine if it is valid. If the complaint is valid, action is taken to resolve the situation with the customer. In accordance with ISO/IEC 17025 requirements, the response to the customer is independently reviewed before it is given to ensure the response from PAS is thorough and proper for the situation.

Complaint information is captured in a centralized database and the data is used by PAS management personnel to identify trends and opportunities for improvement during Annual Management Review - See Section 4.15 for more information about annual management review.

4.9 Nonconforming Work

4.9.1 Definition of Nonconforming Work

Nonconforming work is work that does not conform to customer requirements, standard specifications, policies, and procedures, or that does not meet acceptance criteria.

The discovery of non-conforming work comes from various sources which include, but are not limited to:

- results of quality control samples and instrument calibrations;
- quality checks on consumables and materials;
- general observations of personnel;
- data review;
- proficiency testing;
- internal and external audits;
- complaints and feedback;
- management review and reports; and
- regulatory and certification and accreditation actions.

The way in which the laboratory or service center manages nonconforming work depends on the significance and impact (risk) of the issue. Some issues may simply require correction, others may require investigation, corrective action (See 4.11) and/or data recall (See 4.16).

COPYRIGHT © 2019-2023 Pace® Analytical Services, LLC.

When the location releases data and test results associated with nonconforming QC and acceptance criteria, test results are qualified, or non-conformances are noted in the final analytical report to apprise the data user of the situation. (See 5.10)

Nonconforming work also includes unauthorized departure from policies, procedures, and test methods. Authorized departures are explained in the following subsections. Situations that do not conform to these conditions are considered unauthorized departure(s).

4.9.1.1 Authorized Departure from SOPs

Departures from an SOP may sometimes be necessary to correct an error in an SOP or to resolve a complex problem. For example, to mitigate complex matrix interference.

An authorized departure from a test method SOP is one that has been reviewed and approved by the department leader, however named, of the work area in which the test method is performed. The leader, when authorizing a departure from an SOP, accepts full responsibility to ensure the departure does not conflict with Pace® or PAS policy or procedure, does not affect statutory, regulatory or program compliance and does not adversely affect data integrity or usability.

Departure from administrative or process-oriented SOPs must be approved by the local QM.

Documentation of the reason for the SOP departures must be retained with management approval. Approved departures from test method SOPs should be noted in the final test report to advise the data user.

See SOP ENV-SOP-CORQ-0016 *SOP for SOPs and SWI*, for more information.

4.9.1.2 Authorized Departure from Test Methods (Method Modifications)

When test results are associated to a published reference test method, the location's test method SOP must be consistent with the test method. If the test method is mandated for use by a specific regulatory program such as drinking water, wastewater or a certification or accreditation program, such as TNI/NELAC, the SOP must comply with or include these requirements, or the resulting data and test results cannot be used for regulatory compliance purposes.

If the procedures in the SOP are modified from the test method, these modifications must be clearly identified in the SOP. The conditions under which the location may establish an SOP that is modified from these reference methods or regulatory program and what is considered a modification are specified in ENV-SOP-CORQ-0011 *Method Validation and Instrument Verification.*

Client requests to deviate from the test method are managed as client requests to depart from the test method SOP since it is the SOP that the location follows when performing work.

COPYRIGHT © 2019-2023 Pace® Analytical Services, LLC.

4.9.1.3 Stop Work Authority

Stop Work Authority provides PAS personnel with capability to temporarily stop work when there is a perceived unsafe condition or situation that may affect data integrity or the safety of personnel.

All personnel have the authority to initiate and request a stop work order when necessary to preserve data integrity or safety of workers.

The need for the stop work order and resolution of the problem must be confirmed by subject matter experts and resumption of work must be approved as follows:

- For stop work orders related to environmental health and safety (EHS) and/or waste management, the decision to stop work may be made in real time to protect the safety of the worker. Actions taken to correct the problem and lift the stop work order are made by the EHS Director, or the deputies assigned to these positions.
- Any employee may request a temporary stop work order for concerns related to data integrity. However, the request must be reviewed and the need to stop work affirmed by the Quality Manager to confirm the concern is valid. The decision to uphold the stop work order must be made jointly by the local QM, the QPM, the GM or DLO, and the VPO. The Corporate Quality Director and Chief Technical Officer, and other members of PAS management are consulted as needed. The actions taken to correct the problem and authorization to lift the stop work order are made by the same management team.

4.10 Continuous Improvement

The PAS QMS is designed to achieve continuous improvement through the implementation of the quality policy and objectives outlined in this manual. Information about laboratory and service center activities and performance is gained from sources such as customer feedback, audits, QC, trend analysis, business analytics, management reports, proficiency testing, and management systems review. This information is subsequently used during the corrective action (see section 4.11) and preventive action (see section 4.12) processes and during annual review of the management system (see section 4.15) to establish goals and objectives for improvement.

PAS also promotes a continuous improvement culture based on the principles of lean manufacturing. These principles include 3P (Process, Productivity, Performance) and Kaizen. 3P is a platform used by Pace to share best practices and standardization across the network to achieve operational excellence. Kaizen is a team-based process used to implement tools and philosophies of lean to reduce waste and achieve flow with the purpose of improving both external and internal customer satisfaction. All activities of 3P and Lean must conform with the requirements of this quality manual and supporting policies and procedures.

4.11 Corrective Action

Corrective action is a process used to eliminate the cause of a detected nonconformity. It is different from a correction. A correction is an action taken to fix an immediate problem but that does not resolve the underlying cause of why the problem occurred. The objective of corrective action is to find the underlying cause(s) of the problem and to put in place fixes to prevent the problem from

COPYRIGHT © 2019-2023 Pace® Analytical Services, LLC.

happening again. The corrective action process, referred to as CAPA, is one of the most effective tools used by PAS to prevent nonconforming work, identify risk and opportunity, and improve service to our customers.

PAS has two general processes for corrective action, the application of which process is used depends on the type of nonconformity.

Quality control (QC) exceptions (nonconformance) that occur during routine testing is investigated through troubleshooting and required actions for correction is specified in policies and SOPs. When action is not taken, cannot be taken, or is not successful, test results associated with the nonconforming work are qualified in the final test report. Documentation of the nonconformance and corrective action taken is documented in the analytical record.

A 7-stage corrective action process is used when there is a recurring problem. These problems are identified through various activities such as but not limited to quality control trends, internal and external audits, management review, customer feedback, and general observation.

The 7 Stage CAPA Process for PAS includes:

1) Identification and Containment
2) Evaluation
3) Investigation
4) Cause Analysis
5) Action Plan
6) Implementation
7) Follow Up and Effectiveness Review

PAS procedures for corrective action are specified in corporate SOP ENV-SOP-CORQ-0018, *Procedure for Corrective and Preventive Action*. Some key concepts and activities related to the PAS corrective action process is provided in the next three subsections.

4.11.1 Cause Analysis (AKA Root Cause Analysis)

Cause analysis is the process of investigation used to identify the underlying cause(s) of the problem. After causal factors are identified, ways to mitigate the causal factors are identified and action(s) most likely to eliminate these factors are taken.

PAS uses different methods to conduct cause analysis. The most common approach is 5-Why, 4M, Fishbone Diagrams, or brainstorming may be appropriate depending on the situation. The method used is case specific and is documented in the CAPA record.

4.11.2 Effectiveness Review

Monitoring corrective actions for effectiveness is an essential part of the corrective action process. Effectiveness means the actions taken were appropriate and sustainable. Appropriate means the action(s) taken prevented recurrence of the problem since the time corrective action was taken and sustainable means the actions taken are still in place.

The data from CAPA records are used by PAS to identify opportunities for preventive action or to gain lessons learned when actions taken were not adequate to solve the problem. See Section 4.12 (Preventive Action) and 4.15 (Management Review) for more information.

COPYRIGHT © 2019-2023 Pace® Analytical Services, LLC.

4.11.3 Additional Audits

When cause analysis and investigation of a problem casts doubt on compliance with PAS policies, procedures, or to regulatory requirements; a special audit of the area of activity may be performed as part of the corrective action process. These special audits are used to determine the scope of the problem and to provide information for the CAPA process. Additional full-scale audits are done when a grave issue or risk to the business is identified.

4.12 Preventive Action

Preventive action(s) are actions taken to eliminate the cause of a potential nonconformity before it happens.

Some examples of preventive action include, but are not limited to:

- Routine instrument maintenance (Preventive maintenance)
- Addition of Staff and Equipment
- Professional Development Activities
- Implementation of New Technology

PAS looks for opportunities for preventive action from a variety of sources including employee idea's, customer feedback, business partners input, trend analysis, business analytics, management reviews, proficiency testing results, and risk-benefit analysis.

PAS management evaluates the success of preventive actions taken in any given year during annual management review. See Section 4.15 for more information.

4.12.1 Change Management

Preventive actions may sometimes result in significant changes to processes and procedures used by PAS locations. PAS management evaluates the risks and benefits of change and includes in its implementation of change process, actions to minimize or eliminate any risk. The types of changes for which risk are considered and managed include infrastructure change, change in analytical service offerings, certification or accreditation status, instrumentation, LIMS changes, and changes in key personnel.

4.13 Control of Records

PAS records document activities and provide evidence of conformity to the requirements established in the QMS. These records may be hardcopy or electronic on any form of media.

4.13.1 General Requirements

4.13.1.1 Procedure

PAS requirements for control of records are specified in corporate policy ENV-POL-CORQ-0013 *Record Managemen*t.

The policy was established to assure quality and technical records are identified, retained, indexed, and filed to allow for retrieval during the entire retention time. During storage, records are kept secure and protected from deterioration. At the end

COPYRIGHT © 2019-2023 Pace® Analytical Services, LLC.

of the retention time, the records are disposed of properly in order to maintain client confidentiality and to protect the interests of the company.

In general, PAS records fall into three categories: quality, technical, and administrative.

Examples of each are provided in the following table:

Record Type	Includes Records of:
Quality	Audits: Internal and External Certificates and Scopes of Accreditation Corrective & Preventive Action Management Review Data Investigations Method Validation Instrument Verification Training Records
Technical	Raw Data Logbooks Certificates of Traceability Analytical Record Test Reports & Project Information Technical Training Records & Demonstration of Capability
Administrative	Personnel Records Finance/Business

4.13.1.2 Record Legibility and Storage

Records are designed to clearly identify the information recorded. Manual entries are made in indelible ink; automated entries are in a typeface and of sufficient resolution to be read. The records identify personnel that performed the activity or entered the information. Records are archived and stored in a way that they are retrievable. Access to archived records is controlled and managed.

For records stored electronically, the capability to restore or retrieve the electronic record is maintained for the entire retention period. Hardcopy records are filed and stored in a suitable environment to protect from damage, deterioration, or loss. Hardcopy records may be scanned to PDF for retention. Scanned records must be checked against the hardcopy to verify the scan is complete and legible.

Administrative records are kept for a minimum of 5 years and technical and quality records are kept for 10 years unless otherwise specified by the client or regulatory program.

The date from which retention time is calculated depends on the record. In general, the retention time of technical records of original observation and measurement is calculated from the date the record is created. If the technical record is kept in a chronological logbook, the date of retention may be calculated from the date the logbook is archived. The retention time of test reports and project records, which are considered technical records, is calculated from the date the test report was issued.

COPYRIGHT © 2019-2023 Pace® Analytical Services, LLC.

The retention time of quality records is usually calculated from the date the record is archived.

Refer to the record management policy and the location specific SOP for more information.

4.13.1.3 Security

PAS locations are secure facilities and access to records is restricted to authorized personnel.

4.13.1.4 Electronic Records

The data systems used to store electronic records is backed up in accordance with SOP ENV-SOP-WES2-0115, *Computer System Backup Control*. Access to archived records stored electronically is maintained by personnel responsible for management of the electronic system.

4.13.1.5 Electronic Signature Policy

Work done by PAS locations include activities that require the application of a signature. Some work products are in electronic format and signatures are applied electronically.

The Electronic Signatures in Global and National Commerce Act (E-Sign Act) clarifies that electronic signatures are legally valid and enforceable under United States law.

See guide ENV-GUI-CORQ-0007 *Electronic Signatures* for more information.

4.13.2 Technical Records

In addition to the requirements specified in subsections 4.13.1.1 through 4.13.1.5, the requirements in the following subsections also apply to technical records.

4.13.2.1 Description

Technical records are the accumulation of data and information generated from the analytical process. These records may include forms, worksheets, workbooks, checklists, notes, raw data, calibration records, final test reports, and project records. The accumulated record needs to provide adequate detail to historically reconstruct the process and identify the personnel that performed the tasks associated with a test result.

4.13.2.2 Real Time Recordkeeping

Personnel are instructed and expected to always record observations, data, and calculations at the time they are made. PAS managers are responsible for ensuring that data entries, whether made electronically or on hardcopy, are identifiable to the task.

4.13.2.3 Error Correction

Errors in records must never be erased, deleted, or made illegible. Use of correction fluid, such as white-out is prohibited. In hardcopy records, the error is corrected by a

COPYRIGHT © 2019-2023 Pace® Analytical Services, LLC.

single strike through the original entry and the new entry recorded alongside or footnoted to allow for readability. Corrections are initialed and dated by the person making the correction. If the correction is not self-explanatory, a reason for the correction is recorded. Maintenance of proper practices for error correction is monitored through the tiered data review process described in Section 5.9.3.

For electronic records, equivalent measures of error correction or traceability of changes made is kept. For example, audit trails provide records of change.

4.14 Audits

Quality personnel, or their designees, perform internal systems and technical audits to assess implementation of the QMS and compliance to this manual, policy, and procedures that make up the QMS.

PAS locations are also audited by external parties such as regulatory agencies, customers, consultants, and non-government assessment bodies (NGAB).

Information from internal and external audits is used by local and corporate PAS management to address deficiencies and to identify opportunities to improve customer service and quality of work, including reliability and usability of data and test results.

Deficiencies, observations, and recommendations from audits are managed by the local QM using the CAPA process. See Section 4.11 for more information.

4.14.1 Internal Audit

Internal audits are conducted to ensure laboratory and business practices match what we say we do and what we say we do is compliant with the PAS QMS and relevant standards and requirements.

The internal audit program is managed by the local QM who prepares an audit plan at the beginning of each calendar year. The schedule is prepared to assure that all work areas are reviewed over the course of the year and test methods are audited every two years, unless a more frequent test method audit is required by program. Conformance to the schedule is monitored on a monthly basis.

PAS management is responsible for ensuring the audit schedule is maintained. PAS supervisors are expected to cooperate with the quality personnel to provide them with complete access to the work area, personnel, and records needed to conduct the audit.

Internal audits may be performed by non-quality personnel when the auditor is approved by the local QM. Non-quality personnel may not audit their own work activities unless it can be demonstrated that an effective and objective audit will be conducted. The person conducting the audit must be trained, qualified, and familiar enough with the objectives and policies of the PAS QMS and knowledgeable with process and test method SOPs related to the activities audited. The auditor should be trained in auditing practices in order to perform a thorough and effective evaluation.

Test method audits include reviews of test reports to verify the product is consistent with customer/project requirements, the work was conducted in accordance with policy and SOPs, the SOP complies with the cited reference method, test results are accurate, and of known and documented quality and properly qualified, when necessary.

COPYRIGHT © 2019-2023 Pace® Analytical Services, LLC.

Special audits are performed as needed to follow up on a specific issue such as a client complaint, negative feedback, concerns of data integrity or ethics, or a problem identified through other audits. Special audits may be scheduled or unscheduled. Unscheduled internal audits are conducted whenever doubts are cast on compliance with regulatory requirements or its own policies and procedures. These unscheduled internal audits may be conducted at any time and may be performed without an announcement to the location or work area audited.

When observations and findings from any audit (internal or external) cast doubt on the validity of testing results, the location takes immediate action to investigate the problem and take corrective action. (Also see 4.11 and 4.16)

4.14.1.1 Corporate Compliance Audit

PAS locations may also be audited by Pace® corporate personnel at discretion. The purpose of the corporate compliance audit is to assess whether the location's practices, processes and procedures conform with the PAS QMS and to identify risk and opportunity.

4.15 Management Review

Local management conducts an annual business review of each location under their purview to assess performance and to establish goals, objectives, and action plans for the upcoming year.

The procedure used to conduct this review is specified in corporate SOP ENV-SOP-CORQ-0005 *Management Review*.

At a minimum, the following topics are reviewed and discussed during annual management review:

- Changes in internal and external issues relevant to the location;
- Fulfillment of objectives and initiatives;
- suitability of policies and procedures, including EHS and waste management;
- status of actions from previous performance reviews;
- The outcome of recent internal audits;
- Corrective and preventive actions;
- Assessments by external bodies;
- The results of interlaboratory comparisons or proficiency tests;
- Changes in the volume and type of the work;
- Customer and personnel feedback, including complaints;
- Effectiveness of improvements / preventive actions made since last review;
- Adequacy of resources;
- results of risk identification;

COPYRIGHT © 2019-2023 Pace® Analytical Services, LLC.

- Proficiency testing performance and other measures related to the assurance of validity of test results; other relevant factors, such as QC trends and training status.

The discussion and results of this review are documented in a report prepared by local management. This report includes a determination of the effectiveness of the management system and its processes, goals, and objectives for improvements in the coming year with timelines and responsibilities, and any other need for change.

Goals and action items from annual management systems review are shared with local employees and with corporate management to highlight focus areas for improvement in addition to areas in which the location has excelled.

4.16 Data Integrity

PAS procedures for the investigation and response to events that may affect data integrity are described in the PAS corporate SOP ENV-SOP-CORQ-0017 *Data Impact Assessment*s.

Customers whose data are affected by the problem are notified in a timely manner, usually within 30 days after the impact of the problem is understood. Some accreditation programs also require notification to the accreditation body (AB) within a certain timeframe from date of discovery. PAS locations must follow any program or project specific requirements for notification, when applicable.

5.0 TECHNICAL REQUIREMENTS

5.1 General

Multiple factors contribute to the correctness and reliability of the technical work performed by PAS.

These factors fall under these broad categories:

- Human Performance
- Facility and Environmental Conditions
- Test Method Performance and Validation
- Measurement Traceability
- Handling of Samples

The impact of each of these factors varies based on the type of work performed. To minimize negative effects from each of these factors, PAS accounts for the contribution from each of these categories when developing test method and process (administrative) SOPs, evaluating personnel qualifications and competence, and in the selection of equipment and supplies used.

5.2 Personnel

5.2.1 Personnel Qualifications

PAS personnel are qualified and competent to perform the roles and responsibilities of their position based on education, experience, and training.

Qualifications, duties, responsibilities, and authorities of each position are specified in job descriptions maintained by corporate HR (See Section 5.2.4). These job descriptions provide the general basis for the selection of personnel for hire and are used by the location to

COPYRIGHT © 2019-2023 Pace® Analytical Services, LLC.

communicate to personnel the duties, responsibilities, and authorities of their position. Qualification records may include but are not limited to diploma, transcripts, and curriculum vitae (CV).

The term "personnel" refers to individuals employed by PAS or a PAS subsidiary directly as full-time, part-time, or temporary, and individuals employed by PAS by contract, such as through an employment agency. The term "personnel" is used interchangeably with the term "employee" throughout this manual. For the purposes of this manual, these terms are equivalent.

5.2.1.1 Competence

Competence is the ability to apply a skill or series of skills to complete a task or series of tasks correctly within defined expectations.

PAS requirements for competence of personnel (education, qualification, work experience, technical skills, and responsibilities) are specified in job descriptions created by management and kept by human resources (HR). The job description provides the basis for the selection of personnel for each position.

An employee is considered competent when they have completed the required training specified in Section 5.2.2.

5.2.2 Required Training

Training requirements are outlined in Pace® policies COR-POL-0023 *Mandatory Training Policy,* COR-POL-0004 *Code of Ethics and Professional Conduct* and this Quality Manual.

5.2.2.1 Training Program

The PAS training program includes these elements:

- Scheduling
- Execution
- Documentation
- Evaluation of Effectiveness

Training is scheduled by corporate personnel, local quality personnel, and the employee's direct supervisor.

Training is delivered using various methods that incorporate techniques that appeal to the four main learning styles: visual, aural, linguistic, and kinesthetic. Delivery methods include, on-the-job (OJT), instructor-led, self-study, eLearning, and blended.

Training must be documented with a training record to prove training occurred. Required training (Section 5.2.2.1.1-5.2.2.1.5) must be complete before the employee is authorized to work independently on client samples. Complete means the employee has successfully completed training and evidence of training is filed in the employees training record maintained by the corporate training group, the corporate group that assigned training, such as IT, HR, or EHS, and/or and the local quality department.

The employee's direct supervisor is responsible for monitoring completion of the employee's required training program and for providing adequate time to the

COPYRIGHT © 2019-2023 Pace® Analytical Services, LLC.

employee to complete training assignments. The supervisor and employee are jointly responsible to ensure the employee's training status and training records for all required training is current, complete, documented and the training records are accessible.

Until the required training is complete, the employee's direct supervisor is responsible and accountable for all work produced by the employee under their supervision.

Training status is tracked by local quality personnel and made readily available to all employees so they can access and monitor their status in real time.

The following subsections specify the required PAS training for new hires and requirements for on-going training.

5.2.2.1.1 New Hire Required Training

New hire training requirements apply to personnel new to Pace® and to existing employees starting in a new position or different work area.

Required new hire training includes each of the following topics:

- Ethics and Data Integrity (5.2.2.1.3)
- Quality Management System Policy and Procedure (5.2.2.1.4)
- Environmental Health and Safety (EHS)
- Demonstration of Capability (DOC) (5.2.2.1.5): Employees that prepare and test samples may also be required to successfully complete a DOC for the test method they are assigned before working independently on customer samples and to verify capability on a routine basis thereafter. Independent means without direct supervision of the work activity by the supervisor or a qualified trainer.

5.2.2.1.2 On-Going Required Training

All personnel receive on-going training on each of the following topics:

- Ethics and Data Integrity
- Quality Management System Policy and Procedure
- EHS

5.2.2.1.3 Ethics and Data Integrity

Ethics and data integrity training is provided to all new personnel upon hire and refresher training is provided to all employees minimally on an annual basis and more frequently as needed.

The training materials emphasize expectations, what to do, what not to do and the potential consequences that result from scientific misconduct and improper practices. Employees are informed that Pace® has a Zero Tolerance Policy for scientific misconduct, improper practices, and fraud. The employment of any employee found to have conducted, sanctioned,

COPYRIGHT © 2019-2023 Pace® Analytical Services, LLC.

or instructed an employee to engage in these infractions will be terminated and the employee may be subject to debarment, and civil/criminal prosecution.

The following topics are covered:

- Pace® Policy for honest, transparent, and objective reporting of test results and data;
- Practices that are considered scientific misconduct, fraudulent and improper;
- How and when to report data integrity concerns or ethical violations;
- Record Keeping. The training emphasizes the importance of accurate, complete, and legible documentation of work activities;
- Procedures used by Pace® to prevent and monitor for infractions;
- Specific examples of breaches of ethical behavior such as improper data manipulations, adjustments of instrument time clocks, and inappropriate changes in concentrations of standards.

See COR-POL-0004 for more information.

5.2.2.1.4 Management System Documents Training

The primary documents that support the PAS QMS include the Quality Manual, policies, and SOPs.

These documents specify what we do, how, and why and are the documents all employees must abide. The employee's commitment to abide by these documents is acknowledged with a Read and Acknowledgement Attestation (R&A). PAS employees must have a R&A on record for the local Quality Manual, and the policies and SOPs relevant to their job responsibilities. The R&A acknowledges the employee has received, read, and understands the content of the management system document, the employee agrees to follow any instructions and requirements specified in the document when carrying out their work tasks; and the employee understands that unauthorized changes or departure from procedures and requirements specified in the documents not allowed unless authorized, documented and disclosed.

Other documents that support the management system include forms and worksheets that record original observations and/or calculate test results, guides, project-specific documents, or other reference materials. Employees are not required to have a R&A for these types of documents – how to use the document is learned on the job.

Employee understanding, application, and adherence to the content specified in management system documents is continuously reinforced by

COPYRIGHT © 2019-2023 Pace® Analytical Services, LLC.

on-the-job (OJT) training and routine checks and balances, such as secondary data review and internal audits.

5.2.2.1.5 Demonstration of Capability (DOC) Requirements

A DOC is a procedure that establishes the ability of the analyst to perform a test procedure and obtain test results with acceptable accuracy and/or precision.

Newly hired employees that prepare or test samples are required to successfully complete an initial demonstration of capability (IDOC) for the test method before they are permitted to work independently on real world samples.

On-going demonstration of capability (ODOC) must be demonstrated on an annual basis thereafter.

The procedure for IDOC and ODOC can differ based on technology, analyte group and/or the regulatory or accreditation/certification program requirements that apply. In general, the options for ODOC are more flexible than for an IDOC on the premise that the analyst has routinely analyzed samples by the test method during the calendar year.

When more than 365 days (1 Year) has passed since the employee last analyzed real world samples by the test method; the employee must successfully redemonstrate capability with an IDOC to remain authorized to independently test real world samples.

A successfully complete DOC (IDOC or ODOC) is one where:

1) The DOC study data has been compiled, reviewed, and verified to meet acceptance criteria;

2) The DOC record has been approved by the department supervisor;

3) The DOC record has been verified complete by local quality personnel; and

4) The DOC record has been archived in the employee's training file for accessibility and reference.

If any of the above conditions is not met, the DOC is not complete.

Until the required training is complete, the employee's direct supervisor is responsible and accountable for all work produced by the employee under their supervision.

DOC procedures and acceptance criteria vary by program, technology, analyte group - therefore all options are not specified in this manual.

PAS locations must put in place a local DOC program appropriate for the testing services offered and that complies with relevant regulatory and/or accreditation/certification program requirements.

COPYRIGHT © 2019-2023 Pace® Analytical Services, LLC.

For example – an acceptable DOC program for laboratories accredited to the TNI Standard might look like this:

- A DOC for chemistry test methods where spiking is an option is based on the employee's capability to achieve acceptable precision and accuracy for each analyte accredited from a series (usually 4) of replicates that were spiked at a specific concentration, and prepared and analyzed using the laboratory's test method SOPs.
- A DOC for a test method where spiking is not an option is based on an employee's capability to achieve comparable results to a peer.
- Specific instructions and acceptance criteria for DOCs for each test method may be specified in the test method SOP or a stand-alone SOP for DOC.

5.2.2.2 Effectiveness of Training

Training effectiveness is measured by the employee's demonstrated ability to comprehend the training material and apply knowledge and skills gained to their job task. These evaluations include but are not limited to:

- Testing of the employee's knowledge of the QMS, policies, and technical and administrative procedures through various mechanisms, such as quizzes, and interviews.
- Demonstrated ability to convey information correctly and factually in written and verbal communication.
- Demonstrated ability to follow instructions and adhere to policy and procedure.
- Demonstrated ability to make sound decisions based on guidance and information available and to defend decisions made.
- Demonstrated initiative to seek help or guidance when the employee is unsure of how to proceed.

5.2.2.3 Supplemental Learning

Supplemental learning objectives may be established for newly hired personnel to aid in their development of administrative and technical skills. These learning objectives and materials, referred to as Learning Plans (LP), are managed by the employee's direct supervisor.

Pace® also offers a wide variety of supplemental learning courses that are made available to all employees for professional development. The learning may be self-initiated based on an employee's interest or may be assigned to the employee at the discretion of management as professional development as part of an employee's annual goals.

Supplemental learning assignments are not prerequisites for competency (Section 5.2.1.1) and are not included in the required training program.

COPYRIGHT © 2019-2023 Pace® Analytical Services, LLC.

5.2.3 Personnel Supervision

Every employee is assigned a direct supervisor, however named, who is responsible for their supervision.

General supervisory responsibilities may include but are not limited to:

- Hiring Employees
- Training Employees
- Performance Management
- Development, oversight, and execution of personnel training plans
- Monitoring personnel work product to assure the work is conducted in accordance with this quality manual, policies, SOPs, and other documents that support the QMS.

5.2.4 Job Descriptions

Job Descriptions that define the required education, qualifications, experience, skills, roles and responsibilities, and reporting relationships for each Pace® position are established by top management and kept by corporate HR. The job descriptions apply to employees who are directly employed by Pace®, part-time, temporary, technical, and administrative and by those that are under contract with Pace® through other means.

The job descriptions include the education, expertise, and experience required for the position and the responsibilities and duties, including any supervisory or managerial duties assigned to the position.

5.2.5 Authorization of Technical Personnel

Technical personnel are authorized to perform the technical aspects of their position after laboratory management has verified that the employee meets the qualifications for the position, and has successfully completed required training (Section 5.2.2.1). After initial authorization, technical personnel are expected to maintain a current and complete training record, demonstrate on-going capability at least annually for each test method performed, and produce reliable results through accurate analysis of certified reference materials, proficiency testing samples, and/or routine quality control samples in order to remain authorized to continue to perform their duties.

Records used to support authorization which may include but are not limited to, transcripts, resumes, training records, experience, training, and certificates are kept by the PAS location or business function to which the employee is assigned, if the employee is in a role that support more than one location or business unit.

5.3 Accommodations and Facilities

5.3.1 Facilities

PAS facilities are designed to support the activity performed. Access to PAS facilities is controlled by various measures, such as card access, locked doors, and staffed main entry.

COPYRIGHT © 2019-2023 Pace® Analytical Services, LLC.

5.3.2 Environmental Conditions

Each location is equipped with energy sources, lighting, heating, and ventilation necessary to facilitate proper and safe performance of calibrations and tests. Local management ensures that housekeeping, electromagnetic interference, humidity, line voltage, temperature, sound, and vibration levels are appropriately controlled to ensure the integrity of specific measurement results and to prevent adverse effects on accuracy or increases in the uncertainty of each measurement.

Environmental conditions are monitored, controlled, and recorded as required by the relevant specifications, methods, and procedures. Operations are stopped if it is discovered that the environmental conditions would jeopardize the integrity of analytical results or other work products.

5.3.3 Separation of Incompatible Activities

The layout and infrastructure of each work area including air handling systems, power supplies, and gas supplies of each work area are designed for the type of analytical activity performed. Effective separation between incompatible work activities is maintained. For example, sample storage, preparation, and chemical handling for volatile organic analysis (VOA) is kept separate from semi-volatile organic analysis (SVOA).

Samples known or suspected to contain high concentration of analytes are separated from other samples to avoid the possibility for cross-contamination. If contamination is found, the source of contamination is investigated and resolved.

5.3.4 Security

Security is maintained by controlled access to the building and by surveillance of work areas by authorized personnel. Access to each area may be controlled depending on the required personnel, the sensitivity of the operations performed, and potential safety concerns.

5.3.5 Good Housekeeping

Local management must maintain good housekeeping practices in their facilities and maintain a standard of cleanliness necessary for analytical integrity and personnel health and safety.

5.4 Test Methods

5.4.1 General Requirements

PAS locations must use test methods and procedures that are appropriate for the scope of analytical test services the laboratory offers.

Instructions on the use and operation of equipment and sample handling, preparation, and analysis of samples must be specified in SOPs. The instructions in SOPs may be supplemented with other documents including, but not limited to, standard work instructions (SWI), manuals, guides, project documents, and other reference materials.

5.4.2 Method Selection

The test methods offered by PAS are primarily industry accepted published reference test methods. Each PAS laboratory bases its test method SOP on the latest version of the reference method unless regulatory requirements specify an earlier version must be used.

COPYRIGHT © 2019-2023 Pace® Analytical Services, LLC.

The laboratory confirms that it can perform the test method and achieve desired outcome before analyzing samples following method validation protocols specified in Section 5.4.5.

The test methods used by the laboratory to test real world samples must meet the needs of the customer, be appropriate for the intended use of the data, and must conform with applicable federal, statutory, or program requirements.

When a customer does not specify the test method(s) to be used, the laboratory may suggest test methods that are appropriate for the intended use of the data and the type of samples to be tested. The laboratory will also inform customers when test methods requested are considered inappropriate for their purpose and/or out of date. This discourse takes place during review of analytical service requests (See Section 4.4).

5.4.3 Laboratory Developed Methods

A laboratory developed method is a test method developed wholly by PAS or a modification to a published method that is substantially modified from the specifications and procedures of a published test method.

Laboratory developed methods must be validated prior to use (see section 5.4.5) and the procedure documented in a test method SOP.

The requirements for non-standard methods (Section 5.4.4) also apply to PAS developed methods.

5.4.4 Non-standard Methods

A non-standard method is a testing protocol that is not published or approved for use by conventional industry standards.

Use of a non-standard method for testing must be agreed upon with the customer. The agreement, which is retained by the laboratory in the project record, must include the specifications of the client's requirements, the purpose of testing, and their authorization for use of the non-standard method.

5.4.5 Method Validation

The laboratory confirms that it can successfully perform the test method before analyzing samples through a process called method validation. Method validation is partially or fully repeated when there is a change in the published reference method or a change in the way the laboratory performs the test method that may affect selectivity, sensitivity, accuracy, precision, or general performance of the method.

5.4.5.1 Validation Description

Validation is the process of confirmation and the provision of objective evidence that the stated requirements for a specific method/procedure are fulfilled.

The laboratory's requirements and procedures for method validation are outlined in SOP ENV-SOP-CORQ-0011 *Method Validation and Instrument Verification.*

5.4.5.2 Validation Summary

All test methods offered by the laboratory are validated before use to confirm the procedure works as expected and the data and test results are accurate and precise.

COPYRIGHT © 2019-2023 Pace® Analytical Services, LLC.

The record of validation is retained and kept in accordance with method validation SOP and PAS corporate policy ENV-CORQ-POL-0013 *Record Management*.

5.4.5.3 Validation of Customer Need

The laboratory's validation process includes measures to assess accuracy, precision, sensitivity, selectivity, linearity, repeatability, reproducibility, robustness, and cross-sensitivity of the laboratory's procedure against general customer expectations for data usability.

The following subsections describe some of these concepts in relation to organic and inorganic chemistry (chemical testing). These descriptions and the requirements specified are pertinent to chemical testing and may not apply in the same context to other testing services offered by PAS such as radiochemistry, whole effluent toxicity (WET), asbestos, and microbiology. For more information about validation measures for these testing services, refer to the laboratory's test method SOPs.

5.4.5.3.1 Accuracy

Accuracy is the degree to which the result of a measurement, calculation, or specification conforms to the correct value or a standard. When the result is within a range from the known value (control limit); the result is considered accurate.

5.4.5.3.2 Precision

Precision refers to the closeness of two or more measurements to each other. It is measured by calculating the relative percent difference (RPD) or relative standard deviation (RSD) of results from separate analysis of the same sample. Precision provides information about repeatability, reproducibility, and robustness of the laboratory's procedure.

5.4.5.3.3 Sensitivity

Sensitivity refers to the smallest amount of substance in a sample that can accurately be measured.

In chemical testing, this threshold is commonly known as the detection limit (DL) or method detection limit (MDL).

The DL is defined as the minimum measured concentration of a substance that can be reported with 99% confidence that the measured concentration is distinguishable from method blank results.

The DL is either a statistically derived value obtained by multiplying the standard deviation from a series of spiked replicates by the student-T value that correlates to the number of replicates analyzed or it is set to the concentration greater than found in a population of method blanks.

Detections of target analytes below the DL are not reported – unless specified by regulatory program protocol, because presence of target analytes at this level cannot be differentiated from noise.

COPYRIGHT © 2019-2023 Pace® Analytical Services, LLC.

Limits of Quantitation represent the threshold of the laboratory's procedure for quantitative sensitivity.

- The LOQ is the minimum level, concentration, or quantity of a target analyte that can be reported with a specified degree of confidence.
- The LLOQ is simply the concentration of the lowest calibration standard included in the calibration curve.

Although the LOQ and LLOQ may be and often are the same value; the definitions are not the same.

The LOQ is static – it is set when the DL is determined. The LOQ value must be routinely verified to confirm the laboratory can detect the concentration within a range of accuracy.

The LLOQ fluctuates based on the series of standards included in each calibration curve – the LLOQ is always the concentration of the lowest calibration standard included in the curve fit and for which samples are quantitated against. The LLOQ is not the concentration of the lowest standard analyzed, if the lowest concentration standard is not included in the curve, it is not relevant to sample quantitation. Unless otherwise specified by test method, regulatory program or project-specific protocol, accuracy at the LLOQ does not need to be verified independent of the evaluation of relative error or relative standard error.

Target analytes detected at concentrations between the DL and LOQ are known as estimated values – they are within the range of qualitative identification and outside the range of quantitative accuracy. If reported, the results must be qualified to indicate the test result is estimated.

The meaning of Limit of Detection (LOD) varies based on the context by which the term is used. Outside of the DoD program, LOD is another term used to refer to the DL or MDL.

PAS laboratories that are accredited for DoD, must also establish an LOD. The DoD defines the LOD as the smallest concentration of a substance that must be present in a sample in order to be detected at the DL with 99% confidence. This definition is different from the definition of DL - the DL represents the theoretical value at which a detection is distinguishable from a blank.

For DoD, the LOD is a value between the DL and the LOQ. Specifically, it must be 2-4X greater than the DL but less than the LLOQ or LOQ. The value of the LOD set by the laboratory must meet all criteria for qualitative identification and quantitative accuracy based on the signal to noise ratio.

For DoD/DOE project work, target analytes that are not detected at the DL are reported as undetected at the LOD and results between the DL and the LOQ are reported as estimated values.

COPYRIGHT © 2019-2023 Pace® Analytical Services, LLC.

The reporting limit (RL) is the value to which test results are reported as detected or not detected. The RL may be project-defined based on project data quality objectives (DQO) and it may be above or below the LOQ or LLOQ. In the absence of project specific requirements, the RL is usually the same value as the LLOQ. The RL is also called the practical quantitation limit (PQL) – but this can be misleading if the RL is less than the LLOQ or LOQ.

In general, the RL should always be greater than or equal to the value that establishes the threshold for quantitative sensitivity, but it is common for clients to request laboratories to report undetected target analytes at the DL value. This instruction has evolved as an acceptable reporting practice; however, data users should understand the DL is a statistically derived value that does not represent the limit of quantitation.

Unless otherwise specified by regulatory program or test method, detection, quantitation, and reporting limits are adjusted for the amount of sample used (preparation factor) and the dilution factor and are adjusted for percent moisture when samples are reported on a dry weight basis.

To ensure detection and quantitation limits are sound and defensible, the procedures that PAS laboratories use to establish detection, quantitation and reporting limits for chemical testing must comply with the current version of each of the following documents:

- EPA document EPA-821-R-16-006 Definition and Procedure for the Determination of the Method Detection Limit;
- 2016 TNI Standard V1M4; and
- TNI GUID-3-109-Rev. 0, V1M4 2016 Standard Update Guidance on Detection and Quantitation.

5.4.5.3.4 Selectivity

Selectivity refers to the ability of a method to correctly determine an analyte without interference from other compounds.

5.4.5.3.5 Linearity

Linearity is a mathematical concept applied to calibration models that employ multiple points to establish a calibration range used for quantitative analysis. Linearity is measured differently based on the calibration model. In general, if linearity is demonstrated then the slope of the response of standards are sufficiently close to one another. The accuracy of the linear regression and non-linear curves is verified by checking percent error or relative standard error (RSE), which is the process of refitting calibration data back to the model to determine if the results are accurate. For linear curves that use average calibration or response factor, error is measured by relative standard difference (RSD).

COPYRIGHT © 2019-2023 Pace® Analytical Services, LLC.

Linearity also establishes the range of quantitation for the test method used which directly impacts the sensitivity of the test method and uncertainty in measurement results. As previously noted, the LLOQ establishes the lower limit of quantitation. The upper range of linearity establishes the upper limit of quantitation. For most technologies, results outside of this range are considered qualitative values. However, some inorganic test methods allow the linear range to be extended above the upper limit of quantitation when accuracy at this level is verified.

Linearity can also be used to establish repeatability, reproducibility, and robustness of the laboratory's test method. When linearity is demonstrated using a specific calibration model during method validation, then use of this same calibration model to achieve linearity on a day-to-day basis confirms the laboratory's method is repeatable, reproducible, and robust.

5.4.6 Measurement Uncertainty

PAS provides an estimate of uncertainty with analytical results on request, or when required. For example, for radiochemistry testing, uncertainty is always reported with the test result.

For chemistry the uncertainty of the test method is embedded in the control limits used to assess performance of quality control (QC) samples. Language in ISO/IEC 17025 clarifies that measurement uncertainty is satisfied when a well-recognized test method specifies limits that account for source of bias, the laboratory has satisfied the requirements on analytical uncertainty by following the test method and reporting instructions. See Section 5.9.1.1.9 for more information.

5.4.7 Control of Data

PAS has policies and processes in place to assure that reported data is free from calculation and transcription errors, manual changes to data are thoroughly reviewed for need and correctness, and software systems used to generate or store data is secure.

5.4.7.1 Calculations, Data Transfer, Reduction and Review

Data reduction is performed using commercially available data processing/reduction software, the LIMS (Laboratory Information Management System) and/or programs and worksheets created by PAS.

PAS does not permit manual calculation of results – that is the calculation of a test result by pen and paper or calculator. When there is no commercial software or LIMS option, PAS laboratories must create a worksheet from a spreadsheet program, such as Excel, to calculate results based on raw inputs and original observations. Spreadsheets for these purposes must be validated and controlled in accordance with policy ENV-CORQ-POL-0015 *Spreadsheet Validation.*

5.4.7.1.1 Manual Integration

The PAS policy and procedures for manual integration are specified in PAS SOP ENV-SOP-CORQ-0006 *Manual Integration.*

This SOP includes the conditions under which manual integration is allowed and the requirements for documentation.

COPYRIGHT © 2019-2023 Pace® Analytical Services, LLC.

Required documentation of manual integration minimally includes:

- complete audit trail to permit reconstruction of before and after results;
- identification of the analyst that performed the integration and the reason the integration was performed; and
- identification of the individual(s) that reviewed the integration and verified the integration was done and documented in compliance with the SOP.

5.4.7.2 Use of Computers and Automated Acquisition

Whenever possible, PAS uses software and automation for the acquisition, processing, recording, reporting, storage, and/or retrieval of data.

In-house developed software is validated by Pace® corporate IT for adequacy before release for routine use. Commercial off the shelf software is considered sufficiently validated when the location follows the manufacturer or vendor's manual for set-up and use. Records of validation are kept by the corporate information technology (IT) group or by the group that performed the validation.

The PAS process for the protection of data stored in electronic systems includes:

- Individual usernames and passwords for Laboratory Information Management Systems (LIMS) and auxiliary systems used to store or process data.
- Employee Training in Computer Security Awareness
- Validation of spreadsheets used for calculations to verify formulas and logic yield correct results and protection of these cells to prevent unauthorized change.
- Operating system and file access safeguards
- Protection from Computer Viruses
- Regular system backup; and testing of retrieved data
- Verification the software application works as expected and is adequate for use and fulfills compliance requirements, such as the need to record date/time of data generation.
- Change control to assure requests for changes are reviewed and approved by management before the change is made.
- Communication channels to assure all staff are aware of changes made.
- Version Control and maintenance of historical records.

COPYRIGHT © 2019-2023 Pace® Analytical Services, LLC.

5.5 Calibration Requirements

5.5.1 Availability of Equipment

Local management ensures the laboratory is furnished with all equipment and instrumentation necessary to correctly perform the tests offered in compliance with the specifications of the test method and to achieve the accuracy and sensitivity required.

5.5.2 Calibration

Equipment and instrumentation are checked prior to use to verify it performs within tolerance for its intended application.

5.5.2.1 Support Equipment

Support equipment is verified to be in proper working order, and to meet the tolerance specifications for the purpose(s) for which it will be used prior to placement in service. Thereafter, periodic checks are performed to verify on-going performance per a schedule maintained by local quality personnel. Support equipment that does not meet specifications is removed from service and either repaired or replaced. Records of repair and maintenance activities are maintained.

Procedures used to conduct and record these checks are outlined in SOP ENV-SOP-WES2-0036, *Balance Calibration Verification*, ENV-SOP-WES2-0039 *Thermometer Calibration*, ENV-SOP-WES2-0123 *Autopipet and Wet Chem Titrator Calibration Verification*.

5.5.2.2 Analytical Instruments

Analytical instruments are checked prior to placement in service in accordance with SOP ENV-SOP-CORQ-0011 *Method Validation and Instrument Verification*. After the initial service date, the calibration of instruments and verification of calibration is performed in accordance with local test method SOPs.

The calibration procedures in the test method SOPs must comply with the requirements for acceptable calibration practices outlined in corporate policy ENV-POL-CORQ-0005 *Acceptable Calibration Practices*, the reference methods, and any applicable regulatory or program requirements.

5.5.3 Equipment Use and Operation

Up-to-date instructions and procedures for the use and maintenance of analytical equipment are included in SOPs and/or supplemental documents such as standard work instructions (SWI) or instrument manuals which are made readily accessible in the work area to all laboratory personnel.

5.5.4 Equipment Identification

Each piece of equipment is uniquely identified by serial number or any other unique ID system. The identifier is included in the equipment list maintained by the quality department and may not be reused or used interchangeably. New equipment and replacement equipment are assigned a new unique ID.

COPYRIGHT © 2019-2023 Pace® Analytical Services, LLC.

5.5.5 Equipment Lists and Records

5.5.5.1 Equipment List

Each PAS location maintains a list of equipment that includes information about the equipment including a description, manufacturer, serial number, date placed in service, condition when received, identity, and the work area where the equipment is used. The equipment list(s) for each location covered by this manual is provided in Appendix E.

5.5.5.2 Equipment Records

In addition to the equipment list, other equipment records maintained by PAS include:

- Verification that equipment conforms with specifications.
- Calibration records including dates, results, acceptance criteria, and next calibration dates.
- Maintenance plan and records.
- Records of damage, malfunction, or repair.

The laboratory follows an equipment maintenance program designed to optimize performance and to prevent instrument failure which is described in the analytical method SOPs.

The maintenance program includes routine maintenance activities which are performed as recommended by the manufacturer at the frequency recommended and non-routine maintenance, which is performed to resolve a specific problem such as degradation of peak resolution, shift in calibration relationship, loss of sensitivity, or repeat failure of instrument performance checks and quality control samples.

Maintenance is performed by PAS personnel or by outside service providers.

All maintenance activities performed by PAS personnel are recorded by the individual(s) that performed the activity at the time the maintenance was performed in an instrument maintenance log.

The maintenance record minimally includes the date of maintenance, the initials of the person(s) performing maintenance, a description of the activity performed, why (when the maintenance is non-routine), and the return to analytical control. When maintenance is performed by an external vendor, the service record must be maintained and accessible for easy retrieval. The location must provide personnel with unrestricted access to instrument maintenance logs in order to promote good instrument maintenance and recordkeeping practices.

If an instrument must be moved, the location will use safe practices for handling and transport to minimize damage and contamination.

COPYRIGHT © 2019-2023 Pace® Analytical Services, LLC.

5.5.6 Out of Service Protocol

Equipment that has been subjected to overloading, mishandling, gives suspect results, has been shown to be defective, or is performing outside of specified limits is taken out of service and either removed from the work area or labeled to prevent accidental use until it has been repaired and verified to perform correctly.

When analytical equipment is taken out of service because it no longer meets tolerance specifications, the potential effect the nonconformity may have had on previously reported analytical results is evaluated.

5.5.7 Calibration Status

Support equipment is labeled to identify its calibration status.

The calibration status of analytical instruments is identified in the instrument run log, in the data processing software or other systems the laboratory may use for processing of data. Analysts verify on-going acceptability of calibration status prior to use and with instrument performance check standards. These procedures are described in test method SOPs.

5.5.8 Returned Equipment Checks

When equipment or an instrument is sent out for service, the function and calibration status of the equipment must be rechecked and shown to be satisfactory before the equipment is returned to service. This requirement must be included in the laboratory's protocols for servicing equipment.

5.5.9 Intermediate Equipment Checks

PAS performs intermediate checks on equipment to verify the on-going calibration status. For example, most test methods require some form of continuing calibration verification check, and these procedures are included in the test method SOP. Periodic checks of support equipment are also performed; see SOP ENV-SOP-WES2-0036 *Balance Calibration Verification*, ENV-SOP-WES2-0039 *Thermometer Calibration*, ENV-SOP-WES2-0039 Autopipet and *Wet Chem Titrator Calibration Verification* for more information.

5.5.10 Safeguarding Equipment Integrity

Equipment integrity in maintained by:

- Following manufacturer's specification for instrument use so that settings do not exceed manufacturer's recommendation or stress the performance of the equipment;
- Established maintenance programs;
- Transparent maintenance records and unrestricted access to maintenance logs;
- Validation and approval of software before use;
- Audits to confirm instrument settings are consistent with SOPs; and
- On-the-job training for safe and proper use of laboratory equipment.

COPYRIGHT © 2019-2023 Pace® Analytical Services, LLC.

5.6 Measurement Traceability

5.6.1 General

Measurement traceability is best described as the way to ensure measurements take into consideration all uncertainties and are representative of the most accurate measurement captured. Traceability is accomplished with the recording of the lot numbers of materials and equipment used in the testing process and by purchasing materials traceable to the international standards of units (SI), International Bureau of Weights and Measures (BIPM) and/or National Measures Institute NMI).

When traceability to SI units, BIPM, or NMI cannot be achieved, traceability is accomplished with the use of reference standards and equipment obtained from competent suppliers that provide calibration certificates and/or certificates of analysis (COA).

5.6.2 Equipment Correction Factors

Measurements are adjusted by the correction factor when the equipment used for the measurement has a correction factor.

5.6.2.1 Requirements for Calibration Laboratories

PAS does not offer calibration services, therefore, the ISO/IEC 17025 for calibration laboratories do not apply.

5.6.2.2 Requirements for Testing Laboratories

Requirements to verify equipment is calibrated prior to being put into service and to maintain measurement traceability are described in sections 5.5.2 and 5.6, respectively.

5.6.3 Reference Standards and Reference Materials

5.6.3.1 Reference Standards

The laboratory uses measurement reference standards to verify adequacy of working weights and thermometers. The working weights are the weight(s) used for daily balance calibration checks and the working thermometers are used for daily temperature measurements.

Working weights and thermometers are periodically checked to verify on-going adequacy for use between the calibrations performed by an external calibration laboratory using reference standards traceable to SI or a national standard and that are used solely for verification purposes.

For example:

- An acceptable reference standard to verify working thermometers is a NIST Certified thermometer or a NIST Traceable thermometer that is not used for any other purpose other than to check the adequacy of the working thermometer.
- An acceptable reference standard for the working weights is a set of Class S weights that is not used for any other purpose than to verify the weights used daily.

COPYRIGHT © 2019-2023 Pace® Analytical Services, LLC.

The working weights are checked against the reference standard annually and recertified by an ISO accredited calibration body every 5 years. "Annually" means within thirteen (13) months from the date of the last check.

Working thermometers are checked against the reference thermometer prior to placement in service to establish a correction factor (CF) and then re-checked annually (± 13 months from date of last check) or if electronic, every three (3) months (± 100 days from date of last check).

Exceptions to the 3-month recheck for battery operated sensors are allowed when the sensor is embedded in a unit and the manufacturer/vendor has evidence to show that the accuracy of the sensor is not affected by battery life.

Liquid in Glass NIST Certified reference thermometers must be recertified by an ISO/IEC accredited calibration laboratory every 5 years. If the reference thermometer is NIST Traceable or is a digital NIST Certified thermometer, the reference thermometer must be recertified annually by an ISO/IEC 17025 accredited calibration laboratory or service provider that provides traceability to a national standard.

5.6.3.2 Reference Materials

PAS purchases chemical reference materials (also known as stock standards) from vendors that are accredited to ISO 17034 or Guide 34. Purchased reference materials must be received with a Certificate of Analysis (COA) where available. If a reference material cannot be purchased with a COA, it must be verified by analysis and comparison to a certified reference material and/or there must be a demonstration of capability for characterization. COA are reviewed for adequacy and retained by the laboratory for future reference.

All prepared standards, reference materials, and reagents are verified to meet the requirements of the test method through routine analyses of quality control samples.

The laboratory procedure for traceability and use of these materials is provided in SOP ENV-SOP-WES2-0038 *Reagent Solvent and Standard Control.*

This SOP must minimally include each of the following requirements:

- Procedures for receipt and tracking of reference and working standards to ensure the record includes material name, name of the material, lot number, receipt date, and manufacturer's expiration date.

- Storage conditions and the requirement that reference standards are stored separately from samples, extracts, and digestates.

- Requirements to assure that preparation of intermediate or working solutions are recorded and assigned a unique identification number for tracking. Records of preparation include the lot number of the stock standard(s) used, the type and lot number of the solvent, the formulation, date, new expiration date, and the preparer's initials. The lot number of working standards is recorded in the analytical record to provide traceability to the standard preparation record. The

COPYRIGHT © 2019-2023 Pace® Analytical Services, LLC.

preparation record provides traceability to the COA, which is traceable to SI or the national measurement standard.

- A requirement that the expiration dates of prepared standards may not exceed the expiration date of the parent standard. Standards, reference materials, and reagents are not used after their expiration dates unless it is not possible to procure a new standard and the reliability of the expired material is verified and documented by the location using a procedure approved by corporate quality personnel. Otherwise, the expired material is promptly removed from the work area or clearly labeled as acceptable for qualitative/troubleshooting purposes only.

- The second source materials used for verification of instrument calibration are obtained from a different manufacturer or may be a different lot from the same manufacturer, when only one vendor or manufacturer provides the standard.

- Procedures to check reference materials for degradation and replacement of material if degradation or evaporation is suspected.

- Procedures for labeling. At a minimum, the container must identify the material, the ID of the material and the expiration date. Original containers should also be labeled with date opened.

5.6.3.3 Intermediate Checks

Checks to confirm the acceptability of reference standards and materials is specified in test method SOPs and are appropriate for the purpose for which the standard is used. For example, a second source standard analyzed after an initial calibration may help the analyst identify if degradation of the standards used for calibration has occurred.

5.6.3.4 Transport and Storage

PAS handles, transports and stores reference standards in a manner that protects the integrity of the materials. The integrity of the reference standard is protected by segregation from incompatible materials and/or minimizing exposure to degrading environments or materials. As previously stated, standards and reference materials are stored separately from samples, extracts, and digestates to prevent contamination. All standards are stored according to the manufacturer's recommended conditions. Temperatures colder than the manufacturer's recommendation are acceptable if it does not compromise the integrity of the material (e.g., remains in liquid state and does not freeze solid).

Specific requirements are provided in test method SOPs.

5.7 Sampling

Sampling refers to both the field collection of samples and to subsamples taken by the laboratory for analysis.

Subsampling procedures are included in each test method SOP or a stand-alone SOP to assure the aliquot used for testing is representative of the field collected sample.

The requirements in the following subsections apply when sampling is performed by PAS.

COPYRIGHT © 2019-2023 Pace® Analytical Services, LLC.

5.7.1 Sampling Plans and SOPs

When PAS performs field collection of samples, the sampling is conducted in accordance with a project sampling plan and sampling SOPs to ensure representative samples are collected.

5.7.2 Customer Requested Deviations

When the customer requests deviations, additions, or exclusions from the project sampling plan and/or the SOP, the laboratory records the client's change request in detail with the sampling record, communicates the change to sampling personnel, and includes this information in the final test report.

5.7.3 Recordkeeping

PAS assures the sampling record includes the sampling procedure used, any deviations from the procedure, the date and time of sampling, the identification of the sampler, environmental conditions (if relevant), and the sampling location.

5.8 Sample Management & Handling

5.8.1 Procedures

The procedures for sample management and handling are outlined in SOP ENV-SOP-WES2-0003 *Sample Receipt and Login* and SOP ENV-SOP-WES2-0002 *Sample Custody and Tracking*. The procedures in the local SOP must meet the requirements specified in this quality manual to guarantee the integrity of the sample from receipt to disposal.

5.8.1.1 Chain of Custody

All samples received by PAS must be accompanied with a Chain of Custody (COC). The COC is the legal record that documents the collection of samples and the transfer of samples to the laboratory. The COC provides PAS with information about the samples collected and tests requested.

The COC is completed by the sample collector and must minimally include the following information:

- Client name, address, phone number;
- Project Reference;
- Client Sample Identification (Client ID);
- Date, Time, and Location of Sampling;
- Sampler's Name or Initials;
- Matrix;
- Type of container, and total number collected;
- Preservative;
- Analyses Requested;
- Mode of collection;

COPYRIGHT © 2019-2023 Pace® Analytical Services, LLC.

- Any special instructions; and
- The date and time and signature of sample transfer from collection to PAS. When samples are shipped to the laboratory by a 3rd party such as UPS or Fed EX, the COC is placed inside the sealed shipping container at time of collection and the container is not opened until it is received by PAS. Thus, the intermediate courier does not sign the COC. The shipping manifest and/or air bill is the record of possession of samples during transport to the laboratory. The shipping manifest and/or air bill is part of the COC record and must be retained and provided in the test report with the COC record, when required. (See Section 5.10.3).

A complete and legible COC is required. When the COC is incomplete, illegible, or cannot be understood, the client is contacted for resolution.

Hand entries on the COC must be made in indelible ink and errors corrected by drawing a single line through the original entry, so the original entry is not obscured and entering the correct information with the date the change was made and the initials of the person making the change.

5.8.1.2 Legal Chain of Custody

Legal chain of custody (Legal COC) is an industry defined protocol that is sometimes used for evidentiary or legal purposes that establishes an intact, continuous record of the physical possession, storage, and disposal of samples, including sample aliquots and prepared samples.

The legal COC record accounts for all time periods associated with the samples and identifies all individuals who physically handled them from the point established by legal authority, which is usually at the time the sample containers are provided for sample collection or at the time of sample collection.

A sample is in someone's legal custody if:

- It is in one's physical possession;
- It is in one's view after being in one's physical possession;
- It has been in one's physical possession and then locked or sealed so that no one can tamper with it; and/or
- It is kept in a secure area, restricted to authorized personnel only.

Legal COC is not a common request, but if it is requested and the laboratory agrees to the project specification; the laboratory must maintain a procedure or process to guarantee all aspects of the protocol are met.

5.8.2 Unique Identification

Each sample received by PAS is assigned a unique identification number (Lab ID) after the sample has been accepted by PAS in accordance with the PAS sample acceptance policy (See 5.8.3). The Lab ID is affixed to the sample container using a durable label.

The lab ID is linked to the field ID (client ID) in the sample receipt and log-in record so that both IDs are traceable to testing activities performed.

COPYRIGHT © 2019-2023 Pace® Analytical Services, LLC.

5.8.3 Sample Receipt Checks and Sample Acceptance Policy

The condition and integrity of samples is checked on receipt and the samples received are verified to match the COC. Any problem with the samples or discrepancy between the COC is recorded. If the problem impacts the suitability of the sample for analysis or if the CoC is incomplete, the client is notified for resolution and decisions and instructions from the client regarding the samples are maintained in the project record.

5.8.3.1 Sample Receipt Checks

The following checks are performed:

- The COC is complete and legible;
- Sample container labels include the client sample ID, the date and time of collection, and the preservative used;
- The container type and preservative are appropriate for the test requested;
- The required volume is received for each test requested;
- There is no evidence of damage or tampering;
- There is no headspace in VOA vials greater than 5-6 mm (the size of a pea);
- Thermal Preservation, when required. When thermal preservation is required, temperature on receipt is typically considered acceptable if the temperature is within 0-6°C and the samples are not frozen solid unless otherwise specified by federal, statutory, program or test method. If samples are received on the same day of collection, there must be evidence that the chilling process has begun, such as arrival of the samples on ice.
- Chemical Preservation, as required.
- Holding Time. When the holding time for the test method is longer than 15 minutes from time of collection and samples are received out of hold, the client is notified of the situation so they can make a decision to proceed or cancel analysis. Tests with a holding time of 15 minutes or less from time of collection are those where the method specifies the holding time as "immediate" are excluded from the notification requirement because the customer is aware that the holding time cannot be met unless the test is performed in the field (in situ).

5.8.3.2 Sample Acceptance Policy

PAS maintains a sample acceptance policy to clearly establish the circumstances in which samples are accepted.

When these conditions are not met, the exception must be documented, and the client notified. Decisions to accept or reject the samples are documented and when required, test results are qualified in the test report.

Criteria for Sample Acceptance:

COPYRIGHT © 2019-2023 Pace® Analytical Services, LLC.

- All samples received must be listed on the COC and information provided must include the client ID of the sample, date and time of collection, collector's name, preservation type and type of sample;
- The sample containers must be properly labeled to uniquely identify the sample; and the label must be both durable and legible;
- The sample container must be appropriate for the tests requested;
- Samples must be received within holding time. Exceptions are made for samples where the test method specifies a holding time of "immediate or immediately" – which is translated to within 15 minutes from sample collection. For these test methods, samples are always received out of hold and/or there is no expectation that the laboratory perform the test within the 15-minute holding time.
- Sufficient sample volume must be provided to perform the test method per the laboratory's SOP. If the test is performed for regulatory compliance and the method requested is mandated; the volume provided must be adequate for the laboratory to perform the test per the test method without modification.
- Be received within appropriate temperature ranges unless program requirements or customer contractual obligations mandate otherwise.
- Be free of evidence of tampering or signs of contamination; and
- Meet applicable requirements for thermal and chemical preservation.

Additional conditions may also apply depending on the services offered. For example, some PAS locations will not accept samples known to be radioactive.

5.8.4 Sample Control and Tracking

Samples received by PAS are tracked using the laboratory's Laboratory Information Management System (LIMS).

After the sample receipt process is complete, samples are logged into the LIMS and a Lab ID is assigned and affixed to each container with a durable label. The Lab ID is used to track the samples through the testing process through test report generation and sample disposal.

Minimally, the following information is included in the log-in for each sample:

- Client Name and Contact Information;
- The laboratory ID linked to the client ID;
- Date and time of sample collection;
- Date and time of sample receipt;
- Matrix; and
- Tests Requested.

After log-in is complete, the log-in record must be independently reviewed by the PAS Project Manager (PM) responsible for the work order to verify the log-in is complete and correct per

COPYRIGHT © 2019-2023 Pace® Analytical Services, LLC.

the testing agreement with the customer and the chain-of-custody so that any log-in errors or questions about the samples received are corrected and resolved before work begins.

Documentation of the log-in record, called a Sample Acknowledgement Form (SRF) is provided to customers per their request. The SRF provides information necessary for the customer to verify that there are no errors with the information provided to PAS with the sample shipment.

As previously stated in this manual, the customer must be notified of any problems or discrepancies between the information expected and information received and/or nonconformances observed during the sample receipt and log-in process. Authorization to proceed with testing and/or instructions to correct the problem must be retained for historical recordkeeping purposes. How the notification requirement is achieved must be included in a laboratory SOP.

5.8.5 Sample Storage, Handling, and Disposal

5.8.5.1 Sample Storage

The samples are stored according to the specification in the test method and any appliable program and regulatory requirements. Samples are stored separately from standards, reagents, or other potential sources of contamination and in a manner that prevents cross contamination. All sample fractions, extracts, leachates, and other sample preparation products are stored in the same manner as actual samples or as specified by the analytical method.

Refrigerated storage areas are maintained at 4°C ±2 (but not frozen) and freezer storage areas are maintained at <-10°C, unless otherwise required per method or regulatory program. The temperature of each storage area is checked and documented at least once for each day of use. If the temperature falls outside the acceptable limits, corrective actions are taken and documented.

Samples are placed in the storage location immediately after sample receipt and log-in procedures are completed. All sample storage areas have limited access. Samples are removed from storage areas by designated personnel and returned to the storage areas as soon as possible after the required sample quantity has been taken.

5.8.5.2 Sample Retention and Disposal

The procedures used by the location for sample retention and disposal are detailed in SOP ENV-SOP-WES2-0002 *Sample Custody and Tracking* and ENV-SOP-MANS-0077 *Hazardous Waste Management and Sample Disposal.*

In general, PAS retains unused sample volume and prepared samples such as extracts, digestates, distillates and leachates (samples) per Pace® Terms & Conditions.

After analysis, samples may be stored at ambient temperature until time of sample disposal, unless otherwise specified by regulation or agreed upon contract specifications.

After the retention time has expired non-hazardous samples are properly disposed. Hazardous samples are returned to the customer, unless other arrangements for disposal have been made with the laboratory.

COPYRIGHT © 2019-2023 Pace® Analytical Services, LLC.

5.9 Assuring the Quality of Test Results

5.9.1 Quality Control (QC) Procedures

PAS monitors the validity and reliability of test results using quality control (QC) samples that are prepared and analyzed concurrently with and in the same manner as field samples. QC results are always associated to and reported with the field samples they were prepared and analyzed with.

When the results are not within acceptance criteria correction and corrective action(s) are taken. These actions may include retesting or qualification of test results and/or disclosure of the situation in the test report to alert the data user of the situation.

Other control measures to maintain quality of test results include the use of certified reference materials (see 5.6.3), participation in interlaboratory proficiency testing (see 5.9.1.2), verification that formulae used for reduction of data and calculation of results is accurate (see 5.9.3), on-going monitoring of environmental conditions that could impact test results (see 5.3.2), and evaluation and verification of method selectivity and sensitivity (see 5.4.5).

QC results are also used for trend analysis and to establish acceptance criteria when no method or regulatory criteria exist. (See 5.9.1.1.9).

5.9.1.1 Essential QC

QC protocol is technology and test method specific and is specified in test method SOPs. The SOP includes the type of QC required, frequency for analysis, acceptance criteria, recommended corrective actions, and procedures for reporting test results associated with QC exceptions.

PAS ensures the QC requirements in the SOP conform to the reference method and applicable regulations for which results of the test are used and to any program requirements for the process required by the certification/accreditation program required for testing.

- When a project requires more stringent QC protocol than specified in PAS policy or the test method SOP, the project specification is followed.
- When the project requires less stringent QC protocol than PAS policy or the SOP, the project specification may be followed as an authorized departure if the project specification still meet the requirements in the test method and any applicable regulatory and certification/accreditation requirements.

The following sections describe essential QC for chemistry. These QC types may not apply to other technologies and disciplines such as microbiology, radiochemistry, whole effluent toxicity, and/or asbestos. For essential QC for these test offerings, refer to test method SOPs.

5.9.1.1.1 Calibration Verification (Second Source)

A second source standard is a standard from a different vendor or from a different lot than the standards used for initial calibration. A different lot from the same vendor is permissible, when the standard is only available from a single vendor.

COPYRIGHT © 2019-2023 Pace® Analytical Services, LLC.

It is a positive control used to verify the accuracy of instrument calibration relative to the purity of the standards used for calibration. This check may be referred to in published test methods and quality system standards as the initial calibration verification (ICV) or a quality control sample (QCS). For most test methods, it is analyzed immediately after the calibration and before analysis of any samples. When the ICV is not within acceptance criteria, a problem with the purity or preparation of the standards may be indicated. The source of the problem should be investigated and corrected prior to use of the calibration/instrument for sample analysis.

5.9.1.1.2 Calibration Verification (CCV)

The CCV is used to determine if the analytical response has significantly changed since calibration. The CCV is usually made from the same standards used for initial calibration, but a second source standard may be used.

When the response of the CCV is within criteria, the calibration is considered valid. If not, there may be a problem that requires further investigation and correction. The actions taken are technology and method specific.

It is sometimes acceptable to report test results associated with a CCV that does not meet criteria.

For example, when a CCV exceeds criteria above the limit; high bias is suspected in the measurement system. If the analyte is not detected in the sample; then the high bias has no impact on the validity of the test result. If the analyte is detected in sample, then corrective action to bring the CCV within criteria is expected to eliminate the possibility that the detection is biased.

5.9.1.1.3 Blanks

Blanks are negative controls used to assess for contamination.

The method blank (MB) is a clean matrix similar to the associated samples that is known to be free of analytes of interest. The MB, unless otherwise specified by the test method, is processed with, and carried through all preparation and analytical steps as the associated samples.

The criteria used to assess for contamination depends on the intended use of data. In general, detections in the MB above the RL or ½ the RL indicate contamination. When contamination is indicated, the source is investigated, and corrections are taken to reduce or eliminate it. Analytical results associated with MB that do not meet criteria are qualified in the final test report.

Other types of blanks that serve as negative controls in the process may include:

- Trip Blanks (VOA)

COPYRIGHT © 2019-2023 Pace® Analytical Services, LLC.

- Storage Blanks
- Equipment Blanks
- Field Blanks
- Calibration Blanks
- Cleanup Blanks
- Instrument Blanks

5.9.1.1.4 Laboratory Control Sample (LCS)

The LCS is a positive control used to measure the accuracy. The LCS is a blank matrix spiked with standard solution that includes target analytes or it may be a pre-made certified reference standard. Like the MB, unless otherwise specified in the test method, the LCS is processed with and carried through all preparation and analytical steps as the associated samples.

When the percent recovery (%R) of the LCS is within the established control limit, the test is within control. If not, the cause of the problem is investigated and corrected, and the procedure may be repeated. Analytical results associated with LCS that does not meet criteria are qualified in the final test report.

5.9.1.1.5 Matrix Spike (MS) and Matrix Spike Duplicate (MSD)

The MS and MSD are replicates of a client sample that is spiked with known amount of target analyte. When there is not a client-designated matrix spike on any sample in the batch, the MS/MSD may be performed on a randomly selected sample and these MS/MSD are called "batch" MS/MSD.

MS/MSD results provide information about the effects the sample matrix has on recovery and reproducibility of target analytes on site samples. MS/MSD results are not used to control performance of the preparation or analytical batch because the way in which the matrix impacts efficiency and robustness of the test cannot be mitigated or controlled by the laboratory.

The heterogeneity of the sample submatrix influences accuracy and precision. For example, MS/MSD results for a sample that is mostly sand will not be the same for a sediment sample even though both matrices are "soil" and both samples subjected to the same test procedure in the same batch. For this reason, batch MS/MSD results may not be representative of the effect the matrix has on accuracy and precision on test results for all samples in the batch – except when all samples in the batch are from the same collection site and are identical in composition.

COPYRIGHT © 2019-2023 Pace® Analytical Services, LLC.

5.9.1.1.6 Sample Duplicate (SD)

A sample duplicate is a second replicate of sample taken through the testing process used to measure precision and/or homogeneity of samples collected.

The relative percent difference (RPD) between replicates are evaluated against the established acceptance criteria and if the RPD is not met, associated test results are reported with qualification.

5.9.1.1.7 Surrogates

Surrogates are compounds not normally found in the environment but that have similar physical and chemical properties of target analytes that are added to environmental samples, QC, and calibration standards prior to preparation and analysis. They are used to evaluate extraction efficiency and matrix interference on a sample specific basis.

The percent recovery of surrogates is evaluated against method-specified limits or statistically derived in-house limits. Project-specific limits and/or program-specific limits are used when required. Results with surrogate recovery out of limits in samples are reported with qualification. Samples with surrogate failures can also be re-extracted and/or re-analyzed to confirm that the out-of-control value was caused by the matrix of the sample and not by some other systematic error.

5.9.1.1.8 Internal Standards

Internal Standards are compounds not expected to occur naturally in field samples. They are added to every standard and sample at a known concentration prior to analysis for the purpose of adjusting the response factor used in quantifying target analytes. The location follows specific guidelines for the treatment of internal standard recoveries and further information can be found in the applicable test method SOP.

5.9.1.1.9 QC Acceptance Criteria and Control Limits

QC acceptance criteria are specified in test method SOPs. The criteria in the SOP are based on the requirements in the published test method or regulatory program. When there are no established acceptance criteria, the location develops acceptance criteria in accordance with recognized industry standards.

Some methods and programs require the laboratory to establish control limits for LCS, MS/MSD, and surrogate evaluation using historical data. PAS developed limits are referred to as "in-house" control limits. In-house control limits represent ± 3 Standard Deviations (99% confidence level) from the average recovery of at least 20 data points generated using the same preparation and analytical procedure in a similar matrix.

See SOP ENV-SOP-WES2-0119 *Control Limit Generation* for more information about the procedures used to establish in-house control limits.

COPYRIGHT © 2019-2023 Pace® Analytical Services, LLC.

5.9.1.2 Proficiency Testing (PT)

PAS participates in interlaboratory proficiency testing (PT) studies to measure our performance of the test method.

PT participation is based on the certification and accreditation requirements held by the laboratory. The PT samples are obtained from accredited proficiency testing providers (PTP) and treated as field samples which means they are incorporated into our normal analytical processes and do not receive extraordinary attention due to their nature.

PAS locations do not share PT samples with other PAS locations, does not communicate with other PAS locations regarding current PT sample results during the duration of the study, and does not attempt to obtain the assigned value of any PT sample from the PT provider.

PT results scored unacceptable are investigated and correction action taken, when necessary.

Refer to corporate policy ENV-POL-CORQ-0002, *PT Policy* for more information.

5.9.2 QC Corrective Action

When the results of QC are not within acceptance criteria or expectations for method performance, correction and corrective action(s) are taken per the specifications in the test method SOP. These actions may include retesting or reporting of data with qualification to alert the end user of the situation.

5.9.3 Data Review

PAS uses a tiered system for data review. The tiered process includes as series of sequential checks to verify data transfer is complete; manual calculations, if performed, are correct, manual integrations are appropriate and documented, calibration and QC requirements are met, appropriate corrective action was taken when required, test results are properly qualified, process and test method SOPs were followed, project specific requirements were met, when applicable, and the test report is complete.

The sequential process includes three tiers referred to as primary review, secondary review, and administrative/completeness review.

Detailed procedures for the data review process are described in SOP ENV-SOP-WES2-0124 *Data Review*. General expectations for the tiered data review process are specified in the following sections:

5.9.3.1 Primary Review

Primary review is performed by the individual that performed the task. All PAS personnel are responsible for the review of their own work to assure it is complete, accurate, documented, and consistent with PAS policy and SOPs.

Checks performed during primary review include but are not limited to:

- Verification that data transfer and acquisition is complete;
- Manual calculations, if performed, are documented and accurate;

COPYRIGHT © 2019-2023 Pace® Analytical Services, LLC.

- Manual integrations, if performed, are documented, and comply with SOP ENV-SOP-CORQ-006 *Manual Integration;*
- Calibration and QC criteria were met, instrument calibration conforms with policy ENV-POL-CORQ-005 *Acceptable Calibration Practices*, and/or proper correction and corrective actions were taken, and data and test results associated with QC and criteria exceptions are properly qualified;
- Work is consistent with SOPs and any other relevant instructional document such as SWI, program requirements, or project quality assurance plans (QAPP).

5.9.3.2 Secondary Review

Secondary review is an independent review of the data set performed by a qualified peer or supervisor. Secondary review includes a repeat of the checks performed during primary review in addition to chromatography review to verify the accuracy of quantitative analyte identification.

5.9.3.3 Completeness Review

Completeness review is an administrative review that is performed prior to release of the test report to the customer to verify the final test report is complete and meets project specifications. This review also assures that information necessary for the client's interpretation of results are explained in the case narrative or footnoted in the test report.

5.9.3.4 Data Audits

Test reports are randomly audited by local quality personnel to verify compliance with SOPs and to check for data integrity, technical accuracy, and compliance with the PAS QMS and any applicable federal, statutory, and program requirements. These audits are not part of the tertiary data review process that is performed prior to release of the test report. These audits are performed on test reports that have been previously released to the customer to avoid potential risks to impartiality and other factors that may influence thoroughness of review.

If any problems with the data or test results are found during the data audit, the impact of the nonconforming work is evaluated using the process described in Section 4.9.

Also see Section 4.14 for internal audits.

5.9.4 Calibration Certificates

PAS does not perform calibration activities for its customers and calibration certificates are not offered or issued.

5.9.5 Opinions and Interpretations

PAS provides objective data and information to its customers of sufficient detail for their interpretation and decision making. Objective data and information are based solely on fact and PAS does not attempt to explain the meaning (interpret) or offer a view or judgement (opinion) on usability of data.

COPYRIGHT © 2019-2023 Pace® Analytical Services, LLC.

PAS personnel are not permitted to provide opinion on how a nonconformance impacts the usability of results or how test results and information should be used, or suggestions or guidance to the customer for improvement..

5.9.6 Subcontractor Reports

When analytical work is subcontracted to an organization external to PAS or its subsidiaries, PAS includes the test report from the subcontractor in its entirety as an amendment to the final test report.

Test results performed by multiple locations within the PAS network (internal subcontracting) may be merged into a single test report so long as the test report issued clearly identifies the location and address of each network location that performed testing, and which tests each PAS location performed. (See 5.10.2)

5.9.7 Electronic Transmission of Results

When test results and/or reports are submitted to the customer through electronic transmission, the procedures established in this manual for confidentiality and protection of data apply.

5.9.8 Format of Test Reports

The test formats offered by PAS are designed to accommodate each type of analytical test method performed and to minimize the possibility of misunderstanding or misuse of analytical results. The format of electronic data deliverables (EDD) follows the specifications for the EDD.

5.9.9 Amendments to Test Reports

Test reports that are revised or amended by the location after date of release of the original final test report to the customer are issued as a new test report that is clearly identified as an amendment or revision and that includes a reference to the originally issued final test report.

The customer is the organization doing business with PAS external to PAS.

Changes made to test results and data before the final test report is issued to the customer are not amendments or revisions and do not need to be tracked or marked as such, these changes are simply corrections to errors found during data review.

The procedure for report amendments and revision are outlined in SOP ENV-SOP-WES2-0120 *Report Generation and Approval.*

5.10 Reporting

5.10.1 General Requirements

PAS offers a wide variety of test report formats to meet project needs of Pace® customers and federal and state regulatory program requirements

The type and level of deliverable, including the electronic data deliverable (EDD) format are established between PAS and the customer during the contracting process. The report specifications include the test report format, protocol for the reporting limit (RL), conventions for the reporting of results less than the limit of quantitation (LOQ), and specification for the

COPYRIGHT © 2019-2023 Pace® Analytical Services, LLC.

use of project or program specific data qualifiers. Information about review of analytical service requests is provided in Section 4.4.

5.10.2 Test Reports: Required Items

Regardless of deliverable or report requested, every test report issued by PAS and its subsidiaries includes each of the following items:

a) A Title;

b) The name and address of the location issuing the test report and for each location where testing was performed if different than address of the location issuing the report. When testing is done at multiple PAS locations, the report must also clearly identify which PAS location performed each test method;

c) Unique identification of the test report and on each page an identification number to link each page to the test report, and clear identification of the end of the report;

d) The name and address of the customer;

e) Identification of test methods used. When testing is done at multiple PAS locations, the report must also clearly identify which PAS location performed each test method;

f) Cross reference between client sample identification number (Sample ID) and the identification number for the sample (Lab ID) to provide unambiguous identification of samples;

g) The date of receipt of samples, condition of samples on receipt, and identification of any instance where receipt of the samples did not meet sample acceptance criteria;

h) Date and times of sample collection, receipt, preparation, and analysis;

i) Test results and units of measurement, and qualification of results associated with QC criteria exceptions, and identification of reported results outside of the calibration range;

j) All chains of custody (COC) including records of internal transfer between locations within PAS;

k) Name, title, signature of the person(s) authorizing release of the test report and date of release;

l) A statement that the results in the test report relate only to the items tested; and

m) Statement that the test report may not be reproduced except in full without written approval from PAS.

5.10.3 Test Reports: Supplemental Items

5.10.3.1 Supplemental Requirements

The following items are included in the test report when required or relevant:

a) Shipping manifests/bill of ladings as applicable when common couriers are utilized for shipment of samples,

b) Explanation of departure from test method SOPs including, what the departure was and why it was necessary.

COPYRIGHT © 2019-2023 Pace® Analytical Services, LLC.

c) Statistical methods used. (Required for Whole Effluent Toxicity)

d) For solid samples, specification that results are reported on a dry weight or wet weight basis.

e) Signed Affidavit, when required by client or regulatory agency.

f) A statement of compliance/non-compliance with requirements or specifications (client, program, or standard) that includes identification of test results that did not meet acceptance criteria.

g) When requested by the client, statement of estimated measurement uncertainty. In general, for environmental testing, estimated uncertainty of measurement is extrapolated from LCS control limits. Control limits incorporate the expected variation of the data derived from the laboratory's procedure. When the control limits are specified by the test method or regulatory program, the control limits represent the expected variation of the test method and/or matrices for which the test method was designed.

h) If a claim of accreditation/certification is included in the test report, identification of any test methods or analytes for which accreditation/certification is not held by the location if the accrediting body offers accreditation/certification for the test method/analyte. The fields of accreditation/certification vary between agencies, and it cannot be presumed that because accreditation/certification is not held that it is offered or required.

i) Certification Information, including certificate number and issuing body.

For PAS locations accredited to ISO/IEC 17025:2017:

- Data included in the test report provided by a customer should be clearly identified.
- A statement that the test results apply only to the samples as received.

PAS does not provide opinion or interpretations about usability of data or test results in order to maintain impartiality with the testing services provided.

5.10.3.2 Test Reports: Sampling Information

The following items are included in the test report when samples are collected by PAS or when this information is necessary for the interpretation of test results:

a) Date of Sampling.

b) Unambiguous identification of material samples.

c) Location of sampling including diagrams, sketches, or photographs.

d) Reference to the sampling plan and procedures used.

e) Details of environmental conditions at time of sample that may impact test results.

f) Any standard or other specification for the sampling method or procedure, and deviations, additions to or exclusions from the specification concerned.

6.0 REVISION HISTORY

This Version (Version 3):

SECTION	DESCRIPTION OF CHANGE
Management Approval Page	Created a new cover page for management approval date / time stamps to allow room for signatories. This information was previously on the Title Page.
Header	Updated Copyright
Title Page	Simplified options for laboratory name based on legal entity.
Approval Page	Revised language for clarity, added spot for TNI accredited laboratories to list the AB approved "TNI Technical Manager, however named" – this description is not a job title, it refers to the individual designated by the laboratory and approved by the AB to provide technical oversight for a specific discipline.
All Sections	Updated format where needed.
4.1.5.1.1	Updated deputies for key personnel.
4.4	Added TNI requirement to notify customers when PAS is proposing or has made a deviation to a contract previously approved by both parties.
4.8	Added reference to the PAS Corporate SOP for Client Complaints
4.9.1.3	Added "Temporary" to "Stop Work Order" to clarify that a stop work is temporary and distinct from permanent discontinuation of a testing service, which is called a reduction in capabilities. Updated content to clearly identify the roles authorized to lift the stop work order.
4.13.15	Deleted the reference to an obsolete policy and inserted a reference to the technical guide that replaced the policy.
4.13.2.3	Replaced last paragraph with a reference to another section to eliminate redundancy.
4.14	Rewrote entire section to refine language; no change in requirements made.
4.16	Added reference to PAS Corporate SOP for Data Impact Assessments
5.2.1	Updated definition for competency. Added roles authorized to provide opinion or consult on usability of test results.
5.2.2	Rewrote entire section to refine language; no change in requirements made.
5.4	Rewrote entire section to refine language; no change in requirements made.
5.5	Rewrote entire section to refine language; no change in requirements made.
5.6	Rewrote entire section to refine language; no change in requirements made.
5.8	Rewrote entire section to refine language; no change in requirements made.
5.8.1.1 -1.2	Clarified that a CoC is a legal record for sample collection and "legal COC" is an industry-defined protocol for tracking possession of samples.
5.9	Rewrote section and re-organized content to be more concise.
Glossary	Updated Definition List and Definitions
Section 8.0	Added Suggested Addendum for AIHA and NVLAP

This document supersedes the following documents:

7.3 Appendix C: Glossary

This glossary provides common terms and definitions used in environmental testing; it is not intended to be a complete list of all terms and definitions used; some terms are defined in the context of the document or application. The definitions have been compiled mostly from the TNI Standard and DoD QSM. Although this information has been reproduced with care, errors cannot be entirely excluded.

Term	Definition
Acceptance Criteria	Specified limits placed on characteristics of an item, process, or service defined in requirement documents.
Accreditation	The process by which an agency or organization evaluates and recognizes a laboratory as meeting certain predetermined qualifications or standards, thereby accrediting the laboratory.
Accreditation Body	The organization having responsibility and accountability for environmental laboratory accreditation, and which grants accreditation.
Accuracy	The degree of agreement between an observed value and an accepted reference value. Accuracy includes a combination of random error (precision) and systematic error (bias) components that are due to sampling and analytical operations; a data quality indicator.
Aliquot	A discrete, measured, representative portion of a sample taken for analysis.
Analysis	A combination of sample preparation and instrument determination.
Analysis Sequence	A compilation of all samples, standards and quality control samples run during a specific amount of time on a particular instrument in the order they are analyzed.
Analyte	A substance, organism, physical parameter, property, or chemical constituent(s) for which an environmental sample is being analyzed.
Analytical Method	A formal process that identifies and quantifies the chemical components of interest in a sample.
Analytical Uncertainty	A subset of Measurement Uncertainty that includes all laboratory activities performed as part of the analysis.
Annual (or annually)	Defined by PAS as every 12 months ± 30 days.
Assessment	The evaluation process used to measure or establish the performance, effectiveness, and conformance of an organization and/or its system to defined criteria (to the standards and requirements of laboratory accreditation).
Atomic Absorption Spectrometer	Instrument used to measure concentration in metals samples.
Audit	A systematic and independent examination of facilities, equipment, personnel, training, procedures, record-keeping, data validation, data management, and reporting aspects of a system to determine whether QA/QC and technical activities are being conducted as planned and whether these activities will effectively achieve quality objectives.
Batch	Environmental samples that are prepared and/or analyzed together with the same process and personnel, using the same lot(s) of reagents. A **preparation batch** is composed of one to 20 environmental samples of the same quality systems matrix, meeting the above-mentioned criteria and with a maximum time between the start of processing of the first and last sample in the batch to be 24 hours or the time specified by the regulatory program. An **analytical batch** is composed of prepared environmental samples (extracts, digestates or concentrates) which are analyzed together as a group. An analytical batch can include prepared samples originating from various quality system matrices and can exceed 20 samples.
Bias	The systematic or persistent distortion of a measurement process, which causes errors in one direction (i.e., the expected sample measurement is different from the sample's true value).
Blank	A sample that has not been exposed to the analyzed sample stream in order to monitor contamination during sampling, transport, storage, or analysis. The blank is subjected to the usual analytical and measurement process to establish a zero baseline or background value and is sometimes used to adjust or correct routine analytical results (See Method Blank).

COPYRIGHT © 2019-2023 Pace® Analytical Services, LLC.

Blind Sample	A sub-sample for analysis with a composition known to the submitter. The analyst/laboratory may know the identity of the sample but not its composition. It is used to test the analyst's or laboratory's proficiency in the execution of the measurement process.
Calibration	A set of operations that establish, under specified conditions, the relationship between values of quantities indicated by a measuring instrument or measuring system, or values represented by a material measure or a reference material, and the corresponding values realized by standards.
Calibration Curve	The mathematical relationship between the known values, such as concentrations, of a series of calibration standards and their instrument response.
Calibration Method	A defined technical procedure for performing a calibration.
Calibration Range	The range of values (concentrations) between the lowest and highest calibration standards of a multi-level calibration curve.
Calibration Standard	A substance or reference material used for calibration.
Certified Reference Material	Reference material accompanied by a certificate, having a value, measurement uncertainty, and stated metrological traceability chain to a national metrology institute.
Chain of Custody	An unbroken trail of accountability that verifies the physical security of samples, data, and records.
Client /Customer	Any individual or organization external to Pace for whom items or services are furnished or work performed in response to defined requirements and expectations.
Code of Federal Regulations (CFR)	A codification of the general and permanent rules published in the Federal Register by agencies of the federal government.
Comparability	An assessment of the confidence with which one data set can be compared to another.
Completeness	The percentage of valid data obtained from a measurement system compared to the amount of valid data expected under normal conditions. This attribute is always calculated by the end data user, not by the laboratory.
Confirmation	Verification of the identity of a component through the use of an approach with a different scientific principle from the original method.
Continuing Calibration Blank (CCB)	A blank sample used to monitor the cleanliness of an analytical system at a frequency determined by the analytical method.
Continuing Calibration Check Compounds (CCC)	Compounds listed in mass spectrometry methods are used to evaluate an instrument calibration from the standpoint of the integrity of the system.
Continuing Calibration Verification (CCV) Standard	A standard used to verify the initial calibration of compounds in an analytical method. May be referred to as a CCC in some programs, such as UCMR.
Control Limit	A range within which specified measurement results must fall to verify that the analytical system is in control.
Correction	Action taken to eliminate a detected non-conformity.
Corrective Action	The action taken to eliminate the causes of an existing non-conformity, defect, or other undesirable situation in order to prevent recurrence.
Data Integrity	The condition that exists when data are sound, correct, and complete, and accurately reflect activities and requirements.
Data Quality Objective (DQO)	Strategic planning tool that identifies and defines the type, quality, and quantity of data needed to satisfy a specified use or end user.
Data Reduction	The process of transforming the number of data items by arithmetic or statistical calculation, standard curves, and concentration factors, and collating them into a more usable form.
Demonstration of Capability (DOC)	A procedure to establish the ability of the analyst to generate analytical results of acceptable accuracy and precision.
Detection Limit (DL)	The minimum measured concentration of a substance that can be reported with 99% confidence that the measured concentration is distinguishable from the method blank results.
Dry Weight	The percent of sample that is not water, which may be used to adjust the reported results.

COPYRIGHT © 2019-2023 Pace® Analytical Services, LLC.

Electronic Data Deliverable (EDD)	A summary of environmental data which clients request for ease of data review and comparison to historical results.
Environmental Protection Agency (EPA)	An agency of the federal government of the United States which was created for the purpose of protecting human health and the environment by writing and enforcing regulations based on laws passed by Congress.
Equipment Blank	A sample of analyte-free media used to rinse common sampling equipment to check effectiveness of decontamination procedures.
Extracted Internal Standard Analyte	Isotopically labeled analogs of analytes of interest added to all standards, blanks and samples analyzed. Added to samples and batch QC samples prior to the first step of sample extraction and to standards and instrument blanks prior to analysis. Used for isotope dilution methods.
False Negative	A result that fails to identify (detect) an analyte to be present.
False Positive	A result that erroneously identifies (detects) an analyte to be present.
Field Blank	A blank sample prepared in the field by filling a clean container with reagent water and appropriate preservative, if any, for the specific sampling activity being undertaken.
Field Measurement	Testing performed in the field outside of a fixed-laboratory or outside of an enclosed structure that meets the requirements of a mobile laboratory.
Flame Atomic Absorption Spectrometer (FAA)	Instrumentation used to measure the concentration of metals in an environmental sample based on the fact that ground state metals absorb light at different wavelengths. Metals in a solution are converted to the atomic state by use of a flame.
Flame Ionization Detector (FID)	A type of gas detector used in GC analysis where samples are passed through a flame which ionizes the sample so that various ions can be measured.
Gas Chromatography (GC)	Instrumentation which utilizes a mobile carrier gas to deliver an environmental sample across a stationary phase with the intent to separate compounds out and measure their retention times.
Gas Chromatograph/ Mass Spectrometry (GC/MS)	In conjunction with a GC, this instrumentation utilizes a mass spectrometer which measures fragments of compounds and determines their identity by their fragmentation patterns (mass spectra).
Gasoline Range Organics (GRO)	A range of compounds that denote all the characteristic compounds that make up gasoline (range can be state or program specific).
Graphite Furnace Atomic Absorption Spectrometry (GFAA)	Instrumentation used to measure the concentration of metals in an environmental sample based on the absorption of light at different wavelengths that are characteristic of different analytes.
High Pressure Liquid Chromatography (HPLC)	Instrumentation used to separate, identify, and quantitate compounds based on retention times which are dependent on interactions between a mobile phase and a stationary phase.
Holding Time	The maximum time specified in a reference method that can elapse between analytical activities.
Homogeneity	The degree to which a property or substance is uniformly distributed throughout a sample.
Incremental Sampling Method (ISM)	A sampling method designed to provide an accurate characterization of contamination in soils at a site through collection of numerous portions of soil that are combined, processed, and subsampled in order to reduce the effects of soil heterogeneity.
Inductively Coupled Plasma Atomic Emission Spectrometry (ICP-AES)	Analytical technique used for the detection of trace metals which uses plasma to produce excited atoms that emit radiation of characteristic wavelengths.
Inductively Coupled Plasma- Mass Spectrometry (ICP/MS)	An ICP that is used in conjunction with a mass spectrometer so that the instrument is not only capable of detecting trace amounts of metals and non-metals but is also capable of monitoring isotopic speciation for the ions of choice.
Infrared Spectrometer (IR)	An instrument that uses infrared light to identify compounds of interest.

COPYRIGHT © 2019-2023 Pace® Analytical Services, LLC.

Initial Calibration (ICAL)	The process of analyzing standards, prepared at specified concentrations, to define the quantitative response relationship of the instrument to the analytes of interest.
Initial Calibration Blank (ICB)	A blank sample used to monitor the cleanliness of an analytical system at a frequency determined by the analytical method.
Initial Calibration Verification (ICV)	A standard obtained or prepared from a source independent of the source of the initial calibration standards to verify the initial calibration.
Instrument Blank	An analyte free matrix processed through the instrumental steps of the measurement process; use to determine instrument contamination.
Interference	The suppression or elevation of result of an analyte of interest due to the presence of other compounds.
Internal Standard	A known amount of standard added to a test portion of a sample as a reference for evaluating and controlling the precision and bias of the applied analytical method.
International Organization for Standardization (ISO)	An international standard-setting body composed of representatives from various national standards organizations.
Intermediate Standard Solution	Reference solutions prepared by dilution of the stock solutions with an appropriate solvent.
International System of Units (SI)	The coherent system of units adopted and recommended by the General Conference on Weights and Measures.
Ion Chromatography (IC)	Instrumentation or process that allows the separation of ions and molecules based on the charge properties of the molecules.
Isomer	One of two or more compounds, radicals, or ions that contain the same number of atoms of the same element but differ in structural arrangement and properties. For example, hexane (C6H14) could be n-hexane, 2-methylpentane, 3-methylpentane, 2,3-dimethylbutane, 2,2-dimethylbutane.
Laboratory	A facility that performs testing, whether in-house or in the field.
Laboratory Control Sample (LCS)	Also known as laboratory fortified blank (LFB): A sample matrix, free from the analytes of interest, spiked with verified known amounts of analytes or a material containing known and verified amounts of analytes, which is taken through all sample preparation and analytical steps of the procedure.
Laboratory Information Management System (LIMS)	The entirety of an electronic data system (including hardware and software) that collects, analyzes, stores, and archives electronic records and documents.
Legal Chain-of-Custody Protocols	Industry defined protocol that is sometimes used for evidentiary or legal purposes that establishes an intact, continuous record of the physical possession, storage, and disposal of samples, including sample aliquots and prepared samples.
Limit(s) of Detection (LOD)	The smallest concentration of a substance that must be present in a sample in order to be detected at the DL with 99% confidence.
Limit(s) of Quantitation (LOQ)	The minimum level, concentration, or quantity of a target analyte that can be reported with a specified degree of confidence.
Lower Limit of Quantitation (LLOQ)	The concentration of the lowest calibration standard included in the calibration curve.
Linear Dynamic Range	Concentration range where the instrument provides a linear response.
Liquid chromatography/ tandem mass spectrometry (LC/MS/MS)	Instrumentation that combines the physical separation techniques of liquid chromatography with the mass analysis capabilities of mass spectrometry.
Lot	A definite amount of material produced during a single manufacturing cycle and intended to have uniform character and quality.
Matrix	The substrate of a test sample.

COPYRIGHT © 2019-2023 Pace® Analytical Services, LLC.

Matrix Duplicate	A replicate matrix prepared in the laboratory and analyzed to obtain a measure of precision.
Matrix Spike (MS)	A sample prepared, taken through all sample preparation and analytical steps of the procedure, to which a known amount of target analyte is added to a specified amount of sample for which an independent test result of target analyte concentration is available.
Matrix Spike Duplicate (MSD)	A replicate matrix spike prepared in the laboratory and analyzed to obtain a measure of the precision of the recovery for each analyte.
Measurement System	A method, as implemented at a particular laboratory, and which includes the equipment used to perform the test and the operator(s).
Measurement Uncertainty	An estimate of the error in a measurement often stated as a range of values that contain the true value within a certain confidence level.
Method	A body of procedures and techniques for performing an activity (e.g., sampling, chemical analysis, quantification).
Method Blank	A sample of a matrix similar to the batch of associated samples (when available) that is free from the analytes of interest and is processed simultaneously with and under the same conditions as samples through all steps of the analytical procedures.
Method Detection Limit (MDL)	The minimum concentration of a substance that can be measured and reported with 99% confidence that the analyte concentration is greater than zero and is determined from analysis of a sample in a given matrix containing the analyte.
Method of Standard Additions	A set of procedures adding one or more increments of a standard solution to sample aliquots of the same size in order to overcome inherent matrix effects.
Minimum Detectable Activity (MDA)	Estimate of the smallest true activity that ensures a specified high confidence, $1 - \beta$, of detection above the Critical Value, and a low probability β of false negatives below the Critical Value. For radiometric methods, β is often set at 0.05.
Negative Control	A sample included in the method that is treated the same as all others but is expected to have a detection of analytes of interest.
Nonconformance	An indication or judgment that a product or service has not met the requirement of the relevant specifications, contract, or regulation; also, the state of failing to meet the requirements.
Positive Control	A sample included in the method that is treated the same as all others and is expected to have a detection of the analytes of interest.
Practical Quantitation Limit (PQL)	Another term for a method reporting limit.
Precision	The degree to which a set of observations or measurements of the same property, obtained under similar conditions, conform to themselves.
Preservation	Any conditions under which a sample must be kept in order to maintain chemical, physical, and/or biological integrity prior to analysis.
Primary Accreditation Body (Primary AB)	The TNI-approved state agency responsible for assessing a laboratory's total quality system, on-site assessment, and PT performance tracking for fields of accreditation.
Procedure	Written instructions detailing the performance of a task, process, or other laboratory activity.
Proficiency Testing (PT)	A means to evaluate a laboratory's performance under controlled conditions relative to a given set of criteria, through analysis of unknown samples provided by an external source.
Proficiency Testing Reporting Limit (PTRL)	A statistically derived value that represents the lowest acceptable concentration for an analyte in a PT sample, if the analyte is spiked into the PT sample. The PTRLs are specified in the TNI FoPT tables.
Qualitative Analysis	Analysis designed to identify the components of a substance or mixture.
Quality Assurance (QA)	An integrated system of management activities involving planning, implementation, assessment, reporting, and quality improvement to ensure that a process, item, or service is of the type and quality needed and expected by the client.
Quality Assurance Project Plan (QAPP)	A formal document describing the detailed quality control procedures by which the quality requirements defined for the data and decisions pertaining to a specific project are to be achieved.

COPYRIGHT © 2019-2023 Pace® Analytical Services, LLC.

Quality Control (QC)	The overall system of technical activities that measures the attributes and performance of a process, item, or service against defined standards to verify that they meet the stated requirements established by the customer; operational techniques and activities that are used to fulfill requirements for quality; also the system of activities and checks used to ensure that measurement systems are maintained within prescribed limits, providing protection against "out of control" conditions and ensuring that the results are of acceptable quality.
Quality Control Sample (QCS)	A sample used to assess the performance the measurement system.
Quality Manual	A document stating the management policies, objectives, principles, organizational structure and authority, responsibilities, accountability, and implementation of an agency, organization, or laboratory, to ensure the quality of its product and the utility of its product to its users.
Quality Management System	A structured and documented management system describing the policies, objectives, principles, organizational authority, responsibilities, accountability, and implementation plan of an organization for ensuring quality in its work processes, products (items), and services. The quality system provides the framework for planning, implementing, and assessing work performed by the organization and for carrying out required quality assurance and quality control activities.
Quantitation Range	The upper and lower limit to which values can be reported without being qualified as estimated.
Quantitative Analysis	Analysis designed to determine the amounts or proportions of the components of a substance.
Raw Data	The documentation generated during sampling and analysis. This documentation includes, but is not limited to, field notes, electronic data, magnetic tapes, untabulated sample results, QC sample results, print outs of chromatograms, instrument outputs, and handwritten records.
Record	Documentation, data, or other records constituting a piece of evidence about the past, especially an account of an act or occurrence kept in writing or some other permanent form. Records may be in electronic or hardcopy media. Unless otherwise specified, the term "record" refers to both electronic and hardcopy media.
Reference Material	Material or substance one or more of whose property values are sufficiently homogenized and well established to be used for the calibration of an apparatus, the assessment of a measurement method, or for assigning values to materials.
Reference Method	A published method issued by an organization recognized as competent to do so. (When the ISO language refers to a "standard method," that term is equivalent to "reference method").
Reference Standard	Standard used for the calibration of working measurement standards in a given organization or at a given location.
Relative Percent Difference (RPD)	A measure of precision defined as the difference between two measurements divided by the average concentration of the two measurements.
Reporting Limit (RL)	The value to which test results are reported as detected or not detected.
Representativeness	A quality element related to the ability to collect a sample reflecting the characteristics of the part of the environment to be assessed.
Retention Time	The time between sample injection and the appearance of a solute peak at the detector.
Sample	The item submitted for testing.
Sampling	Activity related to obtaining a representative sample for analysis.
Selected Ion Monitoring (SIM)	A mode of analysis in mass spectrometry where the detector is set to scan over a very small mass range, typically one mass unit.
Selectivity	The ability of a method to correctly determine an analyte without interference from other compounds.
Sensitivity	The smallest amount of substance in a sample that can accurately be measured.
Serial Dilution	The stepwise dilution of a substance in a solution.
Standard Operating Procedure (SOP)	A written document that details the method for an operation, analysis, or action with thoroughly prescribed techniques and steps.
Standard Reference Material (SRM)	A certified reference material produced by the US NIST or other equivalent organization and characterized for absolute content, independent of analytical method.

COPYRIGHT © 2019-2023 Pace® Analytical Services, LLC.

Stock Standard	A concentrated reference solution containing one or more analytes prepared in the laboratory using an assayed reference compound or purchased from a reputable commercial source.
Storage Blank	A sample of analyte-free media prepared by the laboratory and retained in the sample storage area.
Suitability	The quality of being appropriate for a particular purpose.
Surrogate	A substance with properties that mimic the analyte of interest, and unlikely to be found in environmental samples.
Systems Audit	An on-site inspection or assessment of a laboratory's quality system.
Target Analytes	Analytes or chemicals of primary concern identified by the customer on a project-specific basis.
Technology	A specific arrangement of analytical instruments, detection systems, and/or preparation techniques.
Traceability	The ability to trace the history of measuring equipment to national or international standards, primary standards, basic physical conditions or properties, or reference materials.
Trip Blank	A cleaned sample container filled with laboratory reagent water that is stored, shipped, and analyzed with its associated samples to detect sample contamination during transport and storage of the sample.
Tuning	A check and/or adjustment of instrument performance for mass spectrometry as required by the method.
Validation	The confirmation by examination and provision of objective evidence that the particular requirements for a specific intended use are fulfilled.
Verification	Confirmation by examination and objective evidence that specified requirements have been met. In connection with the management of measuring equipment, verification provides a means for checking that the deviations between values indicated by a measuring instrument and corresponding known values of a measured quantity are consistently smaller than the maximum allowable error defined in a standard, regulation, or specification peculiar to the management of the measuring equipment.
Working Standard	Dilution made of a stock or intermediate standard used in the analytical process.

8.0 ADDENDUM: PROGRAM REQUIREMENTS

Section 8.0 provides additional requirements the locations covered by this manual are required to follow when performing work under the program. Only requirements that are not covered by the main body of the manual are listed in the addendum.

8.1 DoD/DOE

PAS-MANS maintains accreditation for DoD/DoE Environmental Laboratory Approval Program (ELAP).

This addendum outlines additional policies and processes established by this laboratory to maintain compliance with DoD/DOE program specific requirements as outlined in the DoD/DOE Consolidated Quality Systems Manual (QSM) for Environmental Laboratories. The QSM incorporates ISO/IEC 17025 and the TNI Standard and includes additional program-specific requirements for laboratories that perform analytical testing services for DoD and DOE, and which must be followed for DoD / DOE projects.

Section 4.2.5: Supporting Documents

In addition to the requirements specified in Section 4.2.5, technical SOPs used for DoD/DOE testing must also include instructions for equipment and instrument maintenance, computer software/hardware, and troubleshooting.

The review frequency for technical SOPs used for DoD/DOE testing is annual, instead of every 2 years.

Section 4.4: Review of Analytical Service Requests

If the DoD/DOE customer requests a statement of conformity, the standard used for the decision rule must be communicated to and agreed on with the customer and identified in the final test report.

Laboratory requests to deviate from the requirements specified in the DoD/DOE QSM must be requested on a project-basis and include technical justifications for the deviation. These requests are submitted to and approved by the DoD/DOE project chemist or contractor, however name, in addition to the PAS client.

For DoD / DOE projects, will also seek clarification from the customer when the customer has requested an incorrect, obsolete, or improper method for the intended use of data; the laboratory needs to depart from its test method SOP in order to meet project-specific data quality objectives; information in project planning documents is missing or is unclear,

Section 4.5: Subcontracting

In addition to written client approval of any subcontractor for testing, the customer is notified of the laboratory's intent to use a subcontractor for any management system element (such as data review, data processing, project management or IT support) and consent for subcontracting is obtained approved in writing by the DoD/DOE customer and record of consent kept in the project record.

Section 4.6: Purchasing and Supplies

The laboratory procedure for records of receipt of materials and supplies used in testing also include a specification to record the date opened (DOE only).

Section 4.9.3: Nonconforming Work

COPYRIGHT © 2019-2023 Pace® Analytical Services, LLC.

The laboratory's procedure for client notification includes the 15-business day DoD /DOE time for notification of the problem and the 30-business day timeframe for submission of the corrective action plan or corrective actions taken. This procedure also includes the DoD/DOE requirement for AB notification of discovery.

Section 4.13: Control of Records

Technical Records: The laboratory's procedure for logbooks includes measures to prevent the removal of or addition of pages to the logbook (applies to both hardcopy and electronic). Hardcopy logbooks are version controlled, pre-numbered and bound. Initials and entries are signed or initialed and dated by the person making the entry and the entry is made at the time the activity is performed and in chronological order. Each page of the logbook must be closed by the last person making the entry on the page. Closure is recorded by the initial and date of the person making the last entry.

Section 5.4.5.3.3: Limit of Detection

For DoD/DOE the LOD is an estimate of the minimum amount of an analyte that can be reliably detected by an analytical process. For clarification, the LOD is the analyte concentration necessary to distinguish its presence from its absence. The LOD may be used as the lowest concentration for reliably reporting a non-detect (ND). The LOD is specific to each suite of analyte, matrix, and method including sample preparation.

After each DL determination, the laboratory establishes the LOD by spiking a quality system matrix at a concentration of least 2X but no greater than 4X the DL (i.e., 2X DL ≤ LOD Spike ≤ 4X DL). The spike concentration establishes the LOD and the concentration at which the LOD is verified.

The LOD is established during method validation and after major changes to the analytical system or procedure that affects sensitivity of analysis or how the procedure is performed.

An LOD study is not required for any component for which spiking solutions or quality control samples are not available. Additionally, an LOD study is not required if the laboratory does not report data below the LOQ.

The LOD must be verified on a quarterly basis. Each preparation method listed on the scope of accreditation must have quarterly LOD verifications; however, verification of all combinations of preparation and clean-up techniques is not required. Where LOD verifications are not performed on all combinations, the LOD verification is based on the worst-case combination (preparation method with all applicable cleanup steps).

The laboratory's procedure for LOD determination and verification is detailed in SOP ENV-SOP-WES2-0112 Method Detection Limit & Limit of Quantitation.

Section 5.4.5.3.4: Limit of Quantitation

For DoD/DOE, the LOQ is established for each analyte-matrix-method combination, including surrogates. When an LOD is determined or verified by the laboratory, the LOQ must be above the LOD [DL<LOD<LOQ].

At a minimum, the LOQ must be verified quarterly; however, verification of all combinations of preparation and clean-up techniques is not required. Where LOQ verifications are not performed on all combinations, the LOQ verification on the worst-case combination (preparation method with all applicable cleanup steps).

The laboratory's procedure for LOQ determination and verification is detailed in laboratory SOP ENV-SOP-WES2-0112 *Method Detection Limit & Limit of Quantitation*.

COPYRIGHT © 2019-2023 Pace® Analytical Services, LLC.

Section 5.4.7: Control of Data

The laboratory will ensure LIMS passwords are changed at least once per year.

An audit of the LIMS will be incorporated into the laboratory's annual internal audit schedule.

The laboratory will have procedures in place to notify DoD/DOE customers of changes to LIMS software or hardware configurations that may impact the customer's integrity of electronic data

Section 5.9.1: Quality Control

For DoD/DOE, storage blanks are essential QC to monitor the storage of samples for volatile organic analysis (VOA). The SOP for storage of VOA samples must include a contamination monitoring program based on the performance of storage blanks. (See QSM 5.3.3)

Section 5.8.5: Sample Disposal

For DOE projects, the record of disposal must also include how the sample was disposed and the name of the person that performed the task.

Appendix E: Support Equipment Calibration

Mechanical Volumetric Pipette: In addition to the quarterly verification check, pipettes used for DoD/DOE projects are checked daily before use using the same procedure and criteria specified for the quarterly check.

Water Purification System: The performance of the water purification system is checked daily prior to use in accordance with SOP ENV-SOP-WES2-0127 *DI Water System*.

Additional: (DOE): Section 6.0 of the QSM outlines additional management system requirements for the management of hazardous and radioactive materials management and health and safety practices. The laboratory, if approved for DOE, will consult with the PAS Health and Safety Director to establish plans, policies and procedures that conform to these comprehensive specifications and incorporate these documents into the QMS.

COPYRIGHT © 2019-2023 Pace® Analytical Services, LLC.

8.2 Unregulated Contaminant Monitoring Rule 5 (UCMR5)

PAS-MANS maintains EPA approval to report data for the Unregulated Contaminant Monitoring Rule 5. This addendum outlines additional policies and processes established by this laboratory to maintain compliance with UCMR 5 program specific requirements. These requirements are outlined in the UCMR 5 Laboratory Approval Requirements and Information Document. Data may not be uploaded to the Safe Drinking Water Accession and Review System (SDWARS) if it does not comply with these requirements.

Section 5.8.3: Sample Receipt Checks and Sample Acceptance Policy

Samples cannot be reported to SDWARS for UCMR5 Compliance if any of the following receipt issues are encountered: received in an insecure manner, inappropriate containers, outside the required temperature range, outside the recognized holding time, inadequate identification on sample containers and/or COC, improper preservation.

Section 5.8.3.1: Sample Receipt Checks - Thermal Preservation

Samples must be received at the laboratory within 48 hours of collection and must be ≤ 10˚C. After arrival or within 48 hours of collection, whichever is sooner, the samples must be refrigerated at ≤ 6°C. Samples received more than 48 hours after collection are valid only if they are received at ≤ 6°C and the laboratory can obtain documentation from the client to verify that they were refrigerated between collection and shipment. Temperature requirements apply to all UCMR5 samples with the exception of Lithium by EPA 200.7.

Section 5.9.1.1.3: Method Blank

The method blank will be considered contaminated if the concentration of any target analyte in the method blank is greater than 1/3 the MRL for that analyte. If samples cannot be re-processed, then samples must be re-collected. Data with a failing method blank cannot be reported to SDWARS.

Section 5.9.1.1.4: Laboratory Control Sample (LCS)

If the LCS recovery fails, then all data for the problem analyte are considered invalid for all samples in the Extraction or Digestion Batch. Data associated with a failing LCS must not be reported to SDWARS. If the LCS surrogate or internal standard fails QC criteria, all data for the Extraction or Digestion Batch must not be reported to SDWARS.

Section 5.9.1.1.5: Matrix Spikes (MS/MSD)

A UCMR5 sample must be used as the parent sample for the MS/MSD in batches containing UCMR5 samples. The spike concentration of the MS/MSD must be alternated between a low- and mid-level concentration.

There are no method analyte recovery acceptance criteria specific for MS/MSD results. Data should not be rejected based on the recovery of the fortified target analytes or on the precision between the MS and MSD, provided internal standard and surrogate standard recoveries and all other QC results are valid. If surrogate or internal standard recovery fails criteria in the MS and MSD, do not report results. If one of the fortified samples fails QC, the results of the passing fortified sample should be reported as the MS. The entire analysis batch does not need to be reanalyzed because of a failure of a surrogate or internal standard in MS or MSD. Recollection of the field sample is not required with a surrogate or internal standard fails criteria in the MS/MSD.

Section 5.9.1.1.7: Surrogates

COPYRIGHT © 2019-2023 Pace® Analytical Services, LLC.

A sample that fails QC criteria for surrogate recovery should be rerun in case a mis-injection occurred. If the sample continues to fail surrogate QC criteria, the laboratory should process a new aliquot of the sample. Typically, data for samples with failed surrogate recovery must not be reported to SDWARS.

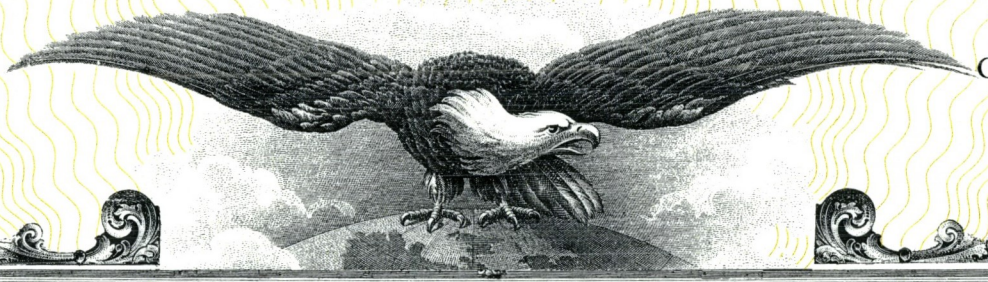
If the surrogate recovery fails the acceptance criteria in a MB or LCS, the MB or LCS may be reanalyzed later in the Analysis Batch. If surrogate recovery fails again, all field sample results for the associated Extraction Batch are invalid and must not be reported. If the surrogate recovery fails in an MB that is needed to pass an Analysis Batch, all data for that Analysis Batch are invalid and must not be reported. If possible, the laboratory should process new aliquots of the affected samples; if this is not possible, the affected field samples must be recollected. One LCS must pass surrogate recovery within a 24-h period of analysis. If not, the samples in the Analysis Batches that correspond to that required LCS, cannot be reported.

Section 5.9.1.1.8: Internal Standards

If the internal standard recovery in a sample fails the acceptance criteria, then the results for the analytes that are associated with the internal standard in that sample are invalid. Data that fail internal standard criteria must not be reported to SDWARS. If possible, the laboratory should process a new aliquot of the sample; if this is not possible, the field sample must be recollected.

For an Extraction Batch or Digestion Batch, if the internal standard recoveries in a MB or LCS fail the acceptance criteria, all data for the analytes that are associated with that internal standard in that Extraction Batch or Digestion Batch are invalid and must not be reported. If the internal standard recoveries in a MB or LCS fail the acceptance criteria in an Analysis Batch, all data for the analytes that are associated with that internal standard in the Analysis Batch are invalid and must not be reported. If possible, the laboratory should process new aliquots of the affected samples.

Accreditation #:
GAI-LAP – 20-96
TEL (610) 522-8440



Geosynthetic Institute
475 Kedron Avenue

REVISION

Re: GAI-LAP

Dear Mr. Michael Pratt:

The Geosynthetic Institute (GSI) is pleased to acknowledge Geotesting Express LLC on its repertoire of Geosynthetic Accreditation Institute's-Laboratory Accreditation Program (GAI-LAP) accredited tests. This letter should serve as notification that Geotesting Express LLC located in Acton, MA. Geotesting Express is currently accredited for the following sixty-three (63) test methods until June 30, 2025.

1. ASTM D374 Test Methods for Thickness of Solid Electrical Insulation
2. ASTM D413 Test Methods for Rubber Property – Adhesion to Flexible Substrate
3. ASTM D751 Test Methods for Coated Fabrics (thickness)
4. ASTM D792 Test Method for Specific Gravity and Density of Plastics by Displacement
5. ASTM D882 Test Method for Tensile Properties of strip tensile
6. ASTM D1004 Test Method for Initial Tear Resistance of Plastic Film and Sheeting
7. ASTM D1204 Test Method for Linear Dimensional Changes of Nonrigid Thermoplastic Sheeting or Film at Elevated Temperature
8. ASTM D1238 Test Method for Flow Rates of Thermoplastics by Extrusion Plastometer
9. ASTM D1505 Test Method for Density of Plastics by the Density Gradient Technique
10. ASTM D1593 Specification for Nonrigid Vinyl Chloride Plastic Sheeting (thickness)
11. ASTM D1603 Test Method for Carbon Black in Olefin Plastics
12. ASTM D1777 Test Method for Measuring the Thickness of Textile Materials
13. ASTM D3015 Standard of Practice for Microscopic Examination of Pigment Dispersion in Plastic Compounds
14. ASTM D3776 Test Method for Mass Per Unit Area (Weight) or Woven Fabric
15. ASTM D3786 Test Method for Hydraulic Burst Strength of Knitted Goods and Nonwoven Fabrics (Diaphragm Bursting Strength Tester Method)
16. ASTM D3787 Test Method for Bursting strength using CRT Bell Burst Test
17. ASTM D4218 Test Method for Carbon Black in Olefin Plastics (Muffle Furnace)

18. ASTM D4491 Test Methods for Water Permeability of Geotextiles by Permittivity
19. ASTM D4533 Test Method for Index Trapezoidal Tearing Strength of Geotextiles
20. ASTM D4595 Standard Test Method for Tensile Properties of Geotextiles by Wide Width Strip Method
21. ASTM D4632 Test Method for Grab Breaking Load and Elongation of Geotextiles
22. ASTM D4716 Test Method for Determining the (In-Plane) Flow Rate per Unit Width and Hydraulic Transmissivity of a Geosynthetic Using a Constant Head
23. ASTM D4751 Test Method for Determining Apparent Opening Size of a Geotextile
24. ASTM D4833 Test Method for Index Puncture Resistance of Geotextiles, Geomembranes and Related Products
25. ASTM D4884 Test Method for Seam Strength of Sewn Geotextiles
26. ASTM D4885 Test Method for Determining Performance Tensile Strength of Geomembranes Using Wide Strip Testing
27. ASTM D5034 Test Method for Breaking Strength and Elongation (Grab Method)
28. ASTM D5035 Test Method for Breaking Strength and Elongation (Strip Method)
29. ASTM D5199 Test Method for Measuring Nominal Thickness of Geotextiles and Geomembranes
30. ASTM D5261 Test Method for Measuring Mass per Unit Area of Geotextiles
31. ASTM D5321 Test Method Using Direct Sheer Method to Determine Soil and Geosynthetic Friction
32. ASTM D5596 Test Methods for Microscopic Evaluation of the Dispersion of Carbon Black in Polyolefin Geosynthetics
33. ASTM D5884 Test Method for the Tearing Strength of Internally Reinforced Geomembranes
34. ASTM D5887 Test Method to Measure Index Flux of Saturated GCLs
35. ASTM D5890 Standard Test Method for Swell Index of Clay Mineral Component of Geosynthetic Clay Liners
36. ASTM D5891 Standard Test Method for Fluid Loss of Clay Component of GCL
37. ASTM D5993 Test Method for Measuring the Mass Per Unit Area of GCL
38. ASTM D5994 Test Method for Measuring the Core Thickness of Textured Geomembranes
39. ASTM D6140 Test Method to Determine Asphalt Retention of Paving Fabrics used in Asphalt Paving
40. ASTM D6214 Test Method for Determining the Integrity of Field Seams Used in Joining Geomembranes by Chemical Fusion Methods
41. ASTM D6241 Test Method for the Static Puncture Strength of Geotextiles and Geotextile Related Products Using a 50-mm Probe
42. ASTM D6243 Test Method for Determine the Internal and Interface Shear Resistance of Geosynthetic Clay Liners by the Direct Shear Method
43. ASTM D6364 Test Method for Determining the Short-Term Compression Behavior of Geosynthetics
44. ASTM D6392 Test Method for Determining the Integrity of Nonreinforced GM Seams using Thermo Fusion Method

45. ASTM D6496 Test Method to Determine the Average Bonding Peel Strength Between Layers of Needle-Punched GCL.
46. ASTM D6566 Test Method for Measuring Mass per Unit Area of Turf Reinforcement Mats
47. ASTM D6636 Test Method for Determining Ply Adhesion Strength of reinforced Geomembranes
48. ASTM D6637 Test Method for determining Tensile Properties of Geogrids by single or multi rib Tensile Method
49. ASTM D6693 Test Method of Determining Tensile Properties of Nonreinforced Polyethylene and Nonreinforced Flexible Polypropylene GM
50. ASTM D6766 Test Method for Evaluation of Hydraulic Properties of Geosynthetic Clay Liners Permeated with Potentially Incompatible Liquids
51. ASTM D6768 Test Method for Tensile Strength of GCL
52. ASTM D7003 Test Method for Strip Tensile Properties of reinforced GM
53. ASTM D7004 Test Method for Grab Tensile Properties of Reinforced GM
54. ASTM D7005 Test Method for Determining the Bond Strength of Geocomposites
55. ASTM D7179 Test Method for Determining Geonet Breaking Force
56. ASTM D7408 Standard Test for Non-resin PVC geomembrane seams
57. ASTM D7466 Test Method for Measuring the Asperity Height of Textured Geomembranes
58. ASTM D7737 Test Method for Individual Geogrid Junction Strength
59. ASTM D7747 Test Method for Determining Integrity of Seams for reinforced Geomembranes using Strip Tensile Method
60. ASTM D7749 Test Method for Determining Integrity of Seams for reinforced Geomembranes using Grab Method
61. ASTM C165 Standard Test Methods for Measuring Compressive Properties of Thermal Insulations
62. ASTM C203 Standard Test Methods for Breaking Load and Flexural Properties of Block-Type Thermal Insulation
63. ASTM C303 Standard Test Method for Dimensions and Density of Preformed Block and Board-Type Thermal Insulation

Any questions regarding your accreditation should be directed to George Koerner at (610) 522-8440. Once again congratulation and thank you for participating in the GAI-LAP.

Regards,

George R. Koerner, Ph.D., P.E. & CQA
Director

Accredited Laboratory

A2LA has accredited

GEOTESTING EXPRESS, LLC.

Acton, MA

for technical competence in the field of

Geotechnical Testing

This laboratory is accredited in accordance with the recognized International Standard ISO/IEC 17025:2017 General requirements for the competence of testing and calibration laboratories. This accreditation demonstrates technical competence for a defined scope and the operation of a laboratory quality management system (refer to joint ISO-ILAC-IAF Communiqué dated April 2017).

Presented this 29th day of April 2024.

Mr. Trace McInturff, Vice President, Accreditation Services
For the Accreditation Council
Certificate Number 2965.01
Valid to March 31, 2026
Revised September 10, 2024

For the tests to which this accreditation applies, please refer to the laboratory's Geotechnical Scope of Accreditation.

SCOPE OF ACCREDITATION TO ISO/IEC 17025:2017

GEOTESTING EXPRESS, LLC.
125 Nagog Park
Acton, MA 01720
Joe Tomei Phone: 978 635 0424

Valid To: March 31, 2026 Certificate Number: 2965.01

GEOTECHNICAL

In recognition of the successful completion of the A2LA evaluation process, accreditation is granted to this laboratory to perform the following tests under the ASTM recommended practice D3740:

Test Method:	**Test Description:**
Soils:	
AASHTO T307	Determining the Resilient Modulus of Soils and Aggregate Materials
ASTM D421 (Withdrawn 2016)	Dry Preparation of Soil Samples for Particle-Size Analysis and Determination of Soil Constant
ASTM D422 (Withdrawn 2016)	Particle Size Analysis of Soils
ASTM D698	Moisture-Density Relations (Standard Proctor)
ASTM D854	Specific Gravity of Soils
ASTM D1140	Amount of Material in Soils Finer than No. 200 Sieve
ASTM D1557	Moisture-Density Relations (Modified Proctor)
ASTM D1883	CBR (California Bearing Ratio) of Laboratory-Compacted Soils
ASTM D2166/D2166M	Unconfined Compressive Strength of Cohesive Soil
ASTM D2216	Water Content of Soil, Rock & Soil-Aggregate Mixtures
ASTM D2434	Permeability of Granular Soils (Constant Head)
ASTM D2435/D2435M	One-Dimensional Consolidation Properties of Soils
ASTM D2487	Classification of Soils for Engineering Purposes
ASTM D2488	Description and Identification of Soils (Visual-Manual Procedure)
ASTM D2850	Undrained, Unconsolidated Strength in Triaxial Compression
ASTM D2974	Moisture, Ash, and Organic Matter of Peat and Other Organic Soils
ASTM D3080/D3080M	Direct Shear Test of Soils Under Consolidated Drained Conditions
ASTM D3999	Determination of the Modulus and Damping Properties of Soils Using the Cyclic Triaxial Apparatus
ASTM D4186	One-Dimensional Consolidation Properties of Saturated Cohesive Soils Using Controlled-Strain Loading
ASTM D4253	Maximum Index Density and Unit Weight of Soils Using a Vibratory Table
ASTM D4254	Minimum Index Density and Unit Weight of Soils and Calculation of Relative Density
ASTM D4318	Liquid Limit, Plastic Limits & Plasticity Index of Soils
ASTM D4373	Rapid Determination of Carbonate Content of Soils
ASTM D4546	One-Dimensional-Swell or Settlement Properties of Cohesive Soils

5202 Presidents Court, Suite 220 | Frederick, MD 21703-8398 | Phone: 301 644 3248 | Fax: 240 454 9449 | www.A2LA.org

Test Method:	**Test Description:**
ASTM D4718	Correction of Unit Weight and Water Content for Soils Containing Oversize Particles
ASTM D4767	Consolidated Undrained Triaxial Compression Test for Cohesive Soils
ASTM D4829	Expansion Index of Soils
ASTM D4972	pH of Soils
ASTM D5084	Measurement of Hydraulic Conductivity of Saturated Porous Materials Using a Flexible Wall Permeameter
ASTM D5334	Thermal Conductivity of Soil and Soft Rock by Thermal Needle Probe Procedure
ASTM D5311	Load Controlled Cyclic Triaxial Strength of Soil
ASTM D6467	Torsional Ring Shear Test to Determine Drained Residual Shear Strength of Cohesive Soils
ASTM D6528	Consolidated Undrained Direct Simple Shear Testing of Cohesive Soils
ASTM D6913	Particle-Size Distribution (Gradation) of Soil using Sieve Analysis
ASTM D6938	In-Place Density and Water Content of Soil and Soil-Aggregate by Nuclear Methods (Shallow Depth)
ASTM D7181	Consolidated Drained Triaxial Compression Test for Soils
ASTM D7263	Laboratory Determination of Density (Unit Weight) of Soil Specimens
ASTM D7608	Standard Test Method for Torsional Ring Shear test to determine Drained Fully Softened Shear Strength and Nonlinear Strength Envelope of Cohesive Soils for Slope with No Preexisting Shear Surfaces
ASTM D7928	Particle-Size Distribution (Gradation) of Fine-Grained Soils Using the Sedimentation (Hydrometer) Analysis
ASTM D8296	Consolidated Undrained Cyclic Direct Simple Shear Test under Constant Volume with Load Control or Displacement Control
ASTM G51	Standard Test Method for Measuring pH of Soil for Use in Corrosion Testing
ASTM G57	Soil Resistivity Using the Wenner Four-Electrode Method
IEEE-STD-422-17	IEEE Guide for Thermal Resistivity Measurements of Soils and Backfill Materials
ISO/TS 17892-1	Determination of Water Content
ISO/TS 17892-3	Determination of Particle Density - Pycnometer Method
ISO/TS 17892-5	Incremental Loading Oedometer Test
ISO/TS 17892-7	Unconfined Compression Test on Fine-Grained Soil
ISO/TS 17892-9	Consolidated Triaxial Compression Tests on Water-Saturated Soil
ISO/TS 17892-11	Determination of Permeability by Constant and Falling Head
ISO/TS 17892-12	Determination of Atterberg Limits
Rock:	
ASTM D2845	Laboratory Determination of Pulse Velocities and Ultrasonic Elastic Constants of Rock
ASTM D2936	Direct Tensile Strength of Intact Rock Core Specimens
ASTM D3967	Splitting Tensile Strength of Intact Rock Core Specimens
ASTM D4543	Preparing Rock Core as Cylindrical Test Specimens and Verifying Conformance to Dimensional and Shape Tolerances
ASTM D4644	Slake Durability of Shales and Similar Weak Rocks

Test Method:	**Test Description:**
ASTM D5607	Performing Laboratory Direct Shear Strength Tests of Rock Specimens Under Constant Normal Force
ASTM D5731	Determination of the Point Load Strength Index of Rock and Application to Rock Strength Classifications
ASTM D5873	Determination of Rock Hardness by Rebound Hammer Method
ASTM D6032	Determining Rock Quality Designation (RQD) of Rock Core
ASTM D7012	Compressive Strength and Elastic Moduli of Intact Rock Core Specimens under Varying States of Stress and Temperature
ASTM D7625	Laboratory Determination of Abrasiveness of Rock Using the CERCHAR Method
Handewith (2000)	Punch Penetration
ISRM Part 1	Water Content of Rock
ISRM Part 2	Porosity/Density
ISRM Part 3	Saturation/Buoyancy

UNCONTROLLED COPY

1 SCOPE

Presented in this document is the Quality Manual for GeoTesting Express, Inc. (GTX). This document compliments other referenced documents which are specific to the laboratory's operation. The quality system outlined in this Quality Manual is designed to meet requirements in ANSI/ISO/IEC 17025:2017. The organization of the GTX Quality Manual follows the organization structure of ANSI/ISO/IEC 17025:2017.

This document may also be used to confirm or recognize the competence of the GTX laboratories by laboratory customers, regulatory authorities, organizations, and schemes using peer-assessment, accreditation bodies, and others.

Created in 1989, GTX is an independent testing laboratory with locations in Acton, MA and Atlanta, GA. GTX is a subsidiary of Geocomp Corporation (Geocomp). GTX is committed to adhering to high standards of quality while providing quick turnaround of test results for soil, rock, geosynthetics, aggregate, concrete, and other "geo" materials. GTX services owners, engineers, contractors, developers, manufacturers, government agencies and other laboratories.

The GTX quality goals can be found in Section 8.

1.1 HEALTH SAFETY AND ENVIRONMENTAL POLICY

It is the policy and practice of the Geocomp and GTX to control hazards in the workplace to the greatest extent feasible. This is to reduce the potential for employee injury and illness as well as to protect potentially affected members of the public, their property, and the environment from loss or damage due to our operations and activities. Geocomp/GTX is committed to the safety and health of all employees and recognizes the need to, at a minimum, comply with regulations governing employee workplace health and safety. When feasible and/or consistent with good management practice, we will always strive to operate in a manner that is "beyond compliance."

The GTX Quality Manual does not address health and safety issues and policies. These matters are addressed by the corporate Health and Safety Program and are beyond the scope of the GTX Quality Manual. Company policies are outlined in the Geocomp Corporation "Health, Safety and Environmental Program."

2 NORMATIVE REFERENCES

The following referenced documents are indispensable for the application of this document. For dated references, only the edition cited applies. For undated references, the latest edition of the referenced document (including any amendments) applies.

3 TERMS AND DEFINITIONS

For the purposes of this document, the following terms and definitions given in ISO/IEC 17000 and ISO/IEC Guide 99 and the following apply.

3.1 Impartiality - presence of objectivity.

3.2 Complaint - expression of dissatisfaction by any person or organization to a laboratory (3.6), relating to the activities or results of that laboratory, where a response is expected.

3.3 Interlaboratory Comparison - organization, performance and evaluation of measurements or tests on the same or similar items by two or more laboratories in accordance with predetermined conditions.

3.4 Intralaboratory Comparison - organization, performance and evaluation of measurements or tests on the same or similar items, within the same laboratory (3.6), in accordance with predetermined conditions.

3.5 Proficiency Testing - evaluation of participant performance against pre-established criteria by means of interlaboratory comparisons (3.3).

3.6 Laboratory - body that performs one or more of the following activities: Testing, calibration, and sampling associated with subsequent testing or calibration.

3.7 Decision Rule - rule that describes how measurement uncertainty is accounted for when stating conformity with a specified requirement.

3.8 Verification - Provision of objective evidence that a given item fulfils specified requirements.

3.9 Validation - Verification (3.8) where the specified requirements are adequate for an intended use.

3.10 AASHTO: n – American Association of State Highway and Transportation Officials. AASHTO is a nonprofit, nonpartisan association representing highway and transportation departments in the 50 states, the District of Columbia and Puerto Rico. It provides standard test methods or specifications that have been developed by and meets the approval of the organization.

3.11 ASTM: n – American Society for Testing and Materials. A not-for-profit organization which provides standard test methods or specifications that have been developed within the consensus principles and that meets the approval requirements for the organization.

3.12 Client: n – The company or individual responsible for payment of delivered product or services.

3.13 Contract: n – Formal or verbal agreement between the Client and the supplier with the terms and requirements for the testing services detailed. The contract terms may include specific testing services, along with the agreed price, and delivery schedule.

3.14 Geosynthetic: n – a planar product manufactured from polymeric material used with soil, rock, earth, or other geotechnical engineering related material as an integral part of a man-made project, structure or system.

UNCONTROLLED COPY

3.15 ISO: n – International Standards Organization for Standardization (ISO) which specifies the quality systems requirements.

3.16 IRM: n – Internal Reference Materials are standard materials of known quality or whose quality has previously been established by the laboratory and are used to validate test methods, equipment performance and to qualify technicians.

3.17 Product: n – The final report submitted to the client describing the test results and test data.

3.18 Quality Assurance: n – The system of testing, inspection, review, documentation, etc. to verify the existence, implementation, and maintenance of the Quality System.

3.19 Quality Control: n – The system of testing, inspection, review, and documentation which are designed to verify that the data generated in the laboratory are produced within known limits of accuracy and precision.

3.20 Quality Policy: n – The documented quality commitment and objectives of the supplier.

3.21 Quality System: n – The entire quality program consisting of quality control, quality assurance, and management programs to verify that the company's Quality Policy and requirements of the client are achieved.

3.22 Sample: n – The material delivered to the laboratory as a source of test specimens.

3.23 Specimen: n – A specific portion of a sample upon which a test is performed. Typically, specimens must be specified dimensions, volume or weight.

3.24 In this document, the following verbal forms are used:

— "shall" indicates a requirement;

— "should" indicates a recommendation;

— "may" indicates a permission;

— "can" indicates a possibility or a capability.

3.25 Definitions of technical terminology used by GTX follows ASTM D653 - Standard Terminology Relating to Soil, Rock, and Contained Fluids.

4 GENERAL REQUIREMENTS

4.1 IMPARTIALITY

GTX is an impartial, 3rd party laboratory whose employees are free from undue pressures which could influence their technical decisions. GTX is a subsidiary of Geocomp Corporation. Personnel of GTX are independent from the other divisions of Geocomp. The other divisions of Geocomp do not exert influence upon the GTX laboratory or its employees.

UNCONTROLLED COPY

4.1.1

GTX activities shall be undertaken impartially and structured and managed to safeguard impartiality.

4.1.2

The GTX laboratory management shall be committed to impartiality.

4.1.3

The GTX laboratory shall be responsible for the impartiality of its laboratory activities and shall not allow commercial, financial, or other pressures to compromise impartiality.

4.1.4

The GTX laboratory shall identify risks to its impartiality on an on-going basis. This shall include those risks that arise from its activities, or from its relationships, or from the relationships of its personnel. However, such relationships do not necessarily present a laboratory with a risk to impartiality.

4.1.5

If a risk to impartiality is identified, GTX shall eliminate and minimize such risk as outlined in Section 8.5.4.

4.2 CONFIDENTIALITY

The GTX Standard Terms and Conditions for Engineering, Testing, and Consulting Services relate to ownership and confidentiality of GTX results and reports. Section 11 of Terms and Conditions states the following:

Confidentiality and Subpoenas. We will not tell anybody about this work unless someone's health or safety is in danger, or the Sheriff delivers a demand. Information about this Agreement and GTX's services and information provided by the Client about the services will be maintained in confidence and will not be disclosed to others without the Client's consent, except as GTX believes is necessary to perform its services, comply with professional standards to protect public safety, health, and the environment, and to comply with laws and court orders. GTX will make reasonable efforts to notify the Client prior to any disclosure except as necessary to perform its services. Information available to the public and unprotected information acquired from third parties will not be considered confidential. The Client will reimburse GTX to respond to any subpoena or governmental inquiry or audit related to the services at GTX's standard rates then in effect.

4.2.1

The GTX laboratory shall be responsible, through legally enforceable commitments, for the management of all information obtained or created during the performance of laboratory activities. The laboratory shall inform the client in advance, of the information it intends to place in the public domain. Except for information that the client makes publicly available, or when agreed between the laboratory and the client (e.g. for the purpose of responding to complaints), all other information is considered proprietary information and shall be regarded as confidential.

4.2.2

UNCONTROLLED COPY

When the laboratory is required by law or authorized by contractual arrangements to release confidential information, the client or individual concerned shall, unless prohibited by law, be notified of the information provided.

4.2.3

Information about the client obtained from sources other than the client (e.g. complainant, regulators) shall be confidential between the client and the laboratory. The provider (source) of this information shall be confidential to the laboratory and shall not be shared with the client, unless agreed by the source.

4.2.4

Personnel, including any committee members, contractors, personnel of external bodies, or individuals acting on the laboratory's behalf, shall keep confidential all information obtained or created during the performance of laboratory activities, except as required by law.

5 STRUCTURAL REQUIREMENTS

5.1 GEOCOMP AND GEOTESTING EXPRESS

GeoTesting Express, Inc. is a subsidiary of Geocomp Corporation and is incorporated in the Commonwealth of Massachusetts. GTX's relationship to the Geocomp Corporation and its reporting structure to its parent company is outlined in the organization chart presented in Appendix A, Figure 1.

5.2 GTX ORGANIZATION

The organization chart of GTX is presented in Appendix A, Figure 2. It outlines the management structure and overall laboratory responsibilities. See Section 5.5 for further details of the GTX organization, management, and responsibilities.

5.3 LABORATORY ACTIVITIES

All GTX laboratory activities shall conform with the GTX Quality Manual. A list of GTX laboratory activities can be found in Appendix B. GTX will only claim conformity for its own range of laboratory activities. GTX will not claim conformity to its quality system for any externally provided laboratory activities performed by others.

5.4 REQUIREMENTS FOR LABORATORY ACTIVITIES

All GTX activities shall be carried out in such a way as to meet the requirements of the ISO/IEC 17025 as well as the requirements of GTX clients, relevant regulatory authorities and organizations providing recognition. This shall include GTX activities performed in all its permanent facilities, at sites away from its permanent facilities, in any associated temporary or mobile facilities or at a client's facility.

UNCONTROLLED COPY

5.5 ORGANIZATION

5.5 a)

GTX is a subsidiary of Geocomp Corporation. The Geocomp leadership consists of the Chief Engineer who is also the Chief Executive Officer (CEO) and the owner of the firm, and the Chief Operating Officer (COO.)

GTX's leader is the Director of Testing Services who reports directly to the COO.

5.5 b) Laboratory Personnel, Their Responsibilities, Authority and Interrelationships

5.5.b.1

GTX is committed to providing the necessary resources to achieve its stated goals. This includes:

- Trained personnel to manage and perform testing as outlined by appropriate standards
- Equipment with capabilities, accuracy and precision as prescribed by appropriate standards
- Computers necessary for data acquisition, analysis, report generation, accounting and marketing
- Facilities necessary to conduct testing in appropriate atmosphere

5.5.b.2

All GTX Laboratory personnel are responsible for the following:

Following Health, Safety and Environmental policy and project specific Health and Safety plans

Client confidentiality

Identifying and reporting risk to the GTX quality system, integrity and impartiality.

The specific responsibilities and authorities for each position are outlined in Appendix C as part of the job description for each lab position.

5.5.b.3

Position descriptions for each operational position in the laboratory/field staff can be found in Appendix C. Resumes of the supervisory technical staff (Chief Engineer/CEO, Director of Testing Services and Laboratory Manager(s)) are located with the Director of Testing Services.

5.5 c) Management System

GTX employs a management team appropriate to the volume and nature of laboratory testing conducted. GTX maintains documented procedures which make up the quality system and are located in the Quality Manual and other quality system documents. These procedures have been developed to assure the consistent application of laboratory activities and the validity of the results. The procedures are followed by employees of GTX. The Quality Manager is responsible for implementing the quality system. The Quality Manual is electronically maintained on GTX's server as a read-only protected file. It is available to each employee for viewing. The Quality Manager is responsible for distribution and maintenance of controlled documents related to the quality system.

UNCONTROLLED COPY

5.5.c.1. Management Responsibilities:

Chief Engineer/CEO: Has overall authority on the laboratory and primary technical authority. The Chief Engineer/CEO provides oversight of technical activities and resources.

Chief Operating Officer (COO): The COO works with the Director of Testing Services to develop a business plan and set yearly financial goals for GTX. He/she is also responsible for making sure GTX has whatever resources are necessary to meet those goals.

Director of Testing Services: Is responsible for the day-to-day management of all GTX branches. This person is responsible for both business development, operational activities, and laboratory health and safety policy, within the testing division. This person is responsible for contract review. He/she will perform quality assurance checks on reports generated by GTX. The Director of Testing Services is responsible for ensuring compliance with ISO/IEC 17025, and maintaining client confidentiality. In addition, the Director of Testing Services is responsible for identifying, assessing, evaluating, and controlling risk and opportunities related to the GTX quality system, impartiality, and lab integrity.

Laboratory Manager: Responsible for scheduling, performing, and reporting for the laboratory and field. Responsible for health and safety in the laboratory and is the main client liaison during the testing portion of a project. This person is responsible for maintaining the testing equipment and laboratory facilities. The Laboratory Manager is responsible for ensuring compliance with ISO/IEC 17025, and maintaining client confidentiality. In addition, the Laboratory Manager is responsible for identifying, assessing, evaluating and controlling risk and opportunities related to the GTX quality system, impartiality and lab integrity.

Assistant Laboratory Manager: Responsible for assisting the Laboratory Manager accomplish his/her duties. The Assistant Laboratory Manager is responsible for ensuring compliance with ISO/IEC 17025, and maintaining client confidentiality. In addition, the Laboratory Manager is responsible for identifying, assessing, evaluating, and controlling risk and opportunities related to the GTX quality system, impartiality, and lab integrity.

Quality Manager: This person is independent of the laboratory operations and reports directly to the Director of Testing Services. He/she establishes, manages, and verifies an effective quality system. This person will perform quality assurance checks on reports generated by the laboratory. This person is authorized to implement changes to the quality system and is charged with the responsibility of reporting corrective actions to management. The Quality Manager is responsible for ensuring compliance with ISO/IEC 17025, and maintaining client confidentiality. In addition, the Quality Manager is responsible for identifying, assessing, evaluating, and controlling risk and opportunities related to the GTX quality system, impartiality, and lab integrity.

Laboratory Engineer: Responsible for assisting the Director of Testing Services, Laboratory Managers, the Quality Manager, and the Quality Control Technician to ensure the technical correctness of testing, review and improve lab procedures, assist with training, help with internal QC/QA programs and reporting. The Laboratory Engineer is responsible for ensuring compliance with ISO/IEC 17025, and maintaining client confidentiality. In addition, the Laboratory Engineer is responsible for identifying and reporting risk and opportunities related to the GTX quality system, impartiality and lab integrity.

UNCONTROLLED COPY

Quality Control Technician: Responsible for assisting the Quality Manager implement and maintain the quality system prescribed by this quality manual in the laboratory. The Quality Control Technician is responsible for ensuring compliance with ISO/IEC 17025, and maintaining client confidentiality. In addition, the Quality Control Technician is responsible for identifying, assessing, evaluating, and reporting risk and opportunities related to the GTX quality system, impartiality and lab integrity.

Laboratory and Field Technicians: Person(s) responsible for receiving samples, conditioning, preparing, and testing them. Technicians prepare test data and provide draft reports to management. The Technicians are responsible for following the GTX Quality Manual and laboratory procedures and maintaining client confidentiality. In addition, the Technicians are responsible for identifying and reporting risk and opportunities related to the GTX quality system, impartiality, and lab integrity.

Finance and Accounting Controller: This person is responsible for the invoicing, collections, payroll, other payables, and financial reporting of the company.

Administrative Staff: This group performs duties related to invoicing, payroll and collections. Basic administrative duties such as phone answering, shipping and filing are also carried out by this staff.

5.6 RESOURCES, DUTIES, AND THE QUALITY SYSTEM

The resources necessary to meet our quality commitments and satisfy our clients' needs are provided by the company. The quality system outlined in this Quality Manual is designed to meet requirements in ANSI/ISO/IEC 17025:2017. Employees of GTX are responsible for adhering to procedures outlined in the Quality Manual while satisfying our clients' needs.

GTX is committed to providing the necessary resources to achieve its stated goals. This includes:

- Trained personnel to manage and perform testing as outlined by appropriate standards
- Equipment with capabilities, accuracy and precision as prescribed by appropriate standards
- Computers necessary for data acquisition, analysis, report generation, accounting and marketing
- Facilities necessary to conduct testing in appropriate atmosphere

5.6.1 Implementation, Maintenance, and Improvement of the Management System

The quality system outlined in this Quality Manual is designed to meet the requirements outlined in ANSI/ISO/IEC 17025:2017.

The GTX Quality System is designed to allow for:

- Identification and management of risks and opportunities related to the GTX quality system
- The identification of deviations from the management system
- Identification of deviations from the procedures for performing laboratory activities
- The initiation of actions to prevent or minimize such deviations

UNCONTROLLED COPY

- Reporting to laboratory management on the performance of the management system and any need for improvement
- Ensuring the effectiveness of laboratory activities.

Improvements to procedures are coordinated with proper authority to assure uniform compliance. Changes are made to existing systems only after a review of the change and how it will affect the quality system. Employees of GTX have access to the appropriate documentation needed to implement the quality system.

Open lines of communication exist between all levels of GTX employees from technician level to Chief Engineer/CEO. Periodic meetings are held and documented to discuss the quality system, problems, corrective actions, and improvement.

5.7 MANAGEMENT RESPONSIBILITIES FOR THE QUALITY SYSTEM

Laboratory management shall ensure that communication takes place regarding the effectiveness of the management system and the importance of meeting customers' and other requirements. Laboratory management shall also ensure that the integrity of the management system is maintained when changes to the management system are planned and implemented.

6 RESOURCE REQUIREMENTS

6.1 GENERAL

The GeoTesting Express, Inc. Laboratory shall be operated so that it will have the personnel, facilities, equipment, systems, and support services necessary to manage and perform its laboratory activities.

6.2 PERSONNEL AND TRAINING

Personnel of GTX have met minimum requirements of education and technical knowledge. Each technician has demonstrated an ability and willingness to work in a laboratory or field environment. Each technician undergoes a training period during which constant supervision is maintained while teaching and performing a specific test method. After demonstrating that the technician is able to perform a test with an adequate level of competence, and after passing a written examination, that technician is considered proficient enough to perform the test without constant supervision.

The Laboratory Managers and Quality Control Technician are responsible for the training program and maintenance of training records. This includes evaluation of initial competency, initial proficiency, and bi-annual renewals in addition to making available and scheduling external training such as ACI, NICET, OSHA 40-hour safety, radiation safety, etc.

Technician proficiency records (initial proficiency and renewals) are maintained electronically for each technician. These records show tests for which a particular technician has been deemed proficient, date of proficiency, trainer, and date for renewal.

UNCONTROLLED COPY

A sample Technician Training Record chart is shown in Appendix D.

GTX also maintains a technician training matrix modeled on A2LA form F117 - "Technical Staff Matrix for Accreditation - ISO-IEC 17025." (See Appendix D.) This form lists all methods performed by the GTX lab and lists all technical personnel trained to perform each test method.

Specific test method training is to be provided by a qualified technician, Quality Control Technician, Laboratory Manager, or Assistant Laboratory Manager. A technician is qualified as a test method trainer when the following has occurred:

- Complete the training for that test him/herself
- Pass the written exam
- Show continued proficiency in performing the test
- Be approved by the Quality Control Technician or Laboratory Manager as a trainer

Renewals are performed once every two years. The Laboratory Manager, Quality Control Technician or Quality Manager conducts the renewals for all technicians. The renewal requires a technician to have reviewed the current ASTM procedure and current SOP as well as conduct a demonstration of the test in the presence of the Laboratory Manager, Quality Control Technician or Quality Manager.

Every four years, a technician shall also take and pass a written examination.

Descriptions of the levels of training required for becoming a Laboratory Technician Trainee, Laboratory Technician I, II, III, IV and V are presented in Section 5.5.b.

NICET, ACI and OSHA testing and evaluation in addition to proficiency achieved as documented in training records are used to determine when a higher Technician training level has been reached.

The technician, Laboratory Manager and Quality Control Technician are responsible for keeping training proficiencies up to date and current. The Laboratory Manager and Quality Control Technician are responsible for signing off (verifying) the training records of each technician. The Laboratory Manager and Quality Control Technician are also responsible for determining when a Technician has reached a higher Technician training level. A technician may perform production work only for those tests which he/she has been determined to be proficient.

Below is an outline of the phases of indoctrination, evaluation, and training:

- Indoctrination
  - Technician meets with human resource manager to:
    - Complete necessary paperwork
    - Be given copy of company employee handbook
    - Be given copy of company health and safety plan
    - Be given a tour of the facility (includes location of exits, safety equipment, etc.)
    - Meet key personnel in the company
    - Be given any necessary items (building key, phone, computer, etc.)

UNCONTROLLED COPY

- Initial competency evaluation
  - Technician meets with member of laboratory management team to:
    - Discuss prior experience and review documentation to determine level of competency from previous employment and develop plan for training.
- General laboratory training
  - Technician reads current revision of Quality Manual
- Specific test training
  - Technician to read latest revision of the published (ASTM, AASHTO, other) test standard
  - Technician to read GTX's standard operating procedure, including job hazard analysis (JHA) specific to the test
  - Trainer to verbally explain the test
  - Technician to watch the test being performed and is encouraged to take notes and ask questions
  - Technician to perform the test in the presence of a trainer on a side-by-side sample of material
  - Technician can begin testing on client samples under supervision of trainer
  - Technician takes the written exam and must receive a grade of at least 80%; written exam is administered independently in an open-book fashion and graded by the Laboratory Manager or Quality Control Technician
- Two year renewals
  - Verify technician has read the latest revision of the published test standard
  - Verify technician has read the latest revision of GTX's standard operating procedure
  - Technician to perform the test in the presence of a trainer to verify proficiency
- Four year renewals
  - In addition to the two-year renewal requirements, technician to take written exam and receive a grade of at least 80%

6.2.1

All GTX personnel shall act impartially and work in accordance with the GTX management system as outlined in Section 4.1 and 5.2 above.

6.2.2

The GTX lab documents the competence requirements of each lab position as outlined in Sections 4.1, 5.5a and 6.2.

6.2.3

GTX ensures the competence of its staff and trains them to be able to evaluate the significance of

UNCONTROLLED COPY

deviations in tests they are trained to perform as outlined in Sections 4.1 and 5.1.

6.2.4

GTX management shall communicate to the staff their duties, responsibilities and authorities as outlined in Section 5.5.

6.2.5 Procedures and Records

Records of current procedures are maintained electronically. Obsolete versions of the procedures are also retained. These procedures include:

- Determining the competence requirements as outlined in Section 5.2.
- Selection of personnel as outlined in Section 5.2.
- Training of personnel as outlined in Section 5.2 and 6.2.
- Supervision of personnel as outlined in Sections 4.1, 5.2 and 6.2.
- Authorization of personnel as outlined in Sections 5.2 and 6.2.3.
- Monitoring of competence of personnel as outlined in Section 5.2.

6.2.6

GTX management authorizes personnel to perform specific laboratory activities, including but not limited to, the following:

- Develop, modify, verify and validate methods and any deviations (See Section 7.2.).
- Analyze results, including statements of conformity or opinions and interpretations
- Review, authorize and report results.

6.3 FACILITIES AND ENVIRONMENTAL CONDITIONS

GTX is a permanent laboratory with two locations. The MA laboratory is located at 125 Nagog Park in Acton, MA 01720 and occupies an approximately 12,000 square feet section of the building. Approximately 600 square feet is allocated to office space and 11,400 square feet allocated to the testing laboratory. The GA laboratory is located at 2358 Perimeter Park Drive in Atlanta, GA 30341 and occupies approximately 3,000 square feet, of which 500 is allocated to office space. Laboratory testing equipment is housed and used in the laboratory. Field testing equipment is housed in the laboratory and transported to the field for use. A floor plan of the laboratory showing the location of testing activities is maintained by the Laboratory Manager. The floor plan is included in Appendix E.

In most cases, samples obtained from various clients are not under the control of GTX laboratory personnel, therefore responsibility for proper shipment is the client's. Once arriving at GTX, samples are visually inspected, and the condition of samples is recorded. A determination is made regarding proper storage techniques for the samples and appropriate actions are taken.

After samples are logged in, samples are stored in the current work storage area. Samples are typically stored in the container they arrived to the laboratory in. Only those technicians who are assigned to

UNCONTROLLED COPY

perform work on a sample will take the sample from the current work storage area. Until all work for the sample is performed, the sample is stored in this area.

The geosynthetics laboratory atmosphere is controlled for temperature and somewhat controlled for relative humidity. Sample preparation, conditioning and testing is performed in this controlled area. The temperature and relative humidity are monitored and logged each day that geosynthetics testing is performed in the Geosynthetics Laboratory Atmosphere Log Book.

An environmental condition criteria table is posted in the geosynthetics laboratory which states the upper and lower limits for each geosynthetics test as per the applicable standard. It also warns that testing should be halted if the temperature in the laboratory becomes out of control. Testing can resume only when temperature is back in control and after receiving approval from a laboratory manager or director. If the relative humidity becomes out of control, it should be noted in the comment section of the laboratory test sheet, however testing may continue.

Access to and use of areas affecting the quality of testing activities is controlled. Visitors entering the laboratory meet with a supervisor and, if other than a sample drop-off is being conducted, shall sign in at the front desk with the receptionist.

6.4 EQUIPMENT

6.4.1

GTX owns all the equipment required for the correct performance of the laboratory activities it performs. These include all measuring instruments, software, measurement standards, reference materials, reference data, reagents, consumables, and auxiliary apparatus which can influence test results.

6.4.1.1

The only equipment not owned by GTX are items used for calibration and verification that are performed by others for GTX.

6.4.2

GTX does not rent or borrow equipment owned by others. If a case came up where GTX had to use equipment outside its permanent control, GTX shall ensure that equipment requirements of its quality system are met.

6.4.3

Policies and procedures are outlined in this section for proper handling, transport, storage, use and planned maintenance of equipment. These procedures ensure that equipment is functioning properly and not allowed to deteriorate or become contaminated in some way. Detailed equipment handling procedures are presented in the GTX Equipment SOP, GTX-QD014.

6.4.4

GTX verifies that all equipment conforms to test and measurement requirements before being placed into or returned to service.

UNCONTROLLED COPY

6.4.5

The equipment used by GTX for measurement shall be capable of achieving the measurement accuracy and/or measurement uncertainty required by ASTM or other test standard agency to provide a valid result.

6.4.6

GTX requires that measuring equipment shall be calibrated when:

6.4.6.1 The measurement accuracy or measurement uncertainty affects the validity of the reported results.

6.4.6.2 The calibration of the equipment is required to establish the metrological traceability of the reported result.

6.4.6.3 The calibration interval established by a test standard (i.e. ASTM, AASHTO, etc.) has been reached.

6.4.6.4 The calibration interval established by GTX has been reached.

6.4.6.5 When equipment calibration has been requested by a client before and/or after project testing, as part of the client's quality control program.

6.4.6.6 When new or repaired equipment is put into service.

6.4.6.7 Calibration or verification is not required for equipment that is out of service and has gone beyond its calibration/verification interval date. Calibration/ verification of out of service equipment is required immediately before the equipment is put back in service.

6.4.7

GTX has an established calibration program. The policies and procedures of the program are outlined below and in Section 6.4.14. The calibration program is reviewed and adjusted as necessary in order to maintain confidence in the status of calibration and test results.

6.4.8

All calibrated equipment or equipment which has a defined period of validity shall be labelled, coded, or otherwise identified to allow the user of the equipment to readily identify the status of calibration or period of validity.

6.4.9

GTX equipment shall be taken out of service if it has been subjected to overloading or mishandling, gives questionable results, has been shown to be defective or outside specified requirements' or requires calibration or verification. Equipment taken out of service is to be clearly labelled or marked, and when practicable, shall be isolated to prevent its use. Equipment labeled or marked out of service shall remain out of service until it has been verified to perform correctly. With the exception of items removed from service by the lab management because they are not currently in calibration, GTX shall initiate a corrective action to examine the effect of the defect or deviation from specified requirements and shall initiate the management of nonconforming work procedure (see 7.10).

UNCONTROLLED COPY

6.4.10

GTX shall have a procedure for all intermediate checks used to maintain confidence in the performance of the equipment.

6.4.11

GTX shall update and implement, as appropriate, all reference values and correction factors as they are generated to meet specified requirements of equipment or test methods.

6.4.12

GTX shall take practicable measures to prevent unintended adjustments of equipment from invalidating results.

6.4.13

Records shall be retained for equipment which can influence laboratory activities. The records shall include the following, where applicable:

- The identity of equipment, including software and firmware version.
- The manufacturer's name, type identification, and serial number or other unique identification.
- Evidence of verification that equipment conforms with specified requirements.
- The current location.
- Calibration dates, results of all calibrations, adjustments, acceptance criteria, and the due date of the next calibration or the calibration interval.
- Documentation of reference materials, results, acceptance criteria, relevant dates, and the period of validity
- The maintenance plan and maintenance carried out to date, where relevant to the performance of the equipment.
- Details of any damage, malfunction, modification to or repair to of the equipment.

6.4.14 Specific GTX Equipment and Equipment Verification and Calibration Policies and Procedures

An inventory list of sampling, testing, and calibration and verification equipment is maintained in the Quality folder on the GTX server. This inventory list contains the following information:

- Description
- Associated System
- Manufacturer
- Quantity
- Model #
- Serial #

UNCONTROLLED COPY

- Location
- Date Received
- Date in Service
- Date Out of Service
- Condition When Received

Laboratory personnel are responsible for verifying the following prior to performing tests:

- Equipment is in working order
- Equipment is calibrated per requirements
- The calibrated equipment to be used is accurate for the range needed for the test
- Calibration records are current

Calibration of laboratory equipment is performed internally by the use of basic calibration instruments which are traceable to NIST standards. Some pieces of equipment are sent out for external calibrations. Certificates of traceability for these instruments are located in the Laboratory Equipment Calibration Log kept in the Laboratory Manager's office. External agencies provide GTX with information regarding any out of ordinary condition of equipment including if the equipment is out of tolerance. This approach permits internal calibration and periodic checks by trained personnel. Equipment is marked with calibration labels with at least the following information: calibration agency, calibration date, and due date for next calibration. Calibration certificates and records are kept in the Laboratory Equipment Calibration Log. Calibration and/or verification procedures are located in the Laboratory Manager's office. Only personnel trained to conduct calibrations are allowed to perform the procedures. (See Section 8.)

The Table in Appendix F summarizes the frequency and requirement for test equipment calibration and verification.

With the use of GTX's LIMS, calibration/verification due dates are tracked and the specific tasks (calibrations or verifications) for equipment are assigned to technicians. In this way, the calibrations and verifications are completed by the required dates. The person responsible for making sure calibrations and verifications are performed is the Quality Control Technician. Both the MA and GA laboratory Quality Control Technician is Nancy Hubbard.

Documentation is kept on each piece of testing equipment. A "Maintenance and Calibration Record" log is maintained by the Laboratory Manager and contains the following information:

- Name of test equipment
- Manufacturer's name
- Type of equipment
- Identification (model number and serial number)
- Dates of calibration and results
- Damage, malfunctions or maintenance performed on equipment

UNCONTROLLED COPY

- As-found and as-left condition if out of ordinary

Either Internal reference materials (IRMs) or verification procedures exist for each piece of testing equipment. IRM and verification records are maintained for each piece of testing equipment.

A copy of the manufacturer's instruction manual is kept for each piece of equipment. These are located in a marked file in the testing laboratory.

The following are general control procedures for maintaining properly calibrated testing equipment:

- Newly acquired equipment without manufacturer's certification is calibrated before being placed into service.
- Prior to testing, the measurements to be made are determined and, depending upon the range, accuracy and precision required, the proper testing equipment is utilized to perform the test.
- Testing equipment and measuring devices are calibrated at regular intervals and checked at various times prior to testing. Calibrations are logged in the Laboratory Equipment Calibration Log. These calibrations are made against internationally known standards when possible. Outside agencies are contracted to perform periodic calibrations.
- Calibrations of equipment and measuring devices are performed to optimize the accuracy of the range in which testing is required. Details of calibration results are located in the Laboratory Equipment Log. These include: equipment name, type and unique identification, locations, frequency of calibration checks, the method of calibration and acceptance criteria. When a calibration or check finds a piece of equipment to be out of control, it is brought to the attention of the Laboratory Manager and a course of action is determined.
- Test equipment is marked with a label depicting identification number and calibration date.
- Records of calibration are kept in the Laboratory Equipment Calibration Log. This log is stored in the Laboratory Manager's office.
- If a piece of equipment is out of control, part of the actions taken include evaluating previous inspections to determine when the equipment became out of control and what effect it has had on previous test results. Clients are notified if previous test results were determined to be adversely affected. The piece of equipment is taken out of service and clearly labeled until repaired or corrected.
- Equipment that has been removed from service shall be verified or calibrated prior to being placed into service again.
- The laboratory atmosphere is kept at the accepted temperature and humidity for testing and is maintained at those conditions during calibrations and checking.
- Test equipment is handled and stored with care, minimizing any activity which may cause calibrations to become invalid. When not in use, equipment is stored in a clean area and typically covered or placed in a closed container.
- Calibrations are saved and stored in computer files which are uniquely named. They are also stored in the Laboratory Equipment Calibration Log.

UNCONTROLLED COPY

6.5 METROLOGICAL TRACEABILITY

6.5.1

GTX has established and maintains metrological traceability of its measurement results by means of a documented unbroken chain of calibrations, each contributing to the measurement uncertainty, linking them to an appropriate reference.

6.5.2

GTX measurement results are traceable to the International System of Units (SI) through:

- Calibration provided by a competent laboratory accredited by A2LA.
- Certified values of certified reference materials provided by a competent producer with stated metrological traceability to the SI.
- Direct realization of the SI units ensured by comparison, directly or indirectly, with national or international standards.

6.5.2.1

The standards used by GTX are primarily from ASTM International. The standards specify both units and calibration/verification methods. ASTM recognizes the use of both metric (SI) units and Imperial (IP) units. For the most part GTX uses standards from ASTM Committee D18 on Soil and Rock. Individual ASTM D18 standards specify measurement units. These units may be in SI, IP or both.

Committee D18's policies for the use of units can be found in Section 8.4 of the ASTM International D18 Standards Preparation Manual Revision 3 (2018.) Committee D18 has put a considerable effort into developing a consistent approach to units in its standards along with meeting a key objective to the users of those standards. That is, the approach is understandable, represents the users (international and domestic), and is scientifically correct.

The following is a summary of ASTM D18's guidance on the usage of units.

- For standards that have units contained in them, the unit section in the Scope must define in detail how units are being used.
- If force is mentioned in the standard and inch-pound (IP) units are included, the gravitational IP system of units shall be used. Force is represented by lbf (IP) and N (SI).
- If force and mass/density are included in the standard, only SI units are used for mass and density. The preference for the units statement is the combined (dual) units statement, either SI with IP in brackets or IP with SI in brackets (SI [IP] or IP [SI]).
- The Civil Engineering profession has used some units not covered or frowned upon by the SI standard for over a century. It is D18's policy to continue to represent this profession by using such units as unit weight (lbf/ft3) and density in g/cm^3 or Mg/m^3.
- For standards where the apparatus was developed using the IP system of units, this document has specialized guidance for the presentation of IP and SI units.

UNCONTROLLED COPY

- If the standard's Calculation section is complicated or extensive, only one set of units should be used; typically, SI if density is involved.

6.5.3

When metrological traceability to the SI units is not technically possible, the laboratory shall demonstrate metrological traceability to an appropriate reference such as:

- Certified values of certified reference materials provided by a competent producer.
- Results of reference measurement procedures, specified methods or consensus standards that are clearly described and accepted as providing measurement results fit for their intended use and ensured by suitable comparison.

6.6 EXTERNALLY PROVIDED PRODUCTS AND SERVICES

GTX shall ensure that any products or services purchased do not negatively affect lab activities and only suitable vendors and products are used. Purchasing policies are outlined below and are specified in the GTX Purchasing SOP, QD16.

6.6.1 Supplies and Services

Purchases of supplies and services that affect the quality of tests are made by using the most qualified vendor at the most reasonable price. GTX maintains a vendor list which is described below. Purchase orders with unique numbers shall be issued for each purchase. A description of the service or supply ordered shall be on the purchase order. Purchase orders can be obtained from the Laboratory Manager(s), Director of Testing Services or the GTX Administrative Assistant. Once generated, a physical copy of the purchase order is produced, and it is reviewed then signed by the person requesting the purchase. It is then maintained in a file by the Administrative Assistant.

GTX shall communicate its requirements to external providers for the products and services to be provided including:

- GTX acceptance criteria
- Evidence of subcontractor competence which can include qualifications of subcontractor's personal
- Any activities that GTX or its clients intend to perform at the subcontractor's facility.

When supplies or equipment are received in the laboratory, a check is performed to ensure it meets the end user's requirements and the specifications given on the purchase order. If acceptable, the purchase order is signed and dated as acceptable by the person who requested the purchase. For instance, when a piece of testing equipment is purchased, that piece of equipment is subject to a calibration/verification check prior to being put into use. If the piece of equipment fails the calibration/verification check, it is sent back to the manufacturer for a replacement. If it is acceptable, the person who ordered the equipment signs and dates the purchase order as acceptable.

GTX maintains a vendor list which lists the vendor, phone number, description of item(s) purchased and overall rating. The overall rating is based on prior history, pricing, availability, service, quality and ease of use. Vendors who repeatedly fail to perform up to standards are no longer used. Heavy

UNCONTROLLED COPY

consideration is given to those vendors whom GTX has fostered a long-term relationship with. When requested, a client's representative is afforded the right to verify the vendor's premises.

When purchasing software or equipment that includes software, an attachment is included which requires the supplier of the software to provide notification of any software error that is found in the future that could affect test results. Commercial software may be considered to be sufficiently validated and software suppliers are not required to provide quality assurance documentation. However, GTX shall request QA documentation at the time software is ordered.

If GTX makes any changes to the configuration or modifies commercial software, then the software shall be verified to confirm that the software is still performing correctly.

Testing for nuclear projects under NQA-1 quality systems can require verification of commercial software. This process will be handled on a case by case basis.

6.6.2 Calibration and Verification Services

When purchasing calibration services, an attachment with specific terms and conditions is included with the purchase order which allows GTX to audit the calibrating agency's facility and which requires the calibration agency to perform its activities in accordance with GTX's quality plan.

6.6.3 Subcontracted Testing Services

In the event that GTX cannot perform a portion of the work for which it is contracted, a subcontractor is used. GTX evaluates and selects subcontractors on the basis of their ability to meet requirements and the nature of their quality system. Subcontractors shall have a quality system equal to or more in-depth than that of GTX. Accreditation to ISO/IEC 17025 will be accepted as evidence of vendor qualification. Qualified subcontractors are listed on an approved vendor list which GTX maintains and makes available to the appropriate personnel.

GTX informs its clients of the subcontracted work and gains approval from the client for undertaking such activity. Reports sent to the client which have test data supplied by a subcontractor are clearly marked as such. Subcontractor results, in part or in full, are provided directly to the client as received from the subcontracted laboratory.

UNCONTROLLED COPY

7 PROCESS REQUIREMENTS

Process requirements are summarized in Figure 1 below from Annex B of ISO/IEC 17025:2017

ISO/IEC 17025:2017(E)

B.5 Figure B.1 illustrates an example of a possible schematic representation of the operational processes of a laboratory, as described in Clause 7.

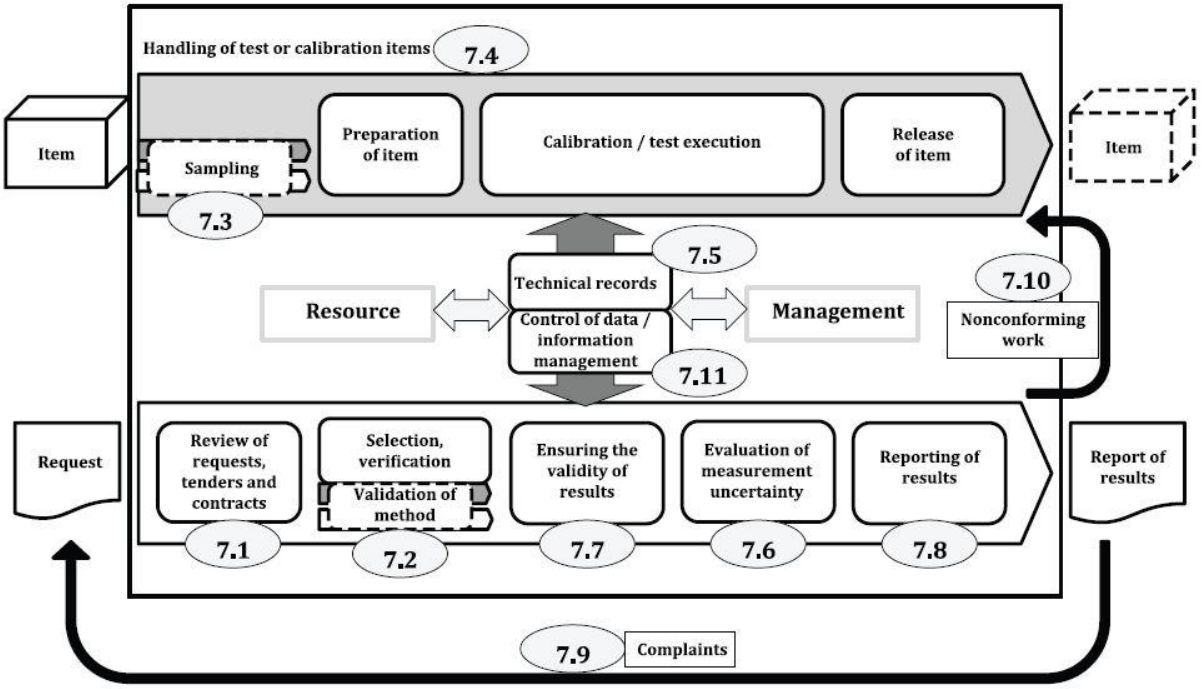

Figure B.1 — Possible schematic representation of the operational processes of a laboratory

Figure 1. ISO/IEC 17025:2017 Operational Processes of a Laboratory

7.1 REVIEW OF REQUESTS, TENDERS AND CONTRACTS

7.1.1

The GTX procedures for the review of client's requests, tenders and contracts are listed below. The procedures are designed to ensure the following:

- The requirements for reviewing a client request or contract are adequately defined, documented and understood.

- Determine if GTX has the capability and resources to meet the client's project needs.
- If a project requires subcontracted testing, GTX will ensure that the requirements of Section 6.6 are followed and GTX informs the client of the specific laboratory activities to be performed by a subcontracted lab and gains the clients approval.
- The appropriate methods or procedures are assigned for each project. GTX must also confirm that the lab is capable of meeting the client's project specific requirements.

7.1.2

GTX shall inform clients when the test method requested is considered to be inappropriate or out of date.

7.1.3

ISO/IEC 17025:2017 requires the following: "When the customer requests a statement of conformity to a specification or standard for the test or calibration (e.g. pass/fail, in-tolerance/out-of-tolerance) the specification or standard, and the decision rule shall be clearly defined. Unless inherent in the requested specification or standard, the decision rule selected shall be communicated to, and agreed with, the customer." However, GTX does not make engineering judgements for its clients. The client is responsible for making pass/fail or in-tolerance/out-of-tolerance decisions based on the client's project specifications and the test data provided by GTX.

7.1.4

Any differences between the test assignment, request or tender and the contract shall be resolved before laboratory activities commence. Each contract shall be acceptable both to the laboratory and the client. Deviations requested by the client shall not impact the integrity of GTX or the validity of the results.

7.1.5

The client shall be informed of any deviation from the contract.

7.1.6

If a contract is amended after work has commenced, the contract review shall be repeated and any amendments shall be communicated to all affected personnel.

7.1.7

The laboratory shall cooperate with clients or their representatives in clarifying the client's request and in monitoring GTX's performance in relation to the work performed.

7.1.8

GTX saves all contract, agreements and assignment reviews in the project files (either electronically or hardcopy), in the GTX database or the Manager's lab notebooks. Records of significant changes are also retained. Emails and written records of pertinent discussions with the client about project assignments, test requirements and test results are retained for a minimum period of seven years.

UNCONTROLLED COPY

7.1.9 GTX Specific Policies on Review of Client Contracts, Agreements and Test Assignments

7.1.9.1 GTX Quotes and Terms and Conditions

Much of GTX's lab work is performed under a GTX Price Quote for Testing Services and the GeoTesting Express, Inc. Standard Terms and Conditions for Engineering, Testing and Consulting Services. In addition, GTX may also perform work under a client's contract or purchase order. (See below)

7.1.9.2 Contracts

A contractual agreement should exist between GTX and the client for laboratory and/or field services supplied by GTX before GTX performs any of these services. This contractual agreement can be in the form of a Purchase Order (PO), contract, Work Order, Task Order, Chain of Custody, or verbal okay. GTX has a procedure in place for reviewing contracts which adhere to the following guidelines:

- Requested services are defined
- Verbal orders are followed with documented requests
- GTX can perform requested services
- GTX can perform the requested services within schedule limits
- GTX can perform the requested services under proposed pricing structure

Review of these contractual agreements is the responsibility of the Chief Engineer, Director of Testing Services and/or Laboratory Manager. The Director of Testing Services coordinates this activity.

Changes which may occur in the scope of work and/or time schedules due to the client's needs are reviewed in the same way as initial contracts. The same key elements are reviewed with respect to the proposed changes. Any condition encountered during execution of the requirements of the contract which changes the scope of work established by the original contract is documented. A written amendment to the contract is agreed upon by both GTX and the client with price and schedule adjustments.

Conditions which change the scope of work encountered during execution are brought to the attention of the Laboratory Manager who in turn initiates a discussion with the client. After the client and GTX mutually agree upon change orders, these changes in scope of work are reviewed with the staff performing this work.

Contracts, amendments and change orders are recorded and signed by responsible representatives of both GTX and the client. These records are filed in the yellow section of a specific project file.

7.1.9.3 Client Service

GTX's level of service can be measured by the results of its client satisfaction survey. The survey is sent to each client upon completion of a project. The survey asks the client to rate GTX on a number of different items on an escalating scale (1-5). GTX's goal is to receive a grade of 4 or higher (1 = failed to meet expectations and 5 = exceeded expectations). GTX aims to continuously improve its

UNCONTROLLED COPY

quality system in order to better serve our clients. A return rate of 5% is required to validate the survey. It is our policy to respond to all complaints received in the customer survey. Data obtained in the customer survey is discussed in quarterly management review meetings.

7.2 SELECTION, VERIFICATION AND VALIDATION OF METHODS

7.2.1 Selection and verification of methods

The GTX procedures for the selection, verification and validation of methods are listed below. The procedures are designed to ensure the following:

7.2.1.1

GTX shall use appropriate methods and procedures for all laboratory activities and, where appropriate, for evaluation of the measurement uncertainty as well as statistical techniques for analysis of data.

7.2.1.2

All methods, procedures and supporting documentation used by GTX, such as GTX Standard Operating Procedures, test standards, manuals and reference data relevant to GTX activities, are kept up to date and are readily available to GTX personnel (see 8.3).

7.2.1.3

GTX uses the latest valid version of a method unless it is not appropriate or possible to do so. This is done primarily through the use of the ASTM International Standards Tracker Alert system. Tracker Alert sends an email notification about newly published or revised ASTM standards. When necessary, the application of the method shall be supplemented with additional details to ensure consistent application. Supplemental details are generally included in the GTX Standard Operating Procedure (SOP.)

7.2.1.4

When the client does not specify the method to be used, GTX shall select an appropriate method and inform the client of the method chosen. Methods published either in international, regional or national standards, or by reputable technical organizations, or in relevant scientific texts or journals, or as specified by the manufacturer of the equipment are recommended. Laboratory-developed or modified methods can also be used.

7.2.1.5

GTX shall verify that it can properly perform methods before introducing them by ensuring that it can achieve the required performance. Records of the verification shall be retained. If the method is revised by the issuing body, verification shall be repeated to the extent necessary.

7.2.1.6

When method development is required, this shall be a planned activity and shall be assigned to competent personnel equipped with adequate resources. As method development proceeds,

UNCONTROLLED COPY

periodic review shall be carried out to confirm that the needs of the client are still being fulfilled. Any modifications to the development plan shall be approved and authorized.

GTX will occasionally develop in-house procedures for testing and calibration. Development of these procedures is a planned activity and is only conducted by qualified personnel with appropriate equipment. Laboratory management is involved in the process during development of procedures and maintains close contact with personnel conducting the development.

7.2.1.7

Planned deviations from methods for all laboratory activities shall occur only if the deviation has been documented, technically justified, authorized, and accepted by the client.

7.2.2 Validation of methods

7.2.2.1

GTX shall validate non-standard methods, laboratory-developed methods and standard methods used outside their intended scope or otherwise modified. The validation shall be as extensive as is necessary to meet the needs of the given application or field of application.

7.2.2.2

When changes are made to a validated method, the influence of such changes shall be determined and where they are found to affect the original validation, a new method validation shall be performed.

7.2.2.3

The performance characteristics of validated methods as assessed for the intended use, shall be relevant to the clients' needs and consistent with specified requirements.

7.2.2.4

The laboratory shall retain the following records of validation:

- The validation procedure used.
- Specification of the requirements.
- Determination of the performance characteristics of the methods.
- Results obtained.
- A statement on the validity of the method, detailing its fitness for the intended use.

7.2.3 GTX Test and Calibration Methods and Method Validation Procedures

7.2.3.1 General

GTX uses appropriate methods and procedures for all testing and calibrations performed. Sampling, handling, transporting, storing and preparing test samples are conducted in accordance with established procedures.

UNCONTROLLED COPY

If a condition exists which will hinder GTX from performing tests in accordance to published standards, the client is notified. If the condition of the samples is such that damage has occurred during shipment the client is notified. In addition, the client is notified if a discrepancy in sample identification exists. Unsuitable conditions or discrepancies in customer supplied samples are noted and recorded in the project file. Any discrepancies will be resolved to the satisfaction of the client with a mutually acceptable course of action. Quality control of test procedures is continuously monitored by technicians performing tests as well as supervisor(s) and the Quality Control Technician. These inspections occur before, during and after testing. Each technician documents procedural deviations in the comment section of the laboratory work sheet or appropriate LIMS entry field.

GTX performs tests according to test standards found in ASTM, AASHTO, EPA, the USA COE and other published test standards. Deviations from stated test methods are noted on the test report. The test standards are located on the GTX server. Technicians have access to these standards. To assist technicians, GTX Standard Operating Procedures are also accessible.

Samples are conditioned according to the appropriate test standard. These conditions include environmental considerations such as temperature and humidity. Client's requests supersede this requirement, and shorter conditioning times may be employed.

GTX maintains a file containing equipment instructions which is available to technicians as appropriate.

7.2.3.2 Selection of Methods

GTX utilizes test methods which meet the client's request and are appropriate for the test. Except where otherwise requested by the client, GTX uses the latest revision of a test standard. If the client does not specify a method, GTX will suggest to the client an appropriate published method or, as a last alternative, a laboratory-developed method. In either case, the client is notified and agrees to the suggested method prior to commencing testing. In addition, if the client specifies a test that is out of date or otherwise inappropriate, GTX will notify that client and provide viable alternatives.

7.2.3.3 Laboratory-developed Methods

GTX will occasionally develop in-house procedures for testing and calibration. Development of these procedures is a planned activity and is only conducted by qualified personnel with appropriate equipment. Laboratory management is involved in the process during development of procedures and maintains close contact with personnel conducting the development.

7.2.3.4 Non-standard Methods

When conducting tests not covered by standard methods, the client must agree on the standard.

7.2.3.5 Validation of Methods

When conducting tests not covered by standard methods, GTX will validate the methods to confirm that they are fit for the intended use. The results, procedure used and a statement as to the soundness of the test for the intended use are obtained are recorded.

GTX conducts its own verification and in some cases, the calibration, of a number of pieces of test equipment. In addition, it contracts an outside agency to conduct verification/calibration on pieces

UNCONTROLLED COPY

of equipment. Several pieces of reference equipment (weights, gauge blocks, pressure gauge, etc.) are sent out to external NIST traceable, A2LA accredited labs for calibration. This calibrated equipment is then used to internally verify equipment such as dies, scales and gauges according to GTX's calibration schedule.

7.2.3.6 Estimation of Uncertainty of Measurement

GTX has adopted A2LA's "G103 – A2LA Guide for Estimation of Uncertainty of Dimensional Calibration and Testing Results" as its own in relation to estimating uncertainty in measurements made on different types of equipment. This procedure can be found on the GTX server.

Uncertainty budgets shall be developed for any type of measuring device calibrated by GTX for in-house use. Established uncertainty budgets shall be updated when there are any changes in the factors effecting the estimated uncertainty, such as recalibrated reference measuring devices. Uncertainty budgets for new models of measuring devices shall be determined before the device is put into service.

7.2.3.7 Control of Data

Computers used to collect data for testing are checked prior to being placed into service for testing. This is performed by the Laboratory Manager, Quality Manager, Quality Control Technician or the IT Manager. Access to computers used for data acquisition is limited (by password protection) to those authorized to do so. Software used to collect data is documented. Software used for testing is checked for accuracy prior to being used in the laboratory and then periodically thereafter. Records of computer and software checks are maintained by the Laboratory Manager. Suppliers of software to GTX are required to provide notification of software errors that could affect test results.

If software that has been utilized for testing is determined to have an error that could affect test results, part of the actions taken include evaluating previous tests performed to determine the extent to which test results have been affected. Clients are notified if previous test results were determined to be adversely affected. The software is taken out of service until an appropriate solution is determined. These actions are documented in a corrective action report.

When data is collected, it is saved to a file on the computer's hard drive with a unique name. At the completion of testing, this file is copied from the hard drive to the project's directory on the GTX server. The GTX server is backed up on a weekly basis.

7.3 SAMPLING

In general, GTX does not sample materials provided by a client for testing. Samples are typically brought to the laboratory for testing by our clients (either hand-delivered or shipped via courier). Samples are conditioned as per the test standard or at the client's request. Test specimens are taken from samples per the test standard requirements or the client's project sampling instructions. See the GTX Geosynthetic Test Standard Operating Procedures book for instructions on sampling geosynthetics.

If a sampling plan is required for a project, then GTX shall follow the ISO/IEC 17025:2017 requirements for sampling as outlined below in 7.3.1 – 7.3.3

UNCONTROLLED COPY

7.3.1

The laboratory shall have a sampling plan and method when it carries out sampling of substances, materials or products for subsequent testing or calibration. The sampling method shall address the factors to be controlled to ensure the validity of subsequent testing or calibration results. The sampling plan and method shall be available at the site where sampling is undertaken. Sampling plans shall, whenever reasonable, be based on appropriate statistical methods

7.3.2

If required, the GTX sampling method shall describe:

- The selection of samples or sites
- The sampling plan
- Preparation and treatment of sample(s) to produce the number of subsamples for subsequent testing.

NOTE: When received into the laboratory, further handling can be required as specified in 7.4

7.3.3

GTX shall retain records of sampling data. These records shall include, where relevant:

- The reference to the sampling method used.
- Date and time of sampling.
- Data to identify and describe the sample (e.g. number, amount, name).
- Identification of the personnel performing sampling.
- Identification of the equipment used.
- Environmental or transport conditions.
- Diagrams or other equivalent means to identify the sampling location when appropriate.
- Deviations, additions to or exclusions from the sampling method and sampling plan.

7.4 HANDLING OF TEST OR CALIBRATION ITEMS

7.4.1 The GTX procedures for the transportation, receipt, handling, protection, storage, retention, and disposal or return of test items are outlined throughout Section 7.4. Details are presented in the GTX Sample Handling SOP, QD019. This includes provisions necessary to protect the integrity of the test item, and to protect the interests of GTX and the client. Precautions are taken to avoid deterioration, contamination, loss or damage to the item during handling, transporting, storing/waiting, and preparation for, testing. If client handling instructions are provided with the item, the instructions shall be followed as long as they do not conflict with standards that define proper handling of samples. All client special handling instructions will be discussed with the client as needed.

UNCONTROLLED COPY

7.4.2

GTX has a system for the unambiguous identification of test samples. The sample identification is retained while the sample is under the responsibility of GTX. The GTX system ensures that samples will not be confused physically or when referred to in records or other documents. Where appropriate, the GTX system can allow for the sub-division of a sample or groups of samples and the transfer of samples between GTX labs as well as subcontracted labs.

7.4.3

Upon receipt of the test or calibration item, deviations from specified conditions shall be recorded. When there is doubt about the suitability of an item for test or calibration, or when an item does not conform to the description provided, GTX shall consult with the client for further instructions before proceeding and shall record the results of this consultation. When the client requires the item to be tested and acknowledges that it has requested a deviation from specified conditions, GTX shall include a disclaimer in the report indicating which results may be affected by the deviation.

7.4.4

When items have to be stored or conditioned under specified environmental conditions, these conditions shall be maintained, monitored and recorded.

7.4.5 GTX Procedures for Sample Receiving

7.4.5.1 Incoming Sample Inspection

After entering the laboratory and before testing, samples shipped (commercial courier, delivered by client, or picked up by a GTX employee) to GTX are visually inspected. This inspection consists of the following:

- Physical condition of the samples
  - Scratches, creases, holes or any other defects for geosynthetics
  - Broken sample containers (such as glass, etc.), condition of undisturbed materials
- Identification numbers are checked for accuracy
- The shipment is checked for completeness (all samples are included)
- Identification of client name, project name, etc. and other pertinent information unique to a project

Deficiencies or problems found during the inspection are documented in GTX's LIMS in the "Comments" field under the specific sample. The client is notified if any deficiencies or problems are found during this inspection.

7.4.5.2 Project Identification

When samples enter the laboratory, a determination is made by the person accepting them: the samples are either part of an existing project or they are part of a new project. If the samples are part of a new project, the Sample Receiving Technician or Administrative Assistant proceeds to create a project folder and assigns a GTX Project Number to that project. The Project Number is

UNCONTROLLED COPY

simply a number incremented by 1 for each new project. This is performed utilizing GTX's Laboratory Information Management System (LIMS). Information such as client name, address, phone and fax numbers, contact, project name, and project location are logged in with the project. A white project information sticker is produced and placed on the cover of the project folder for quick reference.

Located on the project folder is a checklist with the following information:

- Contract, PO, Quote, COC/Test Assignment or Order Confirmation
- Lab Data Sheets (if necessary)
- Archive E-mail Files
- Archive Electronic Files
- Scan Final Report
- Add to Satisfaction Survey List
- Sample Disposition

This checklist is a guide that assists in performing each task as well as a guide to confirm that the project file is complete and samples have been handled appropriately.

Physical project folders are color coded to indicate which type of project it is and consequently, how to handle the samples for that project.

Figure 2. Sample/Folder Color Key

UNCONTROLLED COPY

7.4.5.3 Sample Log-In

After receiving a new project folder or determining that samples received are part of an existing project, the samples are logged in. In the LIMS, the function "Samples" enables logging-in and test assignment. The following is a step-by-step log in procedure:

1) Conduct a search for the GTX Project Number the samples correspond to
2) In the "sample #" field, enter the sample number or numbers if more than one (only one sample number is allowed per line.) Also enter Boring and Depth if either of those are provided. Enter the date received and date results are due in the appropriate fields
3) With a mouse, double click the sample #
4) This new field allows entering each test required for this specific sample, assigning which technician will perform the test, entering any specific special instructions for each test, and the price of the test
5) When finished, click "close"
6) Finally, generate a sample sticker by clicking the box next to the sample name with the mouse to create an "x", then press "Print Labels"
7) Labels will print (see example below)

Samples are color coded with stickers to indicate special handling, storage or disposal procedures. The color scheme used is the same as for physical project folders (shown above).

7.4.5.4 Testing

A technician is assigned to perform each test required. GTX uses the same sample names which our clients use. Each sample identification sticker contains information related to that sample and project. This sticker is placed on the corresponding sample container. An example of GTX's sample identification sticker is shown below.

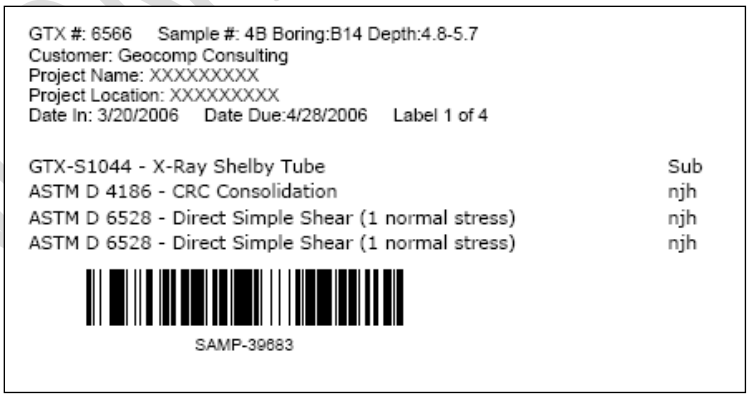

Figure 3. Sample Label

Specimens taken from samples are placed into sealed containers such as zip-loc bags, buckets, jars, etc. This container is then labeled with a sticker or a marker.

UNCONTROLLED COPY

Archive and Disposal

After testing is complete for a particular sample, the sample and any specimens originating from the sample are placed into one of the holding bins for completed work. These holding bins are set up to hold samples for sixty to ninety days. If there is a request for further testing or re-testing during this period, GTX can honor the request because the sample is in the holding bin. At the end of the holding period, the samples are either:

- Discarded
- Returned to client (if requested)
- Returned to client (if hazardous) for disposal on site
- Treated as outlined in USDA Foreign Soil Permit and discarded
- Held in long-term storage

7.5 TECHNICAL RECORDS

7.5.1

GTX maintains technical records for each laboratory project including results, report and other relevant project information. Where possible, sufficient information is maintained to facilitate, if possible, identification of factors affecting the measurement result. If sufficient sample remains, the test records will allow for the repetition of the laboratory test under conditions as close as possible to the original. The technical records shall include the date and the identity of personnel responsible for performing the test, and for checking data and results. For each test, original observations, data and calculations are recorded at the time they are made.

7.5.2

When records are revised or amended, both the original and amended data and files shall be kept. Revision records shall include the date of alteration, an indication of the altered aspects and the personnel responsible for the alterations. GTX shall ensure that revisions to technical records can be tracked to previous versions or to original observations.

7.5.3 GTX Technical Records Management

7.5.3.1

GTX has established and maintained procedures for identifying, collecting, indexing, accessing, filing, storage, maintenance, and disposal of technical and other quality records.

GTX maintains technical records chronologically and via project numbers (for project files). Physical project files are maintained in secure file cabinets in the laboratory for approximately three-four years then archived in a secure storage location until the project is approximately seven years old. Once a project has been closed for seven years or longer, the physical project folder is discarded.

7.5.3.2

The following types of technical records are maintained:

UNCONTROLLED COPY

- Project Files
  - Project verification
  - Test assignment forms
  - Data sheets or electronic test files with raw data
  - Reports
  - Calculations
  - Correspondence
- Equipment
  - Maintenance and calibration
  - Internal Reference Materials (IRM's)

7.5.3.3

GTX test reports have unique dates and number identification to segregate them from other reports. Copies of reports sent to clients are stored in the project file. A physical project file consists of at least two parts: project information (contract, PO, quote, communications, chain of custodies, etc.) in a yellow folder and laboratory test sheets in a blue folder. Electronic copies of original reports are maintained in project folder on the GTX server. Any hard copy test reports are kept in the main part of the physical folder.

7.6 EVALUATION OF MEASUREMENT UNCERTAINTY

7.6.1

GTX has adopted A2LA's "A2LA P103 - Policy on Estimating Measurement Uncertainty for Testing Laboratories" and A2LA P103d - Annex - Policy on Measurement Uncertainty for Construction Materials and Geotechnical Testing Laboratories as its own in relation to estimating uncertainty in measurements made on different types of equipment. These policies can be found on the GTX server.

7.6.2

Uncertainty budgets shall be developed for any type of measuring device calibrated by GTX for in-house use. Established uncertainty budgets shall be updated when there are any changes in the factors effecting the estimated uncertainty, such as recalibrated reference measuring devices. Uncertainty budgets for new models of measuring devices shall be determined before the device is put into service.

7.6.3

GTX will evaluate measurement uncertainty for test methods and equipment calibrations it performs as required by A2LA guidance document "G103d - Annex-Policy on Estimating Measurement Uncertainty for Construction Materials & Geotechnical Testing Labs." This A2LA guidance document can also be found on the GTX server.

UNCONTROLLED COPY

7.7 ASSURING THE QUALITY OF RESULTS

7.7.1

GTX monitors the validity of results in several ways. Where possible, the resulting data is recorded in such a way that trends are detectable and, where practicable, statistical techniques shall be applied to review the results. This monitoring data is planned and reviewed and shall include, where appropriate, but not be limited to:

7.7.1 a) GTX use of reference materials or quality control materials – IRM's.

Use of Internal Reference Materials (IRM's) helps GTX assure the quality of its work. The extent to which the factors contribute to the total uncertainty of measurement differs considerably between (type of) tests and between (types of) calibrations. GTX takes account of these factors by way of internal reference materials (IRMs) and verification checks to verify that equipment is functioning properly prior to testing. An IRM or gauge standard (e.g. calibrated weight, gauge block) is assigned to each piece of equipment. Written procedures for performing IRM or verification checks exist and are maintained electronically.

IRMs are traceable and have known values. Verification checks the critical dimensions and functionality of equipment. The frequency at which these reference checks and verifications are performed varies depending upon the piece of equipment, volume of testing performed with that equipment and likelihood of that piece of equipment to yield results which stray from accepted ranges. At a minimum, GTX performs an IRM or verification check on each piece of equipment once every three months. Typically, three IRMs are conducted each year in addition to a yearly calibration. For scales, ovens, liquid limit bases and liquid limit grooving tools, the IRM/verification check is conducted daily. An IRM schedule listing equipment and frequencies is maintained electronically. If a piece of equipment has been taken out of service, an IRM is not required to be performed until it is brought back in service. Reference and verification checks are recorded in the Laboratory Equipment Calibration Log. Reference checks can be performed by laboratory technicians or management. The Laboratory Manager maintains a list of testing equipment giving details of IRMs, verifications and calibrations for test equipment in the laboratory.

If, after performing a reference check or verification, a piece of equipment is found to be yielding unacceptable results, the Laboratory Manager is consulted and a calibration check is performed. If this does not resolve the problem, the Quality Manager or Director of Testing Services is consulted and a new course of action is determined. Actions taken to resolve the problem include: checking to determine if any previous test results may be affected and documenting corrective actions.

7.7.1 b)

ISO 17025:2017 7.711 b includes the use of alternative instrumentation to assure quality results. However, the methods performed by GTX are based on ASTM, AASHTO and other test standards that prescribe the required equipment and generally do not allow for the use of alternative test apparatus.

7.7.1 c)

Functional check(s) of measuring and testing equipment (See Section 7.7.1.a on IRM's and Section

UNCONTROLLED COPY

6.4.14 on calibration and validation).

7.7.1 d)

Use of check or working standards with control charts, where applicable.

7.7.1 e)

Intermediate checks on measuring equipment (See Section 7.7.1.a on IRM's.)

7.7.1 f)

ISO 17025:2017 7.71 f includes the use of replicate tests using the same or different methods. However, the test standards used by GTX do not require replicate testing. GTX does perform replicate tests from time to time at the request of our clients.

7.7.1 g)

ISO 17025:2017 7.7.1 g includes the retesting of retained items. If there is a question about a test result or a retest is requested by the client, GTX will retest a retained sample, when possible. However, in many cases retesting is not possible because of the lack of available sample, the condition of the sample or natural soil and rock variability that prevents repeatable results. This is particularly true of undisturbed soil samples (Shelby tubes) and rock core.

7.7.1 h)

ISO 17025:2017 7.7.1 h includes the correlation of results for different characteristics of an item. Correlation of different geotechnical test results are frequently used in civil engineering (examples: grain size and hydraulic conductivity, moisture content and organic content, unit weight and density, etc.). However, because of the natural variability of soil and rock, it is not practical to statistically analyze the correlations. GTX does take these correlations into account when reviewing test results but does not systematically record them.

7.7.1 i)

ISO 17025:2017 7.7.1 i includes the review of reported results as a measure of result quality. However geotechnical results are rarely comparable either within or between projects.

7.7.1 j)

ISO 17025:2017 7.7.1 j includes the intra-laboratory comparisons.

7.7.1 k)

Testing of blind sample(s): GTX tests blind samples as part of the AASHTO re:source proficiency testing program. Since each proficiency sample is unique, results can only be used to compare results between participating labs for a single sample. Statistical analysis of all results received is provided by AASHTO re:source for each proficiency sample provided.

7.7.2

GTX shall monitor its performance by comparison with results of other laboratories, where available and appropriate. This monitoring shall be planned and reviewed and shall include, but not be limited to, either or both of the following:

UNCONTROLLED COPY

7.7.2 a) Participation in proficiency testing

GTX Proficiency Testing Program: GTX participates in several proficiency testing programs. These programs help control and maintain that laboratory personnel are performing tests properly. GTX participates in the following proficiency testing programs:

- ASTM/ISR: American Society for Testing and Materials/Institute for Standards Research (soils)
- GAI-LAP: Geosynthetic Accreditation Institute - Laboratory Accreditation Program (geosynthetics)
- AASHTO re:source: AASHTO: (American Association of State Highway and Transportation Officials) (soils & aggregate)
- CCRL: Cement and Concrete Reference Laboratory (AASHTO) (concrete)

These programs give GTX the means to check quality of work whenever a question is raised. The procedure that GTX follows is outlined in the GTX procedure "Proficiency Test Program." If results are outside the control limits (usually 2 standard deviations from the average) the following procedures are followed:

- Determine if the agency conducting the program corrected reported results
- Determine if the test result submitted was properly taken from laboratory data
- Determine if the calculations of the results were correct
- Determine if the equipment used to perform the test is in control
- Determine if the procedures used to perform the test are in accordance with test standards
- Take corrective action to repair or replace defective equipment or inform the technician of proper technique to follow
- Document corrective actions in accordance with section 11.0 Corrective Actions

GTX retains results of participation in proficiency programs including: data sheets, reports, results, and documentation describing steps taken to determine the cause of poor test results and any corrective actions taken.

AASHTO re:source proficiency results for soil testing shall be submitted in accordance with A2LA R103. Soil proficiency results and any corrective actions, if required, shall be submitted to A2LA along with the A2LA Proficiency Testing Data Submissions Form (F104) within 30 days of receiving the results from AASHTO re:source.

7.7.2 b) participation in interlaboratory comparisons other than proficiency testing.

7.7.3

Data from monitoring activities shall be analyzed and used to control, and if applicable, improve the laboratory's activities. If the results of the analysis of data from monitoring activities are found to be

UNCONTROLLED COPY

outside pre-defined criteria, appropriate action shall be taken to prevent incorrect results from being reported.

7.7.4 On-Site Inspection Programs

Assessments performed by external agencies is an additional way to demonstrate the quality of results and, in some cases, can be used to demonstrate conformance with ISO/IEC 17025:2017 and metrological traceability.

GTX participates in various on-site inspection programs, namely: AASHTO re:source, AASHTO-CCRL, A2LA, GAI and US Army Corps of Engineers. Three aspects of the laboratory are checked during these inspections: equipment, procedures, and the quality system. GTX may also undergo project-specific quality audits conducted by its clients. The scope of these audits is project-specific.

If deficiencies are found the following steps are taken:

- Equipment is replaced or repaired
- Correct procedures are discussed and reviewed with the technician; the technician is observed performing the test properly
- The Laboratory Manager reviews deficiencies in the Quality Manual with responsible individuals; corrections are made

Corrective actions are documented and maintained by the Laboratory Manager on the GTX server. Results of on-site inspections are maintained by the Laboratory Manager on the GTX server.

GTX currently holds the accreditations and validations given in Table 1 below. Accreditation certificates and validation letters can be found in Appendix G and on the GTX server at: \\HAL3-GTX.geocomp.com\GTX\Qualifications\Lab Accreditation. Each accreditation or validation document lists the scope of tests covered by the last assessment. The documents also list the dates over which the accreditation or validation are valid.

Agency	Type	Hold Certificate	
		GTX-MA	GTX-GA
AASHTO re:source	Accreditation	YES	YES
CCRL-AASHTO	Accreditation	YES	NO
A2LA	Accreditation	YES	NO
GAI-LAP	Accreditation	YES	NO
USACOE	Validation	YES	YES

Table 1. GeoTesting Express Accreditations and Validations

UNCONTROLLED COPY

7.8 TEST DATA AND REPORTING OF RESULTS

Test reports are created from test data obtained from technicians. Technicians use laboratory work sheets or the LIMS to document and check their work. Lab work sheets are initialed by technicians prior to submitting for review. Laboratory work sheets and the LIMS are designed to minimize errors in performing and reporting the test results. Comment sections of the laboratory work sheets and LIMS are used by technicians to record deviations from applicable test standards, problems arising during the performance of the test, etc. Once checked, the Laboratory Manager initials the laboratory work sheet.

Test report sheets and laboratory work sheets are placed into the project file for the appropriate project. A project file is a collection of color coded folders which represent separate components of the file. The folder which contains all of the sub folders is green. This green folder has a sticker on the outside with pertinent project information such as:

- GTX project #
- Client name, address, contacts, phone and fax numbers, E-mail addresses
- Project name and location
- Special reporting instructions
- Disposal method

The blue folder contains all laboratory work sheets and calculations (hand and computer generated). The yellow folder contains all background project information, pricing, correspondence, records of communication, etc. The orange folder contains all computer generated test report sheets and reports as needed. Most test report sheets and reports are now stored electronically on the GTX server.

Active project files are stored in the lab file cabinets. Technicians have access to these files for information they may need to perform tests.

Each project file has the unique GTX project number located at the top to distinguish it from other files. In addition, each file has a white label on the front to relay pertinent project information.

Most test reports are e-mailed to the client upon passing the internal quality check. (See Section 7.10.4, “GTX Procedures for Identifying and Correcting Nonconforming Work” for quality checking procedure.) All test reports are generally e-mailed to the client. Final project reports are posted to the GTX Client Portal for down loading. Alternatively, GTX can e-mail or mail a final report at the client’s request.

Documents, data, calculations and work papers prepared or furnished by GTX are instruments of service and remain GTX’s property. Reports, data and other work product delivered to or on behalf of the client are for the client’s use only for the limited purposes disclosed to GTX. GTX does not disclose results contained in any report produced for the client or provided by the client without the consent of the client. GTX treats test results, data and reports prepared by GTX as proprietary and confidential. These are only disclosed to a third party with written authorization from the client. If GTX wishes to use test data for purposes other than reporting to a client, it sanitizes the data by removing client names, project names, etc.

Appendix H contains example GTX test reports. A complete set of report formats is located in the Laboratory Manager’s office. Sample report formats are sanitized to maintain customer confidentiality.

UNCONTROLLED COPY

7.8.1 General Report Requirements

7.8.1.1

The Laboratory Manager, Assistant Laboratory Manager or Director of Testing Services generally checks and approves most test reports before being transmitted to the client. If it is impossible for the Laboratory Manager, Quality Technician, Assistant Laboratory Manager or Director of Testing Services to check and approve the report, the Chief Engineer will approve the report. The test report denotes who performed the test and who checked the test/report. Reports have a comment section on them which communicates to the client any deviation from the test standard, problems, observations, etc. Reports are dated and signed by any of the following: Laboratory Manager, Quality Technician, Assistant Laboratory Manager, Director of Testing Services or the Chief Engineer.

7.8.1.2

With approval from the client, the results may be reported in a simplified way. Any information listed in 7.8.2 to 7.8.7 that is not reported to the client shall be readily available.

If corrections are required to reports, they are made and the report is checked again. In the event an incorrect report goes to a client, a new and corrected report is supplied to the client and a corrective action report is completed. Both the corrected report and the original report are considered to be technical records and shall be retained in the project file. (See 7.8.8, Amendments to Reports)

7.8.2 Reports – Common Requirements

7.8.2.1

All test results produced by GTX are submitted to the client in the form of a test report. A test report consists of one or several test report sheets, a written letter and a transmittal page. At a minimum, the test report should satisfy the conditions and instructions outlined in test methods and contract with the client. Per the requirements of ISO/IEC 17025 each report shall include at least the following information, unless the laboratory has valid reasons for not doing so, thereby minimizing any possibility of misunderstanding or misuse:

- Title of "Test Report"
- Name and address of laboratory
- If testing not performed at the GTX laboratory, the report should include the location of performance of the laboratory activities, including when performed at a client facility or in associated temporary or mobile facilities.
- Unique identification of the report (GTX project number)
- Name and address of client, and name of contact at client firm
- Identification and description of samples tested
- Characterization of condition of test sample
- Date test samples were received in laboratory and date tests were performed

UNCONTROLLED COPY

- Identification of test methods used (including any additions to, deviations, or exclusions from the methods)
- Reference to sampling procedures
- Test results with, where appropriate, the units of measurement and supported by tables, graphs, sketches, etc. which support test results
- Signature of a Laboratory Manager or other authorized member of the lab management team who accepts responsibility for the content of the report and date report issued
- Statement declaring test results relate only to the samples tested
- Clear identification when results are from external providers.
- Statement that the report shall not be reproduced except in full, without the written approval of the laboratory

It should be noted that GTX may alter the format of reports but not content to satisfy specific requests of clients. At our clients' request, GTX generally issues reports using English/Imperial units, as is the standard practice in the United States. Reports in SI units can be generated when requested or required.

7.8.2.2

GTX shall be responsible for all the information provided in the report, except when information is provided by the client.

7.8.2.2.1

Where GTX has not been responsible for the sampling stage (e.g. the sample has been provided by the client), it shall state in the report that the results apply to the sample as received.

7.8.2.2.1

In general, the correctness of sample identification provided by the client (including boring number, exploration number, sample number, sample depth, sample description, soil or rock type, etc.) is the responsibility of the client. It is GTX's responsibility to correctly report sample identification provided by others.

7.8.2.2.2

All other information provided by a client shall be clearly identified.

7.8.2.2.3

In addition, a disclaimer shall be put on the report when the information is supplied by the client and can affect the validity of results.

7.8.3 Test Reports – Specific Requirements

7.8.3.1

In addition to the requirements listed in 7.8.2, test reports shall, where necessary for the interpretation of the test results, include the following:

UNCONTROLLED COPY

- Information on specific test conditions, such as environmental conditions.
- Where relevant, a statement of conformity with requirements or specifications
- Where applicable, the measurement uncertainty presented in the same unit as that of the measurand or in a term relative to the measurand (e.g. percent) when it is relevant to the validity or application of the test results, or a client's instruction so requires, or the measurement uncertainty affects conformity to a specification limit.
- Where appropriate, opinions and interpretations.
- Additional information which may be required by specific methods, authorities, clients or groups of customers.

7.8.3.2

Where GTX is responsible for the sampling activity, test reports shall meet the requirements listed in 7.8.5 where necessary for the interpretation of test results.

7.8.4 Calibration Certificates – Specific Requirements

7.8.4.1

In addition to the requirements listed in 7.8.2, calibration certificates shall include the following:

- The measurement uncertainty of the measurement result presented in the same unit as that of the measurand or in a term relative to the measurand (e.g. percent).
- The conditions (e.g. environmental) under which the calibrations were made that have an influence on the measurement results.
- A statement identifying how the measurements are metrologically traceable
- The results before and after any adjustment or repair, if available.
- Where relevant, a statement of conformity with requirements or specifications
- Where appropriate, opinions and interpretations

7.8.4.2

It is extremely rare that a GTX calibration procedure would require sampling. However, if sampling is required for a calibration, ISO 17025 requires that the calibration certificates shall meet the requirements listed in "Reporting Sampling", 7.8.5, if necessary for the interpretation of test results.

7.8.4.3

GTX is required to conform to ASTM D3740, "Standard Practice for Minimum Requirements for Agencies Engaged in Testing and/or Inspection of Soil and Rock as Used in Engineering Design and Construction." This standard specifies calibration intervals for geotechnical laboratories. Therefore, GTX lists a calibration date and the next calibration due date for each piece of calibrated equipment. These dates are included on each of our calibration certificates and calibration labels. This runs counter to ISO/IEC 17025 7.8.4.3 which states that calibration certificates or calibration labels shall not contain any recommendation on the calibration interval except where this has been agreed with

UNCONTROLLED COPY

the customer. GTX will comply with the ISO requirement stated in 7.8.4.3 and issue a calibration certificate without a calibration interval if specifically requested to by a client or agency. GTX equipment labels, however, will continue to list a due date for the next calibration.

7.8.5 Reporting Sampling

Where GTX is responsible for the sampling activity, in addition to the requirements listed in 7.8.2, reports shall include the following, where necessary for the interpretation of results:

- The date of sampling.
- Unique identification of the item or material sampled.
- The location of sampling, including any diagrams, sketches or photographs.
- A reference to the sampling plan and sampling method.
- Details of any environmental conditions during sampling that affect the interpretation of the test results.
- Information required to evaluate measurement uncertainty for subsequent testing or calibration.

7.8.6 Reporting Statements of Conformity

7.8.6.1

As a rule, GTX does not make statements of conformity to a specification. That is for our clients to determine based on our test results.

7.8.6.2

If a statement of conformity to a specification or standard is provided, GTX shall document the decision rule employed, taking into account the level of risk (such as false accept and false reject and statistical assumptions) associated with the decision rule employed and apply the decision rule. If GTX is required by a client to report a statement of conformity it shall identify the following:

- To which results the statement of conformity applies.
- Which specifications, standard or parts thereof are met or not met.
- The decision rule applied (unless it is inherent in the requested specification or standard).

7.8.7 Reporting Opinions and Interpretations

GTX reports provide the results of tests. Opinions and interpretation of the GTX test results are generally left to the professional judgement of our clients. Our client's opinions and interpretation are not included in GTX test reports unless the client specifically requests that they be included. If a client's opinions and interpretation are included in a GTX report they would be clearly noted as coming from the client. If GTX is requested to state its opinions and interpretation in a report than that report shall conform to Sections 7.8.7.1 to 7.8.7.3 below.

7.8.7.1

When opinions and interpretations are expressed, GTX shall ensure that only personnel authorized

UNCONTROLLED COPY

for the expression of opinions and interpretations releases the respective statement. Authorized personnel include the Laboratory Manager, Quality Technician, Laboratory Engineer and the Director of Testing Services. GTX shall document the basis upon which the opinions and interpretations have been made.

7.8.7.2

The opinions and interpretations expressed in reports shall be based on the results obtained from the tested item and shall be clearly identified as such.

7.8.7.3

When opinions and interpretations are directly communicated by dialogue with the client, a record of the dialogue shall be retained.

7.8.8 Amendments to Reports

7.8.8.1

When an issued report needs to be changed, amended or re-issued any change of information shall be clearly identified and, where appropriate, the reason for the change included in the report.

7.8.8.2

Amendments to a report after issue shall be made only in the form of a further document, or data transfer, which includes the statement: "Amendment to Report", or an equivalent form of wording. Such amendments shall meet all the requirements of this document.

7.8.8.3

When it is necessary to issue a complete new report, this shall be uniquely identified and shall contain a reference to the original that it replaces.

7.9 COMPLAINTS

7.9.1

A complaint is defined by ISO 17025:2017 as an expression of dissatisfaction by any person or organization to a laboratory, relating to the activities or results of that laboratory, and where a response is expected.

GTX has a documented process to receive, evaluate and make decisions on complaints. If a complaint is received by the laboratory, the Quality Manager or Director of Testing Services completes a Complaint Form. Resolution of the complaint is recorded on the Complaint Form and maintained in the corrective action file.

7.9.2

The GTX Complaint Form and the corrective response process (Section 8.7) describes the handling process for complaints receive by GTX. The GTX complaint documentation is available to any client or accreditation agency on request. Upon receipt of a complaint, GTX shall confirm whether the complaint relates to laboratory activities that it is responsible for and, if so, shall address it. GTX shall be responsible for all decisions at all levels of the handling process for complaints.

UNCONTROLLED COPY

7.9.3

The GTX Complaint Form and the corrective action procedure includes the following:

- Description of the process for receiving, validating, investigating the complaint, and deciding what actions are to be taken in response to it.
- Tracking and recording complaints, including actions undertaken to resolve them.
- Ensuring that appropriate action is taken.

7.9.4

The GTX manager receiving the complaint shall be responsible for gathering and verifying all necessary information to validate the complaint. If a GTX technician directly receives a communication in any form that maybe considered a complaint, the technician shall discuss the communication with a Lab Manager. The Lab Manager will begin the complaint process based on the discussion with the lab technician.

7.9.5

Whenever possible, GTX shall acknowledge receipt of the complaint, and provide the complainant with progress reports and the outcome.

7.9.6

The outcomes to be communicated to the complainant shall be made by, or reviewed and approved by, individual(s) not involved in the original laboratory activities in question.

7.9.7

Whenever possible, GTX shall give formal notice of the end of the complaint handling to the complainant.

7.10 MANAGEMENT OF NONCONFORMING WORK

7.10.1

The following is GTX's procedure for non-conforming work. It shall be implemented when any aspect of its laboratory activities or results of this work do not conform to its own procedures or the agreed requirements of the client. The procedure shall ensure that:

- The responsibilities and authorities for the management of nonconforming work are defined.
- Actions (including halting or repeating of work and withholding of reports, as necessary) are based upon the risk levels established by GTX.
- An evaluation is made of the significance of the nonconforming work, including an impact analysis on previous results.
- A decision is taken on the acceptability of the nonconforming work.
- Where necessary, the client is notified and work is recalled.
- The responsibility for authorizing the resumption of work is defined.

UNCONTROLLED COPY

7.10.2

GTX shall retain records of nonconforming work and actions as specified in 7.10.1.

7.10.3

Where the evaluation indicates that the nonconforming work could recur or that there is doubt about the conformity of the laboratory's operations with its own management system, the laboratory shall implement corrective action.

7.10.4 GTX Procedures for Identifying and Correcting Nonconforming Work

Test data used to create a report is checked by the Laboratory Manager, Quality Technician, Director of Testing Services, Quality Manager, Chief Operating Officer, or Chief Engineer. Final reports are checked, signed and dated by the Laboratory Manager, Quality Manager, Director of Testing Services, Chief Operating Officer or Chief Engineer before being delivered to the client. Laboratory work sheets and test reports have a comments section where any out of ordinary, pertinent information is included concerning the test.

If an error is detected in the test data, the Laboratory Manager performs a preliminary investigation. If the preliminary investigation finds and resolves the problem, re-testing is performed. If, upon the preliminary investigation, there is no acceptable reason found for the error, the Quality Manager is consulted and a more in depth investigation is performed. Findings and resolutions are documented.

Nonconforming reports identified by the client are corrected, checked by the Laboratory Manager, Quality Technician, Director of Testing Services, Quality Manager, Chief Operating Officer or Chief Engineer and shipped to the client. Both the re-submitted report and the nonconforming report are kept in the project file. If re-testing is required to remedy the situation, it is done at no cost to the client. Again, nonconforming data and/or reports require documentation in the form of a corrective action report. Customer complaints require documentation by way of the corrective action report.

After nonconforming testing and/or calibrations are corrected, it is the responsibility of the Laboratory Manager, Quality Technician, Director of Testing Services, Quality Manager, Chief Operating Officer, or Chief Engineer to authorize the resumption of work.

7.11 CONTROL OF DATA – INFORMATION MANAGEMENT

ISO/IEC 17025 requires the following for the control of data and laboratory information management:

- GTX shall have access to the data and information needed to perform laboratory activities.
- The laboratory information management system (LIMS) used for the collection, processing, recording, reporting, storage or retrieval of data shall be validated for functionality, including the proper functioning of interfaces within the laboratory information management system(s) by the laboratory before introduction. Whenever there are any changes, including laboratory software configuration or modifications to commercial off-the-shelf software, they shall be authorized, documented and validated before implementation. (See Section 7.2.3.7.)
- The laboratory information management system shall:
    - Be protected from unauthorized access.

UNCONTROLLED COPY

- Be safeguarded against tampering and loss.
- Be operated in an environment that complies with supplier or laboratory specifications or, in the case of non-computerized systems, provides conditions which safeguard the accuracy of manual recording and transcription.
- Be maintained in a manner that ensures the integrity of the data and information.
- Include recording system failures and the appropriate immediate and corrective actions.

  See Section 7.2.3.7 for details.

- GTX manages and maintains its LIMS and laboratory data control system with help from the company's Information Technology Department (IT.) IT shall comply with all applicable requirements of the GTX Quality Manual. GTX does not use an external provider to manage or maintain the control of data.
- All GTX SOP's, manuals and reference data relevant to the laboratory information management systems are made readily available to personnel. (See Section 8.3, "Control of Management System Documents")
- Calculations and data transfers shall be checked in an appropriate and systematic manner.

8 MANAGEMENT REQUIREMENTS

GTX's management is committed to good professional practice and to providing quality testing services to its clients. In addition, GTX's management is committed to continually improving the effectiveness of the management system. Testing services are conducted in accordance with stated methods and clients' instructions. GTX's standard of service is to score a 4 or higher on both its customer survey and proficiency tests. These results are tracked and improvement is expected over time. All personnel of GTX are required to familiarize themselves with the GTX quality system and appropriate documentation. This quality system includes the following elements:

- GTX has in place a quality plan which is described in the Quality Manual. This Manual is kept up to date by the Quality Manager.
- Prior to embarking on a new project, a review is required to determine if all the necessary resources for the execution of the project are available in-house and are capable of completing all tasks as required by the client. This includes equipment and technicians. Both must have passed quality system reviews to determine fitness (calibrations, accuracy for equipment and training for technicians).
- GTX performs an internal quality audit once per year. As part of this audit, quality documents are updated and reviewed by the Quality Manager, and Laboratory Managers.
- Management and staff of GTX maintain current memberships in outside organizations such as ASTM, ASCE, NAGS, etc. which enable them to meet or exceed current practices in the geosynthetics and soils industry.

UNCONTROLLED COPY

- Technicians sign their work off in the appropriate location on laboratory work sheets; whoever performs the peer review also signs off on the laboratory work sheet. Final reports are signed by the Laboratory Manager, Chief Engineer, Laboratory Director, Lab Manager, Quality Manager, Assistant Laboratory Manager or Quality Manager as part of the final verification.
- GTX performs tests in accordance with published standards and with assistance from their own standard operating procedures. These procedures are documented and available to all persons within GTX and help reduce ambiguity where confusion may otherwise exist. These documents are available to clients upon request.
- GTX tracks each individual project entering the laboratory with its own unique sequential project identification number.

GTX's quality system objectives are as follows:

- Provide quality test results by conducting testing in accordance with published standards, accepted industry practice and clients' instructions within the time required by the client.
- Continually improve quality by self-evaluation, process review and documentation.
- Constantly meet or exceed our clients' expectations.

GTX's quality goals are summarized in Table 2 below.

Indicator	Measurement	Level of Service (Goal)
Service to clients	Survey response	≥4
	Client complaints per year	0
Proficiency tests	Rating	≥3
Safety	Incidents per year	0
Production	Yearly targets	100%
Turnaround time	On or ahead of schedule per week	95%
Process control	IRM rating	±2 standard deviations

Table 2. GTX Quality Goals

8.1 ISO/IEC 17025:2017 MANAGEMENT OPTIONS

8.1.1 General

ISO/IEC 17025:2017 requires that laboratories establish a management system that follows one of two options, A or B. Option A follows the management of requirements of ISO/IEC 17025:2005. Option B is

UNCONTROLLED COPY

new and requires a management system that is in accordance with the requirements of ISO 9001. In addition, the management system shall meet the requirements of clauses 4 to 7 of ISO/IEC 17025:2017.

GeoTesting Express has decided to follow the requirements of Option A and continue to follow the management system outlined in ISO/IEC 17025:2005 with the addition of the new section 8.5 that addresses risks and opportunities.

8.1.2 Option A (17025:2005)

As a minimum, the GTX management system of the laboratory shall address the following:

— management system documentation (see 8.2).

— control of management system documents (see 8.3).

— control of records (see 8.4).

— actions to address risks and opportunities (see 8.5).

— improvement (see 8.6).

— corrective actions (see 8.7).

— internal audits (see 8.8).

— management reviews (see 8.9).

8.1.3 Option B (9001:2015)

GTX is not following the Option B Management system. The Option B Management System is defined as:

A laboratory that has established and maintains a management system, in accordance with the requirements of ISO 9001, and that is capable of supporting and demonstrating the consistent fulfilment of the requirements of clauses 4 to 7 of ISO/IEC 17025 also fulfils at least the intent of the management system section requirements (8.2 - 8.9)

8.2 MANAGEMENT SYSTEM DOCUMENTATION (OPTION A)

8.2.1

The GTX Quality Manual and quality procedures document the GTX management system. These procedures are followed by employees of GTX. GTX employs a management team appropriate to the volume and nature of laboratory testing conducted. The Quality Manager is responsible for implementing the quality system. The Quality Manual is electronically maintained on GTX's server as a read-only protected file. It is available to each employee for viewing. The Quality Manager is responsible for distribution and maintenance of controlled documents related to the quality system.

8.2.2

The quality system outlined in this Quality Manual is designed to meet requirements in ANSI/ISO/IEC 17025:2017. Procedures used to maintain compliance with the GTX quality system and ANSI/ISO/IEC 17025:2017 are documented below in Sections 8.3 – 8.9. Employees of GTX are responsible for adhering to procedures outlined in the Quality Manual while satisfying our clients' needs.

UNCONTROLLED COPY

Improvements to procedures are coordinated with proper authority to assure uniform compliance. Changes are made to existing systems only after a review on the effect of such changes is performed. Employees of GTX have access to the appropriate documentation needed to implement the quality system.

8.3 CONTROL OF MANAGEMENT SYSTEM DOCUMENTS (OPTION A)

8.3.1

Documents relating to the GTX quality plan are controlled. These include the Quality Manual; test procedures; documents required by GTX to ensure effective planning, operation or and control of its processes; and records required by ISO 17025. Records are maintained indicating controlled documents and those who possess them. Controlled Documents are located where appropriate. Test standards are available in the laboratory. GTX Standard Operating Procedures are located in the Laboratory Manager's office and on the GTX server. GTX's Quality Manual is maintained electronically on GTX's server. SOPs and the Quality Manual are available to employees of GTX.

8.3.2

Controlled documents are reviewed and approved by the Quality Manager and/or Director of Testing Services. Controlled documents (such as the Quality Manual, SOPs, standards and report blanks) are numbered by a unique identification system. Persons receiving a copy of a controlled document are assigned a unique numbered copy of that document. A master list of control documents is maintained which contains the following:

- Unique number or name of controlled document
- Current revision # in use
- Date of issue of current revision

This system allows for tracking current as well as obsolete copies. Master copies of current controlled documents are kept with the Laboratory Manager, or the Quality Manager. The master list and each controlled document's list are maintained by and kept with the Quality Manager.

It is possible to circulate an uncontrolled copy of a controlled document. The cover of the document must clearly state "uncontrolled document" or "UC".

Invalid and/or obsolete controlled documents are removed from those who possess them. This is possible by utilizing the controlled document lists to locate current copies. Uncontrolled copies do not need to be retrieved and/or replaced. Obsolete documents are marked with an "Obsolete" stamp. One copy of obsolete documents is retained for historical preservation and the remainder destroyed.

8.3.3

The GTX Quality System uses a variety of supporting procedures and reference documents. The documents have been organized into a hierarchical structure that is outlined in the GTX Document Control List. The hierarchical structure is organized as follows:

1. Quality Manual

UNCONTROLLED COPY

2. Test Standards/Methods
3. Test Standard Operating Procedures
4. GTX Operating Procedures
5. Form - Test Report Blanks
6. Form - Lab Data Sheets
7. Test Exams
8. Calibration/Verification Standard Operating Procedures
9. Internal Reference Material Standard Operating Procedures
10. A2LA Normative Documents
11. ISO Normative Documents
12. Other Normative Documents

8.3.4

All GTX quality documentation, processes, systems, records are included in, referenced from, or linked to the management system.

8.3.5

All GTX personnel involved in laboratory activities have access to the parts of the management system documentation and related information that are applicable to their responsibilities. Management system documents are maintained either on the GTX lab server or hardcopies are available in the lab manager's office.

8.3.6

For the tests it performs, GTX reviews each revision of a test standard as the revisions are published. This review occurs within one month of receiving notification of the latest published standards. (e.g. ASTM revises every 5 to 8 years, AASHTO issues revised standards once every two years). The review consists of:

- Determining which standards have been updated (GTX Administrative Assistant)
- Revising our master controlled document list to reflect the updated test standard (GTX Administrative Assistant)
- Determining if the test standard revision requires a revision to GTX's standard operating procedures (Lab Manager, Assistant Lab Manager, Quality Manager, Quality Technician)
- Revising GTX's standard operating procedures (if necessary) (Lab Manager, Assistant Lab Manager, Quality Manager, or Quality Technician)
- Revising our master controlled document list (if necessary) to reflect the updated standard operating procedure (Administrative Assistant, Lab Manager, Assistant Lab Manager, Quality Manager, or Quality Technician)

UNCONTROLLED COPY

- Determining if the test standard revision requires a revision to GTX's lab test data sheet
- Revising GTX's lab test data sheet (if necessary) (Lab Manager, Assistant Lab Manager, Quality Manager, or Quality Technician)
- Revising our master controlled document list (if necessary) to reflect the updated lab test data sheet (Administrative Assistant, Lab Manager, Assistant Lab Manager, Quality Manager, or Quality Technician)
- Determining if the test standard revision requires a revision to GTX's standard report format (i.e. verifying if all elements given in the "Report" section of the test standard are recorded by GTX) (Lab Manager, Assistant Lab Manager, Quality Manager, or Quality Technician)
- Revising GTX's standard report format (if necessary) (Lab Manager, Assistant Lab Manager, Quality Manager, or Quality Technician)
- Revising our master controlled document list (if necessary) to reflect the updated standard report format (Administrative Assistant, Lab Manager, Assistant Lab Manager, Quality Manager, or Quality Technician)

Changes to controlled documents are reviewed and approved as stated in section 8.3.2. Each year, documents are re-issued if there have been revisions or changes made, however procedural changes are issued and used immediately following the revision. When changes are made to controlled documents, the Quality Manager or Director of Testing Services is responsible for updating current copies of the manual

Master copies of documents are "read only" protected and can only be modified by the Quality Manager or Director of Testing Services.

8.4 CONTROL OF RECORDS (OPTION A)

GTX has established and maintained procedures for identifying, collecting, indexing, accessing, filing, storage, maintenance and disposal of quality and technical records.

8.4.1

The following types of quality records are maintained:

- Technical Records (see Section 7.5.3)
  - Project Files
  - Equipment Records
- Quality Assurance
  - Management review
  - Internal and external audits
  - Corrective action file
  - Client survey

UNCONTROLLED COPY

- Customer complaint
- Preventative action

- Personnel
  - Training log
  - Resumes

8.4.2

Physical project files (hardcopies) are maintained until the project is approximately seven years old. Electronic project files are maintained indefinitely. Other quality documents are maintained indefinitely in electronic form.

8.4.3

Access to project records are consistent with client confidentiality commitments. Project records shall not be released without the consent of GTX's client.

8.5 ACTIONS TO ADDRESS RISKS AND OPPORTUNITIES (OPTION A)

8.5.1

Options to address risks can include identifying and avoiding threats, taking risk in order to pursue an opportunity, eliminating the risk source, changing the likelihood or consequences, sharing the risk, or retaining risk by informed decision.

Opportunities can lead to expanding the scope of the laboratory activities, addressing new customers, using new technology and other possibilities to address customer needs.

The GTX management system includes a varieties of ways to identify and address risks and opportunities under Option A. GTX considers the risks and opportunities associated with the laboratory activities in order to:

- Give assurance that the management system can achieve its intended results
- Enhance opportunities to achieve the purpose and objectives of GTX
- Prevent, or reduce, undesired impacts and potential failures in the laboratory activities
- Achieve improvement.

8.5.2

As outlined below in Section 8.5.4, the GTX management system includes multiple ways to address risks and opportunities. In addition, the management system is designed to integrate and implement risk and opportunity actions into its management system and to evaluate the effectiveness of these actions.

8.5.3

Proposed actions taken to address risks and opportunities shall be reviewed and evaluated to make sure that the actions are proportional to the potential impact on the validity of laboratory results.

UNCONTROLLED COPY

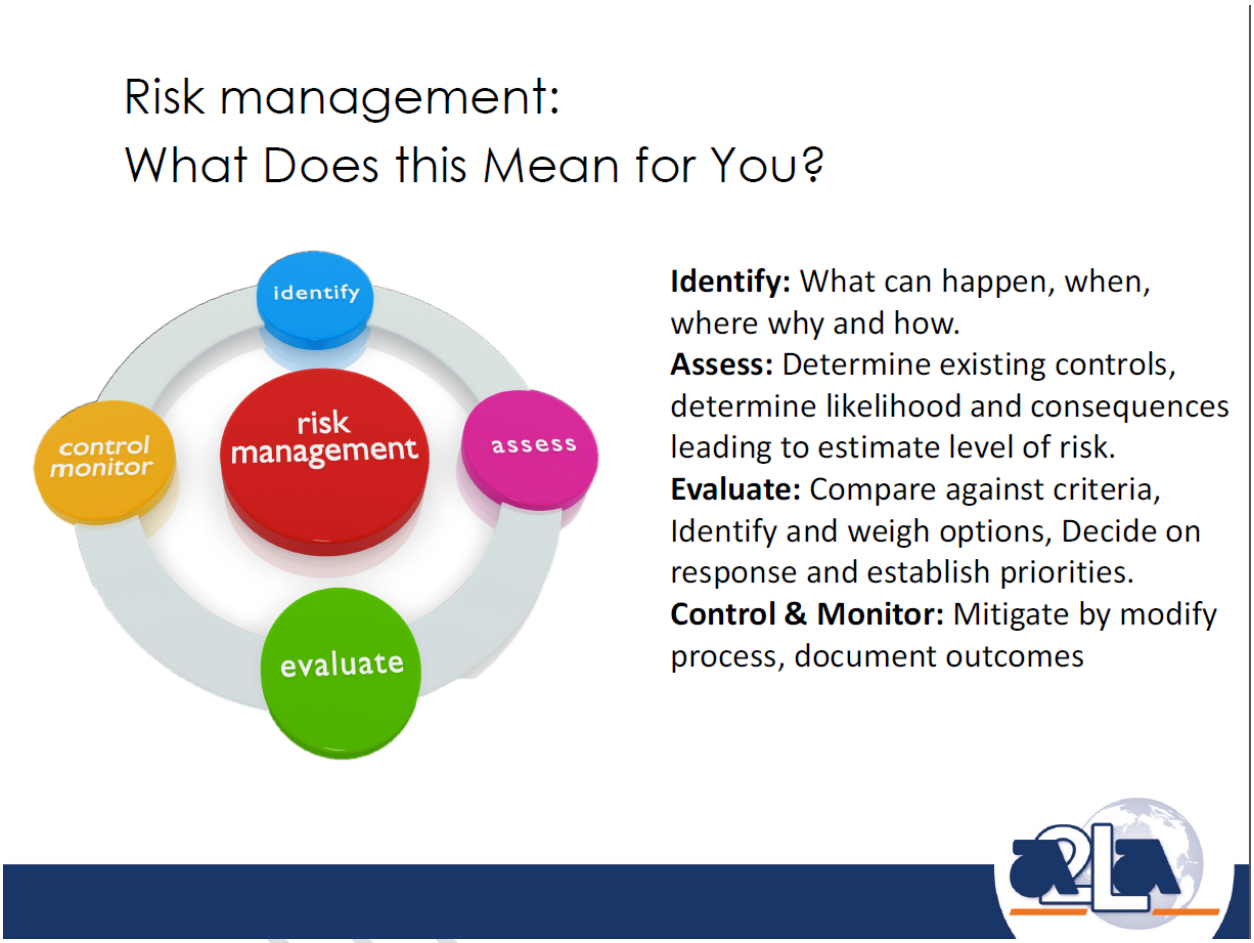

Figure 4. Steps for Risk Management

8.5.4 GTX Procedures related to Risk Management

GTX Actions Used to Identify, Access and Evaluate, Control and Monitor Risk and Opportunity:

- Reviews of risk to GTX's Impartiality
- Review of Client project inquires, quotes, project planning, and contracts
- Project test assignment reviews
- Weekly Staff meetings: in particular, the agenda items that cover Continual Improvement, Preventative Actions, Risk Management
- Bi Weekly Management meetings
- Continual Improvement, Preventative Action, Risk Management Action procedures
- Document Control reviews

- ASTM Tracker Alert (identifies revised test standards)
- Client communication and follow-up discussions between managers and staff
- Vendor List process (vendors reviewed and rated)
- Client complaints
- Corrective Actions and Root Cause Analysis
- Internal Audits
- Management Quality Review
- Results from Internal Reference Materials (IRM's)
- Results from Equipment Calibration and Verification
- Proficiency Testing

8.5.5 GTX Risk Management Assessment and Evaluation

When a new risk or opportunity is identified, it can be assessed, evaluated and recorded by following any of the established processes listed above or it can be reviewed using the GTX Risk Management Assessment form.

8.6 IMPROVEMENT (OPTION A)

8.6.1

GTX strives for continuous improvement in its procedures. The effectiveness of GTX's efforts can be measured by the following means over time:

- Client survey results
- Internal reference material (IRM) testing
- Corrective action files

All of the above are integral parts of our quality system and are reviewed by management at regular intervals.

8.6.2

GTX seeks feedback, both positive and negative, from its clients. The feedback is reviewed and used to improve all phases of the lab's performance. GTX's level of service can be measured by the results of its client satisfaction survey. The survey is sent to each client upon completion of a project. The survey asks the client to rate GTX on a number of different items on an escalating scale (1-5). GTX's goal is to receive a grade of 4 or higher (1 = failed to meet expectations and 5 = exceeded expectations). GTX aims to continuously improve its quality system in order to better serve our clients. A return rate of 10% is required to validate the survey. It is our policy to respond to all complaints received in the customer survey. Data obtained in the customer survey is discussed in quarterly management review meetings.

UNCONTROLLED COPY

8.7 CORRECTIVE ACTION (OPTION A)

Investigations are performed when non-conformities are found in the quality system or from the analysis of materials, test reports or customer complaints. The Laboratory Manager performs a preliminary investigation of all complaints. The investigation shall include a documented Root Cause Analysis of the problem in accordance with the requirements of ISO 17025 section 8.7.1b. If the preliminary investigation finds the problem, GTX will deal with the consequences and correct the problem and resolve any related issues associated with the non-conformity. Once the problem has been corrected, the process is documented in a Corrective Action Report. If, upon the preliminary investigation, there is no acceptable reason found for the error, the Quality Manager and/or Director of Testing Services is consulted and a more in depth investigation is performed. Once a suitable resolution is determined, the findings, Root Cause Analysis, resolutions, and consequences are documented in a Corrective Action Report. The Corrective Action Report is to include a review to determine if similar nonconformities exist, or could potentially occur. In addition, the corrective action should be evaluated to determine if the non-conformity or the corrective action require changes to the management system and, if necessary, update risks and opportunities determined during planning.

A corrective action file is maintained on the GTX server to document non-conformities. Corrective Action Reports are filled out by the Laboratory Manager or Quality Manager. Corrective Action Reports are reviewed by the Management at the end of each year. The reports are reviewed to evaluate the effectiveness of any corrective action take. Appropriate actions are taken to eliminate the possibility of the same problem occurring again. The laboratory staff is part of this process.

A corrective action summary list is constructed and maintained by the Laboratory Manager. This list helps aid in tracking customer complaints, audit deficiencies, etc. A yearly review is conducted with the aid of information contained in this list.

8.8 INTERNAL AUDITS (OPTION A)

Procedures for GTX Internal Audits are documented in Section 8.8. Internal quality audits are performed annually between February and June. The audit shall cover the previous calendar year. The internal audit shall verify if quality activities and related results comply with the GTX quality management system and the requirements set forth in ISO/IEC Guide 17025:2017. The Quality Technician and/or Director of Testing Services perform these audits.

The Quality Audit includes an examination of the following areas of GTX's Quality System:

- Quality Manual
- Corrective Action Summary List during the past year
- Review of previous year's corrective actions.
- Review effectiveness of past corrective actions to verify that issues remain resolved.
- External Audits performed during the past year
- Customer complaints from the past year
- Equipment problems

UNCONTROLLED COPY

- Organizational structure of the laboratory
- Results of proficiency tests during the past year
- Laboratory & field testing
- Training
- Review of controlled documents including Normative References and the Document Master Control List
- Results of customer surveys
- Any other quality issue

The audit shall also take into consideration the importance of the laboratory activities, changes affecting the laboratory, and the results of previous audits.

In addition, the audit shall consider the risks and opportunities associated with the laboratory activities that were identified in the prior year and evaluate the effectiveness of any related actions implemented.

Results of quality audits are recorded and reviewed with GTX management. Corrective actions, if necessary, are implemented without undue delay. Corrective actions are followed-up to verify implementation and effectiveness. The actions taken are documented. Results of quality audits are maintained by the Laboratory Manager in the Laboratory Manager's office and on the GTX server.

If deficiencies are determined by customer complaints, peer review and/or external audits, an increase in internal quality audits will occur. These increased internal quality audits will be in place until deficiencies are rectified.

The Quality Manager is responsible to schedule reminders for the annual Management Review on the GTX Calendar.

8.9 MANAGEMENT REVIEWS (OPTION A)

8.9.1

Procedures for GTX Management Reviews are documented in Section 8.9. The annual management review of the quality system is performed each year after the completion of the internal quality audit. The laboratory management review is to ensure the continuing suitability, adequacy and effectiveness of the GTX quality system in relation to the GTX quality document and the requirements of ISO/IEC 17025:2017.

The management review shall cover the previous calendar year. The management review shall be completed by August 31 at the latest. The management review is the responsibility of the Director of Testing Services with assistance from the Quality Technician and Laboratory Managers. The Director of Testing Services is responsible to schedule reminders for the annual Management Review on the GTX Calendar.

8.9.2

Topics covered during the review of the previous year include:

UNCONTROLLED COPY

- Review of previous year:
  - Changes in internal and external issues that are relevant to the laboratory, including any quality system changes
  - Fulfilment of objectives
  - Suitability of policies and procedures
  - Status of actions from previous management reviews
  - Outcome of recent internal audits including resolution of any related deficiencies
  - Corrective action reviews
  - Review effectiveness of past corrective actions to verify that issues remain resolved.
  - Assessments by external bodies including resolution of any related deficiencies
  - Changes in the volume and type of the work or in the range of laboratory activities
  - Customer and personnel feedback;
  - Complaints
  - Effectiveness of any implemented improvements
  - Adequacy of resources
  - Results of risk identification
  - Outcomes of the assurance of the validity of results including proficiency test results
  - Other relevant factors, such as monitoring activities and training.
- Review of Actions to Address Risks and Opportunities:
  - Review risks and opportunities identified, accessed, evaluated, and controlled or monitored.
  - Review risks to the labs impartiality that were identified since the last Management Review and determine if they were adequately addressed.
  - Review audit deficiencies to determine if required actions are underway, completed or not begun.
  - Review QM Section 5.5 to determine if any position responsibilities need updating, revision or improvement.
  - Review QM Section 5.5.c.1 to determine if any management responsibilities need updating, revision or improvement.
  - Based on the findings of this Management Review were there additional risks to the labs impartiality identified?
  - Based on the findings of this Management Review were there additional risks or opportunities identified?
- Planning for coming year:

UNCONTROLLED COPY

- Preventative action
- Recommendations for improvement
- Resource (personnel and equipment) needs
- Reports from management and supervisory personnel (addressing trends, equipment wish lists, suggestions for improvement, etc.)
- Changes in volume and type of work
- Action items stemming from review with due dates

8.9.3

The outputs from the management review shall record all decisions and actions related to at least:

- The effectiveness of the management system and its processes
- Improvement of the laboratory activities related to the fulfilment of the requirements of this document
- Provision of required resources
- Any need for change.

8.9.4

A copy of the minutes from the management review is provided to the Chief Engineer. Records of management review are maintained and kept in the Director of Testing Services' office.

9 SUPPLEMENTAL INFORMATION

9.1 ADVERTISING POLICY

GTX has adopted A2LA's "R105 – Requirements When Making Reference to A2LA Accredited Status" as its own policy in relation to advertising the A2LA logo. This is given in GTX's Standard Operating Procedure GTX-AD004 and can be found in the Lab Manager's office and on the GTX server.

Whenever the A2LA logo is used in GTX advertising materials it will be accompanied by the GTX A2LA accreditation certificate number 2965.01.

UNCONTROLLED COPY

10 SUMMARY OF CHANGES FROM VERSION 14.0

- Title page: Revised document revision number, date of issue, controlled document number, Joe Tomei's title, and copyright date.
- All headers: Revised document revision number.
- All footers: Revised document revision number, date of issue, and controlled document number.
- Updated Table of Contents.
- Corrected typos and edited short sections of text to improve clarity.
- Section 2 Normative References:
  - Updated ANSI/ASQC Q9001 version to 2015
  - Added A2LA R103a – Annex – Proficiency Testing for ISO-IEC 17025 Laboratories
  - Removed A2LA R104 – General Requirements: Accreditation of Field Testing and Field Calibration Laboratories
  - Added ASTM D653
- Moved updated Figures 1 and 2, Organizational Charts, from Sections 5.1 and 5.2 to new Appendix A.
- Added Appendix B, GeoTesting Express, Inc. Laboratory Activities.
- Rewrote GTX Job Descriptions and moved them from Section 5.5.b.3 to new Appendix C.
- Moved Figure 2, GTX Training Record, from Section 6.2 to new Appendix D and revised text in Section 6.2 as appropriate.
- Added Technician Training Matrix to Appendix D.
- Added Appendix E, Laboratory Floor Plan, and added reference to Appendix E in Section 6.3.
- Moved Table 1, Laboratory Equipment Calibration and Verification Requirements, from Section 6.4.14 to new Appendix F.
- Added Appendix G, GTX Accreditation and Validation Certificates.
- Removed Figures 6-11, Example Test Reports, from Section 7.8 and placed example reports in a new Appendix H containing examples of all soil and rock test reports.
- Renumbered remaining figures and tables.
- Quality Manual 14.0 showed New ISO/IEC 17025:2017 requirements are in RED. However, the A2LA assessment of 2020 pointed out that a number of new requirements were missed in Quality Manual 14.0. Quality Manual 14.1 corrected these omissions in the following sections:
  - 5.3, 6.4.13, 7.1.1, 7.13, 7.2.1.5, 7.7.2 a, 7.7.2 b, 7.8.1.2, 7.8.7.3, 7.10.1, 7.10.2, 7.11, 8.1.1, 8.7, and 8.8
- Rewrote Sections 5.1 – 5.7.

UNCONTROLLED COPY

- Added the following to Section 6.2: “The Laboratory Manager and Quality Control Technician are also responsible for determining when a Technician has reached a higher Technician training level.”
- Added reference to GTX Purchasing SOP, QD16 to Section 6.6.
- Removed Section 7.1.9.3 on Selection of Test Methods. Section content was already covered word for word in Section 7.2.3.2 Selection of Methods.
- Renumbered Section 7.1.9.4.
- Added reference to GTX Sample Handling SOP, QD019 to Section 7.4.1.
- Added new category, Rush Sample, indicated by a green marker, to Figure 4, “Sample/Folder Color Key” in Section 7.4.5.2.
- Corrected bulleting on list of technical records in Section 7.5.3.2.
- Corrected CCRL reference in Section 7.7.2.a.
- Revised last sentence of Section 7.8.1.2.
- Added ISO 17025:2017 definition of complaint to Section 7.9.1.
- Section 7.10.1: Added new 1st sentence: “The following is GTX's procedure for non-conforming work.” Added to document 7.10 as GTX’s procedure.
- Rewrote 1st sentence of 2nd bullet of Section 8.
- Added new 1st sentence to Section 8.2.1 stating that the GTX management system is documented in the Quality Manual and other GTX quality documents. Moved old first sentence from QM 14.1 to 3rd sentence.
- Added new 2nd sentence to Section 8.2.2 indicating that procedures for the management system are listed in Sections 8.3-8.9.
- Added new 1st bullet to Section 8.5.4 adding reviews of risk to impartiality.
- Added new 1st sentence to Section 8.8 indicating that procedures for internal audits are documented in Section 8.8.
- Deleted “effectiveness” from 3rd bullet of Section 8.8.
- Added new 4th bullet to Section 8.8, Review effectiveness of past corrective actions to verify that issues remain resolved.
- Added new 1st sentence to Section 8.9 indicating that procedures for management review are documented in Section 8.9.
- Added new 7th sub-bullet to 1st main bullet of Section 8.9.2, Review effectiveness of past corrective actions to verify that issues remain resolved.
- Added 2nd main bullet and seven new 7th sub-bullets to Section 8.9.2 covering Review of Actions to Address Risks and Opportunities.
- Added Summary of Changes section at end of document.

ROCK

Rock - D 3967 - Tensile Strength, Splitting (Brazilian) Method
Rock - D 4543 - Preparing Rock Core Specimens and Determining Tolerances
Rock - D 4644 - Slake Durability of Shales and Weak Rocks
Rock - D 5312 - Durability of Rock to Freezing and Thawing
Rock - D 5313 - Durability of Rock to Wetting and Drying
Rock - D 5607 - Laboratory direct Shear Tests on Rock Under Constant Normal
Rock - D 5731 - Point Load Index
Rock - D 7012 - Compressive Strength & Elastic Moduli of Rock Core Specimens - Method C - Uniaxial Comp. Strength

SOILS

Soils - G 51 - Measuring pH of Soil for Use in Corrosion Testing
Soils - G 57 - Field Measurement of Soil Resistivity Using the Wenner Four-Electrode Method
Soils - A 187 - Measurement of Soil Resistivity Using the Two-Electrode Soil Box Method
Soils - D 421 - Dry Preparation for Particle Size Distribution & Soil Constants
Soils - D 422 - Particle Size Analysis (Sieve and Hydrometer)
Soils - D 558 - Moisture-Density of Soil-Cement
Soils - D 559 - Wetting & Drying Soil-Cement
Soils - D 560 - Freezing & Thawing Soil-Cement
Soils - D 698 - Compaction Characteristics by Standard Effort
Soils - D 854 - Specific Gravity of Soils
Soils - D 1140 - Material Finer than 75 □m (No. 200) Sieve
Soils - D 1557 - Compaction Characteristics by Modified Effort
Soils - D 1632 - Making and Curing Soil-Cement Compression and Flexure Test Specimens in the Laboratory
Soils - D 1633 - Compressive Strength of Molded Soil-Cement Cylinders
Soils - D 1883 - CA Bearing Ratio (CBR)
Soils - D 2166 - Unconfined Compressive Strength
Soils - D 2216 - Water Content
Soils - D 2434 - Permeability of Granular Soils (Constant Head Method) (Withdrawn 2015)
Soils - D 2435 - One-Dimensional Consolidation Properties
Soils - D 2487 - Classification of Soils
Soils - D 2488 - Description & Identification of Soils (Visual-Manual Procedure)
Soils - D 2850 - Unconsolidated, Undrained Strength in Triaxial Compression
Soils - D 2974 - Moisture, Ash, & Organic Matter of Peat & Other Organic Soils
Soils - D 3080 - Direct Shear Test in Consolidated Drained Conditions
Soils - D 3740 - Soil and Rock Testing Standards (Quality Standard)
Soils - D 4253 - Maximum Index Density by Vibratory Table
Soils - D 4254 - Minimum Index Density
Soils - D 4318 - Liquid & Plastic Limits & Plasticity Index
Soils - D 4546 - One-Dimensional Swell or Settlement Potential
Soils - D 4643 - Determination of Water Content of Soil by Microwave Oven
Soils - D 4718 - Correction of Unit Weight and Water Content for Soils Containing Oversize Particles
Soils - D 4767 - Consolidated-Undrained Triaxial Compression
Soils - D 4829 - Expansion Index of Soils
Soils - D 4972 - pH of Soils
Soils - D 5084 - Hydraulic Conductivity using a Flexible Wall Permeameter
Soils - D 5334 - Thermal Conductivity of Soil and Soft Rock
Soils - D 6913 - Particle-Size Distribution of Soils Using Sieve Analysis
Soils - D 6938 - Density and Water Content by Shallow Depth Nuclear Method
Soils - D 7928 - Fine Grain Distribution with Hydrometer

Appendix D GLNPO Requirements for Submission of Field Data

GREAT LAKES LEGACY ACT

DATA REPORTING STANDARD

REVISION 1

August 2023

Prepared for:

U.S. Environmental Protection Agency
Great Lakes National Program Office
77 West Jackson Boulevard
Chicago, Illinois 60604-3590

Approved by:

_____	August 30, 2023
Mark Loomis, GLLA QA Manager	Date

Preface

The 2023 *Great Lakes Legacy Act Data Reporting Standard* (GLLA DRS) provides a single source for data reporting guidance for projects implemented under the Great Lakes Legacy Act (GLLA). Information provided in this document should serve as a basis for developing a Quality Assurance Project Plan (QAPP) and associated field and laboratory standard operating procedures (SOPs) to clearly identify and describe how the project will meet GLLA data reporting requirements and help ensure that all required data are correctly collected and reported throughout each phase of the GLLA project.

The 2023 version of the GLLA DRS supersedes the 2020 GLLA DRS and provides updated references and minor revisions to the 2020 GLLA DRS.A more substantial revision was completed in 2020 to update the 2010 GLLA DRS, with major changes in the 2020 GLLA DRS including:

- updates to locational, metadata and geospatial data reporting requirements;
- updates to instructions for reporting data using the Environmental Protection Agency (EPA) Region 5 Electronic Data Deliverable (EDD), the National Oceanic and Atmospheric Administration (NOAA) Data Integration, Visualization, Exploration, and Reporting (DIVER) tool, the Scribe software tool developed by the Environmental Response Team (ERT), the Staged Electronic Data Deliverable (SEDD) format, and simplified spreadsheet formats;
- clarification on differences in reporting requirements for routine analytical chemistry data, biology/toxicology data and data from experimental methods;
- instructions for submitting final project data sets via the GLLA Data Submission Site on GLNPO.net; and
- elimination of the requirement for hard-copy reports and documentation.

Since the publication of the 2010 GLLA DRS, the Region 5 EDD Specifications and SEDD Specifications have been comprehensively updated, and NOAA Query Manager has been replaced by NOAA DIVER. The 2023 GLLA DRS provides updated guidance (including links to source documents along with additional clarification and helpful hints for data providers) to ensure that GLLA data reporting requirements align with these updated reporting formats. Data providers should carefully review the 2023 GLLA DRS to: 1) ensure familiarity with any revisions made since the release of the 2020 GLLA DRS, and 2) ensure that updates or addendums to previously approved QAPPs and SOPs are compliant with the 2023 GLLA DRS.

All GLLA data providers, including prime site contractors, subcontractors, laboratories, states, non-federal sponsors, and others are expected to follow the GLLA DRS requirements. The 2023 GLLA DRS details required data components and accepted data reporting formats to facilitate comprehensive data verification, validation and usability reviews (identified by the GLLA Quality Plan (QP) as Data Quality Assessments (DQAs)), as well as the submission of complete project data sets for upload to the Great Lakes Sediment Database (GLSED). Any data-generating project that is wholly or partially funded under the GLLA should follow reporting requirements identified in the GLLA DRS, unless an exception is approved by the GLLA Quality Assurance (QA) Manager.

Requirements identified in the 2023 GLLA DRS should be implemented for all future GLLA projects and GLLA final data deliverable packages. Special consideration should be applied to the updated geospatial database requirements. Current and past GLLA projects with approved quality documentation are exempt from these new or updated requirements but should incorporate them to the extent practical. Any questions on the requirements of the 2023 GLLA DRS should be directed to the GLLA QA Manager, Mark Loomis (loomis.mark@epa.gov), 312-886-0406.

1.0 Introduction

The U.S. Environmental Protection Agency (EPA) Great Lakes National Program Office (GLNPO) collects a variety of environmental data to support sediment assessment and remediation projects implemented under the Great Lakes Legacy Act (GLLA). Projects implemented under the GLLA involve a number of collaborators, which may include EPA Regions, states, non-federal sponsors, state contractors, EPA contractors, non-federal sponsor contractors, state laboratories, commercial laboratories, university laboratories, and others. To facilitate the accuracy, integrity, objectivity, consistency and completeness of these data sets, GLNPO has developed a data reporting standard for all projects administered under the GLLA. These requirements are consistent with common data reporting standards that have been developed by GLLA partner organizations and are familiar to GLLA project partners. The common data reporting formats accepted by GLNPO include: the EPA Region 5 Electronic Data Deliverable (EDD) format; the National Oceanic and Atmospheric Administration (NOAA) Data Integration, Visualization, Exploration, and Reporting (DIVER) templates; and the Staged Electronic Data Deliverable (SEDD), Version 5.2 format. When SEDD is used for laboratory data, data providers often provide accompanying field data in the Scribe format. Data may also be provided in a mini-GLSED format. Laboratories directly contracted with GLNPO for experimental or research methods may provide data in the simplified spreadsheet format. GLLA-specific requirements build upon the source data requirements. Data reporting standardization facilitates efficient upload to GLNPO's Great Lakes Sediment Database (GLSED), which is used to manage and publicly disseminate data collected under the GLLA through the Great Lakes Environmental Database (GLENDA).

This 2023 GLLA Data Reporting Standard (DRS) details data reporting requirements for both field and laboratory data, and addresses the most common types of environmental information generated under the GLLA. As directed by the *Quality Assurance Considerations for Great Lakes Legacy Act Projects* (August 2023), project-specific Quality Assurance Project Plans (QAPPs) should contain detailed information about the data reporting requirements for each specific project, as well as roles and responsibilities for providing project data to GLNPO. Each QAPP must be approved by the GLLA Project Manager and GLLA Quality Assurance (QA) Manager. GLLA projects often involve site-specific data collection requirements that cannot be fully captured by the standards described in this document. In these cases, to ensure GLSED compatibility, the data provider and the GLLA Project Manager should discuss these requirements with the GLLA QA Manager during project planning and QAPP development to ensure these reporting requirements are sufficiently addressed in the project-specific QAPP, and during data collection and reporting. Adhering to requirements in the GLLA DRS facilitates generation of consistent, usable, and reliable data to support GLLA sediment assessment and remediation projects and is mandatory for projects wholly or partially funded under the GLLA.

The original version of the GLLA DRS was published in 2010 and since then, EPA Region 5, NOAA, EPA Superfund, and other partner organizations have developed and implemented comprehensive updates to their data reporting requirements that serve as a basis for GLLA data reporting requirements. This 2023 GLLA DRS reflects the current requirements and as such, identifies options that can: 1) increase flexibility for data providers through the use of several common data reporting formats, and 2) streamline the data reporting process by allowing research laboratories to use simplified data reporting options when submitting directly to GLNPO. Additional modifications have been made to update source links and provide additional clarification and helpful hints to data providers.

2.0 Purpose

The 2023 GLLA DRS provides data reporting guidance for projects being implemented under the GLLA. Any project wholly or partially funded under the GLLA should follow the reporting guidance in the GLLA DRS, unless an exception is approved by the GLLA QA Manager. While GLNPO provides several options for reporting data, to maintain consistency, transparency, and reproducibility, laboratory and field

data submittals must include specific minimum components. In addition, data providers must submit additional supporting information to GLNPO (e.g., optional EDD fields, field reports, additional sample information, final project reports), when available.

For many projects implemented under the GLLA, a site contractor or collaborator is responsible for planning and overseeing field and laboratory data generation, and subsequently reporting the final verified and validated data to GLNPO. These data must be submitted in one of the accepted deliverable formats for upload to GLSED. GLNPO typically does not re-validate final project data when project documentation confirms that project-specific data quality objectives (DQOs) have been met. However, as the final owner of all data generated under GLLA, it is imperative that GLNPO maintain complete information about a data set to both ensure compliance with EPA Information Quality Guidelines and preserve their ability to fully investigate data integrity should future concerns arise. The GLLA QA Process diagrams are provided in Attachment 1. More information on the GLLA QA process and GLLA project-specific QA requirements for prime (i.e., site) contractors can be found in the *Quality Assurance Considerations for Great Lakes Legacy Act Projects* (August 2023), (i.e., QA Considerations) which is available from the GLLA QA Manager.

The remaining sections of this 2023 GLLA DRS are summarized below:

- Section 3: **Overview of GLLA Data Reporting Requirements.** This section provides a brief overview of the accepted reporting formats, GLLA-specific reporting requirements, the relevance and applicability of the Superfund Contract Laboratory Program (CLP) requirements, the use of the Scribe software tool for field data collection, and considerations related to data submission.
- Section 4: **Field and Laboratory Data Deliverable Requirements.** This section of the GLLA DRS details the required components of the data deliverable, including the EDD and supplemental field (Attachment 2) and laboratory information. Supplemental information (e.g., chains of custody, field logs, laboratory raw data, validation reports, final project reports) should be provided in a portable document format (PDF) or in the original electronic file format (e.g., Microsoft Word, Microsoft Excel). To facilitate efficient data storage and retrieval, GLNPO accepts data and reports in electronic format only (i.e., hard copy deliverables are not accepted).
- Section 5: **Accepted Formats for Electronic Data Deliverables.** This section provides information on accepted formats for the EDD submissions and defines minimum information that must be included for each accepted reporting format. Links to guidance documents, user guides, and references to helpful resources are included.
- Section 6: **Geospatial Database Deliverables.** This section provides a summary of the advantages and technical specifications for geospatial database deliverables.
- Section 7: **Data Deliverable Package Checklist.** This section provides a description and reference to a checklist (Attachment 3) that can be used by data providers when preparing their deliverable packages to help avoid common data quality issues.
- Section 8: **Contacts.** This section provides a list of individuals that data providers may contact if questions arise during sample analysis and/or report preparation.
- Section 9: **Resources.** This section provides a list of sources with additional information that may be helpful to data providers, laboratories and other stakeholders.

The following attachments to this GLLA DRS provide additional information to help ensure adherence to GLLA data reporting requirements:

- Attachment 1: **The GLLA QA Process.** These figures depict the GLLA QA and Data Management Process from project planning to final data reporting and identify major requirements and roles/responsibilities of the prime contractor, GLLA Project Manager and GLLA QA Manager.
- Attachment 2: **Minimum Requirements for the Submission of Field Data for GLLA Sediment Projects.** This attachment summarizes the required field data elements for information on the data provider contact, study area, station and samples.
- Attachment 3: **GLLA Final Data Deliverable Package Checklist.** This checklist can be used to help ensure deliverables submitted to the GLLA Data Submission Site on GLNPO.net are complete and speed the GLSED review and approval process.
- Attachment 4: **Locational Data Checklist and Metadata Recording Form.** Data providers should review this form prior to collecting data and upload the completed form to the GLLA Data Submission Site on GLNPO.net along with the GLLA final data deliverable package.
- Attachment 5: **Data Element Dictionary for the Simplified Spreadsheet EDD File.** This file provides a description of each data field in the simplified spreadsheet EDD, which is used by laboratories submitting data directly to GLNPO (if pre-approved by the GLLA QA Manager and documented in the project QAPP).

3.0 Overview of GLLA Data Reporting Requirements

Due to the variety of partners supporting GLLA sediment assessment and remediation projects, GLNPO allows flexibility in the submission of final project data sets. GLNPO encourages data providers to be efficient and practical in their data collection and evaluation efforts, and allows providers to submit data in formats they are typically already familiar with, including the Region 5 EDD format (typically used to report analytical chemistry data as described in Section 5.1) and the NOAA DIVER templates (typically used to report biological, toxicity and habitat data, but may also be used for analytical chemistry data as described in Section 5.2).

Data providers should collect, evaluate, and provide data in a format that meets project-specific DQOs and data management needs, and need not limit data reporting to a single format if the format does not meet project-specific requirements. For example, it is not uncommon for GLLA sediment and remediation projects to collect field data using Scribe and request that the laboratory submit a SEDD file. The data provider may then use EPA's Electronic Data Exchange & Evaluation System (EXES) to merge the field and laboratory data, conduct an automated data review, and complete data verification and validation using EXES Data Manager (EDM) (see Section 5.3). EXES can generate Region 5 EDDs. Supporting toxicity, bioaccumulation, and benthic or fish community data may be reported using NOAA DIVER Templates to support the development of clean-up goals and identify ecological restoration targets. Each of these deliverables are acceptable provided they meet the GLLA DRS minimum requirements for each reporting format, and all supporting information is included in the final data submission to GLNPO.

3.1 Comparison of GLNPO Accepted Reporting Formats

The data reporting format used by the project team is typically chosen based on the type of data generated (e.g., chemistry, biology) as well as laboratory capability. Table 1 provides a summary of accepted reporting formats and describes how each format may support GLLA sediment projects to assist data providers with identifying and selecting the appropriate format during project planning.

Table 1: Laboratory Reporting Format Options and Considerations

Laboratory EDD Format Option	Compatible Field Data Formats	Considerations
Region 5 EDD Format	Scribe, Region 5 EDD Field forms	• Most common format for submitting data to GLLA • Flexible in reporting a variety of site parameters, including geotechnical data and associated quality control (QC) criteria • Files are compatible with EQuIS • Does not allow reporting of benthic community or toxicity data
NOAA DIVER Lab EDD Template	NOAA DIVER Templates (ChemTox or BioLab)	• Useful for site assessments that incorporate toxicity, bioaccumulation, benthic/fish community, or ecological assessments, but may not provide sufficient information on geotechnical parameters to support comprehensive remedial investigations
SEDD	Scribe if using EXES for automated data review	• Uniform, non-proprietary format that can support instrument calibration information and link batch QC to associated samples, allowing automated data review up to Stage 3 • Recommended laboratory deliverable if using EXES and EDM or other automated review program to assist data validation, increasing consistency and saving resources • EXES automatically merges field and laboratory data (if Scribe XML file is provided) and outputs a GLNPO CLP Reporting Format and Universal Data Deliverable, which meets all GLLA DRS EDD requirements • EXES can be used to generate additional project-specific EDDs and preliminary data qualifiers and validation reports • Can be directly mapped to most data management systems, including EQuIS and Scribe • Does not currently support field information
Mini-GLSED Access Database	N/A	• Data providers may provide data in the mini-GLSED Access Database format (this is not typical or required, and does not speed data processing by GLNPO's Data Management Contractor) • Providing a mini-GLSED may be useful if the data are not already in another format accepted by GLNPO (e.g., in a propriety database format)
Simplified Spreadsheet for Laboratory Data	Simplified Spreadsheet for Field Data	• Simplified way for research laboratories directly contracted with GLNPO to provide environmental data when other data reporting options are not practical

Note: The NOAA Query Manager Template is no longer an option to submit data to GLNPO.

3.2 Project Planning to Meet GLLA Data Reporting Requirements

Project planning documentation, particularly the project QAPP, must describe all project-specific data reporting requirements, as well as the process and requirements for data verification and data validation. Project data sets must include certain sample and method quality control data, supporting information, and the results of data verification and validation (to ensure that both data quality and usability are fully evaluated and documented). Project data sets are uploaded to the GLSED only when the GLLA QA Manager has confirmed that minimum data and data quality requirements have been met.

To ensure the data produced are of known and documented quality, all data generated under the GLLA must undergo formal data verification and validation per the requirements in the project QAPP. Field and laboratory data must be correctly merged and verified, and data validation must be performed in accordance with EPA Information Quality Guidelines, Superfund CLP National Functional Guidelines for

Data Review (NFGs), and project-specific DQOs. Data verification and validation procedures, including acceptance criteria and laboratory- and validator-applied qualifiers, must be stated clearly in the QAPP and approved by the GLLA Project Manager and GLLA QA Manager prior to data collection. The results of data verification and validation are typically documented with a data review narrative, which should be provided to GLNPO with the verified and validated final project data set. Many projects document the overall results of data review and evaluate findings in terms of project DQOs. These findings are documented in a separate data usability technical memorandum or provided within a final project report. When available, technical memoranda, final project reports and any other information supporting data quality and usability should be provided to GLNPO when submitting the final project data set.

3.3 GLLA-Specific Data Reporting Requirements

In addition to all minimum data fields required by the Region 5 EDD, NOAA DIVER Templates, and SEDD, GLNPO requires data providers to report the following additional information for all GLLA final data deliverable packages, which may not be required by other EPA programs or NOAA. Section 4.1 provides information on how this information should be reported in the EDD for each data reporting format.

GLLA-Specific Data Reporting Requirements:

- **Contact Information**: Provide contact information for the data provider, including name, email and phone number should questions arise concerning the data.
- **Field Data**: Include sample collection time, sample delivery group, water depth with units, total sediment depth with units, method for measuring total sediment depth (e.g., graduated pole, vibracore), and whether sediment was collected to refusal (Section 4.1.4).
- **Laboratory Information:** Include lab name, sample delivery group, lab sample identification (ID), lab qualifiers, method detection limits, sample specific detection limits, all associated methods and sample QC results (as required by the QAPP), all analyte-specific results from dilutions, and re-extractions and re-analyses with a single reportable result clearly identified (Section 4.3).
- **Data Validation:** Include validator qualifiers, final interpreted data qualifiers, qualifier definitions, and information on summing schemes or correction factors, including how non-detects and data qualifiers were accounted for (e.g., for Total polycyclic aromatic hydrocarbons (PAHs), Total polychlorinated biphenyls (PCBs)).
- **Spatial Data:** Submit in the ESRI File Geodatabase format with a defined coordinate system. If applicable, submissions should include the collection method(s). Each geodatabase should be accompanied by Federal Geographic Data Committee (FGDC) compliant metadata as described in Section 4.2.

Attachment 2 provides additional information on minimum data required for final submission to GLNPO for field data.

3.4 The Superfund Contract Laboratory Program

While not affiliated with the Superfund program, GLNPO closely follows Superfund data quality requirements and data review procedures, including the Superfund CLP requirements and procedures, when practical. The CLP is a national program managed by the U.S. EPA Analytical Services Branch (ASB). CLP Statements of Work (SOWs) contain the technical, contractual, and reporting requirements that must be met by the CLP laboratories. More information on this program is available at https://www.epa.gov/clp.

Use of CLP processes and procedures provide benefits to GLLA projects, including implementation of standardized EPA methods and procedures, consistent method and sample QC requirements, automated data review using EXES, standardized data reporting, and consistent method QA/QC and documentation requirements. Laboratories in the CLP are typically qualified to meet the rigorous data quality and data reporting requirements of the GLLA. However, final decisions on laboratory capability, analytical method and data quality requirements, and project DQOs are determined by the GLLA project team, in consultation with the GLLA QA Manager, to ensure that project-specific DQOs are met.

3.5 The GLNPO CLP Reporting Format and Universal CLP Deliverable

GLNPO has worked with the Superfund CLP Program to develop a customized reporting format for data reported to GLNPO following EXES automated data review, which is known as the "GLNPO CLP Reporting Format." The CLP also provides a "Universal Data Deliverable" for all projects that use EXES automated data review. The GLNPO CLP Reporting Format and CLP Universal Data Deliverable include all of the laboratory analytical information required for upload to the GLSED. Scribe Extensible Markup Language (XML) field data exports can be automatically mapped to the GLNPO CLP Reporting Format and CLP Universal Data Deliverable using EXES. The collaborator may then use EDM to access data in a central location, allowing multiple data reviewers to complete data validation simultaneously. When using EXES automated data review, the original laboratory SEDD file does not need to be provided to GLNPO. Only the validated GLNPO CLP or CLP Universal Data Deliverable with complete field information needs to be provided. The supplemental information should include a PDF of the laboratory raw data package and all EXES-generated and validator-edited reports along with associated data review narratives.

Please note that the Universal Data Deliverable and GLNPO CLP Reporting Format are only accepted as EDDs if EXES is used. These files are specific outputs of EXES and are not accepted by GLNPO as stand-alone templates.

3.6 Scribe for Field Data Collection

Scribe, a software tool developed by EPA's ERT, captures sampling, observational and monitoring field data. Examples of Scribe field tasks include soil sampling, water sampling, air sampling and biota sampling. While Scribe can also import and store analytical laboratory results, GLNPO does not utilize this capability.

Scribe outputs include labels for collected samples and chain-of-custody (COC) generation, which help ensure samples are sent to the correct laboratory and analyzed for the correct parameters. Scribe labels are often used in addition to laboratory provided labels. Scribe supports electronic field data exports in the XML format, which can be automatically combined with the laboratory EDD when using automated data review software, such as EXES, or other mapping software. Field data for GLLA projects can be delivered in the Scribe database format regardless of whether laboratories are delivering analytical data in a format that can be mapped to the field data or if EXES is used. Additional information on the Scribe format for field data can be found at http://www.ertsupport.org/scribe_home.htm.

The Scribe Quick Start Guide provides information for creating new projects, adding samples, and creating labels and chains of custody. The Scribe User Manual provides additional information on where to store data and Geographic Information System (GIS) information in Scribe. Data providers may submit the study-specific Scribe database to GLNPO in lieu of providing a supplemental field data file.

***Helpful Hint**: GLNPO encourages the use of Scribe and EXES automated data review to increase consistency and save costs by streamlining field data collection as well as data verification and validation processes. Use of these free EPA software tools requires up front planning, system access, and laboratory EDD testing. As such, data providers should alert the GLLA QA Manager and CLP program during QAPP development to receive assistance and training on these systems, which can help reduce potential delays.*

3.7 Submission of Final Project Data sets via the GLLA Data Submission Site

GLNPO collaborators should submit final project data, including final EDDs and complete field and laboratory supporting information, to GLNPO (via the GLLA Data Submission Site on GLNPO.net). Data providers requiring access to the GLLA Data Submission Site or training on the data submission process should contact the GLLA QA Manager.

A GLLA Final Data Deliverable Package Checklist is included as Attachment 3.

GLSED final Data Submissions must be uploaded to the GLLA Data Submission Site on GLNPO.net and include the following items:

- Final verified and validated EDD(s) with merged field and laboratory data in one of the accepted formats identified in Section 5
- The complete laboratory raw data package identified in Section 4.3
- Data verification and validation narratives
- Definitions of any validator and laboratory qualifiers applied to the data
- Final QAPPs, Field Sampling Plan (FSP) and Addendums

When available, the data provider should also submit the following items:

- Data Quality/Usability Assessments
- Technical Memoranda
- Final Project Reports
- Any additional information supporting project data quality or usability

Upon receipt of a GLLA final data deliverable package, GLNPO's Data Management contractor pre-loads project data into a project-specific GLSED (i.e., mini-GLSED). Data submissions are first assessed for adherence to basic completeness and compliance requirements during the Data Submission Compliance Overview (DSCO) review. A completed DSCO form identifying data gaps and issues is forwarded to the data provider. Upon receipt of DSCO form responses, the data then undergo various checks, including data consistency checks, a Quality Information Completeness (QIC) review, and a mini-GLSED review. Data quality issues requiring further clarification or confirmation are forwarded to the data provider. GLNPO requires that all data providers comply with these requests for additional information.

Once project-specific mini-GLSEDs are developed and thoroughly reviewed, they are submitted to the GLLA QA Manager for approval prior to final upload to GLSED. GLNPO does not allow project close-out until final project data sets are approved by the GLLA QA Manager. Data providers should compare these project-specific databases against their project data sets to ensure accuracy and completeness prior to project close-out. This final step helps ensure that quality data used to support GLLA decisions are available to the public and in compliance with EPA Information Quality Guidelines.

4.0 Field and Laboratory Data Deliverable Requirements

This section details the minimum components that must be included in the field and laboratory data deliverables. GLNPO requires two distinct data deliverable components. The first is the EDD, which must be provided in one of the accepted formats detailed in Section 5. The second is the supplemental information, to include final project QA documentation, field logs, laboratory raw data, data validation reports, final project reports, and/or other supplemental information necessary to confirm the quality and usability of the data and whether the data meet project data quality requirements. As the final owner of the data, GLNPO must retain this information to 1) comply with EPA Information Quality Guidelines, and 2) maintain the ability to fully investigate data sets in the event that data integrity questions arise after final project decisions have been made.

4.1 Field Data Deliverable Components

Accurate field information and locational data are critical to mapping, modeling and interpreting environmental data. For all GLLA projects, collaborators are required to complete and submit the *Locational Data Checklist and Metadata Recording Form* for each sampling event (Attachment 4), which can be submitted as a fillable/electronically-signed form (preferred) or as a scanned version of the completed form.

To facilitate the use of existing field forms used by GLNPO data providers, a list of data field reporting requirements, *Minimum Requirements for the Submission of Field Data for GLLA Sediment Projects* is included as Attachment 2. When reporting data in the allowable report formats discussed in Section 5, all required elements must be reported according to the specific EDD reporting specifications along with the additional components required by GLLA. Any additional field information requirements based on project objectives must be detailed in the project QAPP. The data provider should discuss any special field data reporting requirements with the GLLA Project Manager and document the final decisions in the project QAPP.

4.1.1 Data Provider Contact Information

The data provider is the person responsible for submitting the EDD and will serve as the contact person to answer any questions that may arise regarding the field and laboratory data provided in the EDD. Required data provider information includes their affiliation, first and last name, physical address information (street address or post office box number, city, state, and zone improvement plan [ZIP] code), and data provider e-mail address and phone number.

4.1.2 Study Information

Study information consists of data that describe a study. These include geographical data, such as: site or location name, site or location description, site or location purpose, EPA region, state, district, county, watershed, and reach, when available.

4.1.3 Station Information

Station information consists of data that describe a particular sampling station. These data include the station identifier; latitude and longitude of sampling stations in World Geodetic System (WGS) 84 or North America Datum (NAD) 83; and a description of the station. These data are critical for projects using geostatistics to map the extent of site contamination. GLLA requirements for locational data include:

- **Horizontal data information:** x-coordinate, y-coordinate, horizontal datum, horizontal collection method, horizontal accuracy value, and horizontal units of measure

- **Vertical data information:** water surface elevation, sediment surface elevation, bedrock elevation, elevation collection method, elevation accuracy value, and vertical datum code
- **Reference point(s):** a structure or recognizable feature within or near the study area that is viewable using aerial photography. See Attachment 4.
- **Control point(s):** a previously surveyed location with known coordinates (e.g., a benchmark). See Attachment 4.

Alternatively, if the vertical data information as listed above is not available, data providers should provide the water and sediment depth measurements and the method for measuring sediment depth.

4.1.4 Field Sample Information

Field sample information consists of data associated with specific environmental samples. These data include the unique sample identifier, sample type (e.g., routine field sample, field duplicate sample, and equipment blank), collection date and time, upper and lower sample collection elevation or depth (z-coordinate), and elevation/depth units. Additional information required by GLNPO for sediment samples includes water depth with units, sediment sampling technique, whether the sample is a composite or a grab sample, a list of sediment sample observations (e.g., color, texture, odor), and whether the sample was collected to refusal.

When using the Region 5 EDD Format, report required field sample station information in the Field EDD location file (EPAR5LOC_v3) as follows:

- Report water depth with the applicable unit of measure in the "remark" data field
- Report sediment depth in the "depth_to_bedrock" data field
- Report observation time along with the date in the "observation_date" data field
- Report the method for collecting sediment depth (graduated pole, vibracore, etc.) and whether the sample was collected to refusal in the "loc_purpose" data field

Report the following sample-specific information in the Lab EDD sample file (EPAR5SMP_v3):

- Report sediment sample observations (e.g., color, texture, odor) in the "comment" data field
- Identify whether the sample was a composite or grab sample in the "composite_yn" data field

More information on the Region 5 EDD format reporting requirements is provided in Section 5.1.

When using the NOAA DIVER ChemTox and BioLab Templates, report this information in the "Notes" data field of the SampleMaster worksheet. More information on this reporting format is provided in Section 5.2.

If more convenient for the data provider, this additional information may be submitted in a supplemental spreadsheet file regardless of EDD format. The only requirement is to use sample and station IDs in the spreadsheet file that are consistent with those used in the main EDD.

4.2 GIS Data Collection and Reporting Requirements

The data provider should follow appropriate guidelines prior to, during and after field data collection for the purpose of maximizing the accuracy of data collected using a global positioning system (GPS). Failure to follow these procedures may result in spatial measurements with reduced accuracy and a failure to meet project objectives. GLNPO recommends that project participants collecting and processing spatial data undergo certified GPS training and spend time familiarizing themselves with each specific GPS unit being used for each project prior to the start of field activities.

To document and facilitate the collection and reporting of locational data, collaborators are required to complete and submit the *Locational Data Checklist and Metadata Recording Form* (Attachment 4). Data providers must review this form prior to writing the project QAPP and complete and submit the form subsequent to field data collection. For a more complete description of GPS data collection policy and guidance, please refer to Section 1 (Standard Operating Procedure for Global Positioning System Data Collection) of EPA's Interim Guidance for Developing Global Positioning System Data Collection Standard Operating Procedures and Quality Assurance Project Plans, dated February 2008.

Technical Specifications for all GLLA GIS Data Deliverables:

1. All horizontal locational data not in a GIS file format (e.g., CSV, Microsoft Excel) must be submitted in decimal degrees in the WGS 84 or NAD 83, specifying which is used. Inclusion of projected coordinates (e.g., Universal Transverse Mercator (UTM)) is optional, but complete metadata regarding projection parameters and datum must accompany projected coordinates.
2. All GIS files (e.g., raster, vector) should be formatted into a standard ESRI format, with the file geodatabase preferred, and must have spatial reference information that describes the projection and datum.
3. All GIS files are required to have associated FGDC metadata. The Content Standard for Digital Geospatial Metadata can be found at http://www.fgdc.gov/metadata/geospatial-metadata-standards#csdgm. An add-on editor for ESRI software, EPA Metadata Editor (EME), complies with the FGDC metadata requirement and is available at https://edg.epa.gov/EME/. Versions are available for both ArcMap and ArcGIS Pro.
4. All map documents should be submitted in the ESRI format (.mxd or .mapx), with all supporting map data submitted as described above, as a map package (.mpk or .mpkx), or as a project package (.ppkx), with the supporting map data included as part of the package. Before saving or exporting, ensure the resultant file includes a relevant title and brief summary, and store relative path names to data sources.
5. Any GIS files and map documents that cannot be formatted into a standard ESRI format must be included in their native editable file format. This includes computer-aided design (CAD) files or any other files that are part of the data submission and support map documents.

4.3 Laboratory Analytical Data Deliverable Components

GLLA data providers are required to submit two laboratory data deliverables to GLNPO: 1) electronic data in an allowed EDD format (Section 5), and 2) a supplemental data package containing laboratory raw data and supporting information. The supplemental laboratory data package facilitates the DSCO and QIC review process and upload to GLSED. GLNPO requires that the laboratory raw data package and supporting information be provided as PDF files or as original file formats (e.g., Microsoft Word) and uploaded with the full data submission to the GLLA Data Submission Site.

The required minimum components of a laboratory EDD and supplemental data package are detailed in this section. In most GLLA projects, the collaborator or site contractor will contract directly with an analytical laboratory. The analytical laboratory should be identified during the project planning and QAPP development process so that the laboratory may provide important feedback on their capability to meet method acceptance criteria and data reporting requirements as documented in the QAPP. The laboratory statement of work should dictate specific GLLA data reporting requirements for the analytical laboratory. When using the Region 5 EDD format, NOAA DIVER, or SEDD, the data provider should carefully review the source documents to ensure all required information is included and the correct valid values are used. The QA Considerations document contains additional information regarding laboratory competency, certification requirements, preferred analytical methods, Performance Evaluation (PE) sample use, and data verification and validation requirements that must be considered when identifying an

analytical laboratory to meet project DQOs. In rare instances when GLNPO contracts directly with a laboratory (usually an academic laboratory for research purposes), the laboratory has the option of submitting data in the simplified spreadsheet format.

> ***Helpful Hint:*** *The analytical laboratory is an important member of the project team and should provide feedback on the project-specific DQOs and how they can be achieved using current analytical technology, prior to QAPP submission.*

While GLNPO does not perform a Stage 4/Tier 2 (described in the GLLA QP) data validation on all laboratory data, as the final data owner, GLNPO requires all laboratories submitting routine analytical chemistry data to submit a complete data package (commonly called a "Level IV" package), which allows an independent reviewer to complete a Stage 4/Tier 2 data validation if future concerns about the data arise. To conduct a comprehensive Stage 4/Tier 2 data validation, independent data reviewers must comprehensively evaluate the following six data deliverable components: a narrative summary, COC forms (or traffic reports), calibration information, raw data, electronic results, and other supporting information. These items are described in detail below. At a minimum, GLNPO requires field data, analytical results, and sample QA/QC data delivered in a machine-readable format (e.g., CSV, XML, Microsoft Excel, Microsoft Access), in one of the accepted EDD formats, to facilitate upload of the data submission to GLSED. Other supporting information and raw data should be provided as an electronic PDF or in the original file format (e.g., Microsoft Word) unless otherwise agreed upon in advance by the GLLA Project Manager and GLLA QA Manager. Scanned photocopies of original sample documentation, such as air bills and COCs should be provided.

For routine organic, inorganic, and high-resolution chemistry parameters in water, sediment, soil and tissue (i.e., CLP or relevant SW-846 methods), GLNPO evaluates data against CLP NFGs, with modifications specific to sediment as described in the GLLA QP. For these types of data, laboratories must provide sufficient information to allow an independent data reviewer to reproduce results and calculations from the raw laboratory data (i.e., a Level IV deliverable like a CLP data package). This information is typically provided in a machine-readable EDD, which contains sample and methods QA/QC information, and a supplemental PDF laboratory data package that contains calibration information and raw data. The SEDD reporting format allows laboratories to report additional information in the EDD, such as calibration information, which is evaluated by an automated data review program, and can speed and streamline the data validation and verification process.

For analyses where NFGs are not available or supplemental GLLA data validation guidance does not exist (e.g., bioassays, habitat evaluations, toxicity tests), the QAPP must identify clear QA/QC acceptance criteria to ensure the data are of sufficient quality to support project DQOs. The QAPP should detail the reporting requirements and supporting information required from the laboratory necessary to complete appropriate data verification and validation to support the intended decision. The GLLA QP provides additional information on the verification and validation of this type of non-routine data.

4.3.1 Narrative Summary

Each laboratory report must contain a narrative summary detailing the samples that were analyzed, the specific methods and procedures followed, any problems or issues encountered with the analysis, and corrective actions taken.

At minimum, the laboratory narrative should include the following components:

- Contact information for the laboratory, including the individual responsible for the data submission

- Reference to relevant test methods and the QAPP
- Copies of (or references to) any communications from the GLLA Project Manager or data provider that: 1) provide specific directions that necessitate a deviation from the QAPP in the sample analysis, or 2) address specific questions posed by the laboratory
- Discussion of problems upon sample delivery, such as broken containers or mislabeling
- Sample issues, such as biphasic nature or insufficient volume for testing
- Testing issues, such as quality control failures or unusual observations during the testing process (e.g., extract solidified on concentration)
- A discussion of how issues were resolved, including any corrective actions taken
- A statement from the Laboratory Director or Laboratory Project Manager attesting to the results and their completeness and providing contact information should questions arise.

4.3.2 Chain-of-custody Forms or Traffic Reports

Copies of sample COC forms or traffic reports and any other paperwork (e.g., air bills, field reports) arriving with the samples should be included in the report. Any sample package receipt logs generated at the laboratory should be included. Internal COC (within the laboratory) is not generally required.

4.3.3 Calibration and Raw Data

For routine analyses, data reviewers must be able to track sample results throughout the analytical process to determine whether the analysis was performed correctly and recalculate reported results (i.e., a Stage 4/Tier 2 review). All data pertinent to reconstructing the sample result must be included in the data package unless otherwise approved by the GLLA Project Manager and GLLA QA Manager and documented in the QAPP. These data include, but are not limited to, calibration information, extraction logs, instrument run logs and chromatograms. PDF files containing this information that are generated directly from the instrument are preferred since it allows for clear interpretation of the chromatograms. Photocopies must be clearly legible and of appropriate resolution to allow the data reviewer to complete the evaluation. Note that if the laboratory is submitting an SEDD file for automated data review using EXES, an SEDD Stage 3 is preferred when possible.

4.3.4 Laboratory EDD

EDDs must be delivered in a machine-readable file format to facilitate data validation and GLSED upload processes. Please note that a PDF file is not considered a machine-readable format. Typically, EDDs are provided as Microsoft Excel, Microsoft Access, XML or CSV files. EQuIS-compatible formats are accepted for validation purposes, but other proprietary formats are not allowed. GLNPO may require data providers to utilize a certain file format, detailed in the project QAPP, to meet project DQOs or to share data with other collaborators.

Files that include laboratory results must include all associated method and sample QC results as required by the QAPP, such as matrix spike or matrix spike duplicate percent recoveries, surrogate recoveries, and laboratory duplicate results. The laboratory should report the results of all associated dilutions, re-extractions, and re-analyses in the EDD, and must clearly identify the reportable result for each specific analyte.

> ***Helpful Hint:*** *Data providers should specify which results should be considered reportable when results for two or more analyses of the same sample are reported in the EDD. When samples are analyzed more than once for a given parameter (dilutions, re-extractions, re-analyses, or cross-over between methods), the laboratory must choose the most appropriate result for reporting purposes. The reportable result is analyte-specific based on the best professional judgement of the laboratory. Reportable results for multiple analytes in a single sample are often reported from multiple runs and not a single analysis. Laboratories that do not select the appropriate reportable result (e.g., only reporting results from the undiluted run when many analytes are outside calibration range) may be asked to revise and resubmit the data at no cost to GLNPO.*

Laboratories are expected to carefully evaluate the method and sample QC results for each analyte and use best professional judgement to determine the reportable result for each analyte in a given sample. Laboratories that do not identify the reportable result may be asked to revise and resubmit the data with the appropriate reportable result identified at no cost to GLNPO. Data validators may identify a different reportable result based on data validation and should provide justification in the data review narrative. The laboratory must report all diluted and undiluted results in the EDD. However, the laboratory **is not** required to run a sample undiluted if high concentrations could cause damage to lab instrumentation. In these cases, laboratories should provide documentation in the laboratory narrative and supplemental data package to explain why the undiluted sample could not be analyzed (e.g., screening chromatograms, pictures, sample descriptions). Calibration data are generally not reported in the EDD unless the laboratory is submitting an SEDD Stage 3 EDD for automated data review.

Many GLLA studies include the analysis of investigation-derived waste (IDW) and confined disposal facility (CDF) samples to characterize these wastes/sediments for disposal purposes (e.g., SW-846 Method 1311: Test Method Toxicity Characteristic Leaching Procedure (TCLP), ignitability). These data are not required to undergo a Stage 4/Tier 2 data validation process because waste disposal typically precedes completion of the data review process. However, the resulting data must be compliant with relevant regulations, such as the Toxic Substance Control Act (TSCA) or the Resource Conservation and Recovery Act (RCRA). Waste characterization tests should be performed on IDW and CDF samples for disposal purposes only and are generally not valid site characterization methods. While the GLLA does not require retention of data for these samples in the master GLSED, the data may be stored within study-specific mini-GLSEDs. When data are submitted electronically for these samples, the data provider must clearly identify which information in the data package corresponds to these samples in the EDD (e.g., by identifying them within the comment data fields in the sample and result level EDD submissions).

Information on the acceptable format for laboratory and field EDD submissions is provided in Section 5.

4.3.5 Additional Supporting Information for the Laboratory Supplemental Data Package

Laboratory data submittals should include any supporting information that may assist data validators or data users in evaluating data quality and usability. Project-specific requirements for reporting supporting information should be detailed in the project QAPP, including laboratory qualifier definitions, schemes for handling non-detect data and qualifiers when summing analytes (e.g., when summing individual PCB Aroclor concentrations to calculate total PCB concentrations), and any correction factors applied. This information is required for GLSED to facilitate reproducibility and use by secondary data users. Requirements for this type of supporting information should be detailed the project QAPP and delivered along with the complete data submission to the GLLA Data Submission Site on GLNPO.net.

Supporting information provided by the laboratory for GLNPO projects must include the following components (as applicable):

- Definitions of any laboratory flags applied to the data
- The number of significant figures used in data reporting
- The scheme or approach used to determine: 1) total concentrations for specific parameters including (but not limited to) PCB Aroclors, PAHs, and PCB congeners (detail the analytes included in each total, how non-detects and qualifiers were handled, if any adjustment factors were applied, etc.); and/or 2) other relevant calculations such as the mean Probable Effect Concentration quotient (PEC-Q)
- Detailed information on all null codes used in the EDD (including definitions and usage)

A GLLA Data Deliverable Package checklist is included as Attachment 3 and should be provided to the laboratories during the project planning/QAPP development phase of the project to ensure the laboratory is able to provide this information.

4.4 Format of the Laboratory Supplementary Data Package

Laboratory supplemental data packages should be submitted as PDF files. Original electronic formats (i.e., Microsoft Word) are also acceptable. Paper copies (i.e., hard copies) are not accepted by GLNPO. Laboratory data package formats can vary depending on laboratory procedures. However, for routine analytical chemistry parameters (i.e., CLP or SW-846 methods), the laboratory data package must contain all information necessary to reconstruct the sample result from the raw data (i.e., perform a Stage 4/Tier 2 data validation on a Level IV data package). For analytical analysis where a Level IV laboratory data package is not practical or possible (i.e., bioassays, toxicity tests or waste disposal samples), the QAPP should clearly describe the supporting information required from the laboratory to ensure that the data meet project data quality requirements.

Two common formats for laboratory data packages are: 1) the chronological format, and 2) the standardized format in the style of the CLP. Other formats are acceptable if approved by the GLLA Project Manager and the GLLA QA Manager as documented in the project QAPP. These two formats are described further below.

4.4.1 Chronological Format

A common option for reporting laboratory data packages is a chronologically assembled data package. In this case, the results of each analysis are followed by the supporting information (Section 4.3) in chronological order. For instance, in the case of semi-volatile analysis of sediment samples, sample results would follow the narrative report, the results would be followed by extraction logs, calibration data and sample analysis data (according to the date performed). In this case, instrument logbook pages for the date of the data included should precede that data. Any information recorded in the logbook that is not relevant to the project samples (i.e., sample results from another project) should be crossed out.

4.4.2 Standardized Form in the Style of the CLP

The CLP SOWs provide specific guidance on data package preparation for laboratories working under a CLP contract to the EPA Superfund Program and requires that laboratories submit a PDF and hard copy of the data package to EPA if required by the EPA Region. GLNPO does not accept hard copy data packages but otherwise accepts the CLP format. GLNPO does not require the submission of CLP or CLP-equivalent forms provided the information is submitted in the associated EDD and the supporting raw data are clearly identified.

The CLP SOW details the correct assembly of data in CLP format and can be found at https://www.epa.gov/clp/superfund-clp-analytical-services.

5.0 Accepted Formats for EDDs

GLNPO allows several options for the submission of the EDD for field and laboratory data. Field data must be verified and correctly merged with associated laboratory data. Complete data sets submissions are accepted in the following formats: 1) the EPA Region 5 Comprehensive EDD format; 2) NOAA DIVER templates (Microsoft Excel or Access versions); 3) a GLNPO CLP Reporting Format/Universal Data Deliverable (when using EXES for electronic data validation); 4) SEDD Version 5.2 file; or a 5) mini-GLSED EDD (Microsoft Access Database). Because SEDD does not currently allow the reporting of field information, if SEDD is used, supplementary field data should be provided via a Scribe XML file or an alternative acceptable reporting format. A Microsoft Excel flat file is acceptable from laboratories directly contracted by GLNPO to perform experimental methods or research. If an alternate EDD format is proposed or anticipated, contact the GLLA QA Manager, Mark Loomis, for approval prior to submission.

Regardless of which format is used, the minimum field requirements detailed in this section and in Attachment 2 must be reported in addition to any project-specific data requested by the GLLA Project Manager. Required EDD data fields should be populated according to the associated source data standard instructions. GLNPO encourages data providers to submit all available field and laboratory information (rather than only the minimum requirements) since additional field and laboratory data reported for a specific project improves data usability in the long-term. Additional information about each allowable report format is provided in the following sections.

The EPA Region 5 EDD is the most common format for submitting routine laboratory analytical chemistry data to GLNPO. Toxicity, bioaccumulation, and benthic/fish community data should be submitted according to the associated NOAA DIVER Templates (ChemTox and/or BioLab) unless otherwise agreed upon with the GLLA Project Manager and GLLA QA Manager. NOAA's Query Manager template has been discontinued and is no longer an acceptable format for GLLA final data deliverable packages. Toxicity and bioaccumulation data should be submitted using the most current ChemTox Template and benthic or fish community data should be submitted using the BioLab Template (Section 5.2). Sediment chemistry results analyzed in conjunction with toxicity data may be reported using the NOAA DIVER Lab EDD Template, which can be appended to the ChemTox template, but are also accepted in the other formats described in this section.

5.1 The EPA Region 5 EDD Format

The EPA Region 5 Superfund Program publishes comprehensive EDD specifications for providing environmental data to the EPA Region 5 Superfund Division. This standard includes reporting requirements for sampling location and mapping information, as well as analytical chemistry results. EPA Region 5 provides detailed instructions on how to report data in the *EPA Region 5 Electronic Data Deliverable Comprehensive Specification Manual, Version 4.3, February 2023*, which can be found at: https://www.epa.gov/superfund/region-5-superfund-electronic-data-submission-documents. The EDD Comprehensive Specification Manual was extensively updated in 2020, and requirements should be reviewed thoroughly by data providers prior to QAPP submission and data collection.

5.1.1 GLNPO Required Files for Region 5 EDD

The *EPA Region 5 EDD Comprehensive Specification Manual* describes the requirements for reporting Superfund environmental data to EPA Region 5, thus not all reporting requirements are applicable to GLNPO. While the Region 5 EDD provides many options for submitting various types of data, GLLA projects normally generate data applicable to just six of the files including: data provider

(EPAR5DATAPROVIDER_v3), sub-facility **(EPAR5SUBFACILITY_v3)**, location **(EPA5LOC_v3)**, chemistry sample **(EPAR5SMP_v3)**, chemistry test result with QC **(EPAR5TRSQC_v3)**, and batch **(EPAR5BAT_v3).** However, a project may generate data that are applicable to more than these standard six files. The data provider should discuss special data reporting requirements and the specific files to be reported with the GLLA Project Manager and document the final decisions in the project QAPP.

Region 5 Files used for GLLA Projects

Field: The field EDD files contain general information about the site, data provider contact information for questions about the EDD, and information regarding the sample locations.

Required Field EDD Files:

- Data Provider (named as "EPAR5DATAPROVIDER_v3) provides sampler contact information for information in the EDD.
- Sub-facility (named as "EPAR5SUBFACILITY_v3) provides general information about the site.
- Location (named as "EPAR5LOC_v3) provides information regarding the sampling locations.

Lab: The Lab EDD files contain data related to chemistry field measurements, sample collection information, and sample results, QC and batch information.

Required Lab EDD Files:

- Sample (**EPAR5SMP_v3**) contains information about sample collection (including some field sample details).
- Test Result QC (**EPAR5TRSQC_v3**) contains the information about the analytical test performed on samples with quality control data elements. ***Note: GLNPO Data Submitters must use this file instead of the Test Result file (EPAR5TRS_v3) to allow for the reporting of spike and surrogate %R information.***
- Batch (**EPAR5BAT_v3**) contains the data that relates individual samples to the batch identifier.

> ***Helpful Hint:*** *Data providers should submit all Sample and associated Test Result QC and Batch files, and ensure that sample IDs, results, QC, and batch information are clearly linked to allow the data reviewer to complete the DSCO and QIC reviews.*

The process for creating Field and Lab EDDs, including required fields and valid values, are thoroughly described in the Region 5 EDD Comprehensive Manual. Laboratories typically produce the Lab files while site contractors/data providers produce the required Field files. When Scribe is used to collect field information, the Scribe XML exports should be provided to facilitate the DSCO review.

5.1.2 GLNPO Required Fields and Valid Values for the Region 5 EDD

Unless otherwise specified in the GLLA DRS, data providers should follow the detailed instructions on how to report data in the *EPA Region 5 Electronic Data Deliverable Comprehensive Specification Manual, Version 4.3, February 2023,* (or most current version) available at: https://www.epa.gov/superfund/region-5-superfund-electronic-data-submission-documents

All Region 5 EDD project files contain required data fields as well as data fields that are applicable when the information is available. Some data fields required by EPA Region 5 are pertinent only to Superfund, and thus not applicable to GLLA final data deliverable packages. GLNPO requires that GLLA project data submissions contain the data fields required by EPA Region 5 (as applicable) as well as specific information as described below (see Exhibit 1). Data providers should submit all available information,

including any project-specific data requirements in the final verified and validated EDD. The minimum additional components necessary for GLLA Data Submission in the Field and Laboratory files are detailed below and in Exhibit 1.

Required Field Files and GLLA Required Data Fields (in addition to R5 requirements):

- Data provider **(EPAR5DataProvider_v3):** data_provider, data_provider_contact_person, data_contact_email, and data_contact_phone
- Subfacility **(EPAR5SUBFACILITY_v3):** subfacility_code (AOC name), subfacility name (use the site name from the QAPP)
- Location **(EPA5LOC_v3):** loc_purpose (state whether collected to refusal and method used), loc_county_code, loc_state_code, remark (water depth), depth_to_bedrock (sediment depth).

Required Lab Files and GLLA Required Data Fields (in addition to R5 requirements):

- Chemistry sample **(EPAR5SMP_v3):** sample_delivery_group, sample_date, sys_loc_code, start_depth, end_depth, depth_unit, sampling_company_code, composite_yn, comment (report sample observations: e.g., color, texture, odor)
- Chemistry test result with QC **(EPAR5TRSQC_v3):** lab_name_code, lab_sample_id, lab_qualifiers, validator_qualifiers, interpreted_qualifiers, method_detection_limit, reporting_detection_limit (regardless of whether or not the result value is non-detect), quantitation_limit, qc_spike_recovery (applicable for all spiked analytes including labeled compounds and surrogates), and qc_dup_spike_recovery (applicable for all spiked analytes including labeled compounds and surrogates).
- Batch (**EPAR5BAT_v3):** Same as R5 requirements

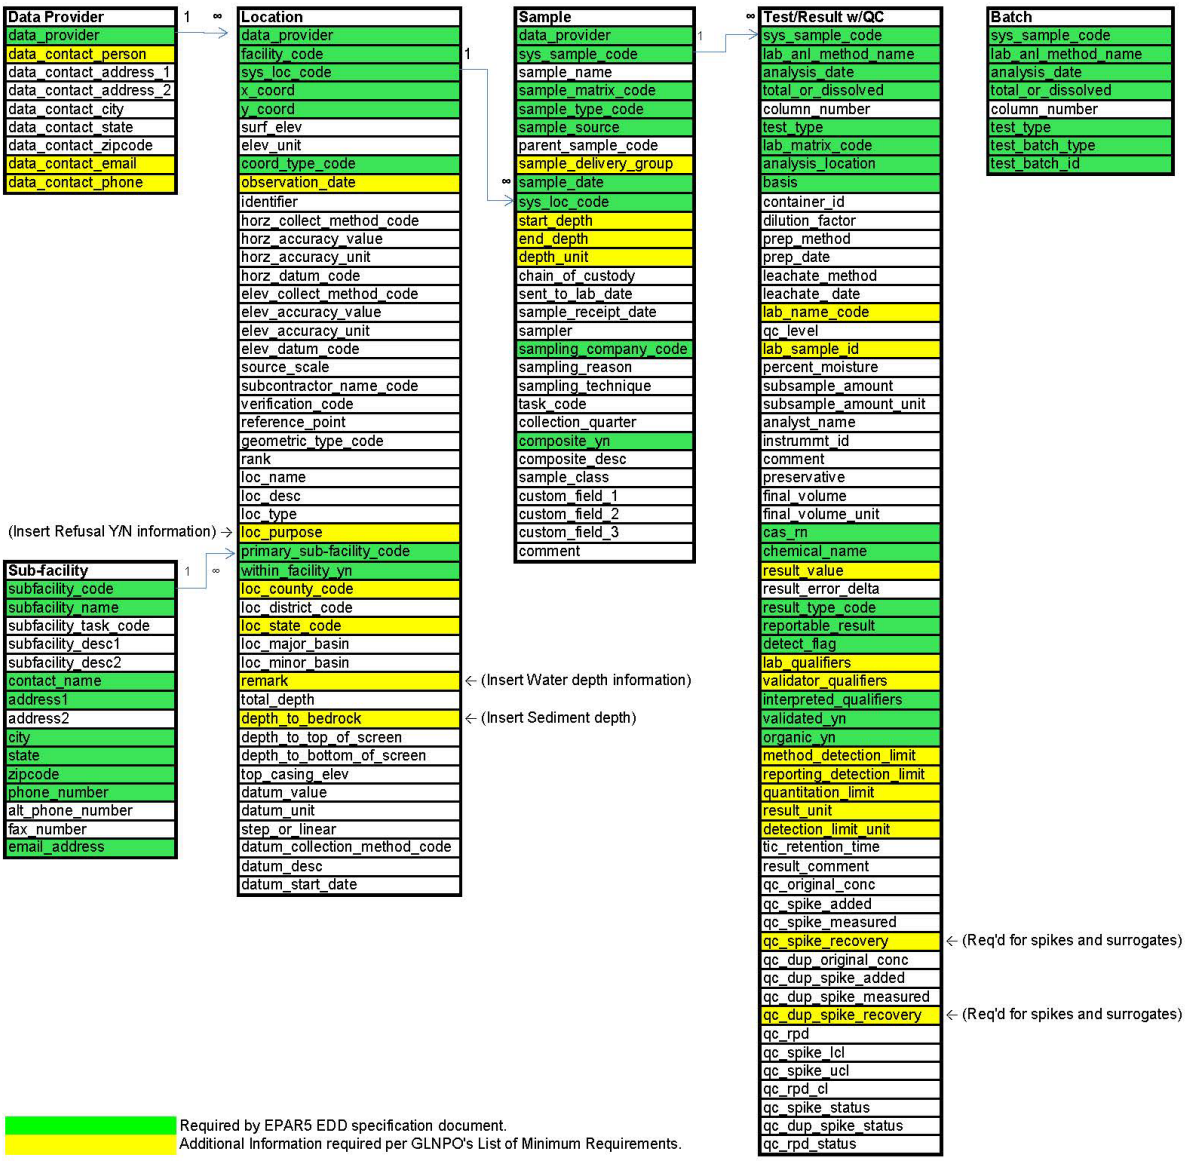

Exhibit 1: EPA Region 5 EDD Templates for Field and Lab Data, and Data Fields Required to Meet GLLA Minimum Data Requirements

> ***Helpful Hint:*** *Please include time information in data fields that include date information (e.g., sample_date, analysis_date, prep_date). Analysis date and time information are critical to link batch information to the corresponding results in the EPA Region 5 EDD structure.*

The Region 5 EDD Valid Values Reference Tables for EDDs (October 2020) lists allowable values for all Region 5 EDD data fields, and should be followed for GLLA final data deliverable package. GLNPO does not require that Region 5 EDDs prepared for GLNPO be checked by the EQuIS Data Processor (EDP) as specified in the Region 5 EDD Comprehensive Specification Manual. The EDP was developed for EDDs being prepared for the Region 5 Superfund Program and requires registration with that

program. However, if the data provider has access to the EDP via their work with the Superfund program, use of the tool to check the EDD prior to submission to GLNPO is highly encouraged.

Please note that GLNPO requires laboratories delivering electronic data in the Region 5 format to submit PDF files of raw data packages and supplemental information (Section 4.3). Laboratories are urged to make certain that data files contain header rows to avoid confusion.

> ***Helpful Hint:*** *Definitions of reporting limits are included in GLSED for each sample result in the form of reporting limits codes. The required reporting detection limit data field must be completed in accordance with the Region 5 EDD Comprehensive Manual. If applicable, any alternative reporting limits must be provided along with a detailed description of how that limit was generated. Compliance with the EDD standard will provide the information needed to complete the reporting limit codes.*

5.2 NOAA DIVER Templates

DIVER is a NOAA application for the integration and distribution of response, assessment, and restoration data, as well as historical data collected from hazardous sites around the country to support the Natural Resources Damage Assessment (NRDA) program. NOAA DIVER includes field and laboratory protocols, data templates, COC forms, and field data collection forms to help standardize data collection. These forms and templates generally meet GLLA field data reporting requirements. Current documents can be downloaded by document type or environmental resource through the NOAA DIVER Dashboard. NOAA DIVER has replaced NOAA's Query Manager template, which is no longer accepted by GLNPO.

> ***Helpful Hint:*** *Field forms developed by NOAA aid sample collectors in accurately collecting and documenting required field information for transcription into the appropriate NOAA DIVER Template. GLNPO does not require the use of field forms, but does require field data to be submitted in a machine-readable electronic format (e.g., Microsoft Excel, CSV, XML). When using field forms to collect information, the data provider should submit PDF copies of any field forms used along with final project data.*

The most current NOAA Templates and Field Forms are continually updated, and the most current version should be obtained directly from the NOAA DIVER website prior to data collection. Both the Microsoft Excel and Microsoft Access version of these templates are acceptable. As NOAA is continually updating these templates to meet the evolving needs of the NRDA program, the most current version of these templates should be downloaded from the NOAA DIVER Dashboard.

5.2.1 Accepted NOAA DIVER Field and Lab EDD Templates

The DIVER ChemTox and BioLab templates are the only way to report toxicity and benthic community data to GLNPO. The NOAA Diver FieldObs Template provides a useful means of recording non-sample specific ecological data (e.g., bird counts, percent cover). Sediment chemistry may be reported using the NOAA Lab EDD Template provided that a supplemental PDF containing required laboratory raw data and supplemental information is included.

The following table provides the Template Name, Example Data, and General Information for the NOAA DIVER Templates that are typically used to report electronic data to GLNPO. Additional information can be found in the NOAA Template Guidance, dated June 1, 2021.

All NOAA DIVER Reporting Templates can be found on NOAA's Field Forms, Data Templates, and Guidelines page. Table 2 identifies the NOAA DIVER Templates accepted for GLLA final data deliverable packages and provides general information on each accepted template.

Table 2: NOAA DIVER Templates Accepted by GLNPO

Template Name	Example Data	General Information
ChemTox Sediment Chemistry and Toxicity Results	• Sediment chemistry • Tissue chemistry • 10-Day *Hyalella* survival • Other benthic toxicity results	This template is intended only for sediment, water, oil, tar, or tissue chemistry (only field data, no laboratory QC data), or bioassay data. Analytical laboratory results are typically appended to this template using the NOAA Lab EDD Template.
BioLab Biological, Habitat and other non-chem laboratory analysis (sample-based)	• Benthic invert community metrics • Fish histopathology • Fish deformities • Stable Isotope analysis	This template is used when submitting biological metrics (e.g., fish histopathology, benthic invertebrate community structure data), which may be stand-alone or paired with contaminant chemistry samples (entered in the ChemTox template).
FieldObs Field measurements and biological surveys (not sample-based)	• Bird Counts • Vegetation Surveys • Percent Cover Estimates • Water Quality Parameters	This template is used to submit biological metrics (e.g., bird counts, vegetation surveys) which are not sample based. These data may be stand-alone or paired with contaminant chemistry samples (entered in the ChemTox template) and/or biological and other non-chemistry laboratory data (entered in the BioLab template).
NOAA Tester Automated Template review program	• ChemTox • BioLab • FieldObs	This application is used to check the internal consistency of the ChemTox, BioLab and FieldObs Templates.
NOAA Lab EDD	• ChemTox	This EDD format can be easily appended to data in the ChemTox Template. All NOAA Lab EDD data fields are required for GLNPO deliverables, but null values are accepted if data are not applicable for the project.

While the file names and locations of these files are current as of publishing, these templates are continually updated. Data providers should check the NOAA DIVER website prior to data collection to verify that the most current version of the templates is used.

5.2.2 GLNPO Required Data Fields and Valid Values for the NOAA DIVER Data Templates

The NOAA DIVER templates include both required data fields and valid values, which are accepted by GLNPO. GLNPO requires the following additional pieces of data, if available in the template, which are not required by NOAA DIVER:

Study Worksheet:

- Contact Name
- Contact Phone Number
- Contact Email
- County
- State

SampleMaster Worksheet:

- Sample Collection Time
- Water Depth/Water Depth Units
- Notes (if applicable: provides sediment depth, whether sediment was collected to refusal, and method used to collect sediment depth).

If the study did not require sample-specific measurements (i.e., habitat data) please state in the "Notes" data field of the appropriate worksheet that this information was not collected.

While sediment chemistry information may be provided in the NOAA Diver Lab EDD Template, which can be appended to the ChemTox template, complete sediment chemistry information is more typically provided in the Region 5 EDD format.

5.2.3 GLNPO Required Data Fields for the NOAA Lab EDD Template

The NOAA Lab EDD Template allows laboratories to report sediment chemistry data in a format that can be easily appended to field data recorded in the ChemTox Template. **GLNPO requires all data fields in this EDD, including those listed as "optional" in the NOAA Lab EDD Template, but allows null values if the data field is not applicable for the project.**

Sediment chemistry data provided in the NOAA Lab EDD are typically appended to the NOAA ChemTox Template prior to data validation and delivered to GLNPO as a single EDD. Please note that when toxicity samples are collected in support of a GLLA sediment assessment or remediation project, the laboratory often provides sediment chemistry for surface-collected samples in the NOAA Lab EDD format as well as full sediment chemistry results (including sub-surface samples). The Region 5 EDD or SEDD format helps facilitate complete data evaluation and minimize manipulation and manual transcription that may be required to add data to the project data management system. The data provider should determine the most appropriate approach for data reporting to meet project DQOs and document the approach and associated laboratory reporting requirements in the QAPP.

5.3 SEDD Format

The SEDD format was developed as part of an inter-agency effort to create a uniform, non-proprietary reporting format for the electronic delivery of analytical chemistry data that are conducive to automated data review. The data deliverable generated by SEDD is an XML file that can be mapped directly to GLSED or to other EPA accepted EDDs. The SEDD Specifications, Version 5.2 (March 2019) provides detailed information on this data deliverable. Please note that GLNPO only accepts SEDD Version 5.2 file formats.

SEDD is a hierarchical format based on a model of laboratory activities, the linkages between these activities, and the data that these activities produce. Laboratories typically provide data in one of the three primary stages of SEDD, based on the level of detail required.

- **Stage 1** contains the minimum amount of data required to transmit "results-only" data. Only limited method QC data (or no QC data at all) are reported in Stage 1.
- **Stage 2** has two distinct levels that build on Stage 1. Stage 2a adds method QC data, and Stage 2b adds instrument QC data.
- **Stage 3** builds on Stage 2 by adding additional measurement and calibration data that allows for independent recalculation of reported results.

Additional assistance in preparing this deliverable, including the SEDD Valid Values, can be found at https://www.epa.gov/clp/staged-electronic-data-deliverable-sedd.

When submitting SEDD files for automated data review, laboratories are urged to deliver:

- SEDD Stage 2a electronic deliverables for dioxin and PCB congeners,
- SEDD Stage 2b or 3 electronic deliverables for Aroclors, pesticides, volatile organic compounds, and semi-volatile organic compounds (including polycyclic aromatic hydrocarbons), and
- Stage 2b or 3 electronic deliverables for metals, mercury and cyanide.

Laboratories utilizing the Stage 2a or 2b deliverable will be required to also submit PDF files containing the raw data (Section 4.4). The CLP SOWs, Exhibit H provide guidance to the CLP laboratories for delivery of SEDD files.

Laboratories submitting SEDD files should process their deliverables through EXES or similar automated data review software. EXES is a free tool that can be accessed through the Sample Management Office (SMO) Portal at smoclpss.com. Access is granted for each user account as approved by the GLLA QA Manager. If all information is complete and compliant with SEDD and GLNPO requirements, EXES will automatically generate a GLSED and EQuIS-compatible data deliverable, electronic data validation reports, and preliminary data qualifiers. If Scribe is used to collect field data, Scribe XML files should be uploaded to the SMO Portal within 72 hours of sample collection. EXES will automatically merge field and laboratory data if all provided information is complete. Site contractors are encouraged to follow this process (as practical) to streamline data verification and validation.

5.4 Mini-GLSED Data Deliverable

Completed GLLA study data are stored in GLNPO's GLSED. GLSED is a relational database that includes field and analytical result information for a number of matrices and analyte classes. In addition to GLSED, which stores data from multiple GLLA projects, single-study data are stored within a "mini-GLSED." While data submissions are typically imported into a mini-GLSED upon completion of the DSCO review, the data provider may populate data directly into a mini-GLSED. This is typically completed when the data provider stores data in a proprietary database or a data format not accepted by GLNPO, and exports the data to a mini-GLSED format. A data element dictionary may be obtained from the GLLA QA Manager.

5.4.1 Mini-GLSED Field Data

The mini-GLSED format includes multiple field sample tables for which sample-level and field-specific information can be stored:

- ptbl – STATION (location information for each collected sample)
- ptbl – SAMPLE (sample level information for field samples for all matrices other than tissue)
- ptbl – SAMPLE_QC (sample level information for field QC samples)
- ptbl – SMPTISS (sample level information for tissue field samples)
- ptbl – SMPTISS_QC (sample level information for tissue QC samples)
- ptbl – PROBE (field probe depth measurement data)

5.4.2 Mini-GLSED Lab Data

GLSED includes ten tables for which laboratory data can be stored, listed below:

- ptbl – CHEM (sediment chemistry sample results for all analytes other than acid volatile sulfide/simultaneously extracted metals (AVS/SEM)

- ptbl – CHEM_AQ (aqueous chemistry sample results for all analytes other than AVS/SEM)
- ptbl – AVS_SEM (sediment and/or aqueous chemistry sample results for AVS/SEM)
- ptbl – CHEMTISS (tissue chemistry sample results)
- ptbl – CHEM_QC (QC data associated with all non-tissue samples for all analytes)
- ptbl – CHEMTISS_QC (QC data associated with tissue samples for all analytes)
- ptbl – CHEM_TCLP (TCLP Extract Sample Results)
- ptbl – BIOSUMM (toxicity and bioaccumulation sample results)
- ptbl – BENTHOSREP (fish and benthic community replicate data)
- ptbl – BENTHOSAMPLE (fish and benthic community data, including mean, standard deviation, and summary data)

A GLSED data element dictionary and an example of a mini-GLSED with populated laboratory data tables is available from the GLLA QA Manager.

5.5 Simplified Spreadsheet Format

GLNPO may contract directly with a laboratory to support research needs. These laboratories typically submit data directly to GLNPO but may not have the data management capabilities to generate the relational or hierarchical data submission formats described in the preceding sections. In these circumstances, directly contracted laboratories have the option of submitting data in a single spreadsheet to meet minimum data requirements. A data element dictionary for the simplified spreadsheet EDD is included as Attachment 5. The spreadsheet should include all the information required for laboratory data as detailed in Section 4.3.4 and encompass all matrices and both field sample and sample-level QC results.

The spreadsheet should also include field information and must include station IDs, sample matrix, sampling date and time, and sampling depths. All available values should be populated in appropriate data fields in the delivered spreadsheet.

> ***Helpful Hint:*** *When populating spreadsheet files, avoid the use of formatting to convey information, because formatted information may be lost when data are imported or transported. For example, entering a percent solid result as 39% could mean that the imported value would become 0.39. The "%" should be placed in the separate RESULT_UNIT data field.*

6.0 Geospatial Database Deliverables

Significant time and effort are invested by GLLA project teams to create geospatial databases necessary to model the nature and extent of contamination and produce the maps required for project plans and reports. Advantages of having a study's geodatabase available to GLNPO are:

- storage of multiple feature classes, raster datasets, and tables in a single location (folder), making it easier for GIS users to share data; and
- increased capabilities for importing, mapping and sharing data on EPA's GeoPlatform.

Technical Specification for Geodatabase Deliverables:

Spatial data should be submitted to GLNPO in the ESRI File Geodatabase format with a defined coordinate system. If applicable, submissions should include the collection method(s). Each geodatabase

should be accompanied by FGDC compliant metadata as described in Section 4.2. The geodatabase deliverable should be submitted as part of the GLSED deliverable package.

7.0 Data Deliverable Package Checklist

To date, over two hundred final data packages have been delivered to GLNPO for upload to GLSED, in support of sediment assessment and remediation projects conducted under GLLA. Some deficiencies noted in the data packages received were repeated across multiple studies. Included in Attachment 3 is a checklist that can be used by laboratories and data providers when preparing the deliverable packages to avoid these common deficiencies. Nearly 95 percent of the EDDs by GLNPO received to date have been in the Region 5 EDD format, so many suggested resolutions to these issues reference the Region 5 data elements. GLNPO recommends providing this checklist to the laboratory during the project planning/QAPP development phase of the project to ensure the chosen lab is able to meet these reporting requirements.

8.0 Contacts

Laboratories, field crews and all other data providers are responsible for providing complete and compliant data of acceptable quality in a format useable by GLNPO. As questions arise during the analysis of samples and their report preparation, laboratories should contact the following representatives in the following order:

1. GLLA Project Manager(s)
2. Mark Loomis, GLLA QA Manager, (312) 886-0406, loomis.mark@epa.gov
3. Louis Blume, GLNPO Quality Manager, (312) 353-2317, blume.louis@epa.gov
4. Kenneth Klewin, GLENDA Manager, (312) 886-4794, klewin.kenneth@epa.gov

9.0 Resources

The following resources provide additional information concerning GLLA data deliverables and data quality requirements:

1. The *Quality Assurance Considerations for Great Lakes Legacy Act Projects* (August 2023), which provides information for GLLA site contractors on important GLLA QA requirements for project planning, DQO development, project analytical method and acceptance criteria, data validation, and final data submission. This document is available from the GLLA QA Manager.
2. The Superfund CLP provides SOWs for many analytical methods used by GLLA. The SOWs detail the correct assembly of data in CLP format. The methods can be found at: https://www.epa.gov/clp/superfund-clp-analytical-services
3. The EPA has produced several documents on the data review process, including:
   - *Guidance on Environmental Data Validation and Verification (EPA QA/G-8)*, EPA-240-R-02-004: https://www.epa.gov/sites/production/files/2015-06/documents/g8-final.pdf
   - *Guidance for Labeling Externally Validated Laboratory Analytical Data for Superfund Use,* EPA-540-R-08-005: https://www.epa.gov/system/files/documents/2021-10/guidance-for-labeling-externally-validated-laboratory-analytical-data-for-superfund-use-2009.pdf
   - *EPA Contract Laboratory Program National Functional Guidelines for Organic Superfund Methods Data Review*, EPA-540-R-20-005, November 2020:

https://www.epa.gov/sites/default/files/2021-03/documents/nfg_for_organic_superfund_methods_data_review_november_ 2020. pdf

- *EPA Contract Laboratory Program National Functional Guidelines for Inorganic Superfund Methods Data Review*, EPA-540-R-20-006, November 2020: https://www.epa.gov/sites/default/files/2021-03/documents/nfg_for_inorganic_superfund_methods_data_review_november_2020.pdf
- *EPA Contract Laboratory Program National Functional Guidelines for High-Resolution Superfund Methods Data Review*, EPA 542-R-20-007 https://www.epa.gov/sites/default/files/2021-03/documents/nfg_for_hrsm_superfund_methods_data_review_november_2020.pdf

4. Federal Geographic Data Committee

   http://www.fgdc.gov/metadata/geospatial-metadata-standards. This site lists the content standard for digital geospatial metadata.

Closeout

GLLA QA Manager & QA Support Contractors

Request analysis of single-blind PE sample provided by GLLA QA Contractor

GLLA QA Manager may communicate with Contractor's QA Lead throughout process as needed.

GLLA Project Manager

Ensure compliance with SOW and QAPP
Ensure adequate contract funding
Review/approve invoices (or advise C-COR)

Evaluate Data Quality and Usability, Reconcile DQOs, Make Decision

[1] Data verification evaluates completeness, correctness and conformance/compliance of the data set against method, procedural or contractual specifications

[2] Data validation is an analyte/sample specific evaluation beyond data verification to determine the quality of the data relative to its end use

GLLA Final Data Reporting Process: August 2023

Site Contractor

Upload final data package to GLLA Data Submission Site per requirements of the Data Reporting Standard. Submit Final QAPP and any addenda

Respond to DSCO and submit revised data or supplemental information as needed

Respond/Resolve – submit new versions or supplemental information as needed

QA Support Contractor

Enter project into tracking system with expected data delivery date

Receive final data package via data submission site

Evaluate final data package using DSCO and final QAPP. Perform locational data checks

Submit DSCO

Initiate DRT which tracks resolution of all issues identified throughout the data management process

Upload to Mini-GLSED

Evaluate completeness and compliance of GLSED upload using a standard checklist

Import mini into SAS, evaluate completeness of upload against original source files, and conduct data integrity checks

Conduct QIC review, draft report, and provide identified issues

Receive information and update DRT and mini GLSED

Prepare mini GLSED and finalize QIC report

Update Master GLSED with approved mini GLSEDs

MASTER GLSED

GLLA Data Status Report tracks project data in real time

GLLA QA Manager

Provide copy of final QAPP upon approval

Direct or refer Site Contractor to work with QA Contractor on GLSED upload

Review DSCO

Issue a DMR to Project Manager if DSR indicates excessive delays in response from prime contractor

Mini GLSED Review and Approval

GLLA Project Manager

Forward DMR to Contractor and facilitate resolutions

Mini GLSED Review (as needed)

Contractor can proceed with project closeout after mini GLSED is approved by GLLA QA Manager

Retrieve Data from GLSED:

- Data converted to **GLENDA** standard and uploaded **via CDX**
- **NOAA DIVER** (periodic transfers)
- To obtain project-specific exports/data: **Complete a DRF** and submit to GLLA QA Manager. DRFs track distribution and version control of data

Acronyms

CDX – Central Data Exchange
DMR – Data Management Request
DRF – Data Request Form
DRT – Discrepancy Resolution Tracking*
DSR – Data Status Report
DSCO – Data Submittal Compliance Overview*
GLENDA – Great Lakes Environmental Database
GLSED – Great Lakes Sediment Database
QAPP – Quality Assurance Project Plan
QC – Quality Control
QIC – Quality Information Completeness*
SAS – Statistical Analysis System

ATTACHMENT 2

MINIMUM REQUIREMENTS FOR THE SUBMISSION OF FIELD DATA FOR GLLA SEDIMENT PROJECTS

Attachment 2: Minimum Requirements for the Submission of Field Data for GLLA Sediment Projects

This document provides the minimum requirements for the submission of field data for sediment samples collected in support of Great Lakes Legacy Act (GLLA) projects. This document supplements information in the *Great Lakes Legacy Act Data Reporting Standard, April 2023*. Please note that GLLA projects may require the collection and submission of additional field data elements, including field data for other types of samples; these additional data elements should be documented in the project-specific qualify assurance project plan. Project participants also are required to complete the *Locational Data Checklist and Metadata Recording Form* (Attachment 4) for each sampling event.

The minimum field data elements to be reported are provided below for four categories: 1) data provider contact information, 2) study area information, 3) station information, and 4) sample information.

Data Provider Contact Information

Provide contact information for data provider including:

- First and last name
- Affiliation
- E-mail address and phone number

Study Area Information

Provide information on the study area, including:

- Site name
- County (or county code)
- State
- Coordinates, date and time of collection, and brief description of at least one control point (or reference location point, if control point is not available)[1]

Station Information

For each sampling station, provide:

- Unique station identifier
- Latitude and longitude coordinates in decimal degrees in WGS 84 or NAD 83
- Water depth with units of measure (reported according to the Electronic Data Deliverable (EDD) specification)[2]

[1] See Section 4.1.3 in the Data Reporting Standard for a description of reference locations. This information should be reported in the Locational Data Checklist and Metadata Recording Form (Attachment 4).

[2] If depth measurements were collected as elevation, please provide a description of the associated reference.

- Sediment depth with units of measure and method for measuring sediment depth (pole, vibracore, etc.) and whether sample was collected to refusal[3]
- Documentation for samples not collected at a proposed station (due to issues such as insufficient amount of sediment, thick layer of ice, etc.) by recording zero for sediment depth along with all other available station information

Sample Information

For each sample, provide:

- Associated station identifier
- Unique sample identifier
- Sample type (e.g., routine field sample, field duplicate sample, equipment blank)
- Sample collection date and time
- Upper and lower sediment collection depths with units of measure
- Sediment sampling technique
- Whether the sample was a composite or a grab
- Sediment sample observations (e.g., color, texture, odor)

[3] When submitting data using the NOAA ChemTox/BioLab Templates, report this information in the "Notes" data field of the SampleMaster worksheet. When submitting data using the EPA Region 5 EDD, report this information in the "depth_to_bedrock" and "loc_purpose" data field of the Location file (EPAR5LOC_v3). Please provide the method used for determining sediment depth in a cover letter or supplemental file.

ATTACHMENT 3

GLLA FINAL DATA DELIVERABLE PACKAGE CHECKLIST

Attachment 3: GLLA Final Data Deliverable Package Checklist

This document complements the *GLLA Data Reporting Standard, April 2023.* Over two hundred final data deliverable packages have been delivered to the U.S. Environmental Protection Agency's (EPA's) Great Lakes National Program Office (GLNPO) for upload to the Great Lakes Sediment Database (GLSED) in support of sediment assessment and remediation projects conducted under the Great Lakes Legacy Act (GLLA). Many data quality issues noted in these final data deliverable packages were repeated across multiple studies and subsequently addressed prior to upload. GLNPO recommends that laboratories and data providers use this checklist when preparing final data deliverable packages for upload to the GLLA Data Submission Site on GLNPO.net to avoid common issues and speed the GLSED review and approval process. Nearly 95 percent of the Electronic Data Deliverables (EDDs) delivered to GLNPO to date have been in the EPA Region 5 EDD format; therefore, references to Region 5 data elements are included in the required supporting information described in the checklist. GLNPO recommends providing this checklist to the laboratory during the project planning/Quality Assurance Project Plan (QAPP) development phase of the project to ensure the chosen laboratory is able to meet these reporting requirements. GLNPO encourages data providers to submit a completed version of the checklist as part of the final data deliverable package.

GLLA Final Data Deliverable Package Checklist		
Required Supporting Information		**Included (✓)**
Final QAPP, FSP and Addendums	Include the final, approved QAPP and FSP (if separate) and any addendums to the QAPP or FSP; make sure to provide document tables, figures, and appendices.	☐
Final Project Reports and Technical Memoranda	Include final project reports and project technical memoranda (i.e., site characterization reports, data usability assessments, reconciliation with DQOs, etc.), especially those identified as project deliverables in the QAPP. This information assists the reviewer in reconciling data quality issues and QAPP deviations.	☐
Deviations from Sampling Plan	In the deliverable cover letter or in a supplemental file, please discuss briefly, as appropriate, why 1) the number of samples collected significantly deviated from those proposed in the sampling plan, or 2) sample locations were off set from proposed sample locations.	☐
Deviations from Analytical Plan	In the deliverable cover letter or in a supplemental file, please discuss briefly, as appropriate, why 1) the list of target analytes differs from the list provided in the QAPP, or 2) analyses were conducted by laboratories different than those specified in the QAPP.	☐
Calculated Totals for Derived Results (e.g., Total PCBs, Total PAHs)	In the deliverable cover letter or in a supplemental file, describe how the totals (e.g., PAHs, PCBs, Dioxins,) provided in the EDD were calculated noting: 1) how non-detects were treated (e.g., ND=0, ND=1/2RL), 2) how qualifiers were handled (e.g., whether "J" flags were carried over to totals), 3) who calculated the totals (e.g., lab, sampling contractor), 4) the individual compounds included, and 5) how co-eluting compounds were treated.	☐

GLLA Final Data Deliverable Package Checklist		
Locational Data Checklist and Metadata Recording Forms	Provide copies of completed *GLLA Locational Data Checklist and Metadata Recording Forms* and ensure the following information is included: • Control point or reference point information (page 2 of *GLLA Locational Data Checklist and Metadata Recording Forms)* • GPS brand and model number(s) • Model accuracy • Final post-processed accuracy of the data	☐
Qualifier Definitions	Provide definitions for all laboratory and validator applied qualifiers, even if common qualifiers were used.	☐
Data Verification/Validation/ Usability Reports	Provide copies of all available data verification, validation, and usability reports prepared for the study as well as any automated review reports.	☐
Site Name	Provide site name information in a supplemental file or in the "subfacility_name" data field of the EPA Region 5 **Field** EDD subfacility file (EPAR5SUBFACILITY_v3).	☐
County	Provide "County" information in a supplemental file or the "loc_county_code" data field of the EPA Region 5 **Field** EDD location data file (EPAR5LOC_v3).	☐
State	Provide "State" information in a supplemental file or in the "loc_state_code" data field of the EPA Region 5 **Field** EDD location data file (EPAR5LOC_v3).	☐
Water Depth	Provide water depth in a supplemental file (with units of measure) or in the "remark" data field of the EPA Region 5 **Field** EDD location data file (EPAR5LOC_v3), expressed in units of feet.	☐
Sediment Depth	Provide sediment depth in a supplemental file (with units of measure) or in the "depth_to_bedrock" data field of the EPA Region 5 **Field** EDD location data file (EPAR5LOC_v3), expressed in units of feet.	☐
Method for Sediment Depth Collection	Identify the method used to determine sediment depth (e.g., graduated pole, vibracore) and whether sediment was collected to refusal in a supplemental file or in the "loc_purpose" data field of the EPA Region 5 **Field** EDD location data file (EPAR5LOC_v3).	☐
Bathymetric Survey (if conducted)	Provide a PDF copy of bathymetric survey report(s), if a bathymetric survey was conducted	☐
Toxicity or Bioaccumulation Data (if generated)	Provide toxicity and/or bioaccumulation data, when generated, using the NOAA DIVER ChemTox Template. If toxicity/bioaccumulation data are not able to be provided in the NOAA DIVER ChemTox Template, provide a PDF copy of the laboratory report covering the toxicity/bioaccumulation tests.	☐

GLLA Final Data Deliverable Package Checklist		
Benthic/Fish Community Data (if generated)	Provide community data, when generated, using the NOAA DIVER BioLab Template. If benthic or fish community data are not able to be provided in the NOAA DIVER BioLab Template, provide a PDF copy of the laboratory report covering the fish/benthic community findings.	☐
Additional EDD Checks		**Included (✓)**
AVS_SEM Data	Report AVS and SEM metals data in units of umoles/g.	☐
QC Batch IDs	Provide Batch IDs that relate field sample result records and their associated QC results.	☐
Unique Station Identifiers	Confirm that station identifiers are unique to each sampling location.	☐
Coordinate Information with Associated Datum	Provide coordinate information in WGS84 or NAD83 latitude and longitude in a supplemental file or in the "X_coord" and "Y_coord" data fields of the EPA Region 5 **Field** EDD location data file (EPAR5LOC_v3), and specify the Datum provided in the "horz_datum_code" data field.	☐
	Identify the coordinate system used and associated Datum for projected coordinates, when provided.	☐
Method and Field QC Results	Provide all associated method and field QC results for each analytical method reported as specified in the project QAPP: • Method blanks • LCS/LCSDs • MS/MSDs • Lab duplicates • Field duplicates • Equipment blanks	☐
Spike and Surrogate Results in %R	Provide percent recovery (%R) information or the data needed to calculate percent recoveries for QC spikes and surrogates.	☐
Reportable Results	Complete the "reportable_result" data field of the EPA Region 5 **Lab** EDD chemistry test result with QC file (EPAR5TRSQC_v3) when results for multiple dilutions and/or re-analyses are reported for a sample. Confirm that only one result was reported as reportable (i.e., "Yes") for each analyte for each sample.	☐
	Provide a complete set of reportable results for each analytical method and sample. Confirm that all target analytes portable result (i.e., no missing analyte results).	☐
Sample-adjusted MDLs or RLs, and QLs	Report the adjusted MDLs or RLs and QLs for all sample results for all methods as appropriate.	☐

GLLA Final Data Deliverable Package Checklist		
Laboratory Locations	Confirm that the laboratory is reported in the "lab_name_code" data field of the EPA Region 5 **Lab** EDD chemistry test result with QC file (EPAR5TRSQC_v3) and is consistent with the laboratory identified in the QAPP.	
Final Data Qualifiers	Provide final qualifiers based on an interpretation of the lab and validator flags in the "interpreted_qualifier" data field of the EPA Region 5 **Lab** EDD chemistry test result with QC file (EPAR5TRSQC_v3).	☐
Non-detect Reporting	The preferred format for reporting non-detects is to set the concentration to the sample-specific detection limit and the final interpreted flag to "U." Alternatively, it is acceptable to leave the concentration field for non-detected analytes blank as required by the EPA Region 5 EDD format. Describe in the deliverable cover letter how non-detected analytes were reported if not reported in one of these formats.	☐

ATTACHMENT 4

LOCATIONAL DATA CHECKLIST AND METADATA RECORDING FORM

Attachment 4: Locational Data Checklist and Metadata Recording Form

This document accompanies the *Great Lakes Legacy Act (GLLA) Data Reporting Standard* , which provides detailed data reporting guidance for GLLA projects, including electronic data deliverables (EDD) requirements. GLLA data providers should review this document prior to collecting data. Copies of completed forms should be uploaded to the GLLA Data Submission Site on GLNPO.net with the complete GLLA data submission.

Study Information

Project Title: _____

Site Name: _____

Sampling Start Date: _____ Sampling End Date: _____

Preparation Activities (please confirm each activity in the boxes to the right)

1. Sampling staff are trained in GPS Field Data Collection and have familiarized themselves with the GPS unit used for this project (certified training recommended). ☐

2. Determined window of satellite availability. https://www.gnssplanning.com ☐

3. Locate at least one control point to assess GPS accuracy. ☐
   For assistance locating control points, visit http://www.ngs.noaa.gov/datasheets or http://www.geocaching.com/mark/. This may not be feasible if the GPS unit is mounted to a vessel.*

4. If a control point cannot be located, establish at least one reference point.* ☐

Data Collection Activities (please confirm each activity in the boxes to the right)

1. GPS unit was configured to collect data only when the following requirements were met:
   a. A minimum of four satellites ☐
   b. Position dilution of precision (PDOP) ≤ 6 ☐
   c. Satellite elevation ≥ 15° above the horizon ☐
   d. A minimum signal-to-noise ratio (refer to GPS user manual for recommendation) ☐

2. Collected point data based on the nearest base station's logging interval. ☐

3. Collected point data for a period of at least 1 minute per location. ☐

4. Reported locational data in WGS 84 or NAD 83 (please specify_____). ☐

Please provide an explanation if a box was not checked for any of the responses above and specify deviations (include sample IDs if applicable):

_____

_____

_____

*At minimum, collect on the first day of sampling prior to beginning data collection and on the last day of sampling following data collection. It is recommended to collect at the start and end of each sampling day. Record on page 2.

GPS Unit Specifications

GPS brand and model number: _____

Model accuracy: _____

Data Processing

Which of the following best describes any data correction that may have been performed:

☐ real-time correction - specify type _____ ☐ post processed differential correction - provide base station id and location _____

☐ no correction ☐ other, please specify _____

Quality Information

Describe any difficulties in collecting locational data: _____

_____

Data Provider:

Confirm required information has been provided.

_____ _____

Signature Date

Locational Data Checklist and Metadata Recording Form

Locate at least one control point to assess GPS accuracy. If a control point cannot be located, establish at least one reference point. At minimum, collect on the first day of sampling prior to beginning data collection and on the last day of sampling following data collection. It is recommended to collect at the start and end of each sampling day.

Project Title: _____

Date: _____

Control Point 1

Benchmark ID: _____ Time: _____

Established y-coordinate: _____ Measured y-coordinate: _____

Horizontal distance offset (include UOM): _____

Established elevation: _____ Measured elevation: _____

Vertical distance offset (include UOM): _____

Control Point 2

Benchmark ID: _____ Time: _____

Established x-coordinate: _____ Measured x-coordinate: _____

Established y-coordinate: _____ Measured y-coordinate: _____

Horizontal distance offset (include UOM): _____

Established elevation: _____ Measured elevation: _____

Vertical distance offset (include UOM): _____

Reference Point 1

Time: _____

Location description: _____

Estimated x-coordinate: _____ Measured x-coordinate: _____

Estimated y-coordinate: _____ Measured y-coordinate: _____

Horizontal distance offset (include UOM)*: _____

Reference Point 2

Time: _____

Location description: _____

Estimated x-coordinate: _____ Measured x-coordinate: _____

Estimated y-coordinate: _____ Measured y-coordinate: _____

Horizontal distance offset (include UOM)*: _____

Control point: a previously surveyed location with known coordinates (e.g., a benchmark).

Reference point: a recognizable feature within or near the study area that is viewable using aerial photography.

UOM: unit of measure - preferably recorded in feet or meters.

*Calculated by estimating the reference point on aerial photography and measuring the distance to the recorded position.

ATTACHMENT 5

DATA ELEMENT DICTIONARY FOR THE SIMPLIFIED SPREADSHEET EDD FILE

Attachment 5: Data Element Dictionary for the Simplified Spreadsheet EDD File

This document provides the Data Element Dictionary for the Simplified Spreadsheet EDD. Use of this EDD must be pre-approved by the GLLA QA Manager and documented in the project QAPP. The Simplified Spreadsheet EDD is typically only accepted when GLNPO contracts directly with a laboratory to support research needs and the laboratory is submitting data directly to GLNPO. These laboratories may not have the data management capabilities to generate the relational or hierarchical data submission formats required by other data reporting formats, and thus have the option of submitting data in a single spreadsheet to meet minimum data requirements.

The Simplified Spreadsheet EDD should include all of the information required for laboratory data, and encompass all matrices and both field sample and sample-level QC results. In addition to laboratory-level information, the simplified spreadsheet format should include field information when available. Required field information for this file format are: 1) Station ID, 2) sample matrix, 3) sampling date and time, and 4) sampling depths. All available values should be populated in the delivered spreadsheet.

Field # -- Column	**Field Name**	**Description**	**Comments**
1 – A	DATA_PROVIDER	Name of company or agency submitting EDD	
2 – B	STATION_ID	Station Location	
3 – C	SAMPLE_NAME	Unique Sample ID	
4 – D	MEDIUM	Sample Matrix	
5 – E	SAMPLE_MATRIX_CODE	Sample Matrix Code	Water = W Soil = S Sediment = SED Porewater = PW
6 – F	SAMPLE_TYPE_ CODE	Sample Type Code	Field Sample, Performance Evaluation Sample = N Field Blank = FB Field Duplicate = FD Laboratory Control Sample = LCS Laboratory Control Sample Dup = LCSD Laboratory Duplicate = LD Matrix Spike, Post Digestion Spike = MS Matrix Spike Duplicate = MSD Method Blank = MB Storage Blank = SB

Field # -- Column	Field Name	Description	Comments
7 – G	SAMPLE_SOURCE	Identifies where the parent sample originated.	Field Sample, Field Blank, Performance Evaluation Sample, Matrix Spike, Matrix Spike Duplicate = FIELD Laboratory Control Sample, Method Blank, Storage Blank= LAB
8 – H	SAMPLE_COLL_ PROC_ID		Field is null
9 – I	SAMPLE_ID_ DUPLICATE		Field is null
10 – J	SAMPLE_DEL_ GROUP	Sample Delivery Group (SDG) Number	
11 – K	SAMPLE_DATE	Date sample was collected; reported in MM/DD/YYY format	
12 – L	SAMPLE_TIME	Time sample was collected; 24-hr format HH:MM	
13 – M	UPPER_DEPTH	Upper depth of sample collection interval from sediment surface	
14 – N	LOWER_DEPTH	Lower depth of sample collection interval from sediment surface	
15 – O	DEPTH_UNIT	Unit of measure for upper and lower depths	
16 – P	CHAIN_OF_ CUSTODY	Chain of Custody Identifier	
17 – Q	SENT_TO_LAB_ DATE	Date sample was shipped; reported in MM/DD/YYYY HH:MM format. Time must be in 24-hr format.	
18 – R	SAMPLE_RECEIPT_DATE	Date sample received by the lab; reported in MM/DD/YYYY HH:MM format. Time must be in 24-hr format.	
19 – S	SAMPLER_NAME	Sampler Name or Initials	
20 – T	TASK_CODE		Field is null

Field # -- Column	Field Name	Description	Comments
21 – U	QAPP_APPROVAL_DATE		Field is null
22 – V	SAMPLE_ COMMENT	Any comments regarding the sample	
23 – W	SAMPLE_ID	Sample Number	
24 – X	CHEMICAL_NAME	CAS Chemical Name	Specific Guidance Regarding Chemical Names available upon request
25 – Y	CAS_RN	CAS Number	CAS Registry Number
26 – Z	FRACTION	Analytical Fraction	VOA_Low_Med = V VOA_Trace = VT VOA (SIM) = VS BNA = B BNA (SIM) = BS Aroclor = A PEST = P Inorganic = I Note: if another value is used, please define in the narrative or cover letter
27 – AA	VALUE_TYPE	Value Type	"ACTUAL"
28 – AB	STAT_TYPE		Field is null
29 – AC	DURATION_BASIS		Field is null
30 – AD	TEMPERATURE_ BASIS		Field is null
31 – AE	RESULT_VALUE	Reported Result	
32 – AF	RESULT_UNIT	Concentration Units	
33 – AG	CONTAINER_ TYPE		Field is null
34 – AH	CONTAINER_SIZE		Field is null
35 – AI	CONTAINER_SIZE_UNITS		Field is null
36 – AJ	CONTAINER_ COLOR		Field is null
37 – AK	TEMP_ PRESERVE_ TYPE	Sample Temperature	
38 – AL	CHEM_ PRESERVATIVE	Preservative Name	
39 – AM	LAB_ANL_ METHOD_ CODE	Name of Analytical Method	
40 – AN	ANALYSIS_DATE	Date sample was analyzed; reported in MM/DD/YYY format	
41 – AO	ANALYSIS_TIME	Time sample was analyzed; 24-hr format HH:MM	
42 – AP	TEST_TYPE	Test Type	Initial, Dilution, Re-analysis, etc.

Field # -- Column	Field Name	Description	Comments
43 – AQ	LAB_MATRIX_ CODE	Sample Matrix Code	Water = W Soil = S Sediment = SED Porewater = PW
44 – AR	ANAL_ LOCATION	Analysis Location	Lab or Field
45 – AS	WET_OR_DRY_ BASIS	Results Basis	"WET" for wet-weight basis reporting. "DRY" for dry-weight basis reporting. "NA" where not applicable.
46 – AT	DILUTION_ FACTOR	Effective test dilution factor	
47 – AU	PREP_METHOD_ NAME	Preparation Method	
48 – AV	PREP_DATE	Beginning date when sample preparation started; reported in MM/DD/YYY format	
49 – AW	PREP_TIME	Time sample preparation began; 24-hr format HH:MM	
50 – AX	LAB_NAME_CODE	Laboratory Name Code	
51 – AY	QC_LEVEL	QC Level	"SCREEN" for screening data. "QUANT" for quantitative data.
52 – AZ	LAB_SAMPLE_ID	Laboratory Sample ID	
53 – BA	PERCENT _MOISTURE	Percent Moisture	Report in numeric format (i.e., 70.1% should be reported as 70.1 not as 70.1%)
54 – BB	SUBSAMPLE_ AMOUNT	Amount of sample used for test.	
55 – BC	SUBSAMPLE_ AMOUNT_UNIT	Unit of measure for Subsample amount.	
56 – BD	TEST_COMMENT		Field is null
57 – BE	FINAL_VOLUME	Final Volume of sample after preparation.	
58 – BF	FINAL_VOLUME_ UNIT	Final Volume Units	
59 – BG	RESULT_ERROR_ DELTA		Field is null
60 – BH	RESULT_TYPE_ CODE	Result Type Code	TRG: Target SC: Spiked Compound SUR: Surrogate Compound IS: Internal Standard TIC: Tentatively Identified Compounds

Field # -- Column	Field Name	Description	Comments
61 – BI	REPORTABLE_ RESULT	Reportable Result Flag (Y/N)	
62 – BJ	DETECT_FLAG	Analyte Detection Flag (Y/N)	
63 – BK	LAB_QUALIFIERS	Laboratory Qualifiers	
64 – BL	VALIDATOR_ QUALIFIERS	Validator Qualifiers	
65 – BM	ORGANIC_YN	Organic analysis Flag (Y/N)	
66 – BN	REPORTING_ DETECTION_ LIMIT	Adjusted Method Detection Limit (MDL)	
67 – BO	QUANTITATION_ LIMIT	Adjusted Contract Required Quantitation Limit (CRQL)	
68 – BP	DETECTION_ LIMIT_UNIT	CRQL/MDL Units	
69 – BQ	RESULT_ COMMENT	Laboratory comments regarding reported result	
70 – BR	QC_ORIGINAL_ CONC	The concentration of the analyte in the original (unspiked) sample.	
71 – BS	QC_SPIKE_ADDED	Amount of Spike Added	
72 – BT	QC_SPIKE_ MEASURED	Amount of Spike Measured	
73 – BU	QC_SPIKE RECOVERY	Spike Percent Recovery	
74 – BV	QC_DUP_ ORIGINAL_ CONC	Matrix Spike Duplicate Original Concentration	
75 – BW	QC_DUP_SPIKE_ ADDED	MSD or LCSD Added Amount	
76 – BX	QC_DUP_SPIKE_ MEASURED	MSD or LCSD Concentration	
77 – BY	QC_DUP_SPIKE_ RECOVERY	MSD or LCSD Percent Recovery	
78 – BZ	QC_RPD	MSD or LCSD RPD	
79 – CA	QC_SPIKE_LCL	Spike Lower Control Limit	

Field # -- Column	Field Name	Description	Comments
80 – CB	QC_SPIKE_UCL	Spike Upper Control Limit	
81 – CC	QC_RPD_CL	RPD Control Limit	
82 – CD	QC_SPIKE_ STATUS	Matrix Spike Result Qualifier	
83 – CE	QC_DUP_SPIKE_ STATUS	Duplicate Result Qualifier	
84 – CF	QC_RPD_STATUS	Duplicate RPD Qualifier	
85 – CG	TEST_BATCH_ TYPE	Test Batch Type	
86 – CH	TEST_BATCH_ID	Preparation Batch ID	
87 – CI	CASE	Case Number	
88 – CJ	SAMPLE_DEL_ GROUP	Sample Delivery Group (SDG) Number	
89 – CK	PH	Sample pH

2. GEI Safety Practices to Live By

Safety is what we do and how we do it every day. These Everyday Practices to Live Safe are simple yet concise reminders to our employees, clients, contractors, visitors of the steps that must be taken to avoid injury, illness, and incident so everyone can live safe every day. To maintain a safe work environment, GEI has established an organizational structure and a Corporate Health and Safety Program along with these safety practices.

1. Stop work if it is unsafe to continue, after any incident, injury, or near miss.

2. Prepare before starting work. Complete safety training and project-related safety requirements, such as preparation and review Health and Safety Plans (HASPs) as required by project or job-related duties.

3. Assess and control safety hazards/risks before starting any tasks and when previously unidentified safety hazards are observed.

4. Be attentive and aware of your environment. Constant focus and awareness will avoid complacency.

5. Properly use and maintain GEI-approved and required PPE in all appropriate circumstances.

6. Do not work or drive impaired, including under the influence of alcohol/drugs or while fatigued.

7. Follow all safety practices when operating a vehicle. Always wear your seatbelt while in any vehicle. Do not drive distracted, including using hand-held cell phones, when operating any vehicle.

8. Use tools, equipment, and safety devices in accordance with manufacturer's recommendations and GEI expectations. Never modify or override safety devices.

9. When activities involve chemicals or hazardous substances, follow GEI's hazard communication requirements, including labeling, reviewing Safety Data Sheets (SDS), and keeping proper protections in place.

10. Be aware of and keep clear of equipment moving in all work areas, at all times.

11. Follow GEI's incident reporting procedure in the event of safety incidents, including injuries, illness, near misses, or observation of unsafe behaviors.

3. Site Background

This Health and Safety Plan (HASP) establishes policies and procedures to protect GEI Consultants, Inc. (GEI) personnel from the potential hazards posed by the activities performed during a Remedial Investigation/Feasibility Study at the Lower Scajaquada Creek Operable Unit property (site) in Buffalo, New York (Figure 1). Reading, understanding, and compliance with the contents of the HASP is required for on-site GEI personnel and will be reviewed by GEI subcontractors. Subcontractors will prepare their own site-specific HASP but may use this HASP as a guide. This HASP identifies measures to minimize accidents and injuries which may result from site conditions or activities. A copy of this HASP will be maintained on site for the duration of the work.

3.1 Site Description

The Scajaquada Creek Operable Unit (OU) encompasses the lands adjacent to Scajaquada Creek, extending from south of the West Avenue Bridge to the creek's mouth where it discharges into the Black Rock Canal. The Scajaquada Creek Slip Area (Inlet Area), which was historically the creek's discharge location before being blocked during the construction of the I-190 New York State Thruway in the 1950s, is also part of the OU.

Upland areas include properties owned by the former Penn Central Railroad (now CSX Transportation), New York State, and City of Buffalo that are used for transportation and infrastructure corridors including a railroad passenger and freight train corridor, the NYS Thruway I-190, the Route 198 Scajaquada Expressway, and City of Buffalo roadways (West Avenue, Tonawanda Street, and Niagara Street). The upland areas also include privately owned properties, many of which were former industrial properties with environmental concerns, many of which have been investigated, and some remediated and developed for reuse in the NYSDEC Brownfield Cleanup Program (BCP) or former Voluntary Cleanup Program (VCP). Most properties in this area are zoned for commercial/industrial use.

3.2 Scope of Field Work

DNAPL associated with former MGP operations is present in the subsurface and locally in shallow sediments. Although significant data have been collected, data gaps identified in Remedial Investigation/Feasibility Study need to be addressed. The scope of the RI has been designed to fill the identified data gaps and support the preparation of feasibility study to evaluate remedial alternatives. Field activities to be performed as part of the RI include the following:

- Infrastructure assessment
- Subsurface soil investigation

- Groundwater investigation
- Sediment investigation
- DNAPL Mobility Assessment

Each of these activities is described in detail below.

- 1. Engineering Source Control and Infrastructure Assessment
    - Field reconnaissance to identify potential utility/infrastructure discharges to Scajaquada Creek that could be affecting surface water and sediment quality (e.g., combined sewer overflows and historical drain line discharges from adjacent properties).
- 2. Subsurface Soil Investigation
    - To delineate DNAPL in the subsurface soil, a series of soil borings will be completed with a drill rig in the Scajaquada OU.
- 3. Groundwater Investigation
    - Installation and sampling of groundwater monitoring wells
    - Hydraulic conductivity testing of wells.
- 4. Creek and Inlet area Sediment Investigation
    - Probing of Creek sediments to be performed from a boat, but where the water is shallow (less than 3 feet deep), or the boat cannot access the probing locations this task will be performed by wading into the creek.
- 5. DNAPL Mobility Assessments
    - Conduct NAPL mobility testing in newly-installed wells and in creek.

Table 2. GEI Employee Site Tasks and Descriptions

Task Number	Task Titles	Task Descriptions
1.	Utility and Infrastructure Assessment	Identification of infrastructure (sewer, utilities, etc.) which have potential DNAPL migration pathways, or utilities which discharge into the creek which could be affecting sediment.
2.	Subsurface Investigation	Oversight of drilling of soil borings to and through clay, soil characterization and sampling.

Task Number	Task Titles	Task Descriptions
3.	Groundwater Investigation	Oversight of monitoring well installation, well development, hydraulic conductivity testing, groundwater sampling
4.	Creek and Inlet area Sediment Investigation	Probing will occur from the barge to disturb sediment to observe characteristics and possible NAPL presence. Oversight of sediment borings with drill rig, collect sediment samples.
5.	DNAPL Mobility Assessments	Conduct NAPL mobility testing in newly-installed monitoring wells.

Notes:
Task Titles correlate to a prepared site-specific JHAs.
Task Descriptions are a brief summary of the task being performed by GEI.

4. Potential Hazards

The potential hazards associated with site conditions and activity hazards related to GEI on-site activities have been identified in this section. Detailed information for these hazards and their control methods are discussed further in the Table 3 and the job hazard analysis (JHAs) included in Appendix B.

4.1 General Site Hazards

General hazards and control measures that are applicable to all site activities have been identified in Table 3.

Table 3. General Site Hazards

General Hazards These Hazards Apply to All Site Activities	Control Measure
Cell Phone Use – On Project Site	• Look and listen for potential hazards while using a cell phone for work related activities. • Limit your cell phone use for personal calls or other activities to non-working hours in areas free of hazards. • Do not use your cell phone when safety hazards are present. • Do not use headphones or ear buds while performing work related activities. Headphone or ear bud use can prevent you from hearing hazards around you. • Noise canceling headphones or earbuds are not to be used in place of hearing protection. • Never use a cell phone while operating any equipment or vehicle. • Consider using the "do not disturb" or "silent" functions to allow you to focus on your task
Chemical/ Contaminant Exposure – Skin and eye injury/ irritation	• Wear protective coveralls (e.g. Tyvek ®) with shoe covers, safety glasses, face shield, Nitrile gloves. • Dispose of gloves after use and wash hands. • Avoid contact with pooled liquids and limit contact with contaminated soils/groundwater.

General Hazards These Hazards Apply to All Site Activities	Control Measure
Cold Stress – Hypothermia, Frostbite	• Take breaks in heated shelters when working in extremely cold temperatures. • Drink warm liquids to reduce the susceptibility to cold stress. • Wear protective clothing (recommended three layers: an outside layer to break the wind, a middle layer to provide insulation, and an inner layer of cotton of synthetic weave to allow ventilation). • Wear a hat and insulated boots. • Keep a change of dry clothing available in case clothes become wet. • Do heavy work during the warmer parts of the day and take breaks from the cold. • If possible, shield work areas from drafts of wind and use insulating material on equipment handles when temperatures are below 30°F • Watch for symptoms of cold stress.
Driving	• Employees must wear their safety belt while in a moving vehicle. • Vehicle accidents will be reported. • Vehicles will be properly maintained and safely operated. • Employees will follow safe driving behaviors, which include limiting distractions such as manipulating radios or other equipment that may cause a distraction. Employees should not exceed the posted speed limit and should maintain a safe distance between other vehicles. • Use defensive driving techniques. • Driving distance and time after a 12-hour shift should not exceed 30 miles or 30 minutes (whichever is greater). • See SOP HS-004
Dusty Conditions – Eye and respiratory irritation	• Avoid travel at extreme times • Wear protective gear – dust masks, safety glasses
Heat Stress - Fainting, Fatigue, Heat Stroke	• Increase water intake while working. • Increase number of rest breaks and/or rotate workers in shorter work shifts. Rest in cool, dry areas. • Watch for signs and symptoms of heat exhaustion and fatigue. • Plan work for early morning or evening during hot months. • Use ice vests when necessary. • In the event of heat stroke, bring the victim to a cool environment and initiate first aid procedures.

General Hazards These Hazards Apply to All Site Activities	Control Measure
Inclement Weather	• Listen to local forecasts for warnings about specific weather hazards such as tornados, thunderstorms, and flash floods. • If the storms produce thunder and/or lightning, leave the work area immediately and move to a safe area. • Discuss an action plan prior to the severe weather. • Wear appropriate PPE for the type of weather that could be encountered. • Stop work until conditions are suitable. Take cover in vehicles or shelter as appropriate. • See SOP HS-010
Insects – Bites, Stings, Allergic Reactions	• Apply insect repellent prior to performing field work and as often as needed throughout the work shift • Wear proper protective clothing (work boots, socks and light-colored clothing) • Wear shoes, long pants with bottoms tucked into boots or socks, and a long-sleeved shirt when outdoors for long periods of time, or when many insects are most active (between dawn and dusk). • When walking in wooded areas, avoid contact with bushes, tall grass, or brush as much as possible. • Field personnel who may have insect allergies should have bee sting allergy medication on site and should provide this information to the SSO and the CHSO prior to commencing work. • Field personnel should perform a self-check at the end of the day for ticks. • See SOP HS-001
Noise	• Maintain distance from the source of the noise. • Wear appropriate hearing protection when working in load environments.

General Hazards These Hazards Apply to All Site Activities	Control Measure
Physical Injury – Slips, Trips, and Falls	• Wear PPE that properly fits, is in good condition and appropriate for the activities and hazards. • Maintain good visibility of the work area. • Avoid walking on uneven, steeply sloped or debris ridden ground surfaces. • Plan tasks prior to preforming them including an activity hazard analysis. • Keep trafficked areas free from slip/trip/fall hazards. • Maintain weed growth in sampling areas, especially on slopes. • Wear shoes with traction. • Avoid traversing steep areas in slippery conditions. • Do not carry heavy objects to sampling areas, on steeply sloped areas, or where steep areas must be traversed to arrive at sample points.
Repetitive Motion Injury- Standing, Squatting, and Bending Over	• Take regular breaks and do not work in unusual positions for long periods of time. • Walk and stretch between tasks.
Sun Exposure	• Liberally apply sunscreen, with a minimum broad-spectrum sun protection factor (SPF) of 30 · Wear safety glasses that offer protection from ultraviolet A and B (UVA/UVB) rays. • Bring shade to the site to reduce exposure. • When possible, wear long-sleeved shirts and long pants. • Clothes made from tightly woven fabric and darker colors offer the best protection. Some clothing is certified as offering UV protection. • Wear a hat that has a brim all the way around that shades your face, ears, and the back of your neck. A tightly woven fabric, such as canvas, works best to protect your skin from UV rays. • Sunscreen wears off. Put it on again if you stay out in the sun for more than 2 hours. • Check the sunscreen's expiration date. Sunscreen without an expiration date has a shelf life of no more than 3 years.

General Hazards These Hazards Apply to All Site Activities	Control Measure
Unsecured or High Crime Areas	• Be aware of your surroundings. • Use the buddy system. Do not remain on site alone. Accompany or be accompanied by others to vehicles. • Request police detail when appropriate. • Let the Site Safety Manager (SSM) know when you begin work in these areas and when you leave. • Call in regularly. • If you arrive in an area and it does not look safe to get out of your vehicle, lock the doors and drive off quickly but safely.
Vehicular Traffic –Struck by injury, crushing	• Do not turn your back on traffic. • Use situational awareness to identify concerns like erratic motorist movements, sudden stops, squealing tires, or other indicators that motorists are having difficulty in maneuvering through the work zone. If observed notify the workers and suspend work until safe restart work. • Have a bail-out plan in case of an errant vehicle. Warn other workers of errant vehicles. Increase visibility of the work area to others by using cones, flags, barricades, proper lighting, and caution tape to define work area. • Use a "spotter" to locate oncoming vehicles. • Use vehicle to block work area. • Engage police detail for all work conducted in appropriate areas. • Wear high-visibility, reflective vest at all times. • Maintain minimum DOT defined distances to other traffic lanes. • See SOP HS-016.

4.1.1 Hazard Controls

On-site safety equipment to control the hazards listed above will include:

Site-Specific Safety Equipment *(check all that apply)*		
☒ Drinking water/electrolyte fluids	☒ Hand cleaner/sanitizer	☒ Tick removal kit
☒ Eye wash bottles	☒ Insect repellent	☐ Other:
☐ Fire extinguisher	☐ Phone charger	☐ Other:
☒ First aid kit	☐ Poison ivy/oak cleanser	☐ Other:
☐ Flashlight/head lamp	☒ Sunscreen	

Personal protective equipment (PPE) is discussed in further detail in Section 5.

4.1.2 Personal Safety

Field activities have the potential to take employees into areas which may pose a risk to personal safety. The following websites have been researched to identify potential crime activity in the area of the project:

- www.cityrating.com/crimestatistics.asp

Crime in Buffalo, NY is significantly above both the New York State and National averages.

Employees must not knowingly enter into a situation where there is the potential for physical and violent behaviors to occur. If employees encounter hostile individuals or a confrontation develops in the work area, suspend work activities, immediately leave the area of concern, and contact local 911 for assistance. Notify the Site Safety Manager (SSM) and Safety Team (Safety Director and Regional Safety Managers – Safety_Team@geiconsultants.com)of any incidents once you are out of potential danger.

In the event of an emergency, prompt communications with local emergency responders are essential. At least one charged and functioning cell phone to enable emergency communications will be on site. Confirmation of cellular phone operation will be confirmed at the start of each working day.

4.1.3 Vehicle Safety

Mobilization to and from the field will likely require the use of a personal, GEI fleet, or rental vehicle. When operating a vehicle while conducting business on behalf of GEI, employees must follow safe driving practices as outlined in the GEI Safe Driving SOP.

In conjunction with the hazard controls listed in the Site Mobilization JHA, GEI employees should follow these guidelines to operate a vehicle safely:

- Do not drive distracted, including using hand-held cell phones, when operating any vehicle.
- Complete a 360° inspection of the vehicle and surrounding area to identify vehicle safety issues and hazards that could be within the travel path.
- Confirm cell phones, tablets, or other potentially distracting equipment are safely secured and put away prior to operating the vehicle.
- Park in designated areas or a safe area away from heavy equipment.
- When parking a vehicle at a job site, the employee should make an effort to position the vehicle in a manner which reduces or eliminates the need to operate the vehicle in reverse.
- Use a spotter whenever possible.

GEI personnel will follow the GEI Incident Reporting (and client specific reporting) procedures if a vehicle accident occurs involving another vehicle, results in injury, or the damage to property.

4.1.4 Communicable Diseases

Communicable diseases are illnesses caused by viruses or bacteria that people spread to one another through contact with contaminated surfaces, bodily fluids, blood products, insect bites, or through the air. Examples of communicable diseases include influenza, coronavirus 2019, hepatitis B, salmonella, measles, and blood-borne illnesses. Most common forms of spread include food, insect bites, droplets, or skin contact. Infections may range in severity from asymptomatic (without symptoms) to severe and fatal. Transmission of these biologic agents can occur in a variety of ways including airborne (inhalation), direct physical contact with an infectious person, consuming contaminated foods or beverages, contact with contaminated body fluids, contact with contaminated inanimate objects, or being bitten by an infected insect or tick. Below are ways to prevent the infection or spread of communicable diseases:

1. Distancing - Maintain distance from others when possible. Minimize the number of employees in one location to the extent possible.
2. Wash Hands Often - Frequent hand washing with soap and warm water for 20 seconds. If soap and water are not readily available, use hand sanitizer (containing 60% alcohol) until soap and water can be used.
3. Clean and Disinfect Commonly Used Surfaces - Wipe down surfaces with disinfectant on a routine basis. This includes field equipment and other items that may have previously been used by others. This is especially important while working in construction trailers. When using company and personal vehicles, wipe surfaces including the steering wheel, gear shifter, controls, and door handles before and after use.
4. Use Good Hygiene Practices – These include washing hands frequently, avoid touching your eyes, nose, and mouth, and cover coughs and sneezes.
5. Get Vaccinated - Vaccines can prevent many infectious diseases. There are also vaccines that are recommended or required for travel to certain parts of the world.
6. Avoid Touching Wild Animals - Be cautious around wild animals as they can spread infectious diseases.
7. Stay home when you are sick.

4.2 Job Hazard Analysis

The site-specific tasks, potential hazards, and control measures established to reduce the risk of injury or illness are identified in step-by-step JHAs included in Appendix B. Prior to the

start of work, project team members will determine what tasks are covered in the scope of work (Table 2) and then develop a JHA for each of these tasks and have them reviewed by the Project Manager (PM) or their designee and approved by a member of the Safety Team. Indicated in each JHA are the specific PPE, training, equipment, health and safety SOPs and programs that apply to each task. Additional information on hazard controls can be found in GEI's SOPs and programs that apply to this project which are indicated in Appendix E.

4.3 Heat and Cold Stress

4.3.1 Heat Stress

Employees may be exposed to the hazards associated with heat stress when ambient temperatures exceed 80ºF. To prevent heat-related illness, Project Managers (PMs) should plan for proper hydration (drinking plenty of water), acclimatization (getting used to weather conditions), and schedules that alternate work with rest. Employees should also be trained to recognize the symptoms of heat related illnesses and know how to administer first aid for heat-related illnesses and activate emergency medical services quickly when needed. Water and shade will be available to all project employees and located as close as practicable to the work areas when temperatures exceed 80°F.

Prior to each workday, the forecasted temperature and humidity for the worksite will be reviewed and will be compared against the National Weather Service Heat Index to evaluate the risk level for heat illness. When the temperature equals or exceeds 95°F, or during a heat wave, high heat procedures will be used which include additional preventive measures including pre-shift meetings to encourage employees to drink plenty of water, working in the buddy system or regular communication so observations can be made for heat related illness, and to remind employees of their right to take a cool-down rest when necessary.

CDC Heat Planning Tool
For the most recent details and tools for heat stress, use your smart phone to access the Centers for Disease Control for the latest information. Additional details can be found in GEI's Heat Stress Program located on the Safety Resources page of GEI Connections.

4.3.2 Cold Stress

Employees may be exposed to the hazards associated with cold stress when working in cold, wet, and/or windy conditions. Potential hazards in cold environments include frostbite, trench foot or immersion foot, hypothermia, as well as slippery surfaces, brittle equipment, and poor judgment.

CDC Cold Stress Info
For the most recent details and tools for cold stress, use your smart phone to access the Centers for Disease Control for the latest information. Additional details can be found in GEI's Cold Stress Program located on the Safety Resources page of GEI Connections.

4.4 Constituents of Concern

The characteristics of constituents of concern (COC) at the site are discussed below for safety information purposes. A COC is any substance classified or defined as hazardous, extremely hazardous, toxic, or dangerous. The COC included in this health and safety plan will be the primary constituents that have been detected, are anticipated to be detected, or are being evaluated for the presence of, on the project site. These COC will be used to determine the action levels and PPE necessary for site personnel. Adherence to the safety and health guidelines in this HASP should reduce the potential for exposure to the COC discussed below.

4.4.1 Site-Specific COC

4.4.1.1 Volatile Organic Compounds

Volatile organic chemicals (VOCs), such as benzene, toluene, ethyl benzene, and xylene (BTEX) are commonly present as soil and groundwater contaminants, and in some cases chemical components in non-aqueous phase liquids (NAPL) such as oil or tar within soils and abandoned pipelines. These compounds are not expected to be at concentrations that exposure symptoms would occur. These compounds generally have a depressant effect on the Central Nervous System (CNS), may cause chronic liver and kidney damage, and some are suspected human carcinogens. Benzene is a known human carcinogen. Acute exposure may include headache, dizziness, nausea, and skin and eye irritation. The primary routes of exposure to VOCs are through inhalation and direct contact, therefore air monitoring, gloves, and respiratory protection are the primary controls against exposure to VOCs.

4.4.1.2 Semi-Volatile Organic Compounds

Semi-volatile organic compounds (SVOCs) usually consist of a mixture of acenaphthene, acenaphthylene, anthracene, benz(a)anthracene, benzo(b)fluoranthene, benzo(k)fluorethene, benz(a)pyrene, benzo(e)pyrene, benzo(g,h,i)peryline, chrysene, dibenz(a,h)anthracene, fluoranthene, fluorene, indeno(1,2,3cd)pyrene, 2-methyl naphthalene, naphththalene, phenanthrene, phenols, and pyrene.

SVOCs are not expected to be present at concentrations that exposure symptoms would occur. SVOCs such as those listed above may cause contact dermatitis. Direct contact can be irritating to the skin and produce itching, burning, swelling, and redness. Direct contact or exposure to the vapors may be irritating to the eyes. Conjunctivitis may result from prolonged exposure. Many SVOCs are considered to be very toxic, if ingested. High levels of exposure to SVOCs, though not anticipated during work activities conducted during this project, may increase the risk of cancer including lung, kidney, and skin cancer. Naphthalene is also an eye and skin irritant and can cause nausea, headache, fever, anemia, liver damage,

vomiting, convulsions, and coma. Poisoning may occur by ingestion of large doses, inhalation, or skin absorption.

The primary routes of exposure to SVOCs are through inhalation and direct contact, therefore air monitoring, gloves, and respiratory protection are primary controls against exposure to SVOCs.

4.4.1.3 Coal Tar and Coal Tar Products

Coal tar products, which are semi-volatile organic compounds (SVOCs) consist of a mixture of acenaphthene, acenaphthylene, anthracene, benz(a)anthracene, benzo(b)fluoranthene, benzo(k)fluorethene, benz(a)pyrene, benzo(e)pyrene, benzo(g,h,i)peryline, chrysene, dibenz(a,h)anthracene, fluoranthene, fluorene, indeno(1,2,3cd)pyrene, 2-methyl naphthalene, naphththalene, phenanthrene, phenols, pyrene.

Coal tar products and other SVOCs are present at the Site within impacted soil and groundwater and as a dense non-aqueous phase liquid (DNAPL) by-product of gas production within soils, former manufactured gas plant (MGP) structures, and abandoned pipelines.

Coal tar products such as those listed above may cause contact dermatitis. Direct contact can be irritating to the skin and produce itching, burning, swelling, and redness. Direct contact or exposure to the vapors may be irritating to the eyes. Conjunctivitis may result from prolonged exposure. Coal tar is considered to be very toxic, if ingested. High levels of exposure to coal tar, though not anticipated during work activities conducted during this project, may increase the risk of cancer including lung, kidney, and skin cancer. Naphthalene is also an eye and skin irritant and can cause nausea, headache, fever, anemia, liver damage, vomiting, convulsions, and coma. Poisoning may occur by ingestion of large doses, inhalation, or skin absorption.

The major route of entry for the work activities to be conducted at this Site is through direct contact. Exposure is most likely when handling soil and water samples. Inhalation may occur when the soil is disturbed causing respirable and nuisance dust particles to become airborne.

4.4.1.4 Heavy Metals

This Site may contain elevated levels of metals including arsenic, copper, iron, manganese, mercury, selenium, and zinc.

Exposure to high concentrations of arsenic can cause dermatitis, gastrointestinal disturbances, peripheral neuropathy, respiratory irritation, and hyper pigmentation of skin. Chronic exposure to arsenic has resulted in lung cancer in humans.

Exposure to high concentrations of copper through inhalation can cause irritation of the eyes, nose, pharynx, nasal septum. Ingestion may cause a metallic taste. Skin irritation may result from direct contact with skin. Damage to the liver and kidneys may occur.

No adverse health effects are associated with environmental exposure to iron. Target organs for iron via ingestion of iron (most often in supplement form) are the liver, cardiovascular system, and kidneys. Exposure to high concentrations of iron through ingestion can cause salivation nausea, vomiting, diarrhea, and abdominal pain.

Exposure to high concentrations of manganese can cause manganism, metal fume fever, flu-like fever, and kidney damage.

Exposure to mercury can cause dizziness, salivation nausea, vomiting, diarrhea, constipation, emotional disturbance, and kidney injury. Chronic exposure to mercury can cause CNS damage.

Exposure to high concentrations of selenium can cause mucous membrane irritation, coughing, sneezing, shortness of breath, chills, headaches, hypotension, and CNS depression. Chronic exposure to selenium could cause bronchial irritation, gastrointestinal distress, excessive fatigue, and skin discoloration.

Exposure to high concentrations of zinc through ingestion can cause abdominal pain, nausea, vomiting, and diarrhea. Chronic exposure can lead to low blood pressure, jaundice, and seizures.

Heavy metals are not expected to be present at concentrations that exposure symptoms would occur. The primary route of exposure is through inhalation of dust particles when soil is disturbed and becomes airborne, therefore, particulate monitoring, respiratory protection, and gloves are primary controls against exposure to heavy metals.

4.4.1.5 Cyanide

Cyanide compounds are common by-products of manufactured gas plant (MGP) production. Hydrogen cyanide is toxic because it is a chemical asphyxiate. It replaces the oxygen in the blood and thereby suffocates the cells. Ferro cyanides are not considered toxic because the hydrogen cyanide ion is bound too tightly to the iron and cannot therefore replace the oxygen. It takes a great amount of heat and/or acid to release cyanide gas from the ferro cyanide molecule; therefore, hydrogen cyanide is not a concern at this Site.

4.4.1.6 Hydrogen Sulfide

Hydrogen sulfide is a common by-product of manufactured gas plant (MGP) production. Exposure to lower concentrations can result in eye irritation, a sore throat and cough, shortness of breath, and fluid in the lungs. These symptoms usually go away in a few weeks.

Long-term, low-level exposure may result in fatigue, loss of appetite, headaches, irritability, poor memory, and dizziness. Breathing very high levels (> 800 parts per million [ppm]) of hydrogen sulfide can cause death within just a few breaths. The primary route of exposure is through inhalation and therefore respiratory protection is the primary control against exposure to hydrogen sulfide.

Table 4. Primary Constituents of Concern Data

Constituent	Exposure Limit(s)	Route of Exposure	Primary Hazard/ Symptoms of Exposure
(Link to COC Data Table) If a COC for your site is not included in this table, use The CDC NIOSH Guide			
Arsenic	0.01 mg/m3 A.L. 0.005mg/m3	Inhalation, skin absorption, ingestion, skin contact	Ulceration of nasal septum, dermatitis, GI disturbances, peripheral neuropathy, respiratory irritation, hyperpigmentation of skin, potential carcinogen
Benzene	1 ppm TWA 5 ppm STEL	Inhalation, skin absorption, ingestion, skin contact	Irritation of eyes, skin, nose, respiratory system, giddiness, headache, nausea; staggering gait, fatigue, anorexia, weakness, dermatitis, bone marrow depression, potential carcinogen
Ethylbenzene	100 ppm	Inhalation, ingestion, skin contact	Eye, skin, mucous membrane irritation; headache; dermatitis, narcosis; coma
Hydrogen sulfide (H2S)	20 ppm C 50 ppm [10-min. Maximum peak]	Inhalation, skin/eye contact	Irritation eyes, respiratory system; apnea, coma, convulsions; conjunctivitis, eye pain, lacrimation (discharge of tears), photophobia (abnormal visual intolerance to light), corneal vesiculation; dizziness, headache, fatigue, irritability, insomnia; gastrointestinal disturbance; liquid: frostbite
Iron	Iron oxide dust and fume: 10 mg/m3	Inhalation, ingestion, eye contact	Respiratory tract irritation, coughing, shortness of breath, overdose of iron may cause vomiting, abdominal pain, bloody diarrhea, vomiting blood, lethargy, and shock; acidity in the blood, bluish skin discoloration, fever, liver damage, and possibly death; eye and cornea irritation and discoloration
Manganese	C 5 mg/m3	Inhalation, ingestion	Manganism; asthenia, insomnia, mental confusion; metal fume fever: dry throat, cough, chest tightness, dyspnea (breathing difficulty), rales, flu-like fever; low-back pain; vomiting; malaise (vague feeling of discomfort); lassitude (weakness, exhaustion); kidney damage

Constituent	Exposure Limit(s)	Route of Exposure	Primary Hazard/ Symptoms of Exposure
(Link to COC Data Table) If a COC for your site is not included in this table, use The CDC NIOSH Guide			
Mercury	0.10 mg/m3	Inhalation, ingestion, skin contact/absorption	Irritates eyes and skin, chest pain, cough, difficulty breathing, bronchitis, pneumonitis, tremor, insomnia, irritability, indecision, headache, fatigue, weakness, stomatitis, salivation, Gastrointestinal disturbance, weight loss, proteinuria
Naphthalene	10 ppm (50 mg/m3) TW	inhalation, skin absorption, ingestion, skin and/or eye contact	Irritation eyes; headache, confusion, excitement, malaise (vague feeling of discomfort); nausea, vomiting, abdominal pain; irritation bladder; profuse sweating; jaundice; hematuria (blood in the urine), renal shutdown; dermatitis, optical neuritis, corneal damage
Selenium	0.2 mg/m3	Inhalation, ingestion, skin contact	Irritant to eyes, skin, nose and throat, visual disturbance, headache, chills, fever, breathing difficulty, bronchitis, metallic taste, garlic breath, GI disturbance, dermatitis, eye, and skin burns
Toluene	200 ppm	Inhalation, skin absorption, ingestion, skin contact	Eye, nose irritation; fatigue, weakness, confusion, euphoria, dizziness, headache; dilated pupils, tearing of eyes; nervousness, muscle fatigue, insomnia, tingling in limbs; dermatitis
Xylene	100 ppm	Inhalation, skin absorption, ingestion, skin contact	Eye, skin, nose, throat irritation; dizziness, excitement, drowsiness; incoordination, staggering gait; corneal damage; appetite loss, nausea, vomiting, abdominal pain; dermatitis
Zinc	TWA 15 mg/m3 (total dust) TWA 5 mg/m3 (resp dust	Inhalation	Metal fume fever: chills, muscle ache, nausea, fever, dry throat, cough; lassitude (weakness, exhaustion); metallic taste; headache; blurred vision; low back pain; vomiting; malaise (vague feeling of discomfort); chest tightness; dyspnea (breathing difficulty), rales, decreased pulmonary function

Notes:
A.L. - Action Level
C - ceiling limit, not to be exceeded
Ca – carcinogen
f/cc - fibers per cubic centimeter
mg/m^3 - micrograms per cubic meter
mppcf - millions of particulates per cubic foot of air
ppm - parts per million
STEL - Short-term exposure limit (15 minutes)

TWA - Time-weighted average (8 hours)

4.4.2 Chemicals Brought on Site

Potential hazards associated with chemicals brought on site (e.g., decontamination chemicals, sample preservatives, fuels, calibration fluids) for the work will be mitigated through training, administrative controls (e.g., proper labeling and storage), and proper use of PPE. Safety data sheets (SDSs) for all chemicals brought on site shall be maintained by the SSM and are included in Appendix C.

5. Personal Protective Equipment

The PPE required to be worn on the project site is listed in the table below. Additional PPE required for the tasks to be performed is listed on the JHAs in Appendix B.

Site Required PPE *(check all that apply)*		
☒ Hard Hat	☐ Respirator	☒ Tyvek clothing/boots
☒ Safety Glasses	☐ Flame Resistant Clothing	☒ Hearing Protection
☒ Safety Boots	☒ Personal Flotation Device	☐ Long Sleeve Shirt
☒ Gloves (task specific)	☐ Snake Chaps	☐ Other:
☒ High Visibility Safety Vest	☐ EH-Rated Boots	☐ Other:

If site conditions suggest the existence of a situation more hazardous than anticipated, the site personnel will evacuate the area to a safe distance. The hazard, the level of precautions, and the PPE will then be reevaluated with the assistance and approval of the Safety Director and the PM. If conditions indicating the need for Level A or Level B PPE are encountered, personnel will leave the site and notify the PM or a member of the Safety Team. GEI's PPE Program can be found on the Safety Resources page of GEI Connections.

5.1 Respiratory PPE

GEI personnel who have the potential to don a respirator must have a valid fit test certification and medical clearance. Both the respirator and cartridges specified for use in Level C protection must be fit-tested prior to use in accordance with OSHA regulations (29 CFR 1910.134). Air purifying respirators cannot be worn under the following conditions:

- Oxygen deficiency (less than 20.7%).
- Imminent Danger to Life and Health (IDLH) concentrations.
- If contaminant levels exceed designated use concentrations.

Upgrades to respiratory protection may be required based on the designated Action Levels found in Section 9.

6. Responsibilities and Lines of Authority

6.1 GEI Personnel Responsibilities

The implementation of health and safety at this project location will be the shared responsibility of the Safety Director, Regional Safety Director, PM, the Site Safety Manager (SSM), and each GEI personnel implementing the proposed scope of work.

6.1.1 GEI Safety Director

The Safety Director is responsible for the overall management of GEI's safety programs, policies, and procedures. Modifications to this HASP which may result in the reduction in the identification, evaluation, and control of safety and health hazards cannot be undertaken by the project team without the approval of the Safety Director.

6.1.2 GEI Project Manager

The PM is responsible for confirming that the requirements of this HASP are implemented. The PM's specific responsibilities include:

- Conducting and documenting the Project Safety Briefing.
- Verifying that the GEI staff and subcontractors selected to work on this program are sufficiently trained for site activities and have reviewed this HASP.
- Maintaining regular communications with the SSM and, if necessary, the Safety Director.

6.1.3 GEI Regional Safety Manager

The RSM is responsible for supporting the safety needs and requirements specified in this HASP. The RSM's specific responsibilities include:

- Reviewing and approving the HASP and applicable JHAs.
- Working with the PM and SSM to meet client safety requirements.
- Providing approval for fall protection plans and confined space entries (permit numbers), as applicable.
- Providing safety support regarding safety programs and procedures as applicable to the project.

6.1.4 GEI Site Safety Manager

The SSM is responsible for implementing and enforcing the safety requirements specified in this HASP and will be on-site during activities covered in the HASP. The SSM's specific responsibilities include:

- Enforcing the requirements of this HASP and notify the PM of noncompliance.
- Conduct daily Safety Tailgate meetings for site-related work.
- Maintaining a high level of health and safety consciousness among employees implementing the proposed activities.
- Procuring the air monitoring instrumentation, PPE, and safety equipment needed for GEI project employees and verifying that each is in good working order.
- Verifying that GEI subcontractors are utilizing the correct PPE and safety equipment.

6.1.5 All GEI Field Personnel

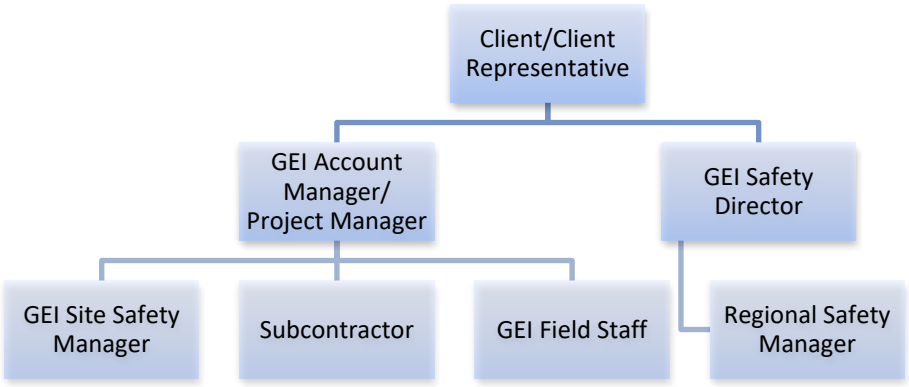
All GEI field personnel (including the PM and SSM) covered by this HASP are responsible for following the health and safety procedures in this HASP and for performing their work in a safe and responsible manner. The specific responsibilities that apply to all field personnel include:

- Reading and signing the HASP prior to the start of on-site work.
- Bringing forth any questions or concerns regarding the content of the HASP to the PM or the SSM.
- Attending and actively participating in the required Project Safety Briefing prior to beginning on-site work and any subsequent safety meetings.
- Complying with the requirements of this HASP and the requests of the SSM.
- Stopping work in the event that an immediate danger situation is perceived.
- Reporting accidents, injuries, and illnesses, regardless of their severity by following GEI's incident reporting procedures.

6.2 Lines of Authority

GEI will have responsibility for safety of its employees during the work performed at the site. GEI's SSM will have a cell phone available to contact the appropriate local authorities, in the event of an emergency. GEI's SSM will be available for communication with the GEI PM and with the Client's representative.

Project Lines of Authority



6.2.1 Stop Work Authority

GEI employees have the authority to stop work activities if an unanticipated hazard is encountered or a potential unsafe condition is observed. The GEI employee should contact the Safety Director and the Project Manager to discuss the stop work conditions and potential control methods that can be implemented.

6.3 Subcontractors

GEI has subcontracted the following firms to assist in performing work on this project:

Subcontractor Information	
Company Name/Address: TBD	
Contact Name:	Cell: (XXX) XXX-XXXX
Scope of Work:	

GEI requires its subcontractors to work in a responsible and safe manner. Subcontractors hired by GEI are required to submit documentation of their safety practices as part of GEI's Subcontractor Safety Prequalification for evaluation and approval before the start of work. Subcontractors for this project will be required to develop their own HASP for protection of their employees, but, at a minimum, must adhere to applicable requirements set forth in this HASP. The PM will obtain applicable safety certifications and training records from the subcontractor's site supervisor prior to the initiation of work.

7. Training Requirements

Prior to commencement of field activities, the PM or their designee will verify GEI field personnel assigned to the project will have completed training that will specifically address the activities, procedures, monitoring, and equipment used in the site operations. This training will be documented on the applicable JHAs (Appendix B). Personnel that have not received project-specific training will not be allowed on site.

Applicable Site-Specific Training Requirements *(check all that apply)*		
✔ HAZWOPER (8Hr Refresher)	☐ Railroad Specific Training	☐ Other:
☐ HAZWOPER (Site Supervisor)	☐ Transportation Worker Identification Credential (TWIC)	☐ Other:
✔ First Aid/CPR	☐ MSHA (Mine Safety and Health Administration)	☐ Other:

7.1 On-Site Safety Briefings

GEI personnel will be given health and safety briefings daily (or as frequently as needed) by the SSM or their designee to plan for conducting work activities safely. The briefing will include GEI subcontractors and others as appropriate. The briefings can include information on:

- Applicable JHAs
- Changes in work practices
- Changes in environmental conditions
- Anticipated weather
- Evacuation/emergency procedures
- Air monitoring results
- Safety inspection results

Documentation of these briefings will be recorded in the GEI field book or the Tailgate Safety Briefing Form (Appendix D). For long-term projects, the Tailgate Safety Briefing Form is preferred.

8. Medical Surveillance Program

GEI maintains a medical surveillance program under the supervision of the Safety Director that includes a plan designed specifically for field personnel engaged in work at sites where hazardous materials may be present. Field personnel undergo an initial physical examination, including a detailed medical and occupational history before they are able to engage in work at hazardous waste sites. Upon successful completion of the examination, personnel are provided a medical clearance from an occupational health physician stating their fitness to perform the specified work activities. Employees who are part of this program will schedule and attend annual exams 12 months from the date of their previous exam.

If a GEI employee or other project worker shows symptoms of exposure to a hazardous substance and wishes to be seen by a doctor, GEI will consult with their third-party medical administrator and provide access to the nearest area hospital or medical facility.

GEI subcontractor personnel that will enter any hazardous waste sites must certify that they are participating in a medical surveillance program that complies with OSHA regulations for hazardous waste operations (i.e., 29 CFR 1910.120 and 29 CFR 1926.65). A copy of their medical clearance will be submitted to the GEI PM or SSM prior to the start of field activities.

9. Personal/Work Zone Air Monitoring

Personal/Work Zone Air Monitoring Required?	
☒ Yes	☐ No

Air monitoring, in the form of personal or work zone monitoring, will be performed to identify and quantify airborne levels of hazardous substances and atmospheric hazards to determine the appropriate level of worker protection needed on-site. A Community Air Monitoring Plan (CAMP) which describes air quality monitoring for receptors at the Site perimeter (outside the work zone) is provided as Appendix A.

Work on this project requiring air monitoring includes:

Personal/Work Zone Air Monitoring Tasks *(check all that apply)*		
☒ Excavation	☐ Confined Space Entry	☐ Other:
☒ Soil Sampling	☐ Indoor Drilling	☐ Other:
☒ GW Monitoring Well Headspace	☒ Product Sampling	☐ Other:

The following air monitoring equipment will be on site:

Personal/Work Zone Air Monitoring Equipment *(check all that apply)*	
☒ PID with 10.6 eV lamp or equivalent	☐ Particulate Meter (PM-10 capable)
☐ Drager Chip Measurement System (CMS) with appropriate gas detection chips	☐ Multi-gas meter: lower explosive limit (LEL) / oxygen (O_2) / hydrogen sulfide (H_2S) / hydrogen cyanide (HCN) or carbon monoxide (CO) meter
☐ Sensidyne Gas Detection Pump with appropriate gas detector tubes (or equivalent colorimetric tube)	☒ Other: Dust Trak DRX (upwind and downwind locations) to evaluate PM10 and TSP concentrations at the Site perimeter as part of the CAMP

GEI will conduct and document on-site work zone monitoring and will inform GEI employees of the results. ***If Action Levels are exceeded, immediately implement site action(s) according to Action Table below and notify the PM***.

9.1 Calibration

Air monitoring equipment will be calibrated and maintained in accordance with manufacturer's requirements. Calibrations will be recorded in the project notes daily or on a daily calibration form.

9.2 Action Levels

The tables below provide a summary of real time air monitoring Action Levels and contingency plans for work zone activities. The below Action Levels are determined by halving the Permissible Exposure Limits (PELs) or Threshold Limit Values (TLVs) as set forth by OSHA and the American Conference of Government Industrial Hygienists (ACGIH).

9.2.1 VOC Monitoring and Control

Air monitoring reduces the risk of overexposure by indicating when action levels have been exceeded and when PPE must be upgraded or changed. Based on the volatile organic compounds (VOCs) listed in Table 4, determine which constituent has the lowest permissible exposure limit (PEL). This data is used to determine the action levels needed including respiratory protection at the project site. GEI's action level is half of the PEL listed in Table 4 (exception is made for benzene).

Exposure to organic COC can be evaluated and/or controlled by:

- Monitoring worker breathing zone atmospheric concentrations for organic COC in the breathing zone with a photoionization detector (PID).
- When possible, engineering control measures will be utilized to suppress the volatile organic vapors. Engineering methods can include utilizing a fan to promote air circulation, utilizing volatile suppressant foam, providing artificial ground cover, or covering up the impacted material with a tarp to mitigate volatile odors.
- When volatile suppression engineering controls are not effective and organic vapor meters indicate concentrations above the action levels, then appropriate respiratory protection (i.e., air purifying respirator with organic vapor cartridge) will be employed.

Air Monitoring Instrument	Action Level (above background)	Site Action
Action Levels for the following parameters are 15-minute time weighted averages (TWA), not a single exceedance.		
PID (Monitoring for VOCs)	0.0 – 50 ppm	No respiratory protection is required if VOCs are not present. (If benzene or naphthalene are constituents of interest at this site, follow the action levels below for benzene and/or naphthalene.)
	> 50 ppm	Stop work, withdrawal from work area, institute engineering controls, if levels persist, upgrade to Level C. Notify PM and Safety Team.
PID	0.0 - 1.0 ppm	No respiratory protection is required if benzene is not present. Use detector tube for benzene to verify if concentration of 1.0 ppm or greater is benzene.

Air Monitoring Instrument	Action Level (above background)	Site Action
(Monitoring for benzene)	1.0 – 50 ppm	If benzene is present (confirmation via detector tube), stop work and contact your PM. If work continues and benzene is present, or no detector tubes are used to determine presence, upgrade to Level C. No respiratory protection is required if benzene is not present.
	> 50 ppm	Stop work, withdraw from work area, notify PM and Safety Team.
PID (Monitoring for naphthalene)	0.0 - 5 ppm	No respiratory protection is required if naphthalene is not present. Use Sensodyne detector tube for naphthalene to verify if concentration of 5 ppm or greater is naphthalene.
	5 – 50 ppm	If naphthalene is present (confirmation via detector tube), stop work and contact your PM. If work continues and naphthalene is present or no detector tubes are used to determine presence, upgrade to Level C. No respiratory protection is required if naphthalene is not present.
	> 50 ppm	Stop work, withdraw from work area, notify PM and Safety Team.

9.2.2 Dust Monitoring and Control

Some COC hazards may become hazardous when they are associated with dust/particles and become airborne. For worker safety, dust levels must be managed to eliminate this hazard. Dust generated during activities can cause irritation to the respiratory system and eyes. Contaminants can also be carried in airborne dust causing potential exposure to workers through skin contact and inhalation. Constituent concentrations on site are expected to be low therefore the exposure hazard through inhalation should be minimal; however, contaminant contact through skin and clothing can introduce additional exposures.

For dust generated during site activities which exceed site-specific limits, engineering controls such as water application will be used to control dust concentrations. However, if excessive dust concentrations cannot to be handled through engineering controls, then respirators will be required to be worn.

Air Monitoring Instrument	Action Level (above background)	Site Action
Action Levels for the following parameters are 15-minute time weighted averages (TWA), not a single exceedance.		
Particulate Meter	150 µg/m^3	Implement work practices to reduce/minimize airborne dust generation, e.g., spray/misting of soil with water. Don respirator with particulate filters if action levels remain in exceedance.

10. Site Control

10.1 Site Zones

Site zones are intended to control the potential spread of contamination and to assure that only authorized individuals are permitted into potentially hazardous areas. This project is being conducted under the requirements of 29 CFR 1910.120, and any personnel working in an area where the potential for exposure to site contaminants exists, will only be allowed access after proper training and medical documentation.

10.2 Buddy System

GEI personnel should be in line-of-site or communication contact with another on-site person. The other on-site person should be aware of his or her role as a "buddy" and be able to help in the event of an emergency. Some projects may not support the need for the buddy system to be implemented. If this is the case, the PM is required to conduct regular check-ins with the employee on site.

10.3 Sanitation for Temporary Work Sites

Sanitation requirements identified in the OSHA Standard 29 CFR 1926.51 "Sanitation" specifies that employees working at temporary project sites have at least one sanitary facility available to them.

10.4 Illumination

Illumination requirements identified by OSHA are directed to work efforts inside buildings and/or during non-daylight hours. Activities planned for the site are anticipated to occur outside during daylight hours. However, if work areas do not meet illumination requirements, they will be equipped with appropriate illumination that meets or exceeds requirements specified in OSHA Standard 29 CFR 1926.56. Employees will not work on sites that are not properly lighted.

10.5 Smoking

Smoking is prohibited at or in the vicinity of hazardous operations or materials. Where smoking is permitted, safe receptacles will be provided for smoking materials.

10.6 Alcohol and Drug Abuse Prevention

Alcohol and drugs will not be allowed on the site. Project personnel under the influence of alcohol or drugs will not be allowed to enter the site. All GEI employees must comply with

GEI's Controlled Substance Use & Alcohol Misuse Policy found on the Safety Resources page of GEI Connections. Employees may be subject to random drug and/or alcohol testing if required by a client at a project site.

11. Incident Reporting

GEI will report incidents involving GEI personnel or subcontractor personnel, such as: lost time injuries, injuries requiring medical attention, near miss incidents, fires, fatalities, accidents involving the public, chemical spills, vehicle accidents, and property damage. The following steps must be followed when an incident occurs:

1. For incidents involving life-threatening situations or serious injury that require emergency response personnel (Police, Fire, EMS), call 9-1-1 from a safe area.
2. **Stop work** activity to address any injury, illness, property damage, spill, or other emergency.
3. Call Medcor Triage at 1-800-775-5866 to speak with a medical professional following any injury or illness.
4. Notify your Supervisor/Project Manager of the incident or injury.
5. Complete an incident report using the GEI Incident Report Form located on the GEI Safety Smartphone App, GEI Connections intranet page, or in the project HASP.
6. Resume work activity if all steps above have been completed and it is safe to do so.

For vehicle accidents involving another vehicle or damage to property, the employee will take pictures of each vehicle or property involved in the incident and obtain a police report. In some municipalities police will not be dispatched to a non-injury accident, but every effort needs to be made to try and obtain the report.

The Incident Report Form and the Near Miss Reporting Form can be found in Appendix D, on the GEI Health and Safety smartphone app, or on the Safety Resources page of GEI Connections. To report subcontractor injuries or incidents, follow the same verbal reporting procedures and submit an email describing the event to the PM and the Safety Team.

11.1 Injury Triage Service

If a GEI employee experiences a work-related injury that is not life-threatening, the employee will initiate a call to Medcor Triage at 1-800-775-5866. The injured employee will detail any medical symptoms or complaints which will be evaluated by a Registered Nurse (RN) specially trained to perform telephonic triage. The RN will recommend first aid self-treatment or refer the injured employee for an off-site medical evaluation by a health professional at a clinic within GEI's workers compensation provider network. GEI employees are still required to follow our Accident Reporting procedures as listed above.

12. Decontamination Procedures

Site decontamination procedures are designed to achieve an orderly, controlled removal or neutralization of contaminants that may come in contact with personnel or equipment. These procedures minimize contact with contaminants and protect against the transfer of contaminants to clean areas. They also extend the useful life of PPE by reducing the amount of time that contaminants contact and can permeate PPE surfaces. This project is being conducted under the requirements of 29 CFR 1910.120(k), and any personnel or equipment that are exposed to site contaminants will follow applicable decontamination procedures.

12.1 Personnel and PPE Decontamination

Contaminated PPE (gloves, suits, etc.) will be decontaminated and stored for reuse or placed in plastic bags (or other appropriate containers) and disposed of in an approved facility. Decontamination wastewater and used cleaning fluids will be collected and disposed of in accordance with applicable state and federal regulations.

12.2 Equipment Decontamination

All tools, equipment, and machinery that have come into contact with contaminated media, will be decontaminated on site prior to departure. Equipment decontamination procedures are designed to minimize the potential for hazardous skin or inhalation exposure and to avoid cross-contamination and chemical incompatibilities.

13. Emergency Response

13.1 Evacuation

Prior to the start of work, emergency procedures must be identified and communicated to workers on site. This includes evacuation routes, safe areas, and/or muster points (Figure 1). Also communicate how employees will be notified that an emergency or evacuation of the site is occurring (audio alarms, visible (light) alarms, radios, sirens, etc.) Upon discovering an emergency situation, personnel will notify the SSM, who will initiate an appropriate response. Once the scene is safe, use the incident report procedures to report the evacuation to the PM and Safety Team.

13.2 Fire

In the event of a fire personnel will evacuate the area to the muster point located on Figure 1. GEI's SSM will contact the local fire department and report the fire. The SSM will account for GEI personnel and subcontractor personnel and report their status to the PM. Incident reporting procedures will be followed once the scene is safe.

13.3 Spills or Material Release

If a hazardous waste spill or material release occurs, if safe, the SSM or their representative will immediately assess the magnitude and potential seriousness of the spill or release based on the following:

- SDS for the material spilled or released.
- Source of the release or spillage of hazardous material.
- An estimate of the quantity released and the rate at which it is being released.
- The direction in which the spill or air release is moving.
- Personnel who may be or may have been in contact with the material, or air release, and possible injury or sickness as a result.
- Potential for fire and/or explosion resulting from the situation; and
- Estimates of area under influence of release.

If the spill or release is determined to be within the on-site emergency response capabilities, the SSM will verify implementation of the necessary remedial action. If the release is beyond the capabilities of the site personnel, personnel will be evacuated from the immediate area and the fire department will be contacted. The SSM will notify the PM and follow the incident reporting procedures.

13.4 Medical Support

In case of minor injuries, on-site care will be administered with the site first aid kit. A GEI employee certified by the American Red Cross or other American Health & Safety Institute (ASHI) will be on-site at all times. For serious injuries, call 911 and request emergency medical assistance. Seriously injured persons should not be moved unless they are in immediate danger. Notify the PM of the emergency and follow incident reporting procedures.

In the event of an emergency, prompt communications with local emergency responders are essential. At least one charged and functioning cell phone to enable emergency communications will be on site. Confirmation of cellular phone operation will be confirmed at the start of each working day.

Table 1 of this HASP contains detailed emergency information, including directions to the nearest hospital, and a list of emergency services and their telephone numbers. In addition, Appendix A includes a map to the local hospital/emergency room and Figure 1 indicates the evacuation route (including muster point).

13.5 Severe Weather

The contingency plan for severe weather includes reviewing the expected weather to determine if severe weather is in the forecast. Severe weather includes high winds over 40 miles per hour (mph), heavy rains or snow squalls, thunderstorms, tornados, and lightning storms. If severe weather is approaching, the decision to evacuate GEI personnel and subcontractor personnel from the site will be the responsibility of GEI's SSM. Notification of evacuation will be made to the PM. The SSM will account for GEI personnel and subcontractor personnel and report their status to the PM. If safe, work can resume 30 minutes after the last clap of thunder or flash of lightning.

13.6 Hazard Communication Plan

GEI personnel have received hazard communication (HAZCOM) training as part of their annual safety training and new employee safety orientation training. Hazardous materials brought on site will be properly labeled, stored, and handled. SDSs for each chemical will be included in this HASP in Appendix C. GEI's HAZCOM program can be found on the Safety Resources page of GEI Connections (Appendix E).

14. Health and Safety Plan Sign-Off

GEI personnel conducting site activities will be familiar with the information in this HASP. After reviewing this plan, please sign the copy in the project files, and bring a copy of the plan with you to the site. By signing this site-specific HASP, you are agreeing that you have read, understand, and will adhere to the provisions described in this plan while working on the site below.

ppm	Parts per Million
SCWP	Site Characterization Work Plan
SVOC	Semi-Volatile Organic Compound
VOC	Volatile Organic Compound
$\mu g/m^3$	Micrograms per cubic meter

1. Introduction

This document presents the Community Air Monitoring Plan (CAMP) that will be implemented during the Remedial Investigation/ Feasibility Study (RI/FS) at the Lower Scajaquada Creek Operable Unit in Buffalo, New York. A CAMP is required by the New York State Department of Environmental Conservation (NYSDEC) and the New York State Department of Health (NYSDOH) at sites where ground-intrusive activities may result in airborne release of compounds of concern (COCs). This CAMP has been developed to monitor for total volatile organic compound (VOC) vapors, and for particulates (dust) which are the principal COCs resulting from intrusive activities performed during implementation of the Site Characterization Plan prepared for the Site.

The Site Characterization will consist of the following elements:

- Installation of soil borings and monitoring wells on the land portion of the Site,
- Sampling of monitoring wells,
- Completions of sediment borings in Scajaquada Creek.

The objectives of this CAMP are to:

- Ensure that the airborne concentrations of COCs are minimized to protect the community.
- Provide an early warning system so that potential emissions can be controlled on site at the source.
- Measure and document the concentrations of airborne COCs to confirm compliance with the specified limits.

This CAMP is a companion document to GEI's site-specific Health and Safety Plan (HASP) which is directed primarily toward protection of on-site workers within the designated work zones. Implementation of this CAMP will be required during any intrusive activities performed on the land portion of the Site, including the installation of soil borings, monitoring wells Sediment borings in Scajaquada Creek are proposed to be completed "in-the-wet" and are not anticipated to generate dust. Therefore, only VOC monitoring will be required in the work zone and upwind and downwind areas.

2. Air Monitoring Equipment, Methods, and Action Levels

This section provides instructions for conducting the CAMP. Discussed are the COCs to be monitored, the equipment to be used, and the action limits. Community air monitoring will be performed for total VOCs and particulates (dust) during the excavation and backfilling activities performed at the Site.

In addition to the community air monitoring, work/exclusion zone monitoring will be performed during work activities where impacted soil may be encountered. The exclusion zone air monitoring requirements, equipment, and action levels are described in the site-specific HASP for this project. Note, however, that the work zone air monitoring and the community air monitoring are conducted as part of the overall site control program. When work zone VOC or particulate readings are found to exceed the downwind CAMP limits, the field staff will check the upwind and downwind air monitoring instruments to assess whether control measures will be required.

2.1 Monitoring Locations

Air monitoring locations will be established at the start of each workday. A minimum of one station located upwind of the work area, and one located downwind of the work area/exclusion zone will be placed at the Site perimeter as determined by the prevailing wind direction at the start of the day. The purpose of the upwind station will be to determine the background concentration of VOCs and particulates at the worksite. The downwind monitoring station will be used to assess compliance with the NYSDEC/NYSDOH specified action limits for VOCs and particulates. The upwind VOC and dust measurements will be subtracted from the downwind measurements in order to compare the downwind instrument readings to the CAMP action levels.

The location of each monitoring station will be noted in the Daily Field Report along with the start and ending time for monitoring at each location. The locations of the instruments may be changed during the day to adapt to changing wind directions. Field personnel will be prepared to move the equipment to multiple locations in the event that there is little wind, if the wind direction changes frequently, or if there is a change to the location of the most sensitive downwind receptor location.

It is not anticipated that any work area will be within 20’ of any occupied structure during implementation of the RI/FS Work Plan. However, if any work area is less than 20 feet from the nearest occupied building, a downwind air monitoring station will be positioned at the air intake for the building or at the most sensitive exposure point for the downwind receptors. Background measurements inside the building will be made prior to the start of work. If

exceedances of the action levels are measured at the outside wall of the building, additional measurements will be made inside the building using portable meters.

If necessary, precautions to minimize the release of VOCs and particulates will be taken at the work zone, and engineering or work controls used to protect the downwind receptor. These controls for minimizing releases from the work zone are discussed in Section 3.

2.2 Air Monitoring Equipment

The monitoring instruments will be calibrated at the start of each workday, and again during the day if the performance of an instrument is in question. The time and method of calibration will be noted on the Daily Field Report. Both the photo-ionization detectors (PIDs) and particulate meters will be mounted on a tripod in a vented protective case, and programmed to record 15-minute averages. A monitoring technician will check the instrumentation at each of these locations regularly during the workday to ensure that they are operating properly.

2.2.1 VOC Monitoring Equipment

VOC monitoring will be performed using PIDs (RAE Systems MiniRAE™ or equivalent) equipped with a 10.2 or 10.6 eV bulb. The instruments will be set to record 15-minute running average concentrations. The PIDs will be equipped with an audible alarm to indicate an exceedance of the action level of 5 ppm total VOCs.

2.2.2 Particulate (Dust) Monitoring Equipment

Particulate monitoring will be performed using meters set to measure 10 micron and finer particulates (PM-10). Particulates will be monitored using an MIE DataRAM DR-2000l, TSI DustTrak™, or equivalent, which is capable of measuring PM-10. The equipment used will be set to record 15-minute running average concentrations, for comparison to the action levels.

In addition to the instrument readings, fugitive dust migration will be visually assessed during all work activities, and the observations recorded. Per NYSDEC requirements, visible dust migration will not be allowed. If visible dust is observed to be migrating from the work zone, the work will be stopped and dust control measures implemented.

2.3 Monitoring Action Levels and Responses

The action levels and responses for VOCs and particulates are presented in Table 1.

Table 1. Air Monitoring Response Levels and Actions

VOCs	
Response Level	**Actions**
>1 ppm at the wall of an occupied structure or at an air intake	▪ Check the indoor air concentration and compare with background measurements taken previously
>5 ppm above background for 15-minute average	▪ Temporarily halt work activities ▪ Continue monitoring, especially inside of occupied structures ▪ Perform work during cold weather ▪ If VOC levels decrease (per instantaneous readings) below 5 ppm over background, work activities can resume
Persistent levels >5 ppm over background but <25 ppm	▪ Halt work activities ▪ Identify source of vapors ▪ Corrective action to abate emissions ▪ Continue monitoring ▪ Resume work activities if VOC levels 200 feet downwind of the property boundary or half the distance to the nearest potential receptor is <5 ppm for a 15-minute average
>25 ppm at the perimeter of the work area	▪ Shut down work

Particulates	
Response Level	**Actions**
>100 µg/m^3 above background for 15-minute average or visual dust observed leaving the site	▪ Apply dust suppression ▪ Continue monitoring ▪ Continue work if downwind PM-10 particulate levels are <150 µg/m^3 above upwind levels and no visual dust leaving site
>150 µg/m^3 above background for 15-minute average	▪ Stop work ▪ Re-evaluate activities ▪ Continue monitoring ▪ Continue work if downwind PM-10 particulate levels are <150 µg/m^3 above upwind levels and no visual dust leaving site

Sources:

- NYSDOH Generic Community Air Monitoring Plan, December 2009, as published in NYSDEC DER-10, Appendix 1A, 2010.
- Fugitive Dust and Particulate Monitoring, NYSDEC DER-10, Appendix 1B, 2010.
- Special Requirements for Work Within 20 Feet of Potentially Exposed Individuals or Structures, NYSDOH.

All data will be downloaded to a computer on a daily basis and saved for review. The data will be provided to the NYSDEC and/or the NYSDOH upon request at any stage of the project.

If VOC or particulate action levels are observed to be exceeded during the workday, the event, the source, and corrective actions taken will be recorded on the Daily Field Report and reported to the on-site NYSDEC representative, if present. If an on-site representative is not

present, exceedances will be noted in the daily report to the NYSDEC project manager within one business day.

GEI Project Manager	Richard Frappa	(716) 984-5958 cell

2.4 Odor Monitoring

The field personnel will record observations of odors generated during the implementation of the RI/FS Work Plan. Odors will be recorded as weak, moderate, or strong, based on olfactory responses. When odors attributable to the exposing of impacted media are generated in the work area during excavation, observations will also be made at the downwind limit of the Site. The observations will be made to assess the potential for significant odors reaching on-site receptors or being transmitted off site. The downwind odor monitoring will be performed in conjunction with the PID and dust monitoring program described in this CAMP.

Upon detection of strong odors at the site perimeter, site controls, starting in the work area, will be implemented and will include encapsulation of the impacted media in 55-gallon drums or temporarily wrapping in polyethylene sheeting until more permanent mitigation can be accomplished. Note that the goal of the Odor Management Plan is to minimize and to prevent, where practicable, the off-site migration of odors. Due to the short distances between some work areas at the site and the property lines of on-site receptors, site controls may be implemented proactively when odors are detected in the breathing zone in some work areas.

There are no action levels specified for odors. In the event that odors persist at the downwind receptors or property line after control measures are carried-out, the odor conditions will be discussed with the National Fuel and NYSDEC project managers.

3. Control Procedures

A dust, odor, and organic vapor control and monitoring plan (DOOVC Plan) will be developed for on-site remedial construction work activity that will meet CAMP requirements and OSHA standards for construction (29 CFR 1926) after selection of the final remedy. The DOOVC Plan will specifically address work practices to minimize dust, odors and vapors during all remediation construction activities.

4. Documentation and Reporting

A Daily Data Sheet will be filled-out each day to record all of the details of the CAMP work. The form will be used to record the following information:

- Date and weather, with significant changes noted which may affect the positioning of the meters or recording of the data.
- Calibration results for the instruments.
- Locations of the upwind and downwind monitoring stations, and any changes made to the locations during the day to adjust for changing work locations or wind directions.
- Any significant readings made during the day, such as exceedances which occur and their causes.

Additional information will be noted in the project fieldbook(s), as necessary.

The electronic measurements from the PIDs and dust meters will be downloaded each day, reviewed, and archived. Exceedances of the action levels, if any, and the actions to be taken to mitigate the situations, will be discussed immediately with the on-site representatives, or reported within one business day to the NYSDEC project manager (if on-site NYSDEC oversight is not provided). The results of the daily CAMP monitoring will also be discussed in the daily written report to the NYSDEC project manager. Summaries of all air monitoring data will be provided to the NYSDEC or the NYSDOH upon request.

CAMP odor monitoring results will be recorded in the field log book and/or the Daily Data Sheet, and will also be available for review by the state agencies.

Appendix C

Job Hazard Analyses

Job Hazard Analysis

Task	**Barge Safety (Passenger)**		
Project Name/Number	2406810 - National Fuel GLLA Lower Scajaquada Ck RI/FS OU	**Client Name**	National Fuel Gas
GEI Project Manager	Richard Frappa	**PM Review Date**	
Tools/Equipment Used			
Task Specific Training	GEI Annual Safety Training (Field or HAZWOPER), CPR/First Aid		
Personal Protective Equipment (PPE)	☐ Hard Hat ☒Safety Glasses ☒Safety-Toed Boots ☒ Reflective Vest ☒Hearing Protection ☒ Personal Flotation Device (PFD) ☐ Face Shield ☐ Chaps ☐ Tyvek clothing/boots ☐ Flame Resistant Clothing ☒ Gloves Leather, work gloves ☐Respirator ☐Other		

JHA Prepared By: Josh Prygon	**Date:**	**Approved by: *RSM to complete***	**Date:**

Task Steps	Potential Hazards	GEI SOP or Program	Hazard Controls[1]
1. Equipment Setup	Heavy lifting, Cuts/Scrapes, Slips/Trips/Falls, Pinch points	Non-Powered Hand Tools HS-008a Manual Lifting HS-025 Ergonomic Program	• User proper lifting techniques. • Keep trafficked areas free from slip/trip/fall hazards. • Wear the proper type of glove to protect hands against sharp edges and skin/soft tissue injuries • Wear appropriate footwear • Be aware of hard to grip and hold items that may force your hand or wrist into awkward, stressful positions • Take breaks when carrying items frequently and/or for long distances • Do not overreach when picking up or placing items. • Use the buddy system when necessary

[1] Use the hierarchy of controls to determine applicable hazard controls for the task in order of most effective to least effective: Elimination (physically remove the hazard), Substitution (replace the hazard), Engineering Controls (Isolate the team from the hazard), Administrative Controls (change the way people work), PPE (personal protective equipment).

Task Steps	Potential Hazards	GEI SOP or Program	Hazard Controls[1]
2. Pre-boarding Safety Presentation	Cuts/Scrapes, Slips/Trips/Falls, Pinch points	Hazard Identification HS-026 Ergonomic Program	• All passengers should be given a presentation of the barge's safety equipment, emergency procedures, hazards, and general passenger instructions/ expectations before boarding. • Passengers, along with the operator, are responsible for knowing the plan and emergency procedures. • Confirm all appropriate operational and safety equipment is on board and in working condition. • Attend a tailgate meeting and review the float plan in detail. • Determine your method of emergency communication (radios, cell phones, air horns, etc.) and obtain all equipment or information needed (radio, cell phone charger, key phone numbers, etc.). • The operator should review all emergency procedures before launching.
3. Boarding	Slips/ Trips/ falls, Drowning, Pinch points, Cuts and Lacerations	Water Safety HS-017 Hazard Identification HS-026 GEI's Ergonomics Program	• Do not board before you have operator approval. • Confirm the barge is operational before boarding. • All passengers should be given a tour/ presentation of the safety equipment, emergency procedures, hazards, and general passenger instructions. • When boarding, use 3 points of contact. Do not jump, run, board in inappropriate locations, or board without captain/ operator permission. The barge should be stationary and secured. • The operator and all passengers are responsible for housekeeping on the on the working platform. All objects, tools, and equipment should be secured and put away before the passengers board. After boarding, take time to find a place for everyone's belongings before leaving the launch. Do not take unnecessary items. • Know your path of travel and keep hands free. • Take orders from and direct communication to operator of vessel. • Hand off packages, backpacks, and carry-ons before attempting a transfer. • Keep self and others clear of suspended or carried loads. • Be aware of and stay clear of overhead hazards or equipment.
4. Barge Passenger	Struck By, Cuts and lacerations, pinch points, fire/ explosion, remote work areas, ergonomics,	Inclement Weather HS-010 Noise Exposure HS-012	• Take orders from and direct communication to operator of vessel. • Do not interfere with the operator while they are maneuvering • Make sure all personnel on board have PFDs on and/or that railing

Task Steps	Potential Hazards	GEI SOP or Program	Hazard Controls[1]
	drowning	Water Safety HS-017 Hazard Identification HS-026	systems are OSHA-compliant. • All life jackets or PFDs should be fastened and well fitting. • Prior to leaving the shore or dock, the operator should look around to determine if there are any oncoming boats or other hazards. Passengers should assist in looking for hazards. • Boat/barge safety practices will be conducted in general accordance with guidance provided in the U.S. Army Corps of Engineers (USACE) Safety and Health Requirements Manual (EM) 385-1-1 and the U.S. Coast Guard. • Keep limbs within the perimeter of the barge platform while it is in motion. • Passengers avoid excessive movement and pay attention to the navigation while the barge is in motion. • The consumption of alcoholic beverages and the use of illegal drugs will not be permitted aboard boats/barges on which GEI employees operating or conducting company business. This includes boats/barges that may belong to someone else (subcontractor, client, etc.). • Employees working on a barge will monitor the weather, incorporating, as appropriate, National Oceanic and Atmospheric Administration (NOAA) marine weather broadcasts and other local commercial weather forecasting services as may be available. • Beware of carbon monoxide poisoning when the engine is running in closed or poorly ventilated areas. • Do not attempt to brace the barge or push off against objects or hazards to assist the operator without specific directions to do so. • Report any near miss or incident situations. • Dress for the weather. • The operator shall maintain good weight distribution to avoid capsizing. • Follow the operator's directions in an emergency situation. Do not panic. • If equipment is on board, confirm it is well secured to prevent it from shifting during transit.
5. Docking (to other boats/barges, shorelines, launches, docks, etc.)	Cuts, scrapes, Struck-by, Eye Injury, Slips/Trips/Falls,	Noise Exposure HS-012 Water Safety HS-017	• Everyone should keep hands, feet, and equipment inside the vessel before docking to avoid pinch points.

Task Steps	Potential Hazards	GEI SOP or Program	Hazard Controls[1]
	Ergonomics, Biological Hazards, Drowning	Hazard Identification HS-026	• If docking to another boat or barge, clearly communicate your plans before coming up alongside their vessel. • If docking on a bank or shoreline, pay attention and watch for overhead branches, poisonous plant materials, and other hazards. • Avoid overreaching when transferring tools or equipment from one boat to another. Confirm both boats are stationary and prepared for the transfer.
6. De-boarding	Slips/ Trips/ falls, Drowning, Pinch points, Cuts and Lacerations, Drowning	Water Safety HS-017 Hazard Identification HS-026 GEI's Ergonomics Program	• When de-boarding, use three points of contact. Do not jump, run, board in inappropriate locations, or de-board without captain/ operator permission. The barge should be stationary and secured. If deboarding to land, check the consistency of the soil before stepping off the boat. • Only exit the barge in approved location • Maintain good housekeeping on the vessel. • Know your path of travel and keep hands free. • Take orders from and direct communication to operator of vessel. • Hand off packages, backpacks, and carry-ons before attempting a transfer. • Keep self and others clear of suspended or carried loads. • Do not leave any trash behind and take your belongings with you. • Once de-boarded, clear the area so that the barge to be trailered or craned out.
7. Equipment De-Mob	Heavy lifting, Cuts/Scrapes, Slips/Trips/Falls, Pinch points	Non-Powered Hand Tools HS-008a Manual Lifting HS-025 Ergonomic Program	• User proper lifting techniques. • Keep trafficked areas free from slip/trip/fall hazards. • Wear the proper type of glove to protect hands against sharp edges and skin/soft tissue injuries • Wear appropriate footwear • Be aware of hard to grip and hold items that may force your hand or wrist into awkward, stressful positions • Take breaks when carrying items frequently and/or for long distances • Do not overreach when picking up or placing items. • Use the buddy system when necessary • Properly secure all cargo before traveling

Task Steps	Potential Hazards	GEI SOP or Program	Hazard Controls[1]
1. Trailering	Vehicle Accidents, Crush/pinch points, Struck by	Driver Safety HS-004 Hazard Identification HS-026 Safe Trailer Use HS-028	• Secure the load completely before traveling. Make stops to check the load. • Only those trained in and comfortable with trailer maneuvering will be allowed to drive with a trailer. • Complete a pre-trip inspection of the vehicle, trailer, and load. • Drive at moderate speeds. This will place less strain on your tow vehicle and trailer. Trailer instability (sway) is more likely to occur as speed increases. • Avoid sudden starts and stops that can cause skidding, sliding, or jackknifing. • Make wider turns at curves and corners. • Check routes and restrictions on bridges and tunnels prior to departure. • Allow considerably more distance for stopping. • When passing a slower vehicle or changing lanes, signal well in advance and make sure you allow extra distance to clear the vehicle before you pull back into the lane. • Avoid passing on steep upgrades or downgrades. • When unhitching a trailer, place blocks at the front and rear of the trailer to keep the trailer from moving while people work, PPE (gloves) when coupling is released.

[1] Use the hierarchy of controls to determine applicable hazard controls for the task in order of most effective to least effective: Elimination (physically remove the hazard), Substitution (replace the hazard), Engineering Controls (Isolate the team from the hazard), Administrative Controls (change the way people work), PPE (personal protective equipment).

Task Steps	Potential Hazards	GEI SOP or Program	Hazard Controls[1]
2. Equipment Setup	Heavy lifting, Cuts/Scrapes, Slips/Trips/Falls, Pinch points	Non-Powered Hand Tools HS-008a Manual Lifting HS-025 Ergonomic Program	• User proper lifting techniques. • Keep trafficked areas free from slip/trip/fall hazards. • Wear the proper type of glove to protect hands against sharp edges and skin/soft tissue injuries. • Wear appropriate footwear. • Be aware of hard to grip and hold items that may force your hand or wrist into awkward, stressful positions. • Take breaks when carrying items frequently and/or for long distances. • Do not overreach when picking up or placing items. • Use the buddy system when necessary.
3. Boat Safety Check	Cuts/Scrapes, Slips/Trips/Falls, Pinch points, Overreaching	Hazard Identification HS-026 Ergonomic Program	• Confirm all appropriate operational and safety equipment is on board and in working condition. • Complete appropriate paperwork to document the safety check procedure. • Inspect the vessel for damage. If damage is found, the vessel should be taken out of service until it can be repaired. • Attend a tailgate meeting and review the float plan in detail. • Determine your method of emergency communication (radios, cell phones, air horns, etc.) and obtain all equipment or information needed (radio, cell phone charger, key phone numbers, etc.). • The operator should review all emergency procedures before launching. • Check with your local and state agency to verify their boat law/regulations before launching.
4. Handling Batteries (Batteries are used to power a small motor and the survey equipment)	Spill, Explosion, Skin Contact	Hazardous Substance Management HS-009 Hazard Identification HS-026 Hazard Communication (HAZCOM) Program	• Avoid bringing metal into contact with the battery terminals. • Never allow both terminals to make contact with an item simultaneously especially you • Do not use damaged batteries due to the risk of battery acid contact • Wear safety gloves when handling the batteries

Task Steps	Potential Hazards	GEI SOP or Program	Hazard Controls[1]
5. Launching the Vessel	Pinch Points, Struck By, cuts and lacerations, Slips/Trips/Falls, Ergonomics	Driver Safety HS-004 Water Safety HS-017 Hazard Identification HS-026 Safe Trailer Use HS-028	• Inspect the launch site before backing down the ramp. Look for people, debris, water body conditions, ruts, and other hazards. • Wear proper footwear. Maintain three points of contact. • Stay clear of moving vehicles and equipment. Keep hands clear of moving parts. • Disconnect trailer lights prior to boat entering the water. • Complete inspection of boat prior to launch. Start boat when in water, while hooked to the trailer. Do not unhook from trailer until boat is fully operational. • PFDs are to be worn within 10' of the water. • Utilize a spotter when backing up. • Hearing Protection must be worn around all loud motors. • All unnecessary personnel should stay out of the launch area while vehicles and boats are in motion. • Confirm secure tie off, anchor hold, or spud pole stick before deboarding the vessel.
6. Passenger Boarding	Slips/ Trips/ falls, Drowning, Pinch points, Cuts and Lacerations, drowning	Water Safety HS-017 Hazard Identification HS-026 GEI's Ergonomics Program	• Confirm the motor is working properly before anyone but the operator boards. • All passengers should be given a tour/ presentation of the boat's safety equipment, emergency procedures, hazards, and general passenger instructions. • When boarding, use three points of contact. Do not jump, run, board in inappropriate locations, or board without captain/ operator permission. The boat should be stationary and secured. • The operator should confirm housekeeping is maintained on the boat. All objects, tools, and equipment should be secured and put away before the passengers board. Take time to find a place for the passenger's belongings before leaving the launch. • Know your path of travel and keep hands free. • Take orders from and direct communication to operator of vessel. • Hand off packages, backpacks, and carry-ons before attempting a transfer. • Keep self and others clear of suspended or carried loads.
7. Boat Operation	Struck By, Cuts and lacerations, pinch points, fire/ explosion, remote work areas, ergonomics, drowning	Inclement Weather HS-010 Noise Exposure HS-012 Water Safety HS-017 Hazard Identification HS-026	• Allow engine to warm up idle speed before leaving the dock or shore. • Make sure all personnel on board are wearing PFDs. • Prior to leaving the shore or dock, the operator should look around to determine if there are any oncoming boats or other

Task Steps	Potential Hazards	GEI SOP or Program	Hazard Controls[1]
			hazards. • Boat safety practices will be conducted in general accordance with guidance provided in the U.S. Army Corps of Engineers (USACE) Safety and Health Requirements Manual (EM) 385-1-1 and the U.S. Coast Guard. • Keep limbs inside the boat while it is in Operation. • Confirm all passengers stay in a sitting position and pay attention to the navigation while the boat is in motion. • Any boat operator, whether GEI or a subcontractor, is not to exceed 12 hours of duty time in a 24-hour period. • The consumption of alcoholic beverages and the use of illegal drugs will not be permitted aboard boats/barges on which GEI employees operating or conducting company business. This includes boats/barges that may belong to someone else (subcontractor, client, etc.). • Employees operating or working on a boat will monitor the weather, incorporating, as appropriate, National Oceanic and Atmospheric Administration (NOAA) marine weather broadcasts and other local commercial weather forecasting services as may be available. • Beware of carbon monoxide poisoning when the boat engine is running in closed or poorly ventilated areas. • Confirm safe proximity to stationary objects. • Report any near miss or incident situations. • Use proper rules of the river when approaching other vessels. • Confirm vessel is out of the water before dark. Operate to the light conditions. • Dress for the weather. • Operators must keep vessels away from turbulent waters caused by discharges, rapids/large riffles, and stationary hazards. • Stay away from shallow or vegetated areas to avoid motor clogging or damage. • The operator shall maintain good weight distribution to avoid capsizing. • Do not stand in the boat. Avoid sudden movements. • Stay away from the edge of the boat/barge. • Have an extra set of clothing in case of drenching/soaking to prevent hypothermia.

Task Steps	Potential Hazards	GEI SOP or Program	Hazard Controls[1]
8. Docking (to other boats/barges, shorelines, launches, docks, etc.)	Cuts, scrapes, Struck-by, Eye Injury, Slips/Trips/Falls, Ergonomics, Biological Hazards	Noise Exposure HS-012 Water Safety HS-017 Hazard Identification HS-026	• Confirm all passengers have hands, feet, and equipment inside the vessel before docking to avoid pinch points. • If docking to another boat or barge, clearly communicate your plans before coming up alongside their vessel. • If docking on a bank or shoreline, watch for overhead branches, poisonous plant materials, and other hazards. • Avoid overreaching when transferring tools or equipment from one boat to another. Confirm both boats are stationary and prepared for the transfer.
9. De-boarding Passengers	Slips/ Trips/ falls, Drowning, Pinch points, Cuts and Lacerations	Water Safety HS-017 Hazard Identification HS-026 GEI's Ergonomics Program	• When de-boarding, use three points of contact. Do not jump, run, board in inappropriate locations, or de-board without captain/ operator permission. The boat should be stationary and secured. If deboarding to land, check the consistency of the soil before stepping off the boat. • Maintain good housekeeping on the vessel. • Know your path of travel and keep hands free. • Take orders from and direct communication to operator of vessel. • Hand off packages, backpacks, and carry-ons before attempting a transfer. • Keep self and others clear of suspended or carried loads. • Do not leave any trash behind and take your belongings with you.
10. Loading Boat on Trailer	Slips/ Trips/ falls, Drowning, Pinch points, Cuts and Lacerations	Driver Safety HS-004 Water Safety HS-017 Hazard Identification HS-026 Safe Trailer Use HS-028	• Confirm the boat launch area is clear before backing the boat trailer down the ramp. • Back up slowly and work with a spotter. • Line the boat up properly on the trailer before pulling it. Tilted or improperly loaded boats will not be secured properly for road travel. • Do not stand between the boat, trailer, and vehicle when loading. • Maintain a high level of communication. • Only use properly maintained winches and equipment. • Securely fasten tie-downs before traveling on roads.
11. Vessel Maintenance	Cuts, Lacerations, Eye Injury, Burns, Pinch points, motorized equipment, ergonomics	Non-Powered Hand Tools HS-008a Hazard Identification HS-026 Manual Lifting HS-025 Ergonomic Program	• Vessels should be maintained according to the operator's manual and as frequently as necessary to keep the boat in good working condition. • Only perform maintenance to your level of comfort and knowledge. Use professionals when necessary. • Use the right equipment for the job and avoid working in

Task Steps	Potential Hazards	GEI SOP or Program	Hazard Controls[1]
			ergonomically harsh positions. • Team lift or use equipment when necessary. • Clean the vessel to prevent the spread of invasive species. • All damage or wear should be addressed prior to further use.
12. Equipment Demobilization	Heavy lifting, Cuts/Scrapes, Slips/Trips/Falls, Pinch points	Non-Powered Hand Tools HS-008a Manual Lifting HS-025 Ergonomic Program	• User proper lifting techniques. • Keep trafficked areas free from slip/trip/fall hazards. • Wear the proper type of glove to protect hands against sharp edges and skin/soft tissue injuries. • Wear appropriate footwear. • Be aware of hard to grip and hold items that may force your hand or wrist into awkward, stressful positions. • Take breaks when carrying items frequently and/or for long distances. • Do not overreach when picking up or placing items. • Use the buddy system when necessary. • Properly secure all cargo before traveling.

Task Steps	Potential Hazards	GEI SOP or Program	Hazard Controls[1]
1. Mobilize on site	Slips/trips/falls, stuck by, crushing hazards	Hazard Identification HS-026	• Wear PPE that properly fits, is in good condition, and is appropriate for the activities and hazards. • Maintain good visibility of the work area. • Avoid walking on uneven, steeply sloped, or debris ridden ground surfaces. • Plan tasks prior to preforming them including an activity hazard analysis. • Keep trafficked areas free from slip/trip/fall hazards. • Wear shoes with traction. • Avoid traversing steep areas in slippery conditions. • Do not carry heavy objects to work areas, on steeply sloped areas, or where steep areas must be traversed to reach work areas.

[1] Use the hierarchy of controls to determine applicable hazard controls for the task in order of most effective to least effective: Elimination (physically remove the hazard), Substitution (replace the hazard), Engineering Controls (Isolate the team from the hazard), Administrative Controls (change the way people work), PPE (personal protective equipment).

Task Steps	Potential Hazards	GEI SOP or Program	Hazard Controls[1]
2. Utility survey/clearance	Shock, Explosion, Fire	Utility Mark-Out HS-014	• Confirm that all utilities have been properly marked prior to beginning work. • If a utility strike occurs, call the appropriate authorities immediately. Clear the area and do not delay. • Confirm adequate clearance from overhead utilities. • Do not stand or sit under suspended loads or near any pressurized equipment lines.
3. Observe contractor activities	Struck by/crushing hazards	Working Around Heavy Equipment HS-018	• Identify yourself and your work location to heavy equipment operators, so they may incorporate you into their operations. • Coordinate hand signals with operators. • Confirm equipment inspection has been completed. • Stay Alert! Pay attention to equipment backup alarms and swing radii. • Position yourself in a safe location. • Notify the contractor immediately if any problems arise. • Do not operate cellular telephones in the vicinity of heavy equipment operation.
4. Demobilize from site	Personal/material security, slips/trips/falls	Hazard Identification HS-026	• Confirm all materials are secured/labeled, including drums and any equipment left on site. • Confirm that any open trenches/pits are properly marked or barricaded. • Clean all equipment/tools prior to leaving. • Secure any gates/locks. • Notify project manager (or designee) you are leaving the site.

JHA Prepared By: Josh Prygon	Date:	Approved by: *RSM to complete*	Date:

Task Steps	Potential Hazards	GEI SOP or Program	Hazard Controls[1]
1. Inspect Vehicle	Slips/trips/falls	Hazard Identification HS-026 Driver Safety HS-004	• Walk around vehicle to inspect for any vehicle safety issues or hazards that could be within the travel path. • Adjust mirrors and seats prior to driving. • Becoming familiar with dashboard, center console, and steering controls. • Locate the turn signals, windshield wipers, lights, emergency flashers, and the heating, air conditioning, and defrost controls. • Use a spotter if needed when backing up.
2. Driving	Struck by/crushing hazards	Driver Safety SOP HS-004	• Employees must wear their safety belt while in a moving vehicle. • Employees will follow safe driving behaviors, which include limiting distractions such as manipulating radios or other equipment that may cause a distraction. Employees will not exceed the posted speed limit and will maintain a safe distance between other vehicles. • Use defensive driving techniques. • Avoid driving during hazardous weather conditions. • Driving distance and time after a 12-hour shift will not exceed 30 miles or 30 minutes (whichever is greater). • Vehicle accidents will be reported in accordance with GEI's Accident Reporting procedures.

[1] Use the hierarchy of controls to determine applicable hazard controls for the task in order of most effective to least effective: Elimination (physically remove the hazard), Substitution (replace the hazard), Engineering Controls (Isolate the team from the hazard), Administrative Controls (change the way people work), PPE (personal protective equipment).

Task Steps	Potential Hazards	GEI SOP or Program	Hazard Controls[1]
3. Parking Vehicle	Struck by, crushing hazards, security	Driver Safety SOP HS-004	• Be aware of surrounding conditions. Park in designated areas or a safe area away from heavy equipment. • Position the vehicle in a manner which reduces or eliminates the need to operate the vehicle in reverse. Choose an easy-exit parking space, like pull-through or where no one else is parked. • Don't crowd neighboring vehicles; be sure to park your vehicle in the middle of your space. • Secure equipment and supplies in the trunk or where they cannot be seen. Or take items with you if they cannot be hidden. • If at night, park in well-lit areas.
4. Site Entry	Slips/trips/falls, struck by, crushing	Working Around Heavy Equipment HS-018 Hazard Identification HS-026	• Don appropriate PPE prior to walking on site. • Identify yourself and your work location to heavy equipment operators, so they may incorporate you into their operations. • Stay Alert! Pay attention to equipment backup alarms and swing radii. • Avoid distractions like using cell phones while traversing the site.
5. Backing Up Vehicle	Struck by, crushing	Driver Safety HS-004	• Before entering your vehicle do a walk-around. Check for fences, poles, drop-offs, buildings, etc. • Know your clearances. While performing your walk-around also check for obstructions, low hanging eaves and tree limbs, wires, and any other potential clearance-related obstacles. • Use a spotter. Do not allow the spotter to be positioned directly behind your vehicle or walk backwards behind you while giving instructions. They should be off to the driver's side where you can see them in your side mirror.

JHA Prepared By: Josh Prygon	Date:	Approved by: *RSM to complete*	Date:

Task Steps	Potential Hazards	GEI SOP or Program	Hazard Controls[1]
1. Mobilize On Site/Equipment Setup	Slips/trips/falls, stuck by, crushing hazards	Hazard Identification HS-026	• Wear PPE that properly fits, is in good condition, and is appropriate for the activities and hazards. • Maintain good visibility of the work area. • Avoid walking on uneven, steeply sloped, or debris ridden ground surfaces. • Plan tasks prior to preforming them including an activity hazard analysis. • Keep trafficked areas free from slip/trip/fall hazards. • Wear shoes with traction. • Avoid traversing steep areas in slippery conditions. • Do not carry heavy objects to work areas, on steeply sloped areas, or where steep areas must be traversed to reach work areas.
2. Opening/Closing Drums	Contaminant Contact, Cuts or Abrasions Heavy Lifting , Slips/Trips/Falls	Container Management HS–003 Ergonomic Program	• Wear proper PPE during sampling including work gloves/nitrile gloves, safety glasses and face shield as appropriate. • Confirm the drum is upright and stable to avoid tipping while opening the drum. • Inspect the drum prior to opening. Do not handle drums with bulging sides. When a drum or container exhibits signs of over pressurization (such as swelling or bulging), the person at the is not to be moved until the cause of the over-pressurization has

[1] Use the hierarchy of controls to determine applicable hazard controls for the task in order of most effective to least effective e: Elimination (physically remove the hazard), Substitution (replace the hazard), Engineering Controls (Isolate the team from the hazard), Administrative Controls (change the way people work), PPE (personal protective equipment).

Task Steps	Potential Hazards	GEI SOP or Program	Hazard Controls[1]
			been determined and proper containment procedures have been implemented. • Inspect drum tools before use. If equipment is damaged, tag it, and do not use. • If the drum has been sealed for a long time, or has been exposed to changes in temperature, there may be pressure built up inside. Gently tap the bung holes with a rubber mallet, and remove the caps with a drum wrench or drum opening tool/pair of pliers to release pressure. • Use drum wrench to loosen the ring clamp around the outside of the drum. • Once the ring is removed, if the lid cannot be removed easily, tap around the entire edge of the lid with a hammer, then use a drum opening tool/wrench to pry the lid away from your body. • Do not use picks or chisels to open drums. • Do not lean over open drums or stand on closed drums. • Dispose of gloves after use and wash hands. • Wear work gloves over nitrile gloves.
3. Moving/Staging Drums	Contaminant Contact, Cuts or Abrasions Heavy Lifting , Slips/Trips/Falls	Container Management HS–003 Manual Lifting HS–025 Ergonomic Program	• Wear proper PPE during sampling including nitrile gloves and safety glasses and face shield as appropriate. • Before moving, check the drum for damage and confirm the bung/lid is securely fastened. Use proper tools to secure. • Confirm the pathway you plan to take is clear and free from debris. • Confirm the drum dolly being used is in a good condition and is designed to handle the specific drum-type being handled; some drum dollies cannot handle plastic open-top drums. • Do not attempt to move drums up and down steep slopes with manual equipment not intended for the application. • Operate drum hand trucks with a straight back using two hands and your leg if required by the design of the trolley; confirm no one is standing close to the load during manipulation. • Do not handle drums with bulging sides. • Dispose of gloves after use and wash hands. • Wear work gloves over nitrile gloves. • Use proper lifting techniques. • Ask fellow worker for help.

Task Steps	Potential Hazards	GEI SOP or Program	Hazard Controls[1]
4. Demobilize from site	Personal/material security, slips/trips/falls	Hazard Identification HS-026	• Confirm all materials are secured/labeled, including drums and any equipment left on site. • Clean all equipment/tools prior to leaving. • Secure any gates/locks. • Notify project manager (or designee) you are leaving the site.

Job Hazard Analysis

Task	GPR Utility Scanning		
Project Name/Number	2406810 - National Fuel GLLA Lower Scajaquada Ck RI/FS OU	Client Name	National Fuel Gas
GEI Project Manager	Richard Frappa	PM Review Date	
Tools/Equipment Used	Ground Penetrating Radar Unit, Marking paint		
Task Specific Training	GEI Annual Safety Training (Field or HAZWOPER), First Aid/CPR, Manufacturer Specific Training on GPR Equipment		
Personal Protective Equipment (PPE)	☐ Hard Hat ☒Safety Glasses ☒Safety-Toed Boots ☒ Reflective Vest ☐Hearing Protection ☐ Personal Flotation Device (PFD) ☐ Face Shield ☐ Chaps ☐ Tyvek clothing/boots ☐ Flame Resistant Clothing ☒ Gloves leather or other mechanics gloves ☐Respirator ☐Other		

JHA Prepared By: Josh Prygon	Date:	Approved by: *RSM to complete*	Date:

Task Steps	Potential Hazards	GEI SOP or Program	Hazard Controls[1]
1. Mobilize on site	Slips/trips/falls, stuck by, crushing hazards	Hazard Identification HS-026	• Wear PPE that properly fits, is in good condition, and is appropriate for the activities and hazards. • Maintain good visibility of the work area. • Avoid walking on uneven, steeply sloped, or debris ridden ground surfaces. • Plan tasks prior to preforming them including an activity hazard analysis. • Keep trafficked areas free from slip/trip/fall hazards. • Wear shoes with traction. • Avoid traversing steep areas in slippery conditions. • Do not carry heavy objects to work areas, on steeply sloped areas, or where steep areas must be traversed to reach work areas.
2. Carry Equipment and Set-up	Heavy lifting, Cuts/Scrapes, Slips/Trips/Falls, Pinch points	Non-Powered Hand Tools HS-008a Manual Lifting HS-025 Ergonomic Program	• User proper lifting techniques. • Keep trafficked areas free from slip/trip/fall hazards. • Wear the proper type of glove to protect hands against sharp edges and skin/soft tissue injuries. • Wear appropriate footwear. • Be aware of hard to grip and hold items that may force your hand or wrist into awkward, stressful positions.

[1] Use the hierarchy of controls to determine applicable hazard controls for the task in order of most effective to least effective: Elimination (physically remove the hazard), Substitution (replace the hazard), Engineering Controls (Isolate the team from the hazard), Administrative Controls (change the way people work), PPE (personal protective equipment).

Task Steps	Potential Hazards	GEI SOP or Program	Hazard Controls[1]
			• Take breaks when carrying items frequently and/or for long distances. • Do not overreach when picking up or placing items. • Use the buddy system when necessary.
3. GPR Equipment Utility Scanning	Heavy lifting, Cuts/Scrapes, Slips/Trips/Falls, Pinch points	Powered Hand Tools HS-008b Manual Lifting HS-025 Ergonomic Program	• Visually scan route before making passes with GPR. • Look for indicators of utility presence. • Keep GPR equipment under constant surveillance or secured against unauthorized use or removal.
4. Demobilize from site	Personal/material security, slips/trips/falls	Hazard Identification HS-026	• Confirm all materials/equipment are secured. • Clean all equipment/tools prior to leaving. • Secure any gates/locks. • Notify project manager (or designee) you are leaving the site.

1. Carry Equipment and Set-up	Heavy lifting, Cuts/Scrapes, Slips/Trips/Falls, Pinch points	Non-Powered Hand Tools HS-008a Manual Lifting HS-025 Ergonomic Program	• User proper lifting techniques. • Keep trafficked areas free from slip/trip/fall hazards. • Wear the proper type of glove to protect hands against sharp edges and skin/soft tissue injuries. • Wear appropriate footwear. • Be aware of hard to grip and hold items that may force your hand or wrist into awkward, stressful positions. • Take breaks when carrying items frequently and/or for long distances. • Do not overreach when picking up or placing items. • Use the buddy system when necessary.
2. Cut Tubing/String	Cuts/Scrapes, pinch points	Non-Powered Hand Tools HS-008a	• Wear cut resistant gloves. • Use safe cutting tools such as safety scissors is a best practice. • Keep free hand out of the way. • Secure the item being cut. • Use only sharp blades; dull blades require more force that results in less control. • Do not put the sharp cutting tool in your pocket.

[1] Use the hierarchy of controls to determine applicable hazard controls for the task in order of most effective to least effective: Elimination (physically remove the hazard), Substitution (replace the hazard), Engineering Controls (Isolate the team from the hazard), Administrative Controls (change the way people work), PPE (personal protective equipment).

Task Steps	Potential Hazards	GEI SOP or Program	Hazard Controls[1]
3. Secure string to bailer and lower bailer down well to collect water	Contaminant Contact, Awkward position, Slips/Trips/Falls, Heavy lifting	Ergonomic Program	• Wear proper PPE during sampling including nitrile gloves and safety glasses and face shield as appropriate. • Keep trafficked areas free from slip/trip/fall hazards. • Be aware of hard to grip and hold items that may force your hand or wrist into awkward, stressful positions. • Take breaks when carrying items frequently and/or for long distances. • Do not overreach when picking up or placing items. • Use the buddy system when necessary.
4. Collect GW Reading/Samples	Awkward position, contaminant exposure	Hazard Identification HS–026 Benzene Awareness Program Ergonomic Program	• Wear Nitrile/neoprene gloves and dispose of gloves after use and wash hands. • Take regular breaks and do not work in unusual positions for long periods of time. • Keep trafficked areas free from slip/trip/fall hazards.
5. Drum Purge Water	Contaminant Contact, Cuts or Abrasions Heavy Lifting , Slips/Trips/Falls	Container Management HS–003 Manual Lifting HS–025 Ergonomic Program	• Wear proper PPE during sampling including nitrile gloves and safety glasses and face shield as appropriate. • Use proper dollies or drum moving tools. • Use applicable tools to open/close drum lids. • Do not handle drums with bulging sides. • Dispose of gloves after use and wash hands. • Wear work gloves over nitrile gloves. • Use proper lifting techniques. • Ask fellow worker for help. • Keep trafficked areas free from slip/trip/fall hazards.
6. Pack Samples	Heavy lifting, cuts, or abrasions	Manual Lifting HS–025 Ergonomic Program	• Confirm that the lids on all bottles are tight (will not leak). • Place cushioning/absorbent material in the bottom of the cooler and then place the containers in the cooler with sufficient space to allow for the addition of cushioning between the containers. • Use proper dollies or other lifting tools. • Use proper lifting techniques. • Take regular breaks and do not work in unusual positions for long periods of time. • If glassware breaks, dispose of in puncture-resistant containers. Use cut resistant gloves to handle any broken glass.

Task Steps	Potential Hazards	GEI SOP or Program	Hazard Controls[1]
7. Equipment Decontamination	Contaminant Contact, Cuts or Abrasions, Slips/Trips/Falls	Hazard Identification HS–026 Ergonomic Program	• Wear nitrile gloves and glasses to provide eye protection from splashing. • Wash hands immediately after use. • Take regular breaks and do not work in unusual positions for long periods of time. • Keep trafficked areas free from slip/trip/fall hazards.
8. Equipment Demobilization	Heavy lifting, Cuts/Scrapes, Slips/Trips/Falls, Pinch points	Non-Powered Hand Tools HS-008a Manual Lifting HS-025 Ergonomic Program	• User proper lifting techniques. • Keep trafficked areas free from slip/trip/fall hazards. • Wear the proper type of glove to protect hands against sharp edges and skin/soft tissue injuries. • Wear appropriate footwear. • Be aware of hard to grip and hold items that may force your hand or wrist into awkward, stressful positions. • Take breaks when carrying items frequently and/or for long distances. • Do not overreach when picking up or placing items. • Use the buddy system when necessary.

JHA Prepared By: Josh Prygon	**Date:**	**Approved by: *RSM to complete***	**Date:**

Task Steps	Potential Hazards	GEI SOP or Program	Hazard Controls[1]
1. Carry Equipment and Set-up	Heavy lifting, Cuts/Scrapes, Slips/Trips/Falls, Pinch points	Non-Powered Hand Tools HS-008a Manual Lifting HS-025 Ergonomic Program	• User proper lifting techniques. • Keep trafficked areas free from slip/trip/fall hazards. • Wear the proper type of glove to protect hands against sharp edges and skin/soft tissue injuries. • Wear appropriate footwear. • Be aware of hard to grip and hold items that may force your hand or wrist into awkward, stressful positions. • Take breaks when carrying items frequently and/or for long distances. • Do not overreach when picking up or placing items. • Use the buddy system when necessary.
2. Working in Water	Drowning, hypothermia	Water Safety HS-017	• Buddy system shall be in use. • Become familiar and comfortable when walking in water with uneven and slippery surfaces. • Be aware of your surroundings. • Avoid going in water deeper than mid-thigh (some waders are chest waders). • Wear PPE, including PFD, gloves, wading boots, and waders. • Avoid going in water deeper than waders. • Avoid areas with a combination of deep water and fast currents.

[1] Use the hierarchy of controls to determine applicable hazard controls for the task in order of most effective to least effective: Elimination (physically remove the hazard), Substitution (replace the hazard), Engineering Controls (Isolate the team from the hazard), Administrative Controls (change the way people work), PPE (personal protective equipment).

Task Steps	Potential Hazards	GEI SOP or Program	Hazard Controls[1]
			• Become familiar and comfortable when walking in streams.
3. Shovel Use	Cuts and lacerations/pinch points	Non-Powered Hand Tools HS-008a	• Use proper lifting techniques. • Do not remove equipment guards on equipment. • Take regular breaks and do not work in unusual positions for long periods of time. • Inspect equipment or tools prior to use. Tag and remove from service if tool is damaged.
4. Soil Sampling	Cuts/Scrapes, Repetition, Slips/Trips/Falls	Hazard Identification HS-026	• Dispose of gloves after use and wash hands. • Wear work gloves over nitrile gloves. • Excavation entry will be allowed only with proper sloping or shoring. • Take regular breaks and do not work in unusual positions for long periods of time. • Keep trafficked areas free from slip/trip/fall hazards.
5. Pack Soil Samples	Heavy lifting, cuts, or abrasions	Manual Lifting HS–025 Ergonomic Program	• Confirm that the lids on all bottles are tight (will not leak). • Place cushioning/absorbent material in the bottom of the cooler and then place the containers in the cooler with sufficient space to allow for the addition of cushioning between the containers. • Use proper dollies or other lifting tools. • Use proper lifting techniques. • Take regular breaks and do not work in unusual positions for long periods of time. • If glassware breaks, dispose of in puncture-resistant containers. Use cut resistant gloves to handle any broken glass.
6. Equipment Cleanup	Cuts or Abrasions, Slips/Trips/Falls	Hazard Identification HS-026 Ergonomic Program	• Wear nitrile gloves and glasses to provide eye protection from splashing. • Wash hands immediately after use. • Take regular breaks and do not work in unusual positions for long periods of time. • Keep trafficked areas free from slip/trip/fall hazards.
7. Demobilize from site	Personal/material security, slips/trips/falls	Hazard Identification HS-026	• Confirm all materials are secured/labeled, including drums and any equipment left on site. • Confirm that any open trenches/pits are properly marked or barricaded. • Clean all equipment/tools prior to leaving.

Task Steps	Potential Hazards	GEI SOP or Program	Hazard Controls[1]
			• Secure any gates/locks. • Notify project manager (or designee) you are leaving the site.

Task Steps	Potential Hazards	GEI SOP or Program	Hazard Controls[1]
1. Walk to Site	Slip/trips/falls, repetition, heat stress, cold stress, biological hazards	Biological Hazards HS-001 Inclement Weather HS-010 Manual Lifting HS-025 Hazard Identification HS-026 GEI Cold Stress Program GEI Heat Stress Program GEI Ergonomic Program	• Follow the rules of the road and obey signs and signals. • Walk on sidewalks whenever they are available. • If there is no sidewalk, walk facing traffic and as far from traffic as possible. • Cross streets at crosswalks or intersections. Look for cars in all directions, including those turning left or right. • If a crosswalk or intersection is not available, locate a well-lit area where you have the best view of traffic. Wait for a gap in traffic that allows enough time to cross safely; continue watching for traffic as you cross. • Watch for cars entering or exiting driveways, or backing up in parking lots. • Avoid walking on uneven, steeply sloped or debris ridden ground surfaces. • Discuss action plan prior to severe weather.

[1] Use the hierarchy of controls to determine applicable hazard controls for the task in order of most effective to least effective: Elimination (physically remove the hazard), Substitution (replace the hazard), Engineering Controls (Isolate the team from the hazard), Administrative Controls (change the way people work), PPE (personal protective equipment).

Task Steps	Potential Hazards	GEI SOP or Program	Hazard Controls[1]
2. Carrying Equipment/Site Setup	Heavy lifting, strains/sprains, slip/trips/falls, pinch points	Non-Powered Hand Tools HAS-008a Manual Lifting HS-025 GEI Ergonomic Program	• Use proper lifting techniques. • Check route for clearance of trip hazards. • Wear appropriate footwear and gloves to protect hands against sharp edges and soft tissue injuries. • Be aware of hard to grip and hold items that may force your hand or wrist into awkward, stressful positions. • Take breaks when carrying items frequently and/or for long distances. • Do not overreach when picking up or placing items. • Use the buddy system when necessary.
3. Demobilize from Site	Personal/material security, slips/trips/falls	Hazard Identification HS-026	• Confirm all materials are secured/labeled, including drums and any equipment left on site. • Confirm that any open trenches/pits are properly marked or barricaded. • Clean all equipment/tools prior to leaving. • Secure any gates/locks. • Notify project manager (or designee) you are leaving the site.

Task Steps	Potential Hazards	GEI SOP or Program	Hazard Controls[1]
1. Clothing Treatment - Permethrin	Chemical Exposure	Biological Hazards HS-001 (Permethrin Guidance)	• Read application instructions thoroughly and apply according to the directions. Do not over-treat products. • Permethrin treatments are for meant only for fabrics, do not apply directly to the skin. • Apply product to clothing and gear outdoors in a well-ventilated area protected from wind. • Hang treated clothing outdoors and allow for them to dry completely before wearing. • Do not spray directly on clothing that you are wearing. • Do not wear clothing or use gear that is not completely dry. • Wash treated clothing separate from other garments. • Retreat clothing and gear after six washings or six weeks of exposure to sun and air.
2. Carrying Equipment/Site Setup	Heavy lifting, strains/sprains, slip/trips/falls, pinch points	Non-Powered Hand Tools HAS-008a Manual Lifting HS-025 GEI Ergonomic Program	• Use proper lifting techniques. • Check route for clearance of trip hazards. • Wear appropriate footwear and gloves to protect hands against sharp edges and soft tissue injuries. • Be aware of hard to grip and hold items that may force your hand or wrist into awkward, stressful positions. • Take breaks when carrying items frequently and/or for long distances.

[1] Use the hierarchy of controls to determine applicable hazard controls for the task in order of most effective to least effective: Elimination (physically remove the hazard), Substitution (replace the hazard), Engineering Controls (Isolate the team from the hazard), Administrative Controls (change the way people work), PPE (personal protective equipment).

			• Do not overreach when picking up or placing items. • Use the buddy system when necessary.
3. Site Walk/Survey	Slip/trips/falls, repetition, heat stress, cold stress, biological hazards	Biological Hazards HS-001 Inclement Weather HS-010 Manual Lifting HS-025 Hazard Identification HS-026 GEI Cold Stress Program GEI Heat Stress Program GEI Ergonomic Program	• Wear steel-toed boots and high visibility reflective vest when traversing work areas. • Avoid walking on uneven, steeply sloped or debris ridden ground surfaces. • Avoid areas infested with poisonous plants. Use a barrier cream to provide some protection against poisonous plants. If exposed to a poisonous plant, wash with soap and water or a product such as Technu. Use a tool or grab stick to move branches instead of touching them directly. • Discuss action plan prior to severe weather. • Apply insect repellent and poisonous plant barrier cream prior to the start of any field work and as needed throughout the workday. • Use the buddy system and have a check in plan with project team and/or project manager. • Bring adequate hydration for the workday (water, fluids with electrolytes). • Apply sunscreen regularly or wear a hat and long sleeve to reduce sun exposure. • Plan an area to take breaks with natural shade or provided by pop up structure. • Bring backpack to carry your fluids, snacks, first aid kits, etc. for larger project sites. • Some project sites may have mammals such as stray or domesticated dogs and cats, raccoons, rats, snakes, etc. All employees should use discretion and attempt to remove avoid any contact with these animals.
4. Demobilize from Site	Personal/material security, slips/trips/falls	Hazard Identification HS-026	• Confirm all materials are secured/labeled, including drums and any equipment left on site. • Confirm that any open trenches/pits are properly marked or barricaded. • Clean all equipment/tools prior to leaving. • Secure any gates/locks. • Notify project manager (or designee) you are leaving the site.

JHA Prepared By: Josh Prygon	**Date:**	**Approved by: *RSM to complete***	**Date:**

Task Steps	Potential Hazards	GEI SOP or Program	Hazard Controls[1]
1. Mobilize On Site/Equipment Setup	Slips/trips/falls, stuck by, crushing hazards	Hazard Identification HS-026	• Wear PPE that properly fits, is in good condition, and is appropriate for the activities and hazards. • Maintain good visibility of the work area. • Avoid walking on uneven, steeply sloped, or debris ridden ground surfaces. • Plan tasks prior to preforming them including an activity hazard analysis. • Keep trafficked areas free from slip/trip/fall hazards. • Wear shoes with traction. • Avoid traversing steep areas in slippery conditions. • Do not carry heavy objects to work areas, on steeply sloped areas, or where steep areas must be traversed to reach work areas.

[1] Use the hierarchy of controls to determine applicable hazard controls for the task in order of most effective to least effective: Elimination (physically remove the hazard), Substitution (replace the hazard), Engineering Controls (Isolate the team from the hazard), Administrative Controls (change the way people work), PPE (personal protective equipment).

Task Steps	Potential Hazards	GEI SOP or Program	Hazard Controls[1]
2. Utility survey	Shock, Explosion, Fire	Utility Mark Out HS-014	• Confirm that all utilities have been properly marked prior to beginning work. • If a utility strike occurs, call the appropriate authorities. immediately. Clear the area and do not delay.
3. Observe contractor activities	Struck by/crushing hazards	Working Around Heavy Equipment HS-018	• Identify yourself and your work location to heavy equipment operators, so they may incorporate you into their operations. • Coordinate hand signals with operators. • Confirm equipment inspection has been completed. • Stay Alert! Pay attention to equipment backup alarms and swing radii. • Position yourself in a safe location. • Confirm adequate clearance from overhead utilities. • Notify the contractor immediately if any problems arise. • Do not stand or sit under suspended loads or near any pressurized equipment lines. • Do not operate cellular telephones in the vicinity of heavy equipment operation.
4. Cutting Soil Core Liners	Cuts/lacerations, contaminant exposure	Non-Powered Hand Tools HS-008a Ergonomic Program	• Eliminate the hazard by having the drillers open the cores/liners for you. o Keep a safe distance from the core while they are cutting the liner (hands, face, and body). o Do not stand on either side of the core in the direction they are cutting. o Make sure your safety glasses are on, in case of material splatter. • If you are cutting the liner, use a liner cutting tool, safety shears, or at a minimum hooked blades on a self-retracting knife. • When using cutting tools, follow these safety precautions: o Wear cut resistant gloves. o Keep free hand out of the way. o Secure the liner if cutting through thick material. o Use only sharp blades; dull blades require more force that results in less control. o Do not put the sharp cutting tool in your pocket. • Use care when evaluating cores, as the plastic that has been cut can be sharp.
5. Sample Soil	Contaminant Exposure, Cuts/Scrapes, Repetition,	Hazard Identification HS-026/Container Management HS-003	• Dispose of gloves after use and wash hands. • Wear work gloves over nitrile gloves. • Excavation entry will be allowed only with proper sloping or

Task Steps	Potential Hazards	GEI SOP or Program	Hazard Controls[1]
	Slips/Trips/Falls		shoring. • Take regular breaks and do not work in unusual positions for long periods of time. • Keep trafficked areas free from slip/trip/fall hazards.
6. Drum Soil Cuttings	Contaminant Contact, Cuts or Abrasions Heavy Lifting , Slips/Trips/Falls	Container Management HS–003 Manual Lifting HS–025 Ergonomic Program	• Wear proper PPE during sampling including nitrile gloves and safety glasses and face shield as appropriate. • Use proper dollies or drum moving tools. • Use applicable tools to open/close drum lids. • Do not handle drums with bulging sides. • Dispose of gloves after use and wash hands. • Wear work gloves over nitrile gloves. • Use proper lifting techniques. • Ask fellow worker for help. • Keep trafficked areas free from slip/trip/fall hazards.
7. Pack Soil Samples	Heavy lifting, cuts, or abrasions	Manual Lifting HS–025 Ergonomic Program	• Confirm that the lids on all bottles are tight (will not leak). • Place cushioning/absorbent material in the bottom of the cooler and then place the containers in the cooler with sufficient space to allow for the addition of cushioning between the containers. • Use proper dollies or other lifting tools. • Use proper lifting techniques. • Take regular breaks and do not work in unusual positions for long periods of time. • If glassware breaks, dispose of in puncture-resistant containers. Use cut resistant gloves to handle any broken glass.
8. Equipment Decontamination	Contaminant Contact, Cuts or Abrasions, Slips/Trips/Falls	Hazard Identification HS–026 Ergonomic Program	• Wear nitrile gloves and glasses to provide eye protection from splashing. • Wash hands immediately after use. • Take regular breaks and do not work in unusual positions for long periods of time. • Keep trafficked areas free from slip/trip/fall hazards.
9. Demobilize from site	Personal/material security, slips/trips/falls	Hazard Identification HS-026	• Confirm all materials are secured/labeled, including drums and any equipment left on site. • Confirm that any open trenches/pits are properly marked or barricaded. • Clean all equipment/tools prior to leaving. • Secure any gates/locks. • Notify project manager (or designee) you are leaving the site.

Material Safety Data Sheet
Benzene MSDS

Section 1: Chemical Product and Company Identification

Product Name: Benzene

Catalog Codes: SLB1564, SLB3055, SLB2881

CAS#: 71-43-2

RTECS: CY1400000

TSCA: TSCA 8(b) inventory: Benzene

CI#: Not available.

Synonym: Benzol; Benzine

Chemical Name: Benzene

Chemical Formula: C6-H6

Contact Information:

Sciencelab.com, Inc.
14025 Smith Rd.
Houston, Texas 77396

US Sales: **1-800-901-7247**
International Sales: **1-281-441-4400**

Order Online: ScienceLab.com

CHEMTREC (24HR Emergency Telephone), call:
1-800-424-9300

International CHEMTREC, call: 1-703-527-3887

For non-emergency assistance, call: 1-281-441-4400

Section 2: Composition and Information on Ingredients

Composition:

Name	CAS #	% by Weight
Benzene	71-43-2	100

Toxicological Data on Ingredients: Benzene: ORAL (LD50): Acute: 930 mg/kg [Rat]. 4700 mg/kg [Mouse]. DERMAL (LD50): Acute: >9400 mg/kg [Rabbit]. VAPOR (LC50): Acute: 10000 ppm 7 hours [Rat].

Section 3: Hazards Identification

Potential Acute Health Effects:
Very hazardous in case of eye contact (irritant), of inhalation. Hazardous in case of skin contact (irritant, permeator), of ingestion. Inflammation of the eye is characterized by redness, watering, and itching.

Potential Chronic Health Effects:
CARCINOGENIC EFFECTS: Classified A1 (Confirmed for human.) by ACGIH, 1 (Proven for human.) by IARC.
MUTAGENIC EFFECTS: Classified POSSIBLE for human. Mutagenic for mammalian somatic cells. Mutagenic for bacteria and/or yeast.
TERATOGENIC EFFECTS: Not available.
DEVELOPMENTAL TOXICITY: Classified Reproductive system/toxin/female [POSSIBLE].
The substance is toxic to blood, bone marrow, central nervous system (CNS).
The substance may be toxic to liver, Urinary System.
Repeated or prolonged exposure to the substance can produce target organs damage.

Section 4: First Aid Measures

Eye Contact:
Check for and remove any contact lenses. In case of contact, immediately flush eyes with plenty of water for at least 15 minutes. Cold water may be used. WARM water MUST be used. Get medical attention immediately.

Skin Contact:
In case of contact, immediately flush skin with plenty of water. Cover the irritated skin with an emollient. Remove contaminated clothing and shoes. Wash clothing before reuse. Thoroughly clean shoes before reuse. Get medical attention.

Serious Skin Contact:
Wash with a disinfectant soap and cover the contaminated skin with an anti-bacterial cream. Seek immediate medical attention.

Inhalation:
If inhaled, remove to fresh air. If not breathing, give artificial respiration. If breathing is difficult, give oxygen. Get medical attention if symptoms appear.

Serious Inhalation:
Evacuate the victim to a safe area as soon as possible. Loosen tight clothing such as a collar, tie, belt or waistband. If breathing is difficult, administer oxygen. If the victim is not breathing, perform mouth-to-mouth resuscitation. Seek medical attention.

Ingestion:
Do NOT induce vomiting unless directed to do so by medical personnel. Never give anything by mouth to an unconscious person. If large quantities of this material are swallowed, call a physician immediately. Loosen tight clothing such as a collar, tie, belt or waistband.

Serious Ingestion: Not available.

Section 5: Fire and Explosion Data

Flammability of the Product: Flammable.

Auto-Ignition Temperature: 497.78°C (928°F)

Flash Points: CLOSED CUP: -11.1°C (12°F). (Setaflash)

Flammable Limits: LOWER: 1.2% UPPER: 7.8%

Products of Combustion: These products are carbon oxides (CO, CO2).

Fire Hazards in Presence of Various Substances:
Highly flammable in presence of open flames and sparks, of heat.
Slightly flammable to flammable in presence of oxidizing materials.
Non-flammable in presence of shocks.

Explosion Hazards in Presence of Various Substances:
Risks of explosion of the product in presence of mechanical impact: Not available.
Risks of explosion of the product in presence of static discharge: Not available.
Explosive in presence of oxidizing materials, of acids.

Fire Fighting Media and Instructions:
Flammable liquid, soluble or dispersed in water.
SMALL FIRE: Use DRY chemical powder.
LARGE FIRE: Use alcohol foam, water spray or fog.

Special Remarks on Fire Hazards:
Extremely flammable liquid and vapor. Vapor may cause flash fire.
Reacts on contact with iodine heptafluoride gas.

Dioxygenyl tetrafluoroborate is as very powferful oxidant. The addition of a small particle to small samples of benzene, at ambient temperature, causes ignition.
Contact with sodium peroxide with benzene causes ignition.
Benzene ignites in contact with powdered chromic anhydride.
Virgorous or incandescent reaction with hydrogen + Raney nickel (above 210 C) and bromine trifluoride.

Special Remarks on Explosion Hazards:
Benzene vapors + chlorine and light causes explosion.
Reacts explosively with bromine pentafluoride, chlorine, chlorine trifluoride, diborane, nitric acid, nitryl perchlorate, liquid oxygen, ozone, silver perchlorate.
Benzene + pentafluoride and methoxide (from arsenic pentafluoride and potassium methoxide) in trichlorotrifluoroethane causes explosion.
Interaction of nitryl perchlorate with benzene gave a slight explosion and flash.
The solution of permanganic acid (or its explosive anhydride, dimaganese heptoxide) produced by interaction of permanganates and sulfuric acid will explode on contact with benzene.
Peroxodisulfuric acid is a very powferful oxidant. Uncontrolled contact with benzene may cause explosion.
Mixtures of peroxomonsulfuric acid with benzene explodes.

Section 6: Accidental Release Measures

Small Spill: Absorb with an inert material and put the spilled material in an appropriate waste disposal.

Large Spill:
Flammable liquid.
Keep away from heat. Keep away from sources of ignition. Stop leak if without risk. Absorb with DRY earth, sand or other non-combustible material. Do not touch spilled material. Prevent entry into sewers, basements or confined areas; dike if needed. Be careful that the product is not present at a concentration level above TLV. Check TLV on the MSDS and with local authorities.

Section 7: Handling and Storage

Precautions:
Keep locked up.. Keep away from heat. Keep away from sources of ignition. Ground all equipment containing material. Do not ingest. Do not breathe gas/fumes/ vapor/spray. In case of insufficient ventilation, wear suitable respiratory equipment. If ingested, seek medical advice immediately and show the container or the label. Avoid contact with skin and eyes. Keep away from incompatibles such as oxidizing agents, acids.

Storage:
Store in a segregated and approved area. Keep container in a cool, well-ventilated area. Keep container tightly closed and sealed until ready for use. Avoid all possible sources of ignition (spark or flame).

Section 8: Exposure Controls/Personal Protection

Engineering Controls:
Provide exhaust ventilation or other engineering controls to keep the airborne concentrations of vapors below their respective threshold limit value. Ensure that eyewash stations and safety showers are proximal to the work-station location.

Personal Protection:
Splash goggles. Lab coat. Vapor respirator. Be sure to use an approved/certified respirator or equivalent. Gloves.

Personal Protection in Case of a Large Spill:
Splash goggles. Full suit. Vapor respirator. Boots. Gloves. A self contained breathing apparatus should be used to avoid inhalation of the product. Suggested protective clothing might not be sufficient; consult a specialist BEFORE handling this product.

Exposure Limits:

TWA: 0.5 STEL: 2.5 (ppm) from ACGIH (TLV) [United States]
TWA: 1.6 STEL: 8 (mg/m3) from ACGIH (TLV) [United States]
TWA: 0.1 STEL: 1 from NIOSH
TWA: 1 STEL: 5 (ppm) from OSHA (PEL) [United States]
TWA: 10 (ppm) from OSHA (PEL) [United States]
TWA: 3 (ppm) [United Kingdom (UK)]
TWA: 1.6 (mg/m3) [United Kingdom (UK)]
TWA: 1 (ppm) [Canada]
TWA: 3.2 (mg/m3) [Canada]
TWA: 0.5 (ppm) [Canada]Consult local authorities for acceptable exposure limits.

Section 9: Physical and Chemical Properties

Physical state and appearance: Liquid.

Odor:
Aromatic. Gasoline-like, rather pleasant.
(Strong.)

Taste: Not available.

Molecular Weight: 78.11 g/mole

Color: Clear Colorless. Colorless to light yellow.

pH (1% soln/water): Not available.

Boiling Point: 80.1 (176.2°F)

Melting Point: 5.5°C (41.9°F)

Critical Temperature: 288.9°C (552°F)

Specific Gravity: 0.8787 @ 15 C (Water = 1)

Vapor Pressure: 10 kPa (@ 20°C)

Vapor Density: 2.8 (Air = 1)

Volatility: Not available.

Odor Threshold: 4.68 ppm

Water/Oil Dist. Coeff.: The product is more soluble in oil; log(oil/water) = 2.1

Ionicity (in Water): Not available.

Dispersion Properties: See solubility in water, diethyl ether, acetone.

Solubility:
Miscible in alcohol, chloroform, carbon disulfide oils, carbon tetrachloride, glacial acetic acid, diethyl ether, acetone.
Very slightly soluble in cold water.

Section 10: Stability and Reactivity Data

Stability: The product is stable.

Instability Temperature: Not available.

Conditions of Instability: Heat, ignition sources, incompatibles.

Incompatibility with various substances: Highly reactive with oxidizing agents, acids.

Corrosivity: Non-corrosive in presence of glass.

Special Remarks on Reactivity:
Benzene vapors + chlorine and light causes explosion.
Reacts explosively with bromine pentafluoride, chlorine, chlorine trifluoride, diborane, nitric acid, nitryl perchlorate, liquid oxygen, ozone, silver perchlorate.
Benzene + pentafluoride and methoxide (from arsenic pentafluoride and potassium methoxide) in trichlorotrifluoroethane causes explosion.
Interaction of nitryl perchlorate with benzene gave a slight explosion and flash.
The solution of permanganic acid (or its explosive anhydride, dimaganese heptoxide) produced by interaction of permanganates and sulfuric acid will explode on contact with benzene.
Peroxodisulfuric acid is a very powferful oxidant. Uncontrolled contact with benzene may cause explosion.
Mixtures of peroxomonsulfuric acid with benzene explodes.

Special Remarks on Corrosivity: Not available.

Polymerization: Will not occur.

Section 11: Toxicological Information

Routes of Entry: Absorbed through skin. Dermal contact. Eye contact. Inhalation.

Toxicity to Animals:
WARNING: THE LC50 VALUES HEREUNDER ARE ESTIMATED ON THE BASIS OF A 4-HOUR EXPOSURE.
Acute oral toxicity (LD50): 930 mg/kg [Rat].
Acute dermal toxicity (LD50): >9400 mg/kg [Rabbit].
Acute toxicity of the vapor (LC50): 10000 7 hours [Rat].

Chronic Effects on Humans:
CARCINOGENIC EFFECTS: Classified A1 (Confirmed for human.) by ACGIH, 1 (Proven for human.) by IARC.
MUTAGENIC EFFECTS: Classified POSSIBLE for human. Mutagenic for mammalian somatic cells. Mutagenic for bacteria and/or yeast.
DEVELOPMENTAL TOXICITY: Classified Reproductive system/toxin/female [POSSIBLE].
Causes damage to the following organs: blood, bone marrow, central nervous system (CNS).
May cause damage to the following organs: liver, Urinary System.

Other Toxic Effects on Humans:
Very hazardous in case of inhalation.
Hazardous in case of skin contact (irritant, permeator), of ingestion.

Special Remarks on Toxicity to Animals: Not available.

Special Remarks on Chronic Effects on Humans:
May cause adverse reproductive effects (female fertility, Embryotoxic and/or foetotoxic in animal) and birth defects.
May affect genetic material (mutagenic).
May cause cancer (tumorigenic, leukemia))
Human: passes the placental barrier, detected in maternal milk.

Special Remarks on other Toxic Effects on Humans:
Acute Potential Health Effects:
Skin: Causes skin irritation. It can be absorbed through intact skin and affect the liver, blood, metabolism,and urinary system.
Eyes: Causes eye irritation.
Inhalation: Causes respiratory tract and mucous membrane irritation. Can be absorbed through the lungs. May affect behavior/Central and Peripheral nervous systems (somnolence, muscle weakness, general anesthetic, and

other symptoms similar to ingestion), gastrointestinal tract (nausea), blood metabolism, urinary system.
Ingestion: May be harmful if swallowed. May cause gastrointestinal tract irritation including vomiting. May affect behavior/Central and Peripheral nervous systems (convulsions, seizures, tremor, irritability, initial CNS stimulation followed by depression, loss of coordination, dizziness, headache, weakness, pallor, flushing), respiration (breathlessness and chest constriction), cardiovascular system, (shallow/rapid pulse), and blood.

Section 12: Ecological Information

Ecotoxicity: Not available.

BOD5 and COD: Not available.

Products of Biodegradation:
Possibly hazardous short term degradation products are not likely. However, long term degradation products may arise.

Toxicity of the Products of Biodegradation: The products of degradation are less toxic than the product itself.

Special Remarks on the Products of Biodegradation: Not available.

Section 13: Disposal Considerations

Waste Disposal:
Waste must be disposed of in accordance with federal, state and local environmental control regulations.

Section 14: Transport Information

DOT Classification: CLASS 3: Flammable liquid.

Identification: : Benzene UNNA: 1114 PG: II

Special Provisions for Transport: Not available.

Section 15: Other Regulatory Information

Federal and State Regulations:
California prop. 65: This product contains the following ingredients for which the State of California has found to cause cancer, birth defects or other reproductive harm, which would require a warning under the statute: Benzene
California prop. 65 (no significant risk level): Benzene: 0.007 mg/day (value)
California prop. 65: This product contains the following ingredients for which the State of California has found to cause cancer which would require a warning under the statute: Benzene
Connecticut carcinogen reporting list.: Benzene
Connecticut hazardous material survey.: Benzene
Illinois toxic substances disclosure to employee act: Benzene
Illinois chemical safety act: Benzene
New York release reporting list: Benzene
Rhode Island RTK hazardous substances: Benzene
Pennsylvania RTK: Benzene
Minnesota: Benzene
Michigan critical material: Benzene
Massachusetts RTK: Benzene
Massachusetts spill list: Benzene
New Jersey: Benzene
New Jersey spill list: Benzene
Louisiana spill reporting: Benzene
California Director's list of Hazardous Substances: Benzene

TSCA 8(b) inventory: Benzene
SARA 313 toxic chemical notification and release reporting: Benzene
CERCLA: Hazardous substances.: Benzene: 10 lbs. (4.536 kg)

Other Regulations:
OSHA: Hazardous by definition of Hazard Communication Standard (29 CFR 1910.1200).
EINECS: This product is on the European Inventory of Existing Commercial Chemical Substances.

Other Classifications:

WHMIS (Canada):
CLASS B-2: Flammable liquid with a flash point lower than 37.8°C (100°F).
CLASS D-2A: Material causing other toxic effects (VERY TOXIC).

DSCL (EEC):
R11- Highly flammable.
R22- Harmful if swallowed.
R38- Irritating to skin.
R41- Risk of serious damage to eyes.
R45- May cause cancer.
R62- Possible risk of impaired fertility.
S2- Keep out of the reach of children.
S26- In case of contact with eyes, rinse immediately with plenty of water and seek medical advice.
S39- Wear eye/face protection.
S46- If swallowed, seek medical advice immediately and show this container or label.
S53- Avoid exposure - obtain special instructions before use.

HMIS (U.S.A.):

Material Safety Data Sheet
Naphthalene MSDS

Section 1: Chemical Product and Company Identification

Product Name: Naphthalene

Catalog Codes: SLN1789, SLN2401

CAS#: 91-20-3

RTECS: QJ0525000

TSCA: TSCA 8(b) inventory: Naphthalene

CI#: Not available.

Synonym:

Chemical Name: Not available.

Chemical Formula: C10H8

Contact Information:

Sciencelab.com, Inc.
14025 Smith Rd.
Houston, Texas 77396

US Sales: **1-800-901-7247**
International Sales: **1-281-441-4400**

Order Online: ScienceLab.com

CHEMTREC (24HR Emergency Telephone), call:
1-800-424-9300

International CHEMTREC, call: 1-703-527-3887

For non-emergency assistance, call: 1-281-441-4400

Section 2: Composition and Information on Ingredients

Composition:

Name	CAS #	% by Weight
Naphthalene	91-20-3	100

Toxicological Data on Ingredients: Naphthalene: ORAL (LD50): Acute: 490 mg/kg [Rat]. 533 mg/kg [Mouse]. 1200 mg/kg [Guinea pig]. DERMAL (LD50): Acute: 20001 mg/kg [Rabbit]. VAPOR (LC50): Acute: 170 ppm 4 hour(s) [Rat].

Section 3: Hazards Identification

Potential Acute Health Effects:
Very hazardous in case of ingestion. Hazardous in case of eye contact (irritant), of inhalation. Slightly hazardous in case of skin contact (irritant, permeator). Severe over-exposure can result in death.

Potential Chronic Health Effects:
CARCINOGENIC EFFECTS: A4 (Not classifiable for human or animal.) by ACGIH.
MUTAGENIC EFFECTS: Not available.
TERATOGENIC EFFECTS: Not available.
DEVELOPMENTAL TOXICITY: Classified Development toxin [POSSIBLE].
The substance is toxic to blood, kidneys, the nervous system, the reproductive system, liver, mucous membranes, gastrointestinal tract, upper respiratory tract, central nervous system (CNS).
Repeated or prolonged exposure to the substance can produce target organs damage. Repeated exposure to an highly toxic material may produce general deterioration of health by an accumulation in one or many human organs.

Section 4: First Aid Measures

Eye Contact:
Check for and remove any contact lenses. Immediately flush eyes with running water for at least 15 minutes, keeping eyelids open. Cold water may be used. Do not use an eye ointment. Seek medical attention.

Skin Contact:
After contact with skin, wash immediately with plenty of water. Gently and thoroughly wash the contaminated skin with running water and non-abrasive soap. Be particularly careful to clean folds, crevices, creases and groin. Cover the irritated skin with an emollient. If irritation persists, seek medical attention. Wash contaminated clothing before reusing.

Serious Skin Contact: Not available.

Inhalation: Allow the victim to rest in a well ventilated area. Seek immediate medical attention.

Serious Inhalation:
Evacuate the victim to a safe area as soon as possible. Loosen tight clothing such as a collar, tie, belt or waistband. If breathing is difficult, administer oxygen. If the victim is not breathing, perform mouth-to-mouth resuscitation. WARNING: It may be hazardous to the person providing aid to give mouth-to-mouth resuscitation when the inhaled material is toxic, infectious or corrosive. Seek immediate medical attention.

Ingestion:
Do not induce vomiting. Examine the lips and mouth to ascertain whether the tissues are damaged, a possible indication that the toxic material was ingested; the absence of such signs, however, is not conclusive. Loosen tight clothing such as a collar, tie, belt or waistband. If the victim is not breathing, perform mouth-to-mouth resuscitation. Seek immediate medical attention.

Serious Ingestion: Not available.

Section 5: Fire and Explosion Data

Flammability of the Product: Flammable.

Auto-Ignition Temperature: 567°C (1052.6°F)

Flash Points: CLOSED CUP: 88°C (190.4°F). OPEN CUP: 79°C (174.2°F).

Flammable Limits: LOWER: 0.9% UPPER: 5.9%

Products of Combustion: These products are carbon oxides (CO, CO2).

Fire Hazards in Presence of Various Substances: Not available.

Explosion Hazards in Presence of Various Substances:
Risks of explosion of the product in presence of mechanical impact: Not available.
Risks of explosion of the product in presence of static discharge: Not available.

Fire Fighting Media and Instructions:
Flammable solid.
SMALL FIRE: Use DRY chemical powder.
LARGE FIRE: Use water spray or fog. Cool containing vessels with water jet in order to prevent pressure build-up, autoignition or explosion.

Special Remarks on Fire Hazards: Not available.

Special Remarks on Explosion Hazards: Not available.

Section 6: Accidental Release Measures

Small Spill: Use appropriate tools to put the spilled solid in a convenient waste disposal container.

Large Spill:
Flammable solid.
Stop leak if without risk. Do not touch spilled material. Use water spray curtain to divert vapor drift. Prevent entry into sewers, basements or confined areas; dike if needed. Eliminate all ignition sources. Call for assistance on disposal. Be careful that the product is not present at a concentration level above TLV. Check TLV on the MSDS and with local authorities.

Section 7: Handling and Storage

Precautions:
Keep locked up Keep away from heat. Keep away from sources of ignition. Ground all equipment containing material. Do not ingest. Do not breathe dust. Avoid contact with eyes Wear suitable protective clothing In case of insufficient ventilation, wear suitable respiratory equipment If ingested, seek medical advice immediately and show the container or the label. Keep away from incompatibles such as oxidizing agents.

Storage:
Flammable materials should be stored in a separate safety storage cabinet or room. Keep away from heat. Keep away from sources of ignition. Keep container tightly closed. Keep in a cool, well-ventilated place. Ground all equipment containing material. Keep container dry. Keep in a cool place.

Section 8: Exposure Controls/Personal Protection

Engineering Controls:
Use process enclosures, local exhaust ventilation, or other engineering controls to keep airborne levels below recommended exposure limits. If user operations generate dust, fume or mist, use ventilation to keep exposure to airborne contaminants below the exposure limit.

Personal Protection:
Splash goggles. Lab coat. Dust respirator. Be sure to use an approved/certified respirator or equivalent. Gloves.

Personal Protection in Case of a Large Spill:
Splash goggles. Full suit. Dust respirator. Boots. Gloves. A self contained breathing apparatus should be used to avoid inhalation of the product. Suggested protective clothing might not be sufficient; consult a specialist BEFORE handling this product.

Exposure Limits:
Israel: TWA: 10 (ppm)
TWA: 10 STEL: 15 (ppm) from ACGIH (TLV) [1995]
TWA: 52 STEL: 79 (mg/m3) from ACGIH [1995]
Australia: STEL: 15 (ppm)
Consult local authorities for acceptable exposure limits.

Section 9: Physical and Chemical Properties

Physical state and appearance: Solid. (Crystalline solid.)

Odor: Aromatic.

Taste: Not available.

Molecular Weight: 128.19 g/mole

Color: White.

pH (1% soln/water): Not available.

Boiling Point: 218°C (424.4°F)

Melting Point: 80.2°C (176.4°F)

Critical Temperature: Not available.

Specific Gravity: 1.162 (Water = 1)

Vapor Pressure: Not applicable.

Vapor Density: 4.4 (Air = 1)

Volatility: Not available.

Odor Threshold: 0.038 ppm

Water/Oil Dist. Coeff.: Not available.

Ionicity (in Water): Not available.

Dispersion Properties:
Partially dispersed in hot water, methanol, n-octanol.
Very slightly dispersed in cold water.
See solubility in methanol, n-octanol.

Solubility:
Partially soluble in methanol, n-octanol.
Very slightly soluble in cold water, hot water.

Section 10: Stability and Reactivity Data

Stability: The product is stable.

Instability Temperature: Not available.

Conditions of Instability: Not available.

Incompatibility with various substances: Highly reactive with oxidizing agents.

Corrosivity: Non-corrosive in presence of glass.

Special Remarks on Reactivity: Not available.

Special Remarks on Corrosivity: May attack some forms of rubber and plastic

Polymerization: No.

Section 11: Toxicological Information

Routes of Entry: Absorbed through skin. Dermal contact. Eye contact. Inhalation. Ingestion.

Toxicity to Animals:
WARNING: THE LC50 VALUES HEREUNDER ARE ESTIMATED ON THE BASIS OF A 4-HOUR EXPOSURE.
Acute oral toxicity (LD50): 490 mg/kg [Rat].
Acute dermal toxicity (LD50): 20001 mg/kg [Rabbit].
Acute toxicity of the vapor (LC50): 170 ppm 4 hour(s) [Rat].

Chronic Effects on Humans:
CARCINOGENIC EFFECTS: A4 (Not classifiable for human or animal.) by ACGIH.

DEVELOPMENTAL TOXICITY: Classified Development toxin [POSSIBLE].
The substance is toxic to blood, kidneys, the nervous system, the reproductive system, liver, mucous membranes, gastrointestinal tract, upper respiratory tract, central nervous system (CNS).

Other Toxic Effects on Humans:
Very hazardous in case of ingestion.
Hazardous in case of inhalation.
Slightly hazardous in case of skin contact (irritant, permeator).

Special Remarks on Toxicity to Animals: Not available.

Special Remarks on Chronic Effects on Humans: Not available.

Special Remarks on other Toxic Effects on Humans: Not available.

Section 12: Ecological Information

Ecotoxicity: Ecotoxicity in water (LC50): 305.2 ppm 96 hour(s) [Trout].

BOD5 and COD: Not available.

Products of Biodegradation:
Possibly hazardous short term degradation products are not likely. However, long term degradation products may arise.

Toxicity of the Products of Biodegradation: The products of degradation are more toxic.

Special Remarks on the Products of Biodegradation: Not available.

Section 13: Disposal Considerations

Waste Disposal:

Section 14: Transport Information

DOT Classification: CLASS 4.1: Flammable solid.

Identification: : Naphthalene, refined : UN1334 PG: III

Special Provisions for Transport: Marine Pollutant

Section 15: Other Regulatory Information

For non-emergency assistance, call: 1-281-441-4400

Section 2: Composition and Information on Ingredients

Composition:

Name	CAS #	% by Weight
Toluene	108-88-3	100

Toxicological Data on Ingredients: Toluene: ORAL (LD50): Acute: 636 mg/kg [Rat]. DERMAL (LD50): Acute: 14100 mg/kg [Rabbit]. VAPOR (LC50): Acute: 49000 mg/m 4 hours [Rat]. 440 ppm 24 hours [Mouse].

Section 3: Hazards Identification

Potential Acute Health Effects:
Hazardous in case of skin contact (irritant), of eye contact (irritant), of ingestion, of inhalation. Slightly hazardous in case of skin contact (permeator).

Potential Chronic Health Effects:
CARCINOGENIC EFFECTS: A4 (Not classifiable for human or animal.) by ACGIH, 3 (Not classifiable for human.) by IARC.
MUTAGENIC EFFECTS: Not available.
TERATOGENIC EFFECTS: Not available.
DEVELOPMENTAL TOXICITY: Not available.
The substance may be toxic to blood, kidneys, the nervous system, liver, brain, central nervous system (CNS). Repeated or prolonged exposure to the substance can produce target organs damage.

Section 4: First Aid Measures

Eye Contact:
Check for and remove any contact lenses. In case of contact, immediately flush eyes with plenty of water for at least 15 minutes. Get medical attention.

Skin Contact:
In case of contact, immediately flush skin with plenty of water. Cover the irritated skin with an emollient. Remove contaminated clothing and shoes. Wash clothing before reuse. Thoroughly clean shoes before reuse. Get medical attention.

Serious Skin Contact:
Wash with a disinfectant soap and cover the contaminated skin with an anti-bacterial cream. Seek immediate medical attention.

Inhalation:
If inhaled, remove to fresh air. If not breathing, give artificial respiration. If breathing is difficult, give oxygen. Get medical attention.

Serious Inhalation:
Evacuate the victim to a safe area as soon as possible. Loosen tight clothing such as a collar, tie, belt or waistband. If breathing is difficult, administer oxygen. If the victim is not breathing, perform mouth-to-mouth resuscitation. WARNING: It may be hazardous to the person providing aid to give mouth-to-mouth resuscitation when the inhaled material is toxic, infectious or corrosive. Seek medical attention.

Ingestion:
Do NOT induce vomiting unless directed to do so by medical personnel. Never give anything by mouth to an unconscious person. If large quantities of this material are swallowed, call a physician immediately. Loosen tight clothing such as a collar, tie, belt or waistband.

Serious Ingestion: Not available.

Section 5: Fire and Explosion Data

Flammability of the Product: Flammable.

Auto-Ignition Temperature: 480°C (896°F)

Flash Points: CLOSED CUP: 4.4444°C (40°F). (Setaflash) OPEN CUP: 16°C (60.8°F).

Flammable Limits: LOWER: 1.1% UPPER: 7.1%

Products of Combustion: These products are carbon oxides (CO, CO2).

Fire Hazards in Presence of Various Substances:
Flammable in presence of open flames and sparks, of heat.
Non-flammable in presence of shocks.

Explosion Hazards in Presence of Various Substances:
Risks of explosion of the product in presence of mechanical impact: Not available.
Risks of explosion of the product in presence of static discharge: Not available.

Fire Fighting Media and Instructions:
Flammable liquid, insoluble in water.
SMALL FIRE: Use DRY chemical powder.
LARGE FIRE: Use water spray or fog.

Special Remarks on Fire Hazards: Not available.

Special Remarks on Explosion Hazards:
Toluene forms explosive reaction with 1,3-dichloro-5,5-dimethyl-2,4-imidazolididione; dinitrogen tetraoxide;

concentrated nitric acid, sulfuric acid + nitric acid; N_2O_4; $AgClO_4$; BrF_3; Uranium hexafluoride; sulfur dichloride. Also forms an explosive mixture with tetranitromethane.

Section 6: Accidental Release Measures

Small Spill: Absorb with an inert material and put the spilled material in an appropriate waste disposal.

Large Spill:
Toxic flammable liquid, insoluble or very slightly soluble in water.
Keep away from heat. Keep away from sources of ignition. Stop leak if without risk. Absorb with DRY earth, sand or other non-combustible material. Do not get water inside container. Do not touch spilled material. Prevent entry into sewers, basements or confined areas; dike if needed. Call for assistance on disposal. Be careful that the product is not present at a concentration level above TLV. Check TLV on the MSDS and with local authorities.

Section 7: Handling and Storage

Precautions:
Keep away from heat. Keep away from sources of ignition. Ground all equipment containing material. Do not ingest. Do not breathe gas/fumes/ vapor/spray. Wear suitable protective clothing. In case of insufficient ventilation, wear suitable respiratory equipment. If ingested, seek medical advice immediately and show the container or the label. Avoid contact with skin and eyes. Keep away from incompatibles such as oxidizing agents.

Storage:
Store in a segregated and approved area. Keep container in a cool, well-ventilated area. Keep container tightly closed and sealed until ready for use. Avoid all possible sources of ignition (spark or flame).

Section 8: Exposure Controls/Personal Protection

Engineering Controls:
Provide exhaust ventilation or other engineering controls to keep the airborne concentrations of vapors below their respective threshold limit value. Ensure that eyewash stations and safety showers are proximal to the work-station location.

Personal Protection:
Splash goggles. Lab coat. Vapor respirator. Be sure to use an approved/certified respirator or equivalent. Gloves.

Personal Protection in Case of a Large Spill:
Splash goggles. Full suit. Vapor respirator. Boots. Gloves. A self contained breathing apparatus should be used to avoid inhalation of the product. Suggested protective clothing might not be sufficient; consult a specialist BEFORE handling this product.

Exposure Limits:
TWA: 200 STEL: 500 CEIL: 300 (ppm) from OSHA (PEL) [United States]
TWA: 50 (ppm) from ACGIH (TLV) [United States] SKIN
TWA: 100 STEL: 150 from NIOSH [United States]
TWA: 375 STEL: 560 (mg/m^3) from NIOSH [United States]
Consult local authorities for acceptable exposure limits.

Section 9: Physical and Chemical Properties

Physical state and appearance: Liquid.

Odor: Sweet, pungent, Benzene-like.

Taste: Not available.

Molecular Weight: 92.14 g/mole

Color: Colorless.

pH (1% soln/water): Not applicable.

Boiling Point: 110.6°C (231.1°F)

Melting Point: -95°C (-139°F)

Critical Temperature: 318.6°C (605.5°F)

Specific Gravity: 0.8636 (Water = 1)

Vapor Pressure: 3.8 kPa (@ 25°C)

Vapor Density: 3.1 (Air = 1)

Volatility: Not available.

Odor Threshold: 1.6 ppm

Water/Oil Dist. Coeff.: The product is more soluble in oil; log(oil/water) = 2.7

Ionicity (in Water): Not available.

Dispersion Properties: See solubility in water, diethyl ether, acetone.

Solubility:
Soluble in diethyl ether, acetone.
Practically insoluble in cold water.
Soluble in ethanol, benzene, chloroform, glacial acetic acid, carbon disulfide.
Solubility in water: 0.561 g/l @ 25 deg. C.

Section 10: Stability and Reactivity Data

Stability: The product is stable.

Instability Temperature: Not available.

Conditions of Instability: Heat, ignition sources (flames, sparks, static), incompatible materials

Incompatibility with various substances: Reactive with oxidizing agents.

Corrosivity: Non-corrosive in presence of glass.

Special Remarks on Reactivity:
Incompatible with strong oxidizers, silver perchlorate, sodium difluoride, Tetranitromethane, Uranium Hexafluoride.
Frozen Bromine Trifluoride reacts violently with Toluene at -80 deg. C.
Reacts chemically with nitrogen oxides, or halogens to form nitrotoluene, nitrobenzene, and nitrophenol and halogenated products, respectively.

Special Remarks on Corrosivity: Not available.

Polymerization: Will not occur.

Section 11: Toxicological Information

Routes of Entry: Absorbed through skin. Dermal contact. Eye contact. Inhalation. Ingestion.

Toxicity to Animals:
WARNING: THE LC50 VALUES HEREUNDER ARE ESTIMATED ON THE BASIS OF A 4-HOUR EXPOSURE.
Acute oral toxicity (LD50): 636 mg/kg [Rat].
Acute dermal toxicity (LD50): 14100 mg/kg [Rabbit].
Acute toxicity of the vapor (LC50): 440 24 hours [Mouse].

Chronic Effects on Humans:
CARCINOGENIC EFFECTS: A4 (Not classifiable for human or animal.) by ACGIH, 3 (Not classifiable for human.) by IARC.
May cause damage to the following organs: blood, kidneys, the nervous system, liver, brain, central nervous system (CNS).

Other Toxic Effects on Humans:
Hazardous in case of skin contact (irritant), of ingestion, of inhalation.
Slightly hazardous in case of skin contact (permeator).

Special Remarks on Toxicity to Animals:
Lowest Published Lethal Dose:
LDL [Human] - Route: Oral; Dose: 50 mg/kg
LCL [Rabbit] - Route: Inhalation; Dose: 55000 ppm/40min

Special Remarks on Chronic Effects on Humans:
Detected in maternal milk in human. Passes through the placental barrier in human. Embryotoxic and/or foetotoxic in animal. May cause adverse reproductive effects and birth defects (teratogenic). May affect genetic material (mutagenic)

Special Remarks on other Toxic Effects on Humans:
Acute Potential Health Effects:
Skin: Causes mild to moderate skin irritation. It can be absorbed to some extent through the skin.
Eyes: Cauess mild to moderate eye irritation with a burning sensation. Splash contact with eyes also causes conjunctivitis, blepharospasm, corneal edema, corneal abraisons. This usually resolves in 2 days.
Inhalation: Inhalation of vapor may cause respiratory tract irritation causing coughing and wheezing, and nasal discharge. Inhalation of high concentrations may affect behavior and cause central nervous system effects characterized by nausea, headache, dizziness, tremors, restlessness, lightheadedness, exhilaration, memory loss, insomnia, impaired reaction time, drowsiness, ataxia, hallucinations, somnolence, muscle contraction or spasticity, unconsciousness and coma. Inhalation of high concentration of vapor may also affect the cardiovascular system (rapid heart beat, heart palpitations, increased or decreased blood pressure, dysrhythmia,), respiration (acute pulmonary edema, respiratory depression, apnea, asphyxia), cause vision disturbances and dilated pupils, and cause loss of appetite.
Ingestion: Aspiration hazard. Aspiration of Toluene into the lungs may cause chemical pneumonitis. May cause irritation of the digestive tract with nausea, vomiting, pain. May have effects similar to that of acute inhalation.
Chronic Potential Health Effects:
Inhalation and Ingestion: Prolonged or repeated exposure via inhalation may cause central nervous system and cardiovascular symptoms similar to that of acute inhalation and ingestion as well liver damage/failure, kidney damage/failure (with hematuria, proteinuria, oliguria, renal tubular acidosis), brain damage, weight loss, blood (pigmented or nucleated red blood cells, changes in white blood cell count), bone marrow changes, electrolyte imbalances (Hypokalemia, Hypophostatemia), severe, muscle weakness and Rhabdomyolysis.
Skin: Repeated or prolonged skin contact may cause defatting dermatitis.

Section 12: Ecological Information

Ecotoxicity:
Ecotoxicity in water (LC50): 313 mg/l 48 hours [Daphnia (daphnia)]. 17 mg/l 24 hours [Fish (Blue Gill)]. 13 mg/l 96 hours [Fish (Blue Gill)]. 56 mg/l 24 hours [Fish (Fathead minnow)]. 34 mg/l 96 hours [Fish (Fathead minnow)]. 56.8 ppm any hours [Fish (Goldfish)].

BOD5 and COD: Not available.

Products of Biodegradation:
Possibly hazardous short term degradation products are not likely. However, long term degradation products may

arise.

Toxicity of the Products of Biodegradation: The products of degradation are less toxic than the product itself.

Special Remarks on the Products of Biodegradation: Not available.

Section 13: Disposal Considerations

Waste Disposal:
Waste must be disposed of in accordance with federal, state and local environmental control regulations.

Section 14: Transport Information

DOT Classification: CLASS 3: Flammable liquid.

Identification: : Toluene UNNA: 1294 PG: II

Special Provisions for Transport: Not available.

Section 15: Other Regulatory Information

Federal and State Regulations:
California prop. 65: This product contains the following ingredients for which the State of California has found to cause cancer, birth defects or other reproductive harm, which would require a warning under the statute: Toluene
California prop. 65 (no significant risk level): Toluene: 7 mg/day (value)
California prop. 65 (acceptable daily intake level): Toluene: 7 mg/day (value)
California prop. 65: This product contains the following ingredients for which the State of California has found to cause birth defects which would require a warning under the statute: Toluene
Connecticut hazardous material survey.: Toluene
Illinois toxic substances disclosure to employee act: Toluene
Illinois chemical safety act: Toluene
New York release reporting list: Toluene
Rhode Island RTK hazardous substances: Toluene
Pennsylvania RTK: Toluene
Florida: Toluene
Minnesota: Toluene
Michigan critical material: Toluene
Massachusetts RTK: Toluene
Massachusetts spill list: Toluene
New Jersey: Toluene
New Jersey spill list: Toluene
Louisiana spill reporting: Toluene
California Director's List of Hazardous Substances.: Toluene
TSCA 8(b) inventory: Toluene
TSCA 8(d) H and S data reporting: Toluene: Effective date: 10/04/82; Sunset Date: 10/0/92
SARA 313 toxic chemical notification and release reporting: Toluene
CERCLA: Hazardous substances.: Toluene: 1000 lbs. (453.6 kg)

Other Regulations:
OSHA: Hazardous by definition of Hazard Communication Standard (29 CFR 1910.1200).
EINECS: This product is on the European Inventory of Existing Commercial Chemical Substances.

Other Classifications:

WHMIS (Canada):
CLASS B-2: Flammable liquid with a flash point lower than 37.8°C (100°F).
CLASS D-2A: Material causing other toxic effects (VERY TOXIC).

DSCL (EEC):
R11- Highly flammable.
R20- Harmful by inhalation.
S16- Keep away from sources of ignition - No smoking.
S25- Avoid contact with eyes.
S29- Do not empty into drains.
S33- Take precautionary measures against static discharges.

HMIS (U.S.A.):

Health Hazard: 2

Fire Hazard: 3

Reactivity: 0

Personal Protection: h

National Fire Protection Association (U.S.A.):

Health: 2

Flammability: 3

Reactivity: 0

Specific hazard:

Protective Equipment:
Gloves.
Lab coat.
Vapor respirator. Be sure to use an approved/certified respirator or equivalent. Wear appropriate respirator when ventilation is inadequate.
Splash goggles.

Section 16: Other Information

References: Not available.

Other Special Considerations: Not available.

Occupational Health Guideline for Coal Tar Pitch Volatiles

INTRODUCTION

This guideline is intended as a source of information for employees, employers, physicians, industrial hygienists, and other occupational health professionals who may have a need for such information. It does not attempt to present all data; rather, it presents pertinent information and data in summary form.

SUBSTANCE IDENTIFICATION

Anthracene

- Formula: $C_{14}H_{10}$
- Synonyms: None
- Appearance and odor: Pale green solid with a faint aromatic odor.

Phenanthrene

Formula: $C_{14}H_{10}$
Synonyms: None
Appearance and odor: Colorless solid with a faint aromatic odor.

Pyrene

- Formula: $C_{16}H_{10}$
- Synonyms: None
- Appearance: Bright yellow solid

Carbazole

- Formula: $C_{12}H_9N$
- Synonyms: None
- Appearance and odor: Colorless solid with a faint aromatic odor.

Benzo(a)pyrene

- Formula: $C_{20}H_{12}$
- Synonyms: BaP, 3,4-benzopyrene
- Appearance and odor: Colorless solid with a faint aromatic odor.

PERMISSIBLE EXPOSURE LIMIT (PEL)

The current OSHA standard for coal tar pitch volatiles is 0.2 milligram of coal tar pitch volatiles per cubic meter of air (mg/m^3) averaged over an eight-hour work shift. NIOSH has recommended that the permissible exposure limit for coal tar products be reduced to 0.1 mg/m^3 (cyclohexane-extractable fraction) averaged over a work shift of up to 10 hours per day, 40 hours per week, and that coal tar products be regulated as occupational carcinogens. The NIOSH Criteria Document for Coal Tar Products and NIOSH Criteria Document for Coke Oven Emissions should be consulted for more detailed information.

HEALTH HAZARD INFORMATION

- **Routes of exposure**

Coal tar pitch volatiles can affect the body if they are inhaled or if they come in contact with the eyes or skin.

- **Effects of overexposure**

Repeated exposure to coal tar pitch volatiles has been associated with an increased risk of developing bronchitis and cancer of the lungs, skin, bladder, and kidneys. Pregnant women may be especially susceptible to exposure effects associated with coal tar pitch volatiles. Repeated exposure to these materials may also cause sunlight to have a more severe effect on a person's skin. In addition, this type of exposure may cause an allergic skin rash.

- **Reporting signs and symptoms**

A physician should be contacted if anyone develops any signs or symptoms and suspects that they are caused by exposure to coal tar pitch volatiles.

- **Recommended medical surveillance**

The following medical procedures should be made available to each employee who is exposed to coal tar pitch volatiles at potentially hazardous levels:

These recommendations reflect good industrial hygiene and medical surveillance practices and their implementation will assist in achieving an effective occupational health program. However, they may not be sufficient to achieve compliance with all requirements of OSHA regulations.

U.S. DEPARTMENT OF HEALTH AND HUMAN SERVICES
Public Health Service Centers for Disease Control
National Institute for Occupational Safety and Health

U.S. DEPARTMENT OF LABOR
Occupational Safety and Health Administration

September 1978

1. Initial Medical Examination:

—A complete history and physical examination: The purpose is to detect pre-existing conditions that might place the exposed employee at increased risk, and to establish a baseline for future health monitoring. Examination of the oral cavity, respiratory tract, bladder, and kidneys should be stressed. The skin should be examined for evidence of chronic disorders, for premalignant and malignant lesions, and evidence of hyperpigmentation or photosensitivity.

—Urinalysis: Coal tar pitch volatiles are associated with an excess of kidney and bladder cancer. A urinalysis should be obtained to include at a minimum specific gravity, albumin, glucose, and a microscopic on centrifuged sediment, as well as a test for red blood cells.

—Urinary cytology: Coal tar pitch volatiles are associated with an excess of kidney and bladder cancer. Employees having 5 or more years of exposure or who are 45 years of age or older should have a urinary cytology examination.

—Sputum cytology: Coal tar pitch volatiles are associated with an excess of lung cancer. Employees having 10 or more years of exposure or who are 45 years of age or older should have a sputum cytology examination.

—14" x 17" chest roentgenogram: Coal tar pitch volatiles are associated with an excess of lung cancer. Surveillance of the lungs is indicated.

—FVC and FEV (1 sec): Coal tar pitch volatiles are reported to cause an excess of bronchitis. Periodic surveillance is indicated.

—A complete blood count: Due to the possibility of benzene exposure associated with coal tar pitch volatiles, a complete blood count is considered necessary to search for leukemia and aplastic anemia.

—Skin disease: Coal tar pitch volatiles are defatting agents and can cause dermatitis on prolonged exposure. Persons with pre-existing skin disorders may be more susceptible to the effects of these agents.

2. Periodic Medical Examination: The aforementioned medical examinations should be repeated on an annual basis, and semi-annually for employees 45 years of age or older or with 10 or more years' exposure to coal tar pitch volatiles.

• **Summary of toxicology**

Coal tar pitch volatiles (CTPV) are products of the destructive distillation of bituminous coal and contain polynuclear aromatic hydrocarbons (PNA's). These hydrocarbons sublime readily, thereby increasing the amounts of carcinogenic compounds in working areas. Epidemiologic evidence suggests that workers intimately exposed to the products of combustion or distillation of bituminous coal are at increased risk of cancer at many sites. These include cancer of the respiratory tract, kidney, bladder, and skin. In a study of coke oven workers, the level of exposure to CTPV and the length of time exposed were related to the development of cancer. Coke oven workers with the highest risk of cancer were those employed exclusively at topside jobs for 5 or more years, for whom the increased risk of dying from lung cancer was 10-fold; all coke oven workers had a 7-½-fold increase in risk of dying from kidney cancer. Although the causative agent or agents of the cancer in coke oven workers is unidentified, it is suspected that several PNA's in the CTPV generated during the coking process are involved. Certain industrial populations exposed to coal tar products have a demonstrated risk of skin cancer. Substances containing PNA's which may produce skin cancer also produce contact dermatitis; examples are coal tar, pitch, and cutting oils. Although allergic dermatitis is readily induced by PNA's in guinea pigs, it is only rarely reported in humans from occupational contact with PNA's; these have resulted largely from the therapeutic use of coal tar preparations. Components of pitch and coal tar produce cutaneous photosensitization; skin eruptions are usually limited to areas exposed to the sun or ultraviolet light. Most of the phototoxic agents will induce hypermelanosis of the skin; if chronic photodermatitis is severe and prolonged, leukoderma may occur. Some oils containing PNA's have been associated with changes of follicular and sebaceous glands which commonly take the form of acne. There is evidence that exposures to emissions at coke ovens and gas retorts may be associated with an increased occurrence of chronic bronchitis. Coal tar pitch volatiles may be associated with benzene, an agent suspected of causing leukemia and known to cause aplastic anemia.

CHEMICAL AND PHYSICAL PROPERTIES

• **Physical data—Anthracene**

1. Molecular weight: 178.2
2. Boiling point (760 mm Hg): 340 C (644 F)
3. Specific gravity (water = 1): 1.24
4. Vapor density (air = 1 at boiling point of anthracene): 6.15
5. Melting point: 217 C (423 F)
6. Vapor pressure at 20 C (68 F): Less than 1 mm Hg
7. Solubility in water, g/100 g water at 20 C (68 F): Insoluble
8. Evaporation rate (butyl acetate = 1): Not applicable

• **Physical data—Phenanthrene**

1. Molecular weight: 178.2
2. Boiling point (760 mm Hg): 340 C (644 F)
3. Specific gravity (water = 1): 1.18
4. Vapor density (air = 1 at boiling point of phenanthrene): 6.15
5. Melting point: 100.5 C (213 F)
6. Vapor pressure at 20 C (68 F): Less than 1 mm Hg
7. Solubility in water, g/100 g water at 20 C (68 F): Insoluble
8. Evaporation rate (butyl acetate = 1): Not applicable

• **Physical data—Pyrene**

1. Molecular weight: 202.3
2. Boiling point (760 mm Hg): Greater than 360 C (greater than 680 F)

3. Specific gravity (water = 1): 1.28
4. Vapor density (air = 1 at boiling point of pyrene): 6.9
5. Melting point: 150.4 C (303 F)
6. Vapor pressure at 20 C (68 F): Less than 1 mm Hg
7. Solubility in water, g/100 g water at 20 C (68 F): Insoluble
8. Evaporation rate (butyl acetate = 1): Not applicable

• **Physical data—Carbazole**

1. Molecular weight: 167.2
2. Boiling point (760 mm Hg): 355 C (671 F)
3. Specific gravity (water = 1): Greater than 1
4. Vapor density (air = 1 at boiling point of carbazole): 5.8
5. Melting point: 246 C (475 F)
6. Vapor pressure at 20 C (68 F): Less than 1 mm Hg
7. Solubility in water, g/100 g water at 20 C (68 F): Insoluble
8. Evaporation rate (butyl acetate = 1): Not applicable

• **Physical data—Benzo(a)pyrene**

1. Molecular weight: 252.3
2. Boiling point (760 mm Hg): Greater than 360 C (greater than 680 F)
3. Specific gravity (water = 1): Greater than 1
4. Vapor density (air = 1 at boiling point of benzo(a)pyrene): 8.7
5. Melting point: 179 C (354 F)
6. Vapor pressure at 20 C (68 F): Less than 1 mm Hg
7. Solubility in water, g/100 g water at 20 C (68 F): Insoluble
8. Evaporation rate (butyl acetate = 1): Not applicable

• **Reactivity**

1. Conditions contributing to instability: None hazardous
2. Incompatibilities: Contact with strong oxidizers may cause fires and explosions.
3. Hazardous decomposition products: None
4. Special precautions: None

• **Flammability**

1. Flash point: Anthracene: 121 C (250 F) (closed cup); Others: Data not available
2. Autoignition temperature: Anthracene: 540 C (1004 F); Others: Data not available
3. Flammable limits in air, % by volume: Anthracene: Lower: 0.6; Others: Data not available
4. Extinguishant: Foam, dry chemical, and carbon dioxide

• **Warning properties**

Grant states that "coal tar and its various crude fractions appear principally to cause reddening and squamous eczema of the lid margins, with only small erosions of the corneal epithelium and superficial changes in the stroma, which disappear in a month following exposure. Chronic exposure of workmen to tar fumes and dust has been reported to cause conjunctivitis and discoloration of the cornea in the palpebral fissure, either near the limbus or, in extreme cases, across the whole cornea. Occasionally, epithelioma of the lid margin has been attributed to contact with coal tar."

MONITORING AND MEASUREMENT PROCEDURES

• **General**

Measurements to determine employee exposure are best taken so that the average eight-hour exposure is based on a single eight-hour sample or on two four-hour samples. Several short-time interval samples (up to 30 minutes) may also be used to determine the average exposure level. Air samples should be taken in the employee's breathing zone (air that would most nearly represent that inhaled by the employee).

• **Method**

Coal tar products may be sampled by collection on a glass fiber filter with subsequent ultrasonic extraction and weighing. An analytical method for coal tar pitch volatiles is in the *NIOSH Manual of Analytical Methods*, 2nd Ed., Vol. 1, 1977, available from the Government Printing Office, Washington, D.C. 20402 (GPO No. 017-033-00267-3).

RESPIRATORS

• Good industrial hygiene practices recommend that engineering controls be used to reduce environmental concentrations to the permissible exposure level. However, there are some exceptions where respirators may be used to control exposure. Respirators may be used when engineering and work practice controls are not technically feasible, when such controls are in the process of being installed, or when they fail and need to be supplemented. Respirators may also be used for operations which require entry into tanks or closed vessels, and in emergency situations. If the use of respirators is necessary, the only respirators permitted are those that have been approved by the Mine Safety and Health Administration (formerly Mining Enforcement and Safety Administration) or by the National Institute for Occupational Safety and Health.

• In addition to respirator selection, a complete respiratory protection program should be instituted which includes regular training, maintenance, inspection, cleaning, and evaluation.

PERSONAL PROTECTIVE EQUIPMENT

• Employees should be provided with and required to use impervious clothing, gloves, face shields (eight-inch minimum), and other appropriate protective clothing necessary to prevent skin contact with condensed coal tar pitch volatiles, where skin contact may occur.

• If employees' clothing may have become contaminated with coal tar pitch volatiles, employees should change into uncontaminated clothing before leaving the work premises.

• Clothing contaminated with coal tar pitch volatiles

should be placed in closed containers for storage until it can be discarded or until provision is made for the removal of coal tar pitch volatiles from the clothing. If the clothing is to be laundered or otherwise cleaned to remove the coal tar pitch volatiles, the person performing the operation should be informed of coal tar pitch volatiles's hazardous properties.

- Employees should be provided with and required to use splash-proof safety goggles where condensed coal tar pitch volatiles may contact the eyes.

SANITATION

- Workers subject to skin contact with coal tar pitch volatiles should wash with soap or mild detergent and water any areas of the body which may have contacted coal tar pitch volatiles at the end of each work day.
- Employees who handle coal tar pitch volatiles should wash their hands thoroughly with soap or mild detergent and water before eating, smoking, or using toilet facilities.
- Areas in which exposure to coal tar pitch volatiles may occur should be identified by signs or other appropriate means, and access to these areas should be limited to authorized persons.

COMMON OPERATIONS AND CONTROLS

The following list includes some common operations in which exposure to coal tar pitch volatiles may occur and control methods which may be effective in each case:

Operation	Controls
Liberation from extraction and packaging from coal tar fraction of coking	Process enclosure; local exhaust ventilation; general dilution ventilation; personal protective equipment
Use as a binding agent in manufacture of coal briquettes used for fuel; use as a dielectric in the manufacture of battery electrodes, electric-arc furnace electrodes, and electrodes for alumina reduction	Process enclosure; local exhaust ventilation; general dilution ventilation; personal protective equipment
Use in manufacture of roofing felts and papers and roofing	Process enclosure; local exhaust ventilation; general dilution ventilation; personal protective equipment
Use for protective coatings for pipes for underground conduits and drainage; use as a coating on concrete as waterproofing and corrosion-resistant material; use in road paving and sealing	Process enclosure; local exhaust ventilation; general dilution ventilation; personal protective equipment
Use in manufacture and repair of refractory brick; use in production of foundry cores; use in manufacture of carbon ceramic items	Process enclosure; local exhaust ventilation; general dilution ventilation; personal protective equipment

EMERGENCY FIRST AID PROCEDURES

In the event of an emergency, institute first aid procedures and send for first aid or medical assistance.

- **Eye Exposure**

If condensed coal tar pitch volatiles get into the eyes, wash eyes immediately with large amounts of water, lifting the lower and upper lids occasionally. If irritation is present after washing, get medical attention. Contact lenses should not be worn when working with these chemicals.

- **Skin Exposure**

If condensed coal tar pitch volatiles get on the skin, wash the contaminated skin using soap or mild detergent and water. Be sure to wash the hands before eating or smoking and to wash thoroughly at the close of work.

- **Breathing**

If a person breathes in large amounts of coal tar pitch volatiles, move the exposed person to fresh air at once. If breathing has stopped, perform artificial respiration. Keep the affected person warm and at rest. Get medical attention as soon as possible.

- **Rescue**

Move the affected person from the hazardous exposure. If the exposed person has been overcome, notify someone else and put into effect the established emergency rescue procedures. Do not become a casualty. Understand the facility's emergency rescue procedures and know the locations of rescue equipment before the need arises.

SPILL AND DISPOSAL PROCEDURES

- Persons not wearing protective equipment and clothing should be restricted from areas of releases until cleanup has been completed.
- If coal tar pitch volatiles are released in hazardous concentrations, the following steps should be taken:

1. Ventilate area of spill.

2. Collect released material in the most convenient and safe manner for reclamation or for disposal in sealed containers in a secured sanitary landfill.

• Waste disposal method:

Coal tar pitch volatiles may be disposed of in sealed containers in a secured sanitary landfill.

RESPIRATORY PROTECTION FOR COAL TAR PITCH VOLATILES

Condition	Minimum Respiratory Protection* Required Above 0.2 mg/m³
Particulate and Vapor Concentration	
2 mg/m³ or less	A chemical cartridge respirator with an organic vapor cartridge(s) and with a fume or high-efficiency filter. Any supplied-air respirator. Any self-contained breathing apparatus.
10 mg/m³ or less	A chemical cartridge respirator with a full facepiece and an organic vapor cartridge(s) and with a fume or high-efficiency filter. A gas mask with a chin-style or a front- or back-mounted organic vapor canister and with a full facepiece and a fume or high-efficiency filter. Any supplied-air respirator with a full facepiece, helmet, or hood. Any self-contained breathing apparatus with a full facepiece.
200 mg/m³ or less	A Type C supplied-air respirator operated in pressure-demand or other positive pressure or continuous-flow mode. A powered air-purifying respirator with an organic vapor cartridge and a high-efficiency particulate filter.
400 mg/m³ or less	A Type C supplied-air respirator with a full facepiece operated in pressure-demand or other positive pressure mode or with a full facepiece, helmet, or hood operated in continuous-flow mode.
Greater than 400 mg/m³ or entry and escape from unknown concentrations	Self-contained breathing apparatus with a full facepiece operated in pressure-demand or other positive pressure mode. A combination respirator which includes a Type C supplied-air respirator with a full facepiece operated in pressure-demand or other positive pressure or continuous-flow mode and an auxiliary self-contained breathing apparatus operated in pressure-demand or other positive pressure mode.
Fire Fighting	Self-contained breathing apparatus with a full facepiece operated in pressure-demand or other positive pressure mode.
Escape	Any gas mask providing protection against organic vapors and particulates, including pesticide respirators which meet the requirements of this class. Any escape self-contained breathing apparatus.

*Only NIOSH-approved or MSHA-approved equipment should be used.

PRODUCT NAME: ISOBUTYLENE
CHEMICAL NAME: Isobutylene
COMMON NAMES/SYNONYMS: 2-Methylpropene, Isobutene
TDG (Canada) CLASSIFICATION: 2.1
WHMIS CLASSIFICATION: A, B1, D2B

PREPARED BY: Loss Control (908)464-8100/(905)501-1700
PREPARATION DATE: 6/1/95
REVIEW DATES: 6/7/96

2. Composition, Information on Ingredients

INGREDIENT	% VOLUME	PEL-OSHA[1]	TLV-ACGIH[2]	LD_{50} or LC_{50} Route/Species
Isobutylene FORMULA: C4H8 CAS: 115-11-7 RTECS #: UD0890000	99.0 to 99.8	Simple Asphyxiant	Simple Asphyxiant	LC_{50} 620 mg/m^3/3H (rat)

[1] As stated in 29 CFR 1910, Subpart Z (revised July 1, 1993)
[2] As stated in the ACGIH 1994-95 Threshold Limit Values for Chemical Substances and Physical Agents

3. Hazards Identification

EMERGENCY OVERVIEW

This product does not contain oxygen and may cause asphyxia if released in a confined area. Simple hydrocarbons can cause irritation and central nervous system depression at high concentrations. flammable.

ROUTE OF ENTRY:

Skin Contact	Skin Absorption	Eye Contact	Inhalation	Ingestion
Yes	No	Yes	Yes	No

HEALTH EFFECTS:

Exposure Limits	Irritant	Sensitization
No	Yes	No
Teratogen	Reproductive Hazard	Mutagen
No	No	No
Synergistic Effects		
None Reported		

Carcinogenicity: -- NTP: No IARC: No OSHA: No

EYE EFFECTS:
Irritation may occur.

SKIN EFFECTS:
None anticipated as product is a gas at room temperature.

INGESTION EFFECTS:
Ingestion is unlikely.

INHALATION EFFECTS:
Product is relatively nontoxic. Simple hydrocarbons can irritate the eyes, mucous membranes and respiratory system at high concentrations.

Inhalation of high concentrations may cause dizziness, disorientation, incoordination, narcosis, nausea or narcotic effects.

This product may displace oxygen if released in a confined space. Maintain oxygen levels above 19.5% at sea level to prevent asphyxiation.

Effects of oxygen deficiency resulting from simple asphyxiants may include: rapid breathing, diminished mental alertness, impaired muscular coordination, faulty judgement, depression of all sensations, emotional instability, and fatigue. As asphyxiation progresses, nausea, vomiting, prostration, and loss of consciousness may result, eventually leading to convulsions, coma, and death.

Oxygen deficiency during pregnancy has produced developmental abnormalities in humans and experimental animals.

NFPA HAZARD CODES	HMIS HAZARD CODES	RATINGS SYSTEM
Health: 1	Health: 1	0 = No Hazard
Flammability: 4	Flammability: 4	1 = Slight Hazard
Reactivity: 0	Reactivity: 0	2 = Moderate Hazard
		3 = Serious Hazard
		4 = Severe Hazard

4. First Aid Measures

EYES:
Never introduce oil or ointment into the eyes without medical advice! If pain is present, refer the victim to an ophthalmologist for further treatment and follow up.

SKIN:

Remove contaminated clothing and wash affected area with soap and water. If irritation persists, seek medical attention.

INGESTION:
Not normally required. Seek immediate medical attention.

INHALATION:
PROMPT MEDICAL ATTENTION IS MANDATORY IN ALL CASES OF OVEREXPOSURE TO PRODUCT. RESCUE PERSONNEL SHOULD BE EQUIPPED WITH SELF-CONTAINED BREATHING APPARATUS. Conscious persons should be assisted to an uncontaminated area and inhale fresh air. Quick removal from the contaminated area is most important. Unconscious persons should be moved to an uncontaminated area, given assisted (artificial) respiration and supplemental oxygen. Further treatment should be symptomatic and supportive.

5. Fire Fighting Measures

Conditions of Flammability: Flammable liquid and vapor		
Flash point: -105 °F (-76 °C)	Method: Closed Cup	Autoignition Temperature: 869 °F (465 °C)
LEL(%): 1.8	UEL(%): 9.6	
Hazardous combustion products: Carbon monoxide, Carbon dioxide		
Sensitivity to mechanical shock: None		
Sensitivity to static discharge: Not Available		

FIRE AND EXPLOSION HAZARDS:
Isobutylene is heavier than air and may travel a considerable distance to an ignition source. Isobutylene is a flammable gas! Keep away from open flame and other sources of ignition. Do not allow smoking in storage areas or when handling.

EXTINGUISHING MEDIA:
Water, carbon dioxide, dry chemical.

FIRE FIGHTING INSTRUCTIONS:
If possible, stop the flow of gas with a remote valve. Use water spray to cool fire exposed containers. If fire is extinguished and flow of gas is continued, increase ventilation to prevent a build up of a flammable/ explosive atmosphere. Extinguish sources of ignition.

Be cautious of a Boiling Liquid Evaporating Vapor Explosion, BLEVE, if flame is impinging on surrounding containers. Direct 500 GPM water stream onto containers above the liquid level with remote monitors. Limit the number of personnel in proximity to the fire. Evacuate surrounding areas to at least 3000 feet in all directions.

6. Accidental Release Measures

Evacuate all personnel from affected area. Use appropriate protective equipment. Increase ventilation to prevent build up of a flammable/explosive atmosphere. Extinguish all sources of ignition! If leak is in user's equipment, be certain to purge piping with inert gas prior to attempting repairs. If leak is in container or container valve, contact the appropriate emergency telephone number listed in Section 1 or call your closest BOC location

7. Handling and Storage

Earth bond and ground all lines and equipment associated with the product system. Electrical equipment should be non-sparking and explosion proof.

Use only in well-ventilated areas. Valve protection caps must remain in place unless container is secured with valve outlet piped to use point. Do not drag, slide or roll cylinders. Use a suitable hand truck for cylinder movement. Use a pressure regulator when connecting cylinder to lower pressure (<250 psig) piping or systems. Do not heat cylinder by any means to increase the discharge rate of product from the cylinder. Use a check valve or trap in the discharge line to prevent hazardous back flow into the cylinder.

Protect cylinders from physical damage. Store in cool, dry, well-ventilated area away from heavily trafficked areas and emergency exits. Do not allow the temperature where cylinders are stored to exceed 130°F (54°C). Cylinders should be stored upright and firmly secured to prevent falling or being knocked over. Full and empty cylinders should be segregated. Use a "first in-first out" inventory system to prevent full cylinders from being stored for excessive periods of time.

Post "No Smoking" signs in storage or use areas.

For additional recommendations consult Compressed Gas Association Pamphlet P-1.

Never carry a compressed gas cylinder or a container of a gas in cryogenic liquid form in an enclosed space such as a car trunk, van or station wagon. A leak can result in a fire, explosion, asphyxiation or a toxic exposure.

8. Exposure Controls, Personal Protection

EXPOSURE LIMITS[1]:

INGREDIENT	% VOLUME	PEL-OSHA[2]	TLV-ACGIH[3]	LD_{50} or LC_{50} Route/Species
Isobuylene FORMULA: C4H8 CAS: 115-11-7 RTECS #: UD0890000	99.0 to 99.8	Simple Asphyxiant	Simple Asphyxiant	LC_{50} 620 mg/m^3/3H (rat)

[1] Refer to individual state of provincial regulations, as applicable, for limits which may be more stringent than those listed here.
[2] As stated in 29 CFR 1910, Subpart Z (revised July 1, 1993)
[3] As stated in the ACGIH 1994-1995 Threshold Limit Values for Chemical Substances and Physical Agents.

ENGINEERING CONTROLS:
Use local exhaust to prevent accumulation. Use general ventilation to prevent build up of flammable concentrations. May use hood with forced ventilation when handling small quantities. If product is handled routinely where the potential for leaks exists, all electrical equipment must be rated for use in potentially flammable atmospheres. Consult the National Electrical Code for details.

EYE/FACE PROTECTION:
Safety goggles or glasses.

SKIN PROTECTION:
Protective gloves made of plastic or rubber.

RESPIRATORY PROTECTION:
Positive pressure air line with full-face mask and escape bottle or self-contained breathing apparatus should be available for emergency use.

OTHER/GENERAL PROTECTION:
Safety shoes, safety shower, eyewash.

9. Physical and Chemical Properties

PARAMETER	VALUE	UNITS
Physical state (gas, liquid, solid)	: Gas	
Vapor pressure at 70°F	: 39	psia
Vapor density at STP (Air = 1)	: 1.98	
Evaporation point	: Not Available	
Boiling point	: 19.5	°F
	: -6.9	°C
Freezing point	: -220.6	°F
	: -140.3	°C
pH	: Not Available	
Specific gravity	: Not Available	
Oil/water partition coefficient	: Not Available	
Solubility (H20)	: Insoluble	
Odor threshold	: Not Available	
Odor and appearance	: A colorless gas with an unpleasant odor similar to that of burning coal.	

10. Stability and Reactivity

STABILITY:
Stable

CONDITIONS TO AVOID (STABILITY):
None

INCOMPATIBLE MATERIALS:
Oxidizers

HAZARDOUS DECOMPOSITION PRODUCTS:
Carbon monoxide

11. Toxicological Information

Oxygen deficiency during pregnancy has produced developmental abnormalities in humans and experimental animals.

No chronic effects data given in the Registry of Toxic Effects of Chemical Substances (RTECS) or Sax, Dangerous Properties of Industrial Materials, 7th ed.

12. Ecological Information

No data given.

13. Disposal Considerations

Do not attempt to dispose of residual waste or unused quantities. Return in the shipping container PROPERLY LABELED, WITH ANY VALVE OUTLET PLUGS OR CAPS SECURED AND VALVE PROTECTION CAP IN PLACE to BOC Gases or authorized distributor for proper disposal.

14. Transport Information

PARAMETER	United States DOT	Canada TDG
PROPER SHIPPING NAME:	Isobutylene	Isobutylene
HAZARD CLASS:	2.1	2.1
IDENTIFICATION NUMBER:	UN 1055	UN 1055
SHIPPING LABEL:	FLAMMABLE GAS	FLAMMABLE GAS

15. Regulatory Information

Isoutylene is listed under the accident prevention provisions of section 112(r) of the Clean Air Act (CAA) with a threshold quantity (TQ) of 10,000 pounds.

SARA TITLE III NOTIFICATIONS AND INFORMATION

SARA TITLE III - HAZARD CLASSES:
Acute Health Hazard
Fire Hazard
Sudden Release of Pressure Hazard

16. Other Information

Compressed gas cylinders shall not be refilled without the express written permission of the owner. Shipment of a compressed gas cylinder which has not been filled by the owner or with his/her (written) consent is a violation of transportation regulations.

DISCLAIMER OF EXPRESSED AND IMPLIED WARRANTIES:

Each individual should make a determination as to the suitability of the information for their particular purpose(s).

Material Safety Data Sheet: **Simple Green® All-Purpose Cleaner**
Simple Green® Scrubbing Pad
Version No. 1300509A Date of Issue: January 2009 *ANSI-Z400.1-2003 Format*

Section 1: PRODUCT & COMPANY IDENTIFICATION

Product Name: Simple Green® All-Purpose Cleaner
Simple Green® Scrubbing Pad
Additional Name: Simple Green® Concentrated Cleaner/Degreaser/Deodorizer

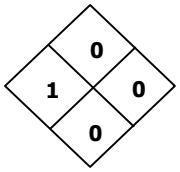
Manufacturer's Product Code Numbers: **Please refer to page 4*

Company: Sunshine Makers, Inc.
15922 Pacific Coast Highway
Huntington Harbour, CA 92649 USA
Telephone: 800-228-0709 ● 562-795-6000 Fax: 562-592-3830
Emergency Phone: Chem-Tel 24-Hour Emergency Service: 800-255-3924

Use of Product: An all purpose cleaner and degreaser used diluted in water for direct, spray and dip tank procedures. Scrubbing pad is used with water for manual scrubbing applications. Both are for cleaning water-safe surfaces.

Section 2: HAZARDS IDENTIFICATION

Emergency Overview: CAUTION. Mild eye irritant.
Simple Green@ is a dark green liquid with a sassafras odor. Scrubbing Pad is a green fibrous rectangle.



HMIS Rating:
Health = 1 = slight
Fire = 0
Reactivity, and Special = 0 = minimal

Eye Contact: Mild Eye Irritant.

Skin Contact: No adverse effects expected under typical use conditions. Prolonged exposure may cause dryness. Under this condition, use of gloves or skin moisturizer after washing may be indicated.

Ingestion: May cause stomach or intestinal upset if swallowed (due to detersive properties.)

Inhalation: No adverse effects expected under typical use conditions. Adequate ventilation should be present when using Simple Green® over a prolonged period of time. Open windows or ventilate via fan or other air-moving equipment if necessary.

Carcinogens: No ingredients are listed by OSHA, IARC, or NTP as known or suspected carcinogens.

Medical Conditions: No medical conditions are known to be aggravated by exposure to Simple Green®. Dermal-sensitive users may experience mild but reversible reactions.

UN Number: Not Required **Dangerous Goods Class:** Non-hazardous

Section 3: COMPOSITION/INFORMATION ON INGREDIENTS

The only ingredient of Simple Green® with established exposure limits is undiluted 2-butoxyethanol (<4%) (Butyl Cellosolve; CAS No. 111-76-2) [*1% for Scrubbing Pad*]: the ACGIH TLV-TWA is 20 ppm (97 mg/m^3). Based upon chemical analysis, Simple Green® contains no known EPA priority pollutants, heavy metals or chemicals listed under RCRA, CERCLA, or CWA. Analysis by TCLP (Toxicity Characteristic Leaching Procedure) according to RCRA revealed no toxic organic or inorganic constituents.

All components of Simple Green® are listed on the TSCA Chemical Substance Inventory.
This product does not contain any ingredients covered by the provisions of 29 CFR 1910.1200.

Section 4: FIRST AID MEASURES

Eye Contact: Reddening may develop. Immediately rinse the eye with large quantities of cool water; continue 10-15 minutes or until the material has been removed; be sure to remove contact lenses, if present, and to lift upper and lower lids during rinsing. Get medical attention if irritation persists.

Skin Contact: Minimal effects, if any; rinse skin with water, rinse shoes and launder clothing before reuse. Reversible reddening may occur in some dermal-sensitive users; thoroughly rinse area and get medical attention if reaction persists.

Swallowing; Essentially non-toxic. Give several glasses of water to dilute; do not induce vomiting. If stomach upset occurs, consult physician.

Inhalation: Non-toxic. Exposure to concentrate may cause mild irritation of nasal passages or throat; remove to fresh air. Get medical attention if irritation persists.

Section 5: FIRE FIGHTING MEASURES

Simple Green® is stable, not flammable, and will not burn. No special procedures required.

Flash Point/Auto-Ignition: Not flammable. Extinguishing Media: Not flammable/non-explosive.
Flammability Limits: Not flammable. Special Fire Fighting Procedures: None required.

Section 6: ACCIDENTAL RELEASE MEASURES

Personal Precautions: Avoid contact with eyes. Do not rub eyes with hands during cleanup. No special precautions for dermal contact are needed. Wash hands thoroughly after cleaning up spill or leak.

Method for cleaning up: Recover usable material by convenient method, residual may be removed by wipe or wet mop. If necessary, unrecoverable material may be washed to drain with large quantities of water.

Section 7: HANDLING AND STORAGE

No Special precautions are required. **This product is non-hazardous for storage and transport according to the U.S. Department of Transportation Regulations.** Simple Green® requires no special labeling or placarding to meet U.S. Department of Transportation requirements.

UN Number: Not Required **Dangerous Goods Class:** Non-hazardous

Section 8: EXPOSURE CONTROLS/PERSONAL PROTECTION

Exposure Limits: The Simple Green® formulation presents no health hazards to the user when used according to label directions for its intended purposes. Mild skin and eye irritation is possible (please see Eye contact and Skin contact in section IV.) No special precautionary measures required under normal use conditions.

Ventilation: No special ventilation, precautions or respiratory protection is required during normal use. Large-scale use indoors should provide an increased rate of air exchange.

Human Health Effects or Risks From Exposure: Adverse effects on human health are not expected from Simple Green®, based on 20 years of use of Simple Green® without reported adverse health incidence in diverse population groups, including extensive use by inmates of U.S. Federal prisons in cleaning operations.

Eye protection: Simple Green® is a mild eye irritant; mucous membranes may become irritated by concentrate. Eye protection not generally required. Wash hands after using wipes.

Skin protection: Simple Green® is not likely to irritate the skin in the majority of users. Repeated daily application to the skin without rinsing, or continuous contact on the skin may lead to temporary, but reversible, irritation. Rinse completely from skin after contact.

Section 8: EXPOSURE CONTROLS/PERSONAL PROTECTION – continued –

General hygiene conditions: There are no known hazards associated with this material when used as recommended. The following general hygiene considerations are recognized as common good industrial hygiene practices:

- Avoid breathing vapor or mist.
- Avoid contact with eyes.
- Wash thoroughly after handling and before eating, drinking, or smoking.

Section 9: PHYSICAL AND CHEMICAL PROPERTIES

Appearance & Odor: Cleaner is a dark green liquid, pad is a fibrous green matrix; both exhibit a sassafras odor.			
Specific Gravity:	1.010 ± 0.010	**Vapor Pressure:**	18 mm Hg @ 20°C; 23.5 mmHg @ 26°C
Evaporation:	>1 (butyl acetate = 1)	**Vapor Density:**	1.3 (air = 1)
Water Solubility:	100%	**Density:**	8.5 lbs/gallon
Boiling Point:	100.6°C (212°F)	**pH:**	9.5 ± 0.3
Ash Content:	At 600°F: 1.86% by weight	**Nutrient Content:** Phosphorus: 0.3% by formula Nitrogen <1.0% by weight (fusion and qualitative test for ammonia) Sulfur: 0.6% by weight (barium chloride precipitation method)	
Freezing Point: Approx -9 °C (16 °F) *If product freezes, it will reconstitute without loss of efficacy when brought back to room temperature and agitated.*			
VOC Composite Partial Pressure: 0.006 mmHg @ 20°C			
Volatile Organic Compounds (VOCs): CARB Method 310 3.8% SCAQMD Method 313 2.8%	Cleaner meets CARB & BAAQMD regulations. Cleaner must be diluted 1:1 with water to Meet SCAQMD Rule 1171 & Rule 1122 VOC requirements for solvent cleaning operations. [*Scrubber VOCs = 3.3% prior to dilution w/water*]		

Section 10: STABILITY AND REACTIVITY

Stability: Stable
Materials to Avoid: None known
Hazardous Decomposition Products: None expected

Section 11: TOXICOLOGICAL INFORMATION

Toxicology information is based on chemical profile of ingredients and extrapolation of data from similar formulas.

Acute Toxicity: Oral LD_{50} (rat) >5 g/kg body weight*
Dermal LD_{50} (rabbit) >2 g/kg body weight

**Calculation from OECD series on testing and assessment number 33, Chapter 3.2*

Eye Irritation: Moderate/Mild reversible eye irritation may occur based on relevant laboratory studies. This potential is reduced by immediate rinsing of eyes in case of eye contact.

Dermal Irritation: Mild, reversible skin irritation may occur based on relevant laboratory studies. A 6-hour exposure to human skin under a patch did not produce irritation

Repeat Exposure Via Skin Contact: Based on relevant laboratory studies, no toxic effects are expected to be associated with daily skin exposures (with up to 2 g/kg/day tested for 13 weeks on rabbits). Skin irritation may, however, occur with repeated or prolonged exposures.

Reproductive Effects Assessment: Based on relevant laboratory studies (CD-1 mouse 18-week fertility assessment continuous breeding), no adverse effects on reproduction, fertility, or health of offspring are expected.

Section 12: ECOLOGICAL INFORMATION

Hazard to wild animals & aquatic organisms: Low, based on toxicological profile.

Biodegradability: Readily biodegradable based on biodegradation profile,
PRO/FT CBT-AC 014-7 "Ready Biodegradability: Closed Bottle Test" OECD, and OECD 302B laboratory tests

Environmental Toxicity Information: It is important not to allow the runoff from cleaning into closed systems such as decorative ponds. Always protect closed systems with tarps or dikes if necessary.

Section 13: DISPOSAL CONSIDERATIONS

Dispose of in accordance with all applicable local, state and federal laws. Dispose of used or unused product, and empty containers in accordance with the local, State, Provincial, and Federal regulations for your location. Never dispose of used degreasing rinsates into lakes, streams, and open bodies of water or storm drains.

Section 14: TRANSPORT INFORMATION

This product is non-hazardous for transport according to the U.S. Department of Transportation Services
UN Number: Not required Dangerous Goods Class: Non-hazardous

Section 15: REGULATORY INFORMATION

*Reportable components:

All components are listed on:	EINECS and TSCA Inventory
No components listed under:	Clean Air Act Section 112
SARA:	This material contains 2-Butoxyethanol, < 4%, (CAS# 111-76-2) which is subject to the reporting requirements of Section 313 of SARA Title III and 49 CFR Part 373.

RCRA Status:	Not a hazardous waste.	CERCLA Status:	No components listed
TSCA TRI Reporting:	Not required / Not listed	CA PROP. 65 Status:	No components listed

STANDARD OPERATING PROCEDURES

SOP No. HS-001 Biological Hazards

1.1 Objective

The objective of this Standard Operating Procedure (SOP) is to prevent or limit the potential for GEI personnel to encounter biological hazards during field activities.

1.2 General

This SOP is intended for use by employees engaged in work with the potential for contact with biological hazards such as animals, insects, plants, and sewage. The site-specific health and safety plan (HASP) should include a hazard assessment for the project that identifies the potential for encounters with biological hazards and the control methods to be implemented by GEI employees. These hazards must be reviewed in the project safety briefing and documented on the Project Safety Briefing form, found on the Safety page of the GEI intranet.

1.3 Mammals

During some site operations, animals such as stray or domesticated dogs or cats, raccoons, snakes, bears, rats, bats, etc. may be encountered. Employees should use discretion and attempt to avoid contact with animals. If these animals present a problem, efforts will be made to remove these animals from the site by contacting a licensed animal control technician.

1.3.1 Rabies

The rabies virus is transmitted through the bite of an infected animal or contact with saliva or brain/nervous system tissue of an infected animal. The rabies virus infects the central nervous system, causing disease in the brain. The early symptoms of rabies in people are fever, headache, and general weakness or discomfort. As the disease progresses, more specific symptoms appear and may include insomnia, anxiety, confusion, slight or partial paralysis, excitation, hallucinations, agitation, hypersalivation (increase in saliva), difficulty swallowing, and hydrophobia (fear of water). Death usually occurs within days of the onset of these symptoms.

If you are bitten or think you may be exposed, wash any wounds immediately and thoroughly with soap and water. Then go to the hospital emergency room and notify the Project Manager and the People Safety Team. The doctor, possibly in consultation with the state or local health department, will decide if you need a rabies vaccination. Decisions to start series of vaccinations will be based on your type of exposure and the animal you were exposed to, as well as laboratory and surveillance information for the geographic area where the exposure occurred. If possible have someone document what type of animal it was, how it was behaving prior to the bite, what caused it to bite the

employee, and if it's not a domestic animal that would be easy to find again in the future, try to get animal control on site to capture it. An Incident Report Form must be completed and submitted, per GEI's Incident reporting procedures. This form is available on the Safety App (smart phones) and on the Safety page on the GEI intranet.

1.4 Insects and Arachnids

Insects, including bees, wasps, hornets, mosquitoes, ticks, spiders, etc., may be present at a job site making the chance of a bite/sting possible. Some individuals may have a severe allergic reaction to an insect bite or sting that can result in a life-threatening condition. Some insect bites can transmit diseases such as Lyme disease or a virus such as West Nile. The following is a list of preventive measures:

- Apply insect repellent prior to performing field work and as often as needed throughout the work shift.
- Wear proper personal protective equipment (PPE), including protective clothing (work boots, socks, and light colored clothing).
- Wear shoes, long pants with bottoms tucked into boots or socks, and a long-sleeved shirt when outdoors for long periods of time, or when many insects are most active (between dawn and dusk).
- When walking in wooded areas, avoid contact with bushes, tall grass, or brush as much as possible.
- Field personnel who have or may have insect allergies must have insect allergy medication onsite and must inform the Site Safety Officer (SSO) and the People and Safety Team of their particular allergy prior to commencing work.
- Field personnel should perform a self-check at the end of the day for ticks.

1.4.1 Tick-borne Diseases

Lyme Disease

Lyme disease is caused by infection from a deer tick that carries a spirochete (a bacterium). During the painless tick bite, the spirochete may be transmitted into the bloodstream, often after feeding on the host for 12 to 24 hours. The ticks that cause the disease are often no bigger than a poppy seed or a comma in newsprint. The peak months for human infection are from May to September.

Symptoms appear in three stages. First symptoms usually appear from 2 days to a few weeks after a person is bitten by an infected tick. Symptoms usually consist of a ring-like red rash on the skin where the tick was attached. The rash is often bulls-eye like with red around the edges and clear in the center. The rash may be warm, itchy, tender, and/or "doughy." This rash appears in only 60 to 80 percent of infected persons. An infected

person also has flu-like symptoms of a stiff neck, chills, fever, sore throat, headache, fatigue, and joint pain. These symptoms often disappear after a few weeks.

The second stage symptoms, which occur weeks to months later include meningitis, severe headache, drooping of the muscles on the face, called Bell's Palsy, encephalitis, numbness, withdrawal, and lethargy. These symptoms may last for several weeks to several months. Third stage symptoms, which occur months or years later include arthritis, heart problems, and loss of memory. The third stage symptoms may mimic multiple sclerosis and Alzheimer's disease.

When in areas that could harbor deer ticks, employees should wear light color clothing, and visually check themselves and check and be checked by another employee when coming from wooded or vegetated areas. If a GEI employee has a tick bite, the People and Safety Team and Project Manager must be contacted immediately. The employee will be offered the option for medical treatment by a physician, which typically involves antibiotics. An Incident Report form must be completed in compliance with the Incident Reporting procedures. This form is available on the Safety App (smart phones) and on the Safety page on the GEI intranet.

If personnel feel sick or have signs similar to those mentioned above, the SSO and the People and Safety Team must be notified immediately.

Figure 1: From left to right, the deer tick adult female, adult male, nymph, and larva on a centimeter scale.

How to Remove a Tick

A tick can be removed from the skin by pulling gently at the head with tweezers. If tweezers are not available, use tissue paper or cloth to grasp the tick. It is important to grasp the tick as close to the site of attachment and use a firm steady pull to remove it. Wash hands immediately after with soap and water. The affected area should also be washed with soap and water, then disinfected with an antiseptic wipe, if available. All mouth parts must be removed from the skin. If the tick was removed by breaking off the

mouth parts, an irritation or infection may occur because the organism that is causing the disease can still enter the body through the skin.

Treatment for Lyme Disease

Treatment with antibiotics is effective and recovery is usually complete. For first stage symptoms, antibiotics are usually given orally. However, treatment for second and third stage symptoms is prolonged and recovery may take longer. Antibiotic treatment is usually provided intravenously for second and third stage Lyme disease.

Babesiosis

The deer tick can also cause Babesiosis, an infection of the parasite Babesia Microti. Symptoms of Baesiosis may not be evident, but may also include fever, fatigue and hemolytic anemia lasting from several days to several months. Babesiosis is most commonly diagnosed in the elderly or in individuals whose immune systems are compromised. If there are no signs or symptoms of Babesiosis, usually no treatment it needed. If an employee believes they might have Babesiosis they'll see a physician to be tested. Treatment usually consists of taking prescription medications for 7 to 10 days.

Ehrlichiosis

Ehrlichiosis is a tick-borne disease which can be caused by either of two different organisms. Human monocytic ehrlichiosis (HME) is caused by *Ehrlichia chaffeensis*, which is transmitted by the lone star tick (*Amblyomma americanum*). Human granulocytic anaplasmosis (HGA), previously known as human granulocytic ehrlichiosis (HGE), is caused by *Anaplasma phagocytophilia*, which is transmitted by the deer tick (*Ixodes scapularis*).

Ehrlichiosis is transmitted by the bite of infected ticks, including the deer tick and the lone star tick. The symptoms of HME and HGE are the same and usually include fever, muscle aches, weakness and headache. Patients may also experience confusion, nausea, vomiting and joint pain. Unlike Lyme disease or Rocky Mountain spotted fever, a rash is not common. Infection usually produces mild to moderately severe illness, with high fever and headache, but may occasionally be life-threatening or even fatal. Symptoms appear 1 to 3 weeks after the bite of an infected tick. However, not every exposure results in infection. For those that become infected a drug called Doxcycline will be prescribed.

Rocky Mountain Spotted Fever

Rocky Mountain spotted fever is a tick-borne disease caused by a rickettsia (a microbe that differs somewhat from bacteria and virus). In the eastern United States, children are infected most frequently, while in the western United States, disease incidence is highest among adult males. Disease incidence is directly related to exposure to tick-infested habitats or to infested pets. Rocky Mountain spotted fever is characterized by a sudden onset of moderate to high fever (which can last for 2-3 weeks), severe headache, fatigue, deep muscle pain, chills and rash. The rash begins on the legs or arms, may include the

soles of the feet or palms of the hands and may spread rapidly to the trunk or rest of the body. Symptoms usually appear within 2 weeks of the bite of an infected tick. Like Ehrlichiosis the prescription drug Doxcycline is the first line treatment option.

1.4.2 Mosquito-Borne Disease

West Nile Virus
West Nile Virus is a mosquito-borne infection transmitted through the bite of an infected mosquito. The symptoms of West Nile Virus can be asymptomatic (no symptoms) or in more serious cases can lead to West Nile Fever. West Nile Fever can include fever, headache, tiredness, body ache, an occasional rash on the trunk of the body, and swollen lymph glands, In severe cases, people have developed West Nile Encephalitis or Meningitis which symptoms include fever, headache, neck stiffness, tremors, coma, and in some cases death. The incubation period for the disease is usually 2 to 15 days. The symptoms can range from a few days to several weeks. Most mosquitoes are not infected and the chance of infection from a mosquito bite of an on-site employee is very small.

1.5 Repellants

The following precautions will be used to help reduce the risk of mosquito bites:

Reduce mosquito-breeding areas by making sure wheelbarrows, buckets, and other containers are turned upside down when not used so that they do not collect standing water. According to the Environmental Protection Agency (EPA), many mosquitoes can breed in pooled water that's minimal enough to fill a bottle cap.

Wear shoes, long pants with bottoms tucked into boots or socks, and a long-sleeved shirt when outdoors for long periods of time, or when many mosquitoes are most active (between dawn and dusk).

Use mosquito repellant according to the manufacturer's directions when outdoors for long periods of time and when mosquitoes are most active.

Centers for Disease Control and Prevention (CDC) evaluation of information contained in peer-reviewed scientific literature and data available from the EPA has identified several EPA-registered products that provide repellent activity sufficient to help people avoid the bites of disease carrying mosquitoes. Products containing these active ingredients typically provide reasonably long-lasting protection:

- **DEET** (Chemical Name: N,N-diethyl-m-toluamide or N,N-diethly-3-methyl-benzamide)
- **Picaridin** (KBR 3023, Chemical Name: 2-(2-hydroxyethyl)-1-piperidinecarboxylic acid 1-methylpropyl ester)

- **Oil of Lemon Eucalyptus** or **PMD** (Chemical Name: para-Menthane-3,8-diol) the synthesized version of oil of lemon eucalyptus
- **IR3535** (Chemical Name: 3-[N-Butyl-N-acetyl]-aminopropionic acid, ethyl ester)
- **Permethrin** (3-Phenoxybenzyl (1RS)-cis,trans-3-(2,2-dichlorovinyl) -2,2-dimethylcyclopropanecarboxylate) **–** Permethrin kills ticks and can be used on clothing (but not skin)

The EPA characterizes the active ingredients DEET and Picaridin as "conventional repellents" and Oil of Lemon Eucalyptus, PMD, and IR3535 as "biopesticide repellents", which are derived from natural materials.

In general, higher concentrations of active ingredient provide longer duration of protection, regardless of the active ingredient, although concentrations above approximately 50 percent do not offer a marked increase in protection time. Products with less than 10 percent active ingredient may offer only limited protection, often from 1 to 2 hours. Products that offer sustained release or controlled release (micro-encapsulated) formulations, even with lower active ingredient concentrations, may provide longer protection times. Regardless of what product you use, if you start to get mosquito bites reapply the repellent according to the label instructions or remove yourself from the area with biting insects if possible.

Clothing and other products can be purchased pre-treated, or products can be treated using EPA-registered products. Permethrin is the only pesticide approved by the EPA for these uses. Permethrin binds tightly to the fabrics, resulting in little loss during washing and minimal transfer to the skin. Permethrin is poorly absorbed through the skin, although sunscreens and other products may increase the rate of skin absorption.

If you decide to use permethrin-treated clothing, consider these tips:

- Read the application instructions carefully and apply the product according to the label directions. Do not over-treat products.
- Permethrin treatments are only intended for use on fabrics; do not apply them directly to the skin or other items.
- Do not apply permethrin to clothing while it is being worn.
- Apply the product to clothing outdoors in well ventilated areas that are protected from wind.
- Hang treated fabrics outdoors and allow them to dry completely before wearing them.
- Wash permethrin treated clothing separately from other clothing items.

1.6 Poisonous Plants

The potential for contact with poisonous plants, such as poison ivy, oak, and sumac exists when performing fieldwork in wooded or boggy areas. Urushiol, an oily organic allergen found in plants, can cause an allergic reaction when in contact with the leaves or vines.

Poison ivy can be found as vines on tree trunks or as upright bushes. Poison ivy consists of three leaflets with notched edges. Two leaflets form a pair on opposite sides of the stalk, and the third leaflet stands by itself at the tip. Poison ivy is red in the early spring and turns shiny green later in the spring. Poison ivy grows throughout much of North America, including all states east of the Rocky Mountains. It is normally found in wooded areas, especially along edge areas where the tree line breaks and allows sunshine to filter through. It also grows in exposed rocky areas, open fields, and disturbed areas.

Poison oak can be present as a sparsely-branched shrub. Poison oak can grow anywhere in the United States with the exception of Hawaii, Alaska, and some southwest areas that have desert climates. Poison oak is similar to poison ivy in that it has the same leaflet configuration; however, the leaves have slightly deeper notches.

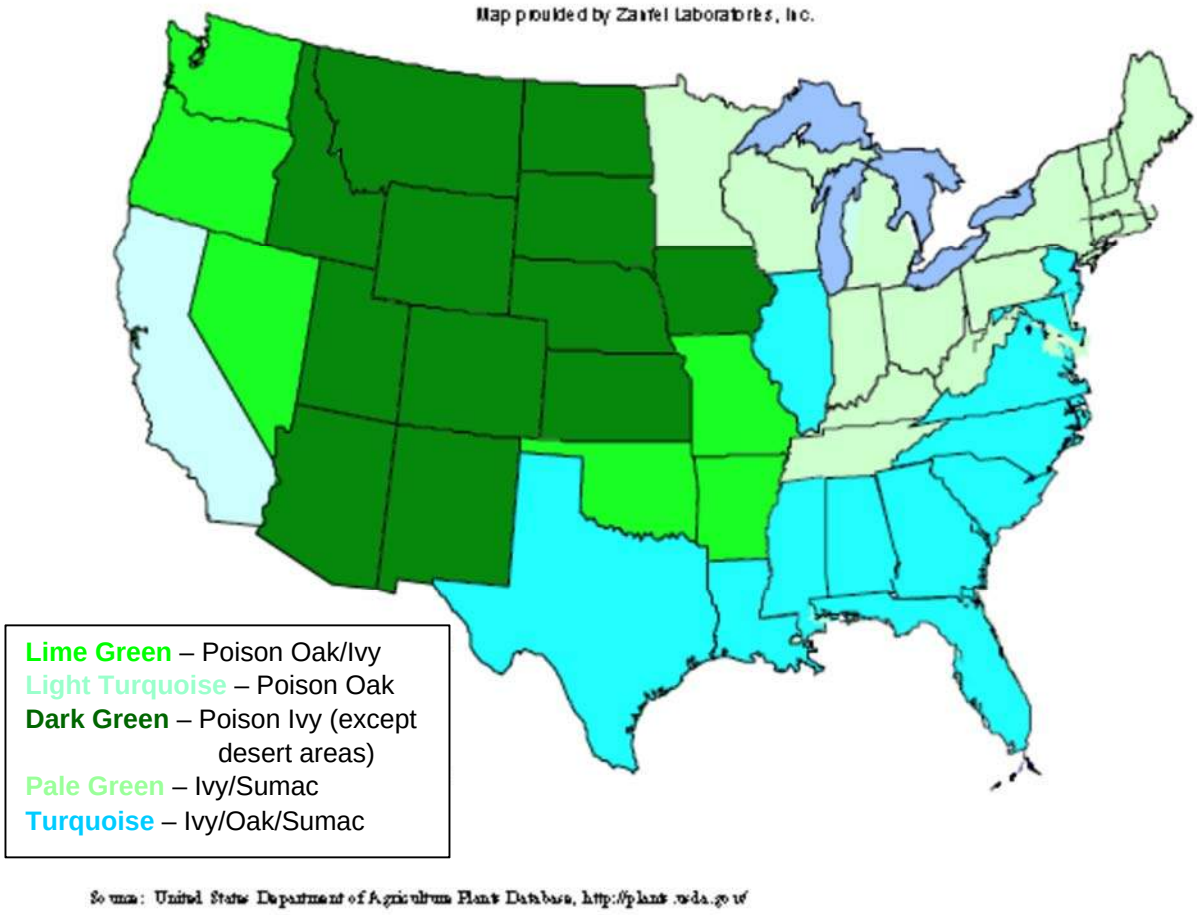
Poison sumac can be present in the form of a flat-topped shrub or tree. It has fern-like leaves, which are velvety dark green on top and pale underneath. The branches of immature trees have a velvety “down.” Poison sumac has white, “hairy” berry clusters. Poison sumac grows exclusively in very wet or flooded soils, usually in swamps and peat bogs, in the eastern United States.

Poison Ivy

Poison Oak

Poison Sumac

U.S. Prevalence of Poison Ivy, Oak & Sumac



Source: United State Department of Agriculture Plant Database, http://plants.usda.gov/

To prevent exposure to these poisonous plants:

- Wear proper PPE, including long sleeves, long pants, boots, and gloves.
- Barrier skin creams, such as lotion containing bentoquatum (Tecnu®), may offer some protection prevent the occurrence of exposure symptoms.
- Contact with poison ivy, sumac, or oak may lead to a skin rash, characterized by reddened, itchy, blistering skin which needs first aid treatment. Employees with known allergies should identify themselves to the SSO or Project Manager prior to starting field work as a precautionary measure. If you believe you have contacted one of these plants:
    - Immediately wash skin thoroughly with soap and water, taking care not to touch your face or other body parts.
    - Contact the People and Safety Team and Project Manager immediately after caring for affected skin.

- Wash exposed clothing separately in hot water with detergent.

- After use, clean tools, and soles of boots with rubbing alcohol or soap and lots of water. Urushiol can remain active on the surface of objects for up to 5 years.
- If a rash occurs, contact the People and Safety Team and complete and submit an Incident Report Form. This form is available on the Safety App (smart phones) and on the Safety page on the GEI intranet.

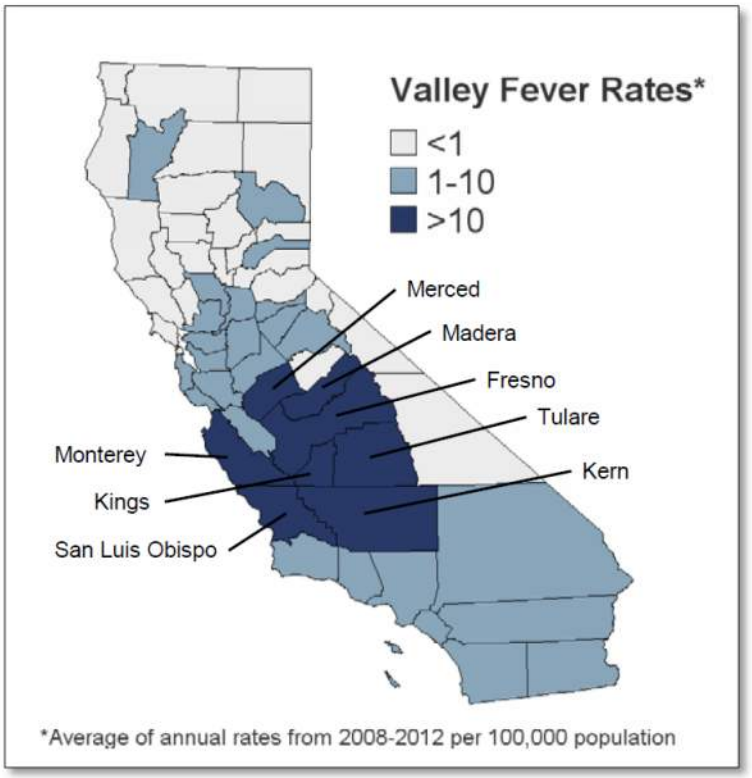
1.7 Sewage and Bacterial Impacted Sediments

Some project work may be conducted at sites that serve or have served as a combined sewer overflow and consequently may have received untreated sanitary sewage from numerous sources. Decomposed sewage can potentially be encountered within sites and their sediments. Sediments could contain soil and marine microorganisms, and bacterium associated with sewage. Many of these bacterium can cause illness through ingestion, direct contact, or the inhalation of a bio-aerosol possibly in the form of dust. Potential respiratory exposure to biological agents can also occur through the inhalation of aerosols produced during sediment handling activities. PPE as identified in the site-specific HASP will be worn to minimize potential exposures. Employees will follow the decontamination or disposal procedures identified in the HASP.

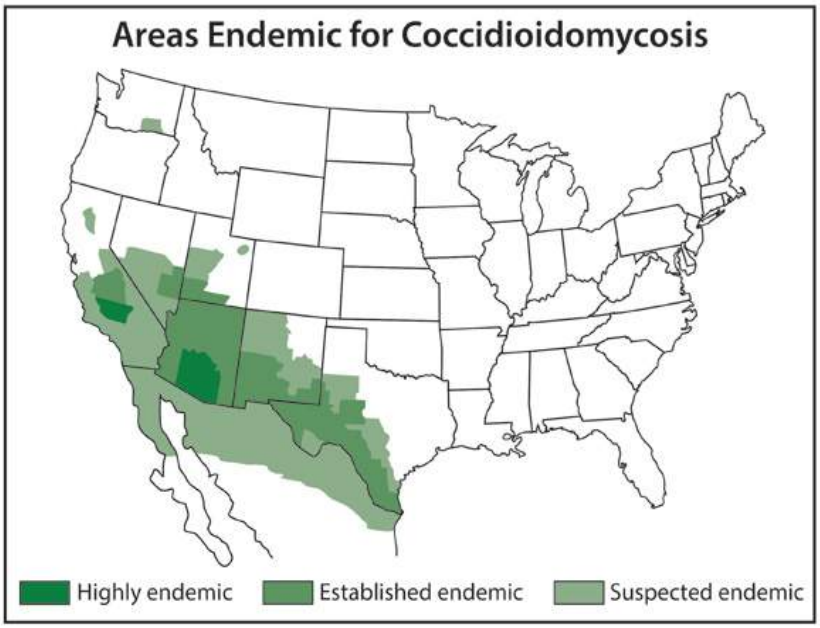
1.7.1 Fungal Spores in Soil – Valley Fever

Valley Fever is an illness that usually affects the lungs. It is caused by the fungus *Coccidioides immitis* that lives in the top 2 to 12 inches of soil in many parts of California. When fungal spores are present, any work activity that disturbs the soil, such as digging, grading, or other earth moving operations, or vehicle operation on dirt roads, can cause the spores to become airborne, therefore increasing the risk of Valley Fever. All employees on sites where the fungus is present, and who are exposed to dusty conditions and wind-blown dusts are at increased risk of becoming infected.

Valley Fever fungal spores are too small to be seen, and there is no reliable way to test the soil for spores before working in a particular place. Valley Fever can be found throughout the southwestern United States, parts of Mexico, and South America. Some California counties consistently have Valley Fever fungus present in the soil. In these regions Valley Fever is considered endemic. Health departments track the number of cases of Valley Fever illness that occur. This information is used to map illness rates as seen on the figures below from the Center of Disease Control Valley Fever Awareness website.



Rates of reported Valley Fever cases in California counties from 2008–2012. Darkest colored counties had the highest rates of Valley Fever.



When present, symptoms usually occur between 7 to 21 days after breathing in spores, and can include:

- Cough
- Fever
- Chest pain
- Headache
- Muscle aches
- Rash on upper trunk or extremities
- Joint pain in the knees or ankles
- Fatigue

Symptoms of Valley Fever can be mistaken for other diseases such as the flu (influenza) and TB (tuberculosis), so it is important for employees to obtain medical care for an accurate diagnosis and possible treatment.

While there is no vaccine to prevent Valley Fever, the following important steps must be taken in order to limit risk:

- Determine if the worksite is in an endemic area. Contact the local health department for more information about the risk in the county GEI is performing work that may disturb soils.
- Prepare work plans and work practices that reduce employee's exposure, which may include:
    - Provide air conditioned cabs with properly maintained dust filters for vehicles that generate heavy dust and make sure employees keep windows and vents closed.
    - Suspend work during heavy winds.
- When exposure to dust is unavoidable, National Institute for Occupational Safety and Health (NIOSH)-approved respiratory protection with particulate filters rated as N95, N99, N100, P100, or High Efficiency Particulate Air (HEPA) must be provided. The Project Manager must work with the Safety Team to develop and implement a respiratory protection program in accordance with California's Occupational Safety and Health Administration (Cal/OSHA's) Respiratory Protection standard (8 CCR 5144) for the project.
- Take measures to reduce transporting spores offsite, such as:
    - Clean tools, equipment, PPE, and vehicles before transporting offsite.
    - If employee's clothing is likely to be heavily contaminated with dust, provide coveralls and change rooms, and showers where possible.

1.8 Injury Reporting

If a GEI employee suffers an injury, bite, or sting on the job that is not life threating, call Medcor Triage at 1-800-775-5866 to speak with a medical professional. Then, immediately report the injury to the Supervisor/Project Manager and Regional Safety Officer.

After verbal notification has been made, an Incident Report Form is to be completed by the employee and/or Supervisor/Project Manager and submitted to the People & Safety Team immediately following care of the incident. This form is available on the Safety App (smart phones) and on the Safety page on the GEI intranet.

Upon notification from a Branch or Office Manager, Human Resources, and/or the receipt of the Incident Report Form, the Regional Health & Safety Officer (RHSO) will conduct an investigation and evaluation on what happened and how and why it happened. The Corporate Health and Safety Officer (CHSO) will then recommend (as necessary) engineering controls, personal protection equipment, training or other appropriate measures to minimize the potential for future injuries. The CHSO/RHSO may develop educational information based on lessons learned for distribution to GEI employees.

1.9 Limitations

Follow safety procedures as defined in the site-specific HASP. Appropriate PPE must be worn correctly to provide the intended level of protection.

STANDARD OPERATING PROCEDURES

SOP No. HS-002 Infectious Materials and Bloodborne Pathogens Exposure Control Plan

1.1 Objective

GEI personnel may come in contact with potentially infectious agents (materials) when performing first aid or cardiopulmonary resuscitation (CPR). Employees may also come into contact with these agents when working at certain contaminated sites (i.e., urban sites, discarded contaminated needles, or sewer outfall exposures). This standard operating procedure (SOP) has been developed to minimize the potential for exposure to employees who may contact, directly or indirectly, infectious agents.

1.2 General

This SOP is intended for use by employees engaged in work with the potential for contact with infectious materials and bloodborne pathogens. The site-specific health and safety plan (HASP) should include a hazard assessment for the project that identifies the potential for encounters with infectious materials or bloodborne pathogens and the control methods to be implemented by GEI employees. Exposure determinations are made by listing job functions impacted by potential exposure. The HASP will list job classifications or tasks in which occupational exposure could occur such as employees collecting samples or expected to provide First Aid. These hazards should be reviewed in the project safety briefing and documented on the Project Safety Briefing form, found on the Safety page of the GEI intranet.

Engineering and work practice controls shall be used to eliminate or minimize employee exposure. Exposure determinations are made without regard to the use of personal protective equipment. When differentiation between body fluid types is difficult or impossible, all body fluids shall be considered potentially infectious materials. *Universal Precautions (i.e., treat all potentially infectious materials as if it were infected) will be used by GEI employees.*

1.3 Exposure Control Plan

1.3.1 Standard Procedures

A written Exposure Control Plan applicable to potential occupational exposure to blood or other potentially infectious materials will be developed as necessary based on project hazards. This plan will be accessible to each affected employee.

Sampling of materials containing potentially infectious materials will be performed in a manner that minimizes the potential for creating splashes, droplets, or aerosols. Mechanical pipetting devices will be used for manipulating sanitary sewer effluent. Mouth pipetting is prohibited.

The use of glassware or equipment with sharp or pointed edges will be kept at a minimum to reduce the potential of injury that would create a direct route of entry into the body for infectious materials.

Minor cuts, scratches, or other breaks in the skin barrier will be covered prior to the handling of infectious materials. Employees experiencing exudative lesions or weeping dermatitis will refrain from direct contact with infectious materials.

Eating, drinking, smoking, or application of cosmetics is not permitted in areas where potentially infectious materials are handled or sampled.

Employees will wash and disinfect their hands, face, or other potentially contaminated skin surfaces upon completing the handling of infectious or potentially infectious agents or after rendering first aid. Hand washing facilities are readily available at all work locations. When provision of hand washing facilities is not feasible, either an appropriate antiseptic hand cleanser used in conjunction with clean cloth/paper towels or antiseptic towelettes will be provided.

All equipment and environmental and working surfaces will be cleaned and decontaminated after contact with blood or other potentially infectious materials. Specimens of blood or other potentially infectious materials (i.e. bandages) will be placed in a container which prevents leakage during collection, handling, processing, storage, transport, or shipping.

1.3.2 Personal Protective Equipment

When there is a potential for occupational exposure GEI will provide, at no cost to the employee, appropriate personal protective equipment (PPE). PPE will be worn to reduce the potential of exposures to splashes or aerosols. At a minimum, PPE will include safety glasses and appropriate gloves, but may also require the use of face, respiratory, foot, and full-body protection. Refer to the site-specific HASP for specific PPE requirements.

Disposable PPE used in the handling or sampling of infectious materials will be appropriately disposed of and not reused.

1.3.3 Medical Monitoring

Medical monitoring is required for an employee when a potential workplace exposure has occurred. GEI will make available the hepatitis B vaccine and vaccination series to all employees who have occupational exposure, and post-exposure evaluation and follow-up to all employees who have had an exposure incident. These are made available at no cost to the employee. The employee must follow the GEI Incident Reporting procedures regarding the potential exposure as soon as possible. For infectious agents in which a medically accepted vaccination has been developed (e.g., hepatitis B virus) (HBV) potentially exposed employees will be given the option to receive an inoculation at no cost. Employees who have been exposed will be given the option to receive a confidential medical evaluation also at no cost. Required records for exposed

employees will be kept confidential. GEI will keep these medical records for at least the duration of employment plus 30 years and will be maintained for 3 years from the date on which the training occurred. All records required to be maintained shall be made available and GEI will comply with the requirements involving transfer of records set forth in 29 CFR 1910.1020(h).

1.3.4 Training

Training will be conducted at the time of initial assignment to tasks where exposure may take place and at least annually thereafter. All training for employees shall be provided within one year of their previous training. Employees with a reasonable risk for exposure must complete Bloodborne Pathogen training covering the following topics:

- An explanation of the Occupational Health and Safety Administration (OSHA) bloodborne pathogen standard.
- A general explanation of bloodborne diseases.
- An explanation of the modes of transmission of bloodborne diseases.
- Communications of hazards to employees.
- An explanation of the GEI's Bloodborne Pathogen SOP and exposure control plan.
- Appropriate methods for recognizing tasks that involve potential exposure.
- An explanation of the use and limitations of methods to prevent exposure.
- Proper types, use, handling, decontamination, and disposal of PPE.
- The availability of HBV vaccines and the procedures for obtaining a vaccination.
- Appropriate actions to take during an emergency involving bloodborne pathogens.
- Post-exposure procedures.
- An explanation of required signs and labels.

1.4 Injury Reporting

If a GEI employee suffers an injury on the job that is not life threating, call Medcor Triage at 1-800-775-5866 to speak with a medical professional. Then, immediately report the injury to the Supervisor/Project Manager and Regional Health and Safety Officer (RHSO).

After verbal notification has been made, an Incident Report Form is to be completed by the employee and/or Supervisor/Project Manager and submitted to the People and Safety Team immediately following care of the incident. This form is available on the Safety App (smart phones) and on the Safety page on the GEI intranet.

Upon notification from a Branch or Office Manager, Human Resources, and/or the receipt of the Incident Report Form, the RHSO will conduct an investigation and evaluation on what happened and how and why it happened. The Corporate Health and Safety Officer (CHSO) will then recommend (as necessary) engineering controls, personal protection equipment, training or other

appropriate measures to minimize the potential for future injuries. The CHSO/RHSO may develop educational information based on lessons learned for distribution to GEI employees.

1.5 Limitations

Follow safety procedures as defined in the site-specific HASP. Appropriate PPE must be worn correctly to provide the intended level of protection.

STANDARD OPERATING PROCEDURE
HS-004 Driver Safety

1.1 Objective

GEI has implemented a Driver Safety Procedure to encourage safe driving habits and promote the ongoing safety of our staff and the communities where we work. For more information, refer to the Operation of Vehicles section of GEI's Employee Handbook.

This Standard Operating Procedure (SOP) provides requirements and recommendations to minimize the potential risks while operating or riding in a motor vehicle.

1.2 General

GEI employees will adhere to the following requirements when operating a vehicle while conducting business on behalf of GEI. These requirements apply to GEI fleet, rental, and personal vehicles used to conduct GEI business:

- Employees must maintain a valid driver's license.
- Employees using a personal vehicle for work-related travel must have proper insurance coverage that meets the requirements in the state/province in which they reside.
- Employees are expected to follow state, local, and federal laws including road signs, vehicle operating requirements, and other applicable regulations for the juristiction they are driving.
- Employees must wear their safety belt while in a moving vehicle.
- Vehicle incidents will be reported in accordance with GEI's Incident Reporting procedures (refer to GEI's Safety App or the Safety Resources page on GEI Connections).
- Vehicles will be properly maintained and safely operated (refer to Driving for Company Business in GEI's Handbook and the vehicle Owner's manual).
- Employees will follow safe driving behaviors, which include limiting distractions such as manipulating radios, use of cell phones (see Section 1.5) or other equipment/items that may cause a distraction.
- Smoking in GEI vehicles and rentals is not permitted. When driving a personal vehicle for business, avoid smoking while driving.

1.3 Mobilization and Demobilization of a Vehicle

GEI employees should follow the following guidelines to confirm their safety prior to and while operating a vehicle:

- Before entering the vehicle, complete a 360° inspection of the vehicle and surrounding area to identify vehicle safety issues and hazards that could be within the travel path. Do not drive a vehicle that has any safety issues.
- If driving an unfamiliar vehicle (rental or GEI fleet vehicle), it is the driver's responsibility to orient themselves to the vehicle by becoming familiar with the size, dashboard, center console, steering controls, locating the turn signals, windshield wipers, lights, emergency flashers, and the heating, air conditioning, and defrost controls, as well as noting if the vehicle has anti-lock braking system (ABS[1]).
- Adjust mirrors (rear and side).
- Adjust seats to be situated as far back as safely practical, away from the air bag, located in the steering wheel.
- Confirm that cell phones, tablets, or other potentially distracting items are safely secured and put away prior to operating the vehicle.
- At the end of the workday, complete a 360° inspection of the vehicle and report any vehicle safety issues.

1.3.1 Parking a Vehicle

- Park in designated areas or a safe area away from heavy equipment, hazardous features, or heavily trafficked areas.
- Avoid crowding neighboring vehicles (park in the middle of your spot)
- When parking a vehicle, the employee should position the vehicle in a manner which reduces or eliminates the need to operate the vehicle in reverse.
- When parking on the side of the road, the employee should minimize the encroachment of the vehicle onto the travelled lanes of the road and use pylons to mark a safe area around their vehicle.
- At night, park in a well-lit area and as close to your destination as possible.

[1] ABS is a mechanism that allows the wheels on a vehicle to maintain contact with the surface of the road, based on inputs from the driver (braking), to prevent the wheels from locking up (ceasing rotation) and to avoid an uncontrolled skid.

- When leaving the vehicle, confirm that any supplies or equipment that is meant to stay in the vehicle are secured and cannot be seen. If these items cannot be hidden, take them with you.

1.3.2 Backing Up a Vehicle

- If backing up a vehicle is necessary, complete a 360° inspection with emphasis on identifying nearby fences, poles, drop-offs, buildings, or other objects that may be in your path.
- Know your vehicles clearance and check for overhead obstructions such as tree limbs, wires, or other potential clearance-related obstacles.
- Use a spotter whenever possible. The spotter can be another GEI employee, or on-site personnel. Do not allow the spotter to be positioned directly behind the vehicle or walk backwards while giving you instructions. They should be off the driver's side where you can see them in your side mirror.
- Use available backup cameras as supplementary support while in reverse to assist with blind spots and identify if conditions have changed.
- When backing up at night, use additional lights to increase visibility.

1.4 Driving Defensively

Driving defensively means not only taking responsibility for oneself and actions but also keeping an eye on "the other guy." Good defensive drivers may be able to anticipate what the other driver will do next. GEI recommends the following guidelines to help reduce risks while driving:

- Do not start the vehicle until each passenger and any belongings are secured in the vehicle.
- Remember that driving above or below the speed limit can increase the likelihood of a collision.
- Be aware of impaired drivers; if a car is straddling the center line, weaving, making wide turns, stopping abruptly, or responding slowly to traffic signals, the driver may be impaired or using a cellular telephone. Avoid an impaired driver by turning right at the nearest corner or exiting at the nearest exit.
    - If it appears that an oncoming car is crossing into your lane, pull over to the roadside, sound the horn, and flash the headlights.
    - If an unsafe or suspicious driver is observed, notify the police.
- Follow the rules of the road. Do not contest the "right of way" or try to race another car during a merge. Be respectful of other motorists.
- Allow large vehicles, including tractor trailers, extra breaking distance, turning radius, and avoid traveling in the other driver's blind spots.

- Do not follow too closely. GEI employees should use a minimum of "3-second following distance." Or two vehicle lengths, whichever is greater.
- While driving, be cautious, aware, and responsible.
- Use extra caution, observe road signs, and reduce speed in construction areas and school zones.
- Maintain situational awareness by scanning your surroundings and regularly checking your blind spots. Look for and avoid pedestrians, bicyclists, and motorcyclists.

1.5 Cellular Phone Use and Other Distractions

Refer to the *Cell Phone Use/Texting While Driving* section of the GEI Employee Handbook for GEI's policy on the use of cellular telephones while operating a vehicle.

1.6 Drugs and Alcohol

The use of illegal drugs or alcohol is prohibited when driving a vehicle on GEI business. Be aware of the side effects of prescription and over-the-counter medications which can impair an employee's ability to drive.

1.7 Adverse Driving Conditions

When operating a vehicle, its possible adverse driving conditions may be encountered. Below is a list of possible conditions and how they can be mitigated.

1.7.1 Driving at Night

Vision maybe limited at night due to impairment of the driver's depth perception, color recognition, and peripheral vision. Another factor adding danger to night or early morning driving is fatigue. Drowsiness makes driving more difficult by dulling concentration and slowing reaction time. Effective measures to minimize these hazards by preparing the car and following guidelines:

- Check the headlights to confirm they are properly aimed. If you notice the headlights are not properly aimed, report it to the Branch Manager, or if applicable the rental car agent. Misaimed headlights blind other drivers and reduce the driver's ability to see the road.
- Smoking before driving and while driving is discouraged. Nicotine and carbon monoxide can hamper night vision.

- Increased vigilance 1 hour before sunset and 1 hour after sunset is encouraged. Twilight is one of the most difficult times to drive, because the eyes' pupils are constantly changing to adapt to the growing darkness:
    - Always use headlights at dusk and at dawn; lights will not help the driver see better in early twilight, but they will make it easier for other drivers to see your car.
    - Drive at a speed that allows you to see the road that is within the headlights span. Driving in a manner that prevents you from seeing hazards as they are illuminated is known as overdriving the headlights; it may be necessary for the driver to reduce speed to be prepared to brake within the illuminated area of the headlights.
    - If an oncoming vehicle does not lower beams from high to low, avoid glare by watching the right edge of the road and using it as a steering guide.
- The driver should make frequent stops for light snacks and exercise. If the driver is too tired to drive, stop in a safe area and get some rest.

1.7.2 Snow/Freezing Conditions

When snow and ice are present, be prepared by following these winter driving safety tips.

Prepare the Vehicle Before a Snowstorm

- Check under the hood and take a look at the vehicles cooling system. Make sure the vehicle contains adequate antifreeze and the hoses are in good condition.
- Test heaters and defrosters ahead of time to make sure they are in good working condition.
- Test the windshield wipers and check the condition of the wiper blades. If wipers leave streaks on the windshields, replace the blades at the next possible opportunity. Keep the receipt to expense the cost with GEI or with the car rental company.
- It is recommended that a windshield washer/antifreeze solution is used during winter conditions.
- Check the lights on the vehicle and periodically clear them of snow and dirt.
- Vehicle batteries need extra power in cold conditions. Make sure the battery's terminals are clean and cables are secure.
- Determine if the vehicle has an ABS system.
- Keep the gas tank at least half-full in the winter to help avoid gas line freeze up.

Driving During and After a Snowstorm

- Wear sunglasses to aid in limiting reflection from snow and eye fatigue, as needed.
- Be aware of blind spots created by snowbanks. Be extra cautious of pedestrians and other vehicles in intersections.
- Allow extra time for braking and increase the distance between your car and the car immediately in front of the car.
- Reduce speed and do not exceed the posted limit.
- If the tires starts to lose traction, remove the foot off the gas and gradually reduce speed. Accelerate slowly once traction is regained.
- Use appropriate braking technique:
    - No ABS: steer into the skid. This will bring the back end of the car in line with the front. Avoid using the brakes.
    - ABS: firmly brake as you steer into the skid.

1.7.3 Driving In the Rain

To prevent losing control of the car on wet pavement, take these preventive measures.

- Prevent skids by driving slowly and carefully, especially on curves.
- Steer and brake with a light touch.
- When necessary to stop or slow, do not brake hard or lock the wheels.
- Maintain foot on the brake pedal.

Skidding

If the car begins to skid, ease the foot off the gas, and carefully steer the car in the direction you want the front of the car to go. For cars without ABS, avoid using the brakes. This procedure, known as “steering into the skid,” will bring the back end of the car in line with the front. If the car has ABS, brake firmly as you steer into the skid.

Hydroplaning

Hydroplaning happens when the water in front of the tires builds up faster than the car’s weight can push it out of the way. The water pressure causes the car to lose contact with the road surface and slide on a thin layer of water between the tires and the road. At this point, the car can be completely out of contact with the road, making it possible for the driver to skid or drift out of the lane, or even off the road.

To avoid hydroplaning, keep the tires properly inflated and maintain good tread on the tires. If tires need to be replaced on a company vehicle, notify the branch manager or their designee. Slow down when roads are wet, and stay away from puddles. Try to drive in the tire tracks left by the cars in front of the vehicle. If the car begins to hydroplane, do not brake or turn suddenly. This could throw the car into a skid. Ease the foot off the gas until the car slows; accelerate slowly once traction is regained. If braking is needed, do so gently with light pumping actions. If the car has ABS, brake normally; the car's computer will mimic a pumping action, as necessary.

If weather conditions worsen to the point where the driver is not comfortable driving, pull the vehicle over to a safe location until conditions improve. Do not drive during severe weather conditions. Do not attempt to drive on roads with standing water or that have been flooded. Find an alternate route if these conditions exist.

1.7.4 Off Road

If operation of a vehicle is required off public or private roads or in situations where four-wheel-drive vehicles are required, the appropriate vehicle for the situation will be used.

Be sure any gear or equipment is secured inside the vehicle so it doesn't bounce around while the vehicle is off-road.

- Clearance: know the underside of the vehicle. Look under the vehicle and learn where the lowest-hanging parts are located so they are not damaged.
- Scout tricky terrain on foot. Don't hesitate to get out of the vehicle to examine, up close, the terrain and soil conditions. And be sure to scout out what's on the other side of a hill ahead of time so there are no surprises.
- Drive cautiously. Drive, "as slow as possible, as fast as necessary." Remember to use the gears to efficiently manage engine power, braking, and torque.
- Create a mental picture. Look ahead and visualize the paths to the vehicle will travel. Follow those paths.
- Drive straight up and down hills. Avoid diagonal lines that put the vehicle in a situation where it might roll.

1.8 Driver Training

GEI employees take driver safety training as part of their annual safety training. This training will be assigned through GEI's e-learning provider.

1.9 Injury Reporting

GEI employees will report incidents involving GEI personnel or subcontractor personnel, such as: lost time injuries, injuries requiring medical attention, near miss incidents, fires, fatalities, accidents involving the public, chemical spills, vehicle accidents, and property damage. The following steps must be followed when an incident occurs:

1. For incidents involving life-threatening situations or serious injury that require emergency response personnel (Police, Fire, EMS), call 9-1-1 from a safe area.
2. **Stop work** activity to address any injury, illness, property damage, spill, or other emergency.
3. Call Medcor Triage at 1-800-775-5866 to speak with a medical professional following any injury or illness.
4. Notify your Supervisor/Project Manager of the incident or injury.
5. Complete an incident report using the GEI Incident Report Form located on the GEI Safety Smartphone App, GEI Connections intranet page, or in the project HASP.
6. Resume work activity if all steps above have been completed and it is safe to do so.

For vehicle accidents involving another vehicle or damage to property, the employee will take pictures of each vehicle or property involved in the incident and obtain a police report. In some municipalities police will not be dispatched to a non-injury accident, but every effort needs to be made to try and obtain the report.

1.9.1 Injury Triage Service

If a GEI employee experiences a work-related injury that is not life-threatening, the employee will initiate a call to Medcor Triage at 1-800-775-5866. The injured employee will detail any medical symptoms or complaints which will be evaluated by a Registered Nurse (RN) specially trained to perform telephonic triage. The RN will recommend first aid self-treatment or refer the injured employee for an off-site medical evaluation by a health professional at a clinic within GEI's workers compensation provider network. GEI employees are still required to follow our Accident Reporting procedures as listed above.

1.10 Limitations

Follow safety procedures as defined in the site-specific HASP.

- November 2013
- January 2011

STANDARD OPERATING PROCEDURES

HS-005a Electrical Safety

1.1 Objective

Electrical hazards are typically the most serious physical hazards GEI employees encounter when working on or near an electric substation, conducting intrusive activities such as excavation or drilling, using powered hand tools, or working near overhead utilities. This Standard Operating Procedure (SOP) has been developed to minimize the potential for exposure to energized electrical equipment while performing work activities.

1.2 General

Employees who face a risk of electric shock will be trained and become familiar with electrically-related safety practices in the GEI annual Health and Safety training. This training will include safety-related work practices that pertain to their respective job assignments and minimum approach distances.

An activity hazard analysis conducted for the project scope of work will evaluate the potential for electrical shock and be incorporated in the site-specific health and safety plan (HASP). In addition, site-specific training will be conducted by the Project Manager or their designee to discuss the project electrical hazards and include a review of the HASP requirements.

Annual health and safety training will include review of this electrical safety SOP and GEI's lockout/tagout requirements. Retraining will be required when there is a change in job assignments; a change in the energy control procedures; or a new hazard is introduced. Retraining may also be conducted through the Project Safety Briefing and documented on the Project Safety Briefing form.

Safe work practices will be employed to prevent electric shock or other injuries resulting from either direct or indirect electrical contacts when work is performed near or on equipment or circuits that are or may be energized. Employees may not enter spaces containing exposed energized parts unless proper illumination, protective shields, protective barriers, or insulating materials (if necessary) are provided to enable employees to work safely. If portable ladders are needed near electrical equipment, they will have non-conductive side rails.

1.3 Personal Protection

Measures to mitigate exposure to overhead and subsurface electrical transmission and distribution lines should be adhered to at all times when working adjacent to electrical hazards. These measures include:

- Electrical Hazard (EH)-rated footwear and hardhat are required when working onsite. Additional personal protective equipment (PPE) may be needed as referenced in the site specific HASP.
- Avoid carrying tools/equipment above waist height if overhead electric hazards exist.
- Maintain the minimum approach distance (MAD) from bus bars, transformer/capacitor electrodes, and overhead transmission/distribution lines.
- Stop work immediately and vacate the work area in the event lightning is observed.

Measures of protection that should be adhered to within an active substation perimeter or if work adjacent to the substation perimeter consists of intrusive activities:

- Contact utility clearance agency at least 48 hours prior to any invasive activities for mark out of underground public utilities.
- Obtain the most recent as-built drawings of the transmission/distribution line layout from the client.
- Mark out of underground transmission/distribution lines by the client survey/mark out personnel if applicable.
- Conduct work under the supervision of the client's Health and Safety representative per client requirements.
- Conductive items such as jewelry or clothing containing metals will not be worn unless they are rendered non-conductive by insulating means such as covering or wrapping with materials that specifically rated as non-conductive, or other insulating means.
- Use hand digging tools specifically designed for use on substation property (i.e., insulated digging bar, long-handled spoon shovel, etc.). In addition, rubber gloves and fire-resistant clothing are required if hand digging in a substation.
- Use insulated lineman's gloves when handling equipment that may come into contact with electrical utilities.
- EH-rated footwear is required when working onsite.
- Flame resistant clothing that meets National Fire Protection Association (NFPA) 70E standards is to be worn.

- Avoid carrying tools/equipment above waist height if overhead electric hazards exist.
- Ground vehicles or equipment **within the substation perimeter** using 4-aught gauge grounding cable. Adhere to specific client or site requirement for grounding.
- Maintain a minimum clearances on substations in accordance with 29 CFR 1910.333 and NFPA 70E standards when working near energized equipment.
- Maintain a minimum offset of 3 feet from marked underground transmission/distribution lines.
- Avoid working within or outside of a substations in conditions of high humidity, rain, or thunderstorms.
- Stop work immediately and vacate the work area in the event lightning is observed.

1.3.1 Minimum Approach Distance

According to OSHA, the MAD is "…the closest distance an employee is permitted to approach an energized or grounded object." MADs ensure that employees do not approach or take any conductive object closer to energized equipment than the allowed distances. All GEI employees conducting work onsite must follow the MADs shown below:

Nominal Voltage in Kilovolts	Minimum Approach Distance: Phase to Ground Exposure
0.05 to 1.0	Avoid Contact
1.1 to 15.0	2'1"
15.1 to 36.0	2'4"
36.1 to 46.0	2'7"
46.1 to 72.5	3'
72.6 to 121	3'2"
138 to 145	3'7"
161 to 169	4'
230 to 242	5'3"
345 to 362	8'6"
500 to 550	11'3"
764 to 800	14'11"

Reference: Table R-6 in OSHA regulation CFR 1910.269 (l) (10)

Unqualified employees must maintain a 10-foot distance from all electrical sources. Vehicular and mechanical equipment will also maintain minimum clearance distances of 10 feet.

Site personnel will assume that all electrical equipment at surface, subsurface, and overhead locations are energized until the equipment has been designated as de-energized by a client representative. Client representatives will be responsible for de-energizing and lockout/tagout of all electrical equipment. If the equipment cannot be de-energized, work will stop and the GEI Field Representative and/or the Site Safety Officer (SSO) will consult with the Project Manager and CHSO. GEI will notify the client prior to working adjacent to this equipment, and will verify that the equipment is energized or de-energized in the vicinity of the project area.

All power lines that have been indicated by the client to be de-energized must be locked out by the client or their representative, such that the lines cannot be energized when personnel are working near them. The lines will not be unlocked and re-energized until GEI notifies the client that they have completed work in the area and that all personnel are clear of the area. The client representatives will thoroughly familiarize GEI personnel with site-specific lockout/tagout procedures during the site orientation. Conductors and parts of electrical equipment that have been de-energized, but not been locked or tagged out, shall be treated as live/energized. Only qualified persons may work on electric circuit parts or equipment that has not been de-energized. Such persons will be made familiar with the use of special precautionary techniques, PPE, insulating and shielding materials, and insulated tools.

If power lines cannot be de-energized, the SSO will consult with the client to discuss how to proceed. Work tasks will only commence after determining that a safe working distance (MAD) can be maintained and all personnel working in the area have been informed of the limitation. All work performed within the substation boundaries requires the use of task-specific PPE as described in the HASP.

GEI will verify that the contractor or subcontractor has located and marked all electric, gas, water, steam, sewer, and other utility service lines before any intrusive work is started. In each case, any utility company that is involved should be notified in advance by the contractor, and its approval or services will be obtained, if necessary.

1.3.2 Ground-Fault Circuit Interrupters (GFCI)

GEI employees will use approved ground-fault circuit interrupters for personnel protection when using electrical tools and equipment. Equipment will be plugged into receptacles protected by a GFCI, extension cords with built-in GFCIs, or a GFCI adapter is to be used.

1.3.3 Equipment Inspection

Each extension cord, plug and receptacle, and any equipment connected by the cord and plug, will be visually inspected before each day's use for external defects, such as deformed or missing pins or insulation damage, and for indications of possible internal damage. Each receptacle and plug will be tested for correct attachment of the equipment grounding conductor. The equipment grounding conductor will be connected to its proper terminal.

Inspection of equipment will be performed before first use; before equipment is returned to service following any repairs; before equipment is used after any incident which can be reasonably suspected to have caused damage (e.g., when an extension cord is run over), and at intervals not to exceed 3 months. Cords and receptacles which are fixed and not exposed to damage will be tested at intervals not exceeding 6 months. Equipment found damaged or defective will not be used and will be properly tagged as "Out of Service"; notify the Branch Manager so that the equipment can be replaced or repaired. If the equipment cannot be repaired it will be disposed of properly.

1.4 Injury Reporting

If a GEI employee suffers an injury on the job that is not life threating, call Medcor Triage at 1-800-775-5866 to speak with a medical professional. Then, immediately report the injury to the Supervisor/Project Manager and Regional Safety Officer.

After verbal notification has been made, an Incident Report Form is to be completed by the employee and/or supervisor/project manager and submitted to the People & Safety Team immediately following care of the incident. This form is available on the Safety App (smart phones) and on the Safety page on the GEI intranet.

Upon notification from a Branch or Office Manager, Human Resources, and/or the receipt of the Incident Report Form, the Regional Health & Safety Officer (RHSO) will conduct an investigation and evaluation on what happened and how and why it happened. The Corporate Health & Safety Officer (CHSO) will then recommend (as necessary) engineering controls, personal protection equipment, training or other appropriate measures to minimize the potential for future injuries. The CHSO/RHSO may develop educational information based on lessons learned for distribution to GEI employees.

1.5 Limitations

- Follow safety procedures as defined in the site-specific HASP at all times.
- If lockout/tagout procedures are going to be performed by GEI employees or GEI subcontractors, the specific procedure will be reviewed with the CHSO and the RHSO.

1.9 Review History

- February 2017
- May 2014
- October 2011
- August 2010 (Titled Lock Out/Tag Out)

STANDARD OPERATING PROCEDURES

HS-005b Lockout/Tagout

1.1 Objective

Lockout/tagout, otherwise referred to as the control of hazardous energy, is the procedure used to eliminate the hazards from equipment that contains hazardous energy prior to working on or around this equipment. Energy sources that are controlled using lockout/tagout procedures include electrical, mechanical, hydraulic, pneumatic, chemical, or thermal. Other energy sources can include stored energy such as equipment held under tension, pressurized lines, and capacitors. Lockout/tagout also applies to electric generation, and pumping plant inspections and appurtenances.

This Standard Operating Procedure (SOP) has been developed to protect employees from exposure to these types of hazardous equipment while performing work activities on and around equipment. GEI employees will follow the client's lockout/tagout procedures, when available. If the client does not have specific lockout/tagout procedures in place, use these guidelines at a minimum.

This lockout/tagout program will be reviewed by the Safety Team annually. Health and Safety reviews are conducted by the Safety Team to document compliance with these requirements.

1.2 General

Employees servicing, maintaining, or working near machines or equipment may be seriously injured or killed if hazardous energy is not properly controlled. Injuries resulting from the failure to control hazardous energy during maintenance activities can be serious or fatal. Injuries may include electrocution, burns, crushing, cutting, lacerating, amputating, or fracturing body parts.

Employees who have the potential to work with or around equipment where lockout/tagout is needed, will be trained and become familiar with GEI's lockout/tagout procedures. This training will include safety-related work practices that pertain to their respective job assignments.

An activity hazard analysis conducted for the project scope of work will evaluate the potential for exposure to hazardous energy and be incorporated in the site-specific Health and Safety Plan (HASP). In addition, site-specific training will be conducted by the Project Manager or their designee to discuss the project lockout/tagout requirements and include a review of the HASP requirements.

Annual health and safety training will include review of GEI's lockout/tagout requirements. Retraining will be required when there is a change in job assignments, a change in the energy control procedures, or a new hazard is introduced. Retraining may also be conducted through the Project Safety Briefing and documented on the Project Safety Briefing form.

1.3 Roles and Responsibilities

There are two categories of employees in a lockout/tagout program, Authorized and Affected. Regardless of category, employees are required to comply with the restrictions and limitations imposed upon them during the use of lockout/tagout procedures.

1.3.1 Authorized Employees

Authorized employees are responsible for following established lockout/tagout procedures. An authorized employee is defined as a person who locks out or tags out machines or equipment in order to perform service, maintenance, or work near a piece of equipment that contains or has the potential to contain hazardous energy.

Authorized employees will receive training on the following topics:

- Recognition of hazardous energy sources, types, and magnitudes of energy.
- Methods and means required for energy isolation and control.
- Purpose and use of the lockout/tagout procedures.
- Limitations of the use of tagout systems.

1.3.2 Affected Employees

An affected employee is defined as a person whose job requires him/her to operate or use a machine or equipment on which work activities are being performed under lockout or tagout, or whose job requires him/her to work in an area in which such activities are taking place. Affected employees do not attempt to restart or re-energize machines or equipment that are locked out or tagged out.

Authorized employees will receive training on the following topics:

- Purpose and use of the lockout/tagout procedures.
- Prohibition relating to attempting to restart or reenergize equipment that has been locked or tagged out.

1.4 Lockout/Tagout Procedure

Lockout/tagout procedures will be followed when working on or around machines, equipment, or any system where the unexpected energization or start-up of the machine or equipment or release of stored energy can cause injury to the employee.

GEI uses a red Master Lock® 1 31/32-inch high body high-visibility aluminum padlock, keyed differently, with a 1 1/16-inch shackle, or its equivalent for lockout activities. An employee's lock and tag must not be removed by anyone other than the employee who installed the lock and tag unless removal is accomplished under the direction of the CHSO.

When GEI employees are working on project sites where a group lockout is required, the locked-out device will first be secured using a folding scissors clamp that has many padlock holes capable of holding it closed. Each employee/subcontractor will apply their own padlock to the clamp. The locked-out device cannot be activated until all workers have signed off on their portion of the project and removed their padlock from the clamp. The lead contractor responsible for the group lockout will assign an authorized employee who has primary responsibility for the number of employees working under the protection of a group lockout or tagout device. GEI employees will not act as the Authorized Employee.

Only GEI employees who have completed lockout/tagout training may conduct a lockout/ tagout procedure. Normally GEI employees will follow the client's lockout/tagout procedures. If the client does not have specific lockout/tagout procedures to follow, use these guidelines at a minimum:

- Prior to conducting any lockout/tagout procedures, notify all affected employees.
- Identify the type, magnitude, and hazards of the energy that the machine/ equipment uses.
- Shut down the machine/equipment by the normal stopping procedure (stop button, open switch, close valve, etc.).
- Disconnect the machine/equipment from the energy source.
- Stored or residual energy (such as capacitors, springs, elevated machine members, rotating flywheels, hydraulic systems, and air, gas, or water pressure, etc.) must be dissipated or restrained by methods such as grounding, repositioning, blocking, bleeding down, etc.
- Using the correct type of lockout/tagout device, lockout the machine/equipment with an assigned individual lock by placing a lock on each energy isolating device. Only the employee performing the work should have a key to this lock.
- Locks can be obtained from the RHSO. This lock will have a GEI-approved tag that allows the employee to write their name and date on the tag.

- Lockout devices, where used, will be affixed in a manner that will hold the energy isolating devices in a safe or off position. Locking devices will always be used on energy isolating devices designed with the capability of being locked.
- Tagout devices, where used, will be affixed in such a manner as will clearly indicate that the operation or movement of energy isolating devices from the safe or off position.
- Where a tag cannot be affixed directly to the energy isolating device, the tag shall be located as close, and as safely as possible, to the device in a position that will be immediately obvious to anyone attempting to operate the device.
- Confirm that the machine/equipment has been disconnected by attempting to operate or turn the machine/equipment on. If the machine does not operate, it is now locked out.
- If, during repair or maintenance activities, the machine or equipment is required to be energized, identify the location of lockout/tagout device(s) that can be removed to accomplish this. Only the lockout/tagout devices absolutely necessary to allow the equipment or machine to be energized or partially energized should be removed. After the equipment or machine has been cycled or jogged, the lockout/tagout devices will be reapplied and the steps above will be repeated prior to commencing work.
- When the machine/equipment is ready to be returned to service, make sure all tools are removed and the system is operationally intact. Verify that all employees are in a safe position and have been removed from the area.
- Remove the lockout/tagout devices and reenergize the machine/equipment.
- Notify affected employees that the service or maintenance work is complete and the machine/equipment is ready for use.

1.5 Injury Reporting

If a GEI employee suffers an injury on the job that is not life threating, call Medcor Triage at 1-800-775-5866 to speak with a medical professional. Then, immediately report the injury to the Supervisor/Project Manager and Regional Safety Officer.

After verbal notification has been made, an Incident Report Form is to be completed by the employee and/or supervisor/project manager and submitted to the People & Safety Team immediately following care of the incident. This form is available on the Safety App (smart phones) and on the Safety page on the GEI intranet.

Upon notification from a Branch or Office Manager, Human Resources, and/or the receipt of the Incident Report Form, the Regional Health & Safety Officer (RHSO) will

conduct an investigation and evaluation on what happened and how and why it happened. The Corporate Health & Safety Officer (CHSO) will then recommend (as necessary) engineering controls, personal protection equipment, training or other appropriate measures to minimize the potential for future injuries. The CHSO/RHSO may develop educational information based on lessons learned for distribution to GEI employees.

1.6 Limitations

Follow safety procedures as defined in the site-specific HASP at all times.

If lockout/tagout procedures are going to be performed by GEI employees or GEI subcontractors, the specific procedure will be reviewed the Safety Team, prior to any work being performed.

1.10 Review History

- November 2016 (Separated from a previous SOP)

STANDARD OPERATING PROCEDURES

SOP No. HS-008a Non-Powered Hand Tools

1.1 Objective

This Standard Operating Procedure (SOP) is intended for use by employees working with non-powered hand tools. The site-specific health and safety plan (HASP) should include a hazard assessment for the project that identifies the hazards associated with the non-powered hand tools that will be used. These hazards should be reviewed during the project safety briefing and documented on the Project Safety Briefing form, found on the Safety page of the GEI intranet.

1.2 General

Misuse of hand tools accounts for the majority of accidents and injuries involving hand tools. Only use a tool for the task which it was designed for. If the right tool isn't available contact the Project Manager and discuss what is needed. Improper maintenance is another leading cause of injuries. Employees using hand tools may be exposed to a number of other potentially serious hazards: falling objects (i.e., objects can fall as a result of contact with tools or objects which are abrasive or splash), harmful dust, fumes mists, vapors, and gases, as well as contact with electrical power sources.

1.2.1 Condition of Tools

All hand tools, whether furnished by GEI or the employee, will be maintained in safe working condition. All hand tools must be inspected before use. Never use a tool if its handle has splinters, burrs, cracks, splits or if the head of the tool is loose. Never use impact tools such as hammers, chisels, punches or steel stakes having mushroomed (flattened) heads. Tag worn, damaged or defective tools "Out of Service" and do not use them; notify your Branch Manager or Project Manager so that the tool can be replaced or repaired. If the tools cannot be repaired they will be disposed of properly. GEI does not issue or permit the use of unsafe hand tools.

1.2.2 Personal Protective Equipment

Employees using hand tools will be provided with the personal protective equipment (PPE) necessary to protect them from the hazard of the tool as well as the associated hazards with using the tool. (i.e., projectile debris, dust, etc.). <u>All employees will wear work gloves, steel toe or composite toe boots, and safety glasses at a minimum</u>. In addition, face shields and hearing protection may be required. Most hand injures can be avoided with the proper use of PPE. PPE must be maintained in good condition, kept clean and properly stored when not in use. More information regarding PPE is located in Section 6 of GEI's Corporate Health and Safety Program.

1.2.3 General Safe Practices

Never wear sandals, open-toed or canvas shoes when working with tools. Always tie back long hair. Avoid loose-fitting clothes which might become entangled in a tool. Always remove rings and other jewelry. Make sure your grip and footing are secure when using large tools. Never carry tools up ladders; use a tool belt, hoist, or a rope. Use extra caution when using tools at heights – a falling tool could kill a co-worker. Always pass a tool to another person by the handle – never toss it to them. Never use a tool with hands are wet, oily, or greasy. Select ergonomically-designed tools for work tasks when movements are repetitive and forceful. Always make sure observers are at a safe distance. Always secure work with a vice, clamp, or other support.

1.3 Non-Power Hand Tools

Non-powered hand tools include anything from axes to wrenches. Even though the tool is powered by human inertia, injuries from improper use of non-powered hand tools often involve severe disabilities.

1.3.1 Knives

Only use a knife with a sharpened blade. Pull the knife through the object and away from your body; pulling motions are easier to manage. Never use a knife if its handle has splinters, burrs, cracks, splits or if the blade is loose. Knives should never be used as screwdrivers, pry bars, or can openers. Never pick up knives by their blades. Always carry knives with their tips/points toward the floor. Never carry knives, scissors, or other sharp tools in pockets. Never attempt to catch a falling knife. When not in use, knives should be stored in sheaths. Box cutters will be self-retracting.

1.3.2 Wrenches

Never use wrenches that are bent, cracked, badly chipped, or having loose or broken handles. Discard any wrench with spread or battered jaws; if the handle is bent; or if a wrench has broken or battered points and notify your Branch Manager so that a replacement can be made. Never slip a pipe over a single head wrench handle to increase leverage. Never use a shim to make a wrench fit. Pull on a wrench using a slow, steady motion. Do not use push force on a wrench; you could lose your balance if the wrench slips.

1.3.3 Screwdrivers

Always match the size and type of screwdriver blade to fit the head of the screw. Do not hold the work piece against your body while using a screwdriver. Never put your fingers near the tip of a screwdriver when tightening a screw. Never use a screwdriver to make a starting hole for screws. Never use a screwdriver as a chisel, pry bar, or nail puller. When performing electrical work, always use an insulated screwdriver. Never use a screwdriver to test the charge of a battery.

1.3.4 Hammers

Never use a hammer if your hands are oily, greasy or wet. Always check behind you before swinging a hammer. Use a claw hammer for pulling nails. Never strike nails or other objects with the "cheek" of the hammer. Do not strike a hardened steel surface, such as a cold chisel, with a claw hammer. Never strike one hammer against another hammer. Never use a hammer as a wedge or a pry bar.

1.3.5 Pliers

Never use pliers which are cracked, broken, or sprung. Never use pliers as a wrench or a hammer. Do not attempt to force pliers by using a hammer on them. Never slip a pipe over the handles of pliers to increase leverage. When performing electrical work, always use insulated pliers. When using diagonal cutting pliers, shield loose pieces of cut material from flying into the air by using a cloth or your gloved hand.

1.3.6 Snips

Never use snips as a hammer, screwdriver, or pry bar. Always wear safety glasses or safety goggles when using snips to cut materials. Always wear work gloves when cutting materials with snips. Keep the blade aligned by tightening the nut and bolt of the snips. Never use straight cut snips to cut curves. Always use the locking clip on the snips when you have finished using them. Never leave or store snips in the open position.

1.3.7 Hand Saws

Always keep handsaws sharp and free of rust to prevent them from binding or jumping. Never carry a saw by the blade. Always hold the work piece firmly against a work table. Keep control of saws by releasing downward pressure at the end of the stroke. Never use an adjustable blade saw such as a hacksaw, coping saw, keyhole saw, or bow saw, if the blade is not taut. Oil saw blades after each use. Never force the saw through the cut as this may cause the saw to buckle or fly out of the groove and cause injury.

1.3.8 Chisels

Only use sharpened chisels. Never use chisels having mushroomed (flattened) striking heads. Whenever possible, hold a chisel by using a tool holder. Clamp small work pieces in a vise and chip towards the stationary jaw of the vise. Chip or cut away from yourself and keep both hands in back of the cutting edge. Always wear safety glasses or a face shield.

1.3.9 Vise and Clamps

Never use a vise having worn or broken jaw inserts, or having cracks or fractures in the body of the vise. Position the work piece in the vise so the entire face of the jaw supports the work piece. When clamping a long work piece in a vise, support the far end of the work piece by using an adjustable pipe stand or saw horse. Never slip a pipe over the handle of a vise to increase leverage. Never use a C-clamp for hoisting materials. Never use a C-clamp as a permanent fastening device.

1.3.10 Jacks

A manufacture's rated capacity must be clearly marked on all jacks and all jacks must have a stop indicator. When using a jack, never exceed the capacity of the stop indicator. Jacks should be lubricated and inspected regularly. When setting up a jack, ensure the base is centered on a firm, level surface. The jack head should also be placed against a level surface. Lift force should be applied evenly. Put a block under the base of the jack when the foundation is not firm. If it seems likely the cap could slip, place a block between the jack cap and load. Immediately block the load after it is lifted.

1.4 Injury Reporting

If a GEI employee suffers an injury on the job that is not life threating, call Medcor Triage at 1-800-775-5866 to speak with a medical professional. Then, immediately report the injury to the Supervisor/Project Manager and Regional Safety Officer.

After verbal notification has been made, an Incident Report Form is to be completed by the employee and/or supervisor/project manager and submitted to the People & Safety Team immediately following care of the incident. This form is available on the Safety App (smart phones) and on the Safety page on the GEI intranet.

Upon notification from a Branch or Office Manager, Human Resources, and/or the receipt of the Incident Report Form, the Regional Health & Safety Officer (RHSO) will conduct an investigation and evaluation on what happened and how and why it happened. The Corporate Health & Safety Officer (CHSO) will then recommend (as necessary) engineering controls, personal protection equipment, training or other appropriate measures to minimize the potential for future injuries. The CHSO/RHSO may develop educational information based on lessons learned for distribution to GEI employees.

1.5 Limitations

Follow safety procedures as defined in the site-specific HASP or in the manufacturer's specifications. Appropriate PPE must be worn correctly to provide the intended level of protection. If a hand tool is being used that is not identified in this SOP consult the manufacturer's literature and contact the Safety Team so we can include the information in a future version of this SOP.

STANDARD OPERATING PROCEDURES

SOP No. HS-008b Powered Hand Tools

1.1 Objective

This Standard Operating Procedure (SOP) is intended for use by employees working with powered hand tools. The site-specific health and safety plan (HASP) should include a hazard assessment for the project that identifies the hazards associated with the powered hand tools that will be used. These hazards should be reviewed during the project safety briefing and documented on the Project Safety Briefing form, found on the Safety page of the GEI intranet.

1.2 General

Misuse of hand tools accounts for the majority of accidents and injuries involving hand tools. Only operate power tools according the manufacturer's instructions. Employees using power tools may be exposed to a number of potentially serious hazards including being hit by flying material from the work piece; hit by a flying part of a broken tool; explosion or fire resulting from sparks from a tool igniting combustible materials; electric shock from a broken tool, frayed or defective power cord, or improper grounding; exposure to harmful dust, fumes mists, vapors, and gases. Hazards are usually caused by misuse, improper maintenance, improper or inefficient training, and complacency.

1.2.1 Condition of Tools

All hand tools, whether furnished by GEI or the employee, will be maintained in safe working condition with regular maintenance. Always inspect each tool, as well as power cords and attachments, for damage before use. Make sure the power is off and locked out before inspecting. Insure the tool guards are in place and functioning. Ensure that blades, bits, and other attachments are securely fastened. Tag worn, damaged, or defective tools "Out of Service" and do not use them; notify your Branch Manager or Project Manager so that the tool can be replaced or repaired. If the tools cannot be repaired they will be disposed of properly. GEI does not issue or permit the use of unsafe hand tools.

1.2.2 Personal Protective Equipment

Employees using hand tools will be provided with the personal protective equipment (PPE) necessary to help protect them from the hazards of the tool as well as the associated hazards with using the tool. (i.e., projectile debris, dust, etc.). All employees will wear work gloves, steel toe or composite toe boots, and safety glasses at a minimum. In addition, face shields and hearing protection may be required. Most hand injures can be avoided with the proper use of PPE. PPE must be maintained in good condition, kept clean and properly stored when not in use. More information regarding PPE is located in Section 6 of GEI's Corporate Health and Safety Program.

1.2.3 General Safe Practices

Never wear sandals, open-toed or canvas shoes when working with tools. Always tie back long hair. Avoid loose-fitting clothes which might become entangled in a tool. Always remove rings and other jewelry. Never use a tool without its guard in place. Make sure your grip and footing are secure when using large tools. Never carry tools up ladders; use a tool belt, hoist, or a rope. Use extra caution when using tools at heights – a falling tool could kill a co-worker. Always pass a tool to another person by the handle – never toss it to them. Select ergonomically-designed tools for work tasks when movements are repetitive and forceful. Always make sure observers are at a safe distance. Always secure work with a vice, clamp, or other support. Moving work surfaces can cause the tool to "kick back." Use extra caution when using power tools around flammable materials. Use fire curtains when appropriate and keep a properly charged fire extinguisher within a reasonable distance. Never surprise someone using a power tool. Check above, underneath, and behind solid surfaces if possible, to make sure it's safe to proceed and there isn't another person working on the other side.

1.2.4 Guarding

When power tools are designed to accommodate guards, they will be equipped with such guards prior to, and at all times during use. All guards will be in good condition and be adequate to provide protection to the employee. Regulations stipulate that the following parts of a power tool must be guarded: gears, sprockets, chain drives, belts, pulleys, drums, revolving or reciprocating parts, exposed shafts and projecting shaft ends, collars, clutches, and couplings.

1.2.5 Safety Switches

Safety switches allow the tool to be turned "off" quickly. Hand-held power tools must be equipped with a positive on-off, a momentary on-off, or a constant pressure switch. A positive on-off is a standard on-off switch. Platen sanders, disc sanders, scroll saws, and grinders with less than 2-inch-diameter discs may have a standard on-off switch. A momentary on-off can be turned "off" by a single motion of the same finger or fingers that turn it on. Drills, reciprocating and saber saws, grinders, and belt sanders may have a momentary on-off switch. A constant pressure switch shuts off power upon release. Circular saws and chain saws may have a constant pressure switch. Always test switch to insure it is functioning properly.

1.2.6 Blind Operations

A "blind" operation is any circumstance using any type of saw, drill, or other cutting or penetrating tool where you can't see behind what is being cut. When making a blind cut or drilling operation, be sure that hidden electrical wiring, water pipes, or any mechanical hazards are not in the blade path. If wires are present, they must be disconnected at the power source by a qualified person or avoided. Contact with live wires could cause lethal shock or fire. Water pipes should be drained and capped. Always hold the tool by the insulated grasping surfaces.

1.2.7 Kickback

Kickback is a sudden, uncontrolled reaction to a pinched blade, causing the tool to lift up and out of the work piece toward the operator. Misuse, buildup of sap or dirt on the blade, insufficient *set*, dullness, and unguided cuts, can all cause kickback. Avoid kickback by keeping saw blades sharp, having proper amount of *set* in the teeth, keeping saw blades clean, and support large panels so they will not pinch the blade. Set blade depth to no more than 1/4 inch greater than the thickness of the material being cut. Release the switch immediately if the blade binds or the saw stalls.

1.2.8 Power Tool Accessories

The choice of a wrong accessory or incorrect use can result in serious injury. Read and understand the recommendations in the owner/operators manual for the tool and the accessory literature. Don't use an accessory or attachment unless: the power tool manufacturer recommends its use on their product; the accessory's limitations and specifications match the limitations and specification of the power tool; the use of the accessory does not require the removal of any guards; and you understand the instructions that describe the safe use of the accessory or attachment. Always unplug tools before installing, adjusting, and changing any accessory or attachment of any kind.

1.3 Types of Power-Operated Hand Tools

Power tools include electric, battery-powered, liquid fuel, hydraulic, pneumatic (air), and powder-actuated. Power tools operate at high speeds; when things go wrong, it happens fast.

1.3.1 Electric Power-Operated – Corded

Electric power-operated tools that use a cord will either be double-insulated type or have a three-wire cord plugged into a grounded receptacle, grounded according to Occupational Safety and Health Administration (OSHA) regulations. A ground fault circuit interrupter (GFCI) will be used between the power operated tool and the power source. Test the GFCI before each use and use a portable GFCI if necessary. Power tools should always be stored in a dry place when not in use. Never use a tool in wet/damp conditions unless designed to be used in such an environment. Never carry power tools by the cord or yank the cord to disconnect it. Always keep tools and cords away from heat, oil, and sharp edges. Always disconnect power tools when not in use and when changing accessories such as blades and bits.

1.3.2 Electric Power-Operated – Battery (Cordless)

Electric power-operated tools that run on batteries should be charged in a dry location and away from all combustible materials. Do no operate cordless tools in or near flammable liquids or explosive atmospheres. Motors in these tools may spark and ignite fumes. Always recharge a cordless tool and its battery with its own specified charging unit. Never attempt to recharge a cordless tool in a recharging unit not specifically recommended for that tool. Remove batteries or lock the switch in its “OFF” position before changing accessories, adjusting or cleaning tools. This removes the power supply while hands are in vulnerable

locations such as near switches, bits, or blades. Do not store the battery pack in a container with metal objects such as wire, nails, or coins as it could short the battery. Do not expose the battery pack to moisture, frost, or temperature extremes of over 110 degrees Fahrenheit or under -20 degrees Fahrenheit.

1.3.3 Liquid Fuel Power Tools

Liquid fuel power tools will be stopped, turned "off," and cooled while being refueled, serviced, or maintained. Fuel will be transported, handled, and stored in accordance with federal regulations. Safety Data Sheets (SDS) for fuel or chemicals will be accessible during use of the tools. The tool must be used in a well-ventilated area as the carbon monoxide generated can displace or deplete oxygen. Before refilling a fueled powered tool fuel tank, shut down the engine and allow it to cool as fuel fumes, combined with the heat from the tool, can cause an explosion. Use only Type 1 or Type 2 approved flammable liquid containers. Properly clean any spills from the refueling process.

1.3.4 Hydraulic Power Tools

The fluid used in hydraulic power tools will be fire-resistant and approved for use with the hydraulic powered tool as specified by the manufacturer. The purpose of the specialized fluid is to allow the tool to be safely used in extreme temperatures."

1.3.5 Pneumatic Power Tools

Pneumatic (air) power tools will be properly maintained and operated according to the manufacturer's safe operating procedures. Make sure air hose connections are secure. Use a short wire or positive locking coupler to attach the air hose to the tool. Check hoses regularly for cuts, bulges, and abrasions (tag and replace if defective). Ensure the safety clip for attachments is installed and secure. Ensure the muzzle is in contact with the surface. Never point the tool at anyone. Avoid using on easily penetrated materials unless they are backed by material that will prevent fastener from passing through. Don't drive fasteners into very hard or brittle material that could chip, splatter, or make the fasteners ricochet. Avoid using compressed air for cleaning.

1.3.6 Powder-Actuated Tools

Only employees who have been trained in the operation of the particular tool in use will be allowed to operate a power-actuated tool. Never use in an explosive or flammable atmosphere. Never load the tool unless it will be used immediately. Never leave a loaded tool unattended. Never point the tool at anyone. Always keep hands and feet clear of the barrel end. Always select a powder level that will do the work without excessive force. Avoid using on easily penetrated materials unless they are backed by material that will prevent fastener from passing through. Don't drive fasteners into very hard or brittle material that could chip, splatter, or make the fasteners ricochet.

1.4 Powered Hand Tools

1.4.1 Drills

Be sure the trigger switch actuates properly. If equipped with a lock-on, be sure it releases freely. Be sure the chuck is tightly secured to the spindle. Tighten the drill bit securely as prescribed by the manual. Check auxiliary handles to be sure they are securely installed. Never force a drill; apply only enough pressure to keep the drill bit cutting smoothly. If the drill binds in the work, release the trigger immediately. Unplug the drill from the power source and then remove the bit from the work piece. Never attempt to free a jammed bit by starting and stopping the drill. Review the manufacture's manual for how to unjam the equipment. Unplug the tool before changing bits, accessories, or attachments.

1.4.2 Saws

Circular Saws

Always use sharp blades. Dull blades can cause binding, stalling, and possible kickback. Check blades carefully before each use for proper alignment and possible defects. Be sure all cords are out of the blade path and are sufficiently long to freely complete the cut. Clamp materials whenever possible. Never hold a work piece in your hand when sawing.

Set blade depth to no more than 1/4 inch greater than the thickness of the material being cut. Always allow the blade to reach full speed before the work piece is contacted. Never overreach and never reach under the saw or work piece. Never use a circular saw for cutting logs or roots, trimming trees, or shrubs.

Reciprocating Saws

Always use sharp blades. Dull blades cause binding, stalling, and possible kickback. Only use the blade specifically recommended for the job being done. Be sure all cords are out of the blade path and are sufficiently long to freely complete the cut. Position yourself to maintain full control of the tool and avoid cutting above shoulder height. The work piece must be clamped securely and the shoe of the saw held firmly against the work. When making anything other than a through cut, allow the tool to come to a complete stop before removing the blade from the work piece. Remember that the blade and blade clamp may be hot immediately after cutting. Avoid contact until they have cooled.

Jig/Saber Saws

Check that the blades are secured in position before plugging in. Make sure the cord is not in the line of cut. Firmly position the tool's base plate/shoe on the work piece before turning on the tool. Keep your hands and fingers well clear of moving parts. After making partial cuts, turn "off" and remove the blade from the work piece only after the blade has fully stopped. Maintain firm contact between the base and the material being cut, throughout cutting procedures. Remember that the blade and blade clamp may be hot immediately after cutting. Keep your hands away until cooled down and never overreach.

1.4.3 Abrasive Wheels and Tools

Sanders

Sanding dust can be highly explosive if the concentration becomes too great. Ensure the work area has adequate ventilation. Always use of exhaust type systems or bag collection. Check the power supply to be sure the switch and switch lock are in the "off" position. Always use the appropriate size disk or belt. Use jigs or fixtures to hold your work piece whenever possible. When sanding, always be aware of the cord location.

Never force a sander – the weight of the tool applies adequate pressure. Do not expose the tool to liquids, or to use in wet locations. When adjusting the tracking of the belt, be certain to avoid accidental contact with yourself or other objects.

Grinders

Test grinding wheels before mounting by tapping the wheel lightly with a nonmetallic implement. If it produces a ringing sound, it is in good condition. If it sounds dull, replace the wheel, Never use a cracked wheel. Use only those wheels and discs marked with a rated speed at or above the speed rating on the nameplate of the tool. Never operate a grinder without the proper guards in place. Always allow the wheel to come up to full speed before you contact the work piece. Do not apply excessive pressure to the wheel or disc. Use grinding wheels when working with hard materials, and use rotary files for soft materials such as aluminum, brass, copper, and wood. Using grinding wheels on soft materials will excessively load the wheel and could cause the wheel to shatter or disintegrate.

Power

Grinding machines will be supplied with sufficient power to maintain the spindle speed at safe levels under all conditions of normal operations. Follow manufacturer recommendations for sufficient power supply.

Guarding

Grinding machines will be equipped with safety guards in conformance with the requirements of the American National Standards Institute (ANSI) B7.1-1970.

Routers

Always disconnect the plug from the electrical outlet before changing bits or making any adjustments. Install router bits securely. Make certain that the cutter shaft is engaged in the collet at least ½-inch. Always face the cutter blade opening away from your body. The switch should be in the “off” position before plugging into the power outlet. Always allow the motor to reach full speed before feeding the router into the work. Never attempt to remove debris while the router is operating. Secure clamping devices on the work piece before operating router. When removing a router from your work piece, always be very careful not to turn the base and bit toward you.

1.4.4 Woodworking Tools

Disconnect Switches

Fixed power driven woodworking tools will be provided with a disconnect switch that can either be locked or tagged in the "off" position.

Speeds

The operating speed will be etched or otherwise permanently marked on all circular saws over 20 inches in diameter or operating at over 10,000 peripheral feet per minute. Blades used on these types of saws must be rated to operate at or below the operating speed of the saw.

Self-feed

Automatic feeding devices will be installed on machines whenever the nature of the work will permit. Feeder attachments will have the feed rolls or other moving parts covered or guarded so as to protect the operator from hazardous points.

Guarding

Portable, power-driven circular saws will be equipped with guards above and below the base plate or shoe.

Personal Protective Equipment

Project-specific PPE will be identified in the HASP based on the hazards present during work tasks. Required PPE must be worn when operating power tools. More information regarding PPE is located in Section 6 of GEI's Health and Safety Program.

Other Requirements

Woodworking tools and machinery will meet other applicable requirements of ANSI 01.1-1961, Safety Code for Woodworking Machinery.

1.4.5 Jacks – Lever and Ratchet, Screw, and Hydraulic

General Requirements

The manufacturer's rated capacity will be legibly marked on all jacks and will not be exceeded. All jacks will have a positive stop to prevent over-travel.

Blocking

When the working area does not have a solid working surface and it is necessary to provide a firm foundation, the base of the jack will be blocked or cribbed.

Operation and Maintenance

Hydraulic jacks exposed to freezing temperatures will be supplied with adequate antifreeze liquid. Jacks will be properly lubricated at regular intervals. Jacks will be thoroughly inspected, before each use. Repair or replacement parts will be examined for possible defects. Tag worn, damaged or defective jacks "Out of Service" and do not use them; notify your

Branch Manager so that the jack can be replaced or repaired. Parts subjected to wear will be inspected on a regular basis and repaired or replaced as needed.

1.5 Injury Reporting

If a GEI employee suffers an injury on the job that is not life threating, call Medcor Triage at 1-800-775-5866 to speak with a medical professional. Then, immediately report the injury to the Supervisor/Project Manager and Regional Safety Officer.

After verbal notification has been made, an Incident Report Form is to be completed by the employee and/or Supervisor/Project Manager and submitted to the People & Safety Team immediately following care of the incident. This form is available on the Safety App (smart phones) and on the Safety page on the GEI intranet.

Upon notification from a Branch or Office Manager, Human Resources, and/or the receipt of the Incident Report Form, the Regional Health & Safety Officer (RHSO) will conduct an investigation and evaluation on what happened and how and why it happened. The Corporate Health and Safety Officer (CHSO) will then recommend (as necessary) engineering controls, personal protection equipment, training or other appropriate measures to minimize the potential for future injuries. The CHSO/RHSO may develop educational information based on lessons learned for distribution to GEI employees.

1.6 Limitations

Follow safety procedures as defined in the site-specific HASP. Appropriate PPE must be worn correctly to provide the intended level of protection. Read and understand the recommendations in the owner/operators manual for the tool, and the accessory literature.

1.10 Review History

- July 2016
- May 2015 – Separated from SOP HS-008

STANDARD OPERATING PROCEDURES

SOP NO. HS-009 Hazardous Substances Exposure Management

1.1 Objective

This Standard Operating Procedure (SOP) is intended to outline the steps GEI employees will take to identify potential hazards associated with exposure to hazardous substances, the risks associated with these hazards, and the proper controls to use to minimize exposure. The site-specific health and safety plan (HASP) should include a hazard assessment for the project that identifies the potential of encountering a hazardous substance and the control methods to be implemented by GEI employees. These hazards should be reviewed in the project safety briefing and documented on the Project Safety Briefing form, found on the Safety page of the GEI intranet.

1.2 General

A hazardous substance is any substance that has one or more of the following intrinsic properties:

- Explosiveness
- Flammability
- Ability to oxidize
- Human toxicity (acute or chronic)
- Corrosiveness (to human tissue or metal)
- Ecotoxicity (with or without bioaccumulation)
- Capacity, on contact with air or water, to develop one or more of the above properties

1.3 Hazard Identification

An initial identification of hazards should be done based on a review of available documents including lists of chemicals used on site, analytical data from soil, surface water, groundwater, air, spill history, site history, equipment on site, maps, photos, and a preliminary survey.

Once hazardous substances are identified the regulated exposure limits need to be identified. Each substance may have a state/federal exposure value for each of the following (if applicable):

Action Level – An airborne level, typically one-half of the permissible exposure limit (PEL) designated in Occupational Safety and Health Administration's (OSHA's) substance-specific standards, 29 CFR 1910, Subpart Z, calculated as an

8-hour time weighted average, which initiates certain required activities such as exposure monitoring and medical surveillance.

Ceiling Limit – The exposure limit a worker's exposure may never exceed.

Sampling and Analytical Error – A statistical estimate of the uncertainty associated with a given exposure measurement.

Short-Term Exposure Limit (STEL) – The average exposure to a contaminant to which a worker may be exposed during a short time period (typically 15-30 minutes).

Time Weighted Average (TWA) – The average exposure to a contaminant over a given period of time, typically 8 hours.

1.4 Risk Identification

Once the presence and concentrations of specific hazardous substances and health hazards have been established, the risks associated with these substances will be identified. GEI employees and GEI subcontractors who will be working on the site will be informed of risks that have been identified.

Risks to consider include, but are not limited to:

- Potential exposures exceeding the permissible exposure limits and published exposure levels
- Potential Immediately Dangerous to Life and Health (IDLH) concentrations
- Potential skin absorption and irritation sources
- Potential eye irritation sources
- Potential hazardous atmospheres, including oxygen deficiency and fire and explosion hazards

1.5 Engineering Controls, Work Practices, and Personal Protective Equipment for Employee Protection

Engineering controls, work practices, and personnel protective equipment (PPE) for substances regulated in OSHA Subpart G (Occupational Health and Environmental Control) and Subpart Z (Toxic and Hazardous Substances) will be implemented in to protect employees from exposure to hazardous substances and safety and health hazards.

1.5.1 Elimination/Substitution

The first control method should be to try and eliminate or substitute the hazards with a safer alternative. This is the most effective solution as shown is Figure 1 below. If you can remove the hazard than you no longer need to find a way to protect the employee

from it. Or you can substitute a different piece of equipment or chemical to use that doesn't pose the same hazard and doesn't create a new one.

1.5.2 Engineering Controls

Engineering controls implement physical change to the workplace, which eliminates/reduces the hazard on the job/task. Examples include:

- Change the process to minimize contact with hazardous chemicals
- Isolate or enclose the process
- Use of wet methods to reduce generation of dusts or other particulates
- General dilution ventilation
- Use of fume hoods

1.5.3 Administrative Controls (Work Practices)

Administrative controls establish efficient processes or procedures to help protect the employee. Examples of these are:

- Rotate job assignments
- Adjust work schedules so that workers are not overexposed to a hazardous chemical

1.5.4 Personal Protective Equipment

The use of PPE to reduce exposure to risk factors is the last line of defense. All other options should be exhausted before use of PPE. Examples of PPE are:

- Chemical protective clothing
- Respiratory protection
- Gloves
- Eye or hearing protection
- Steel toe boots

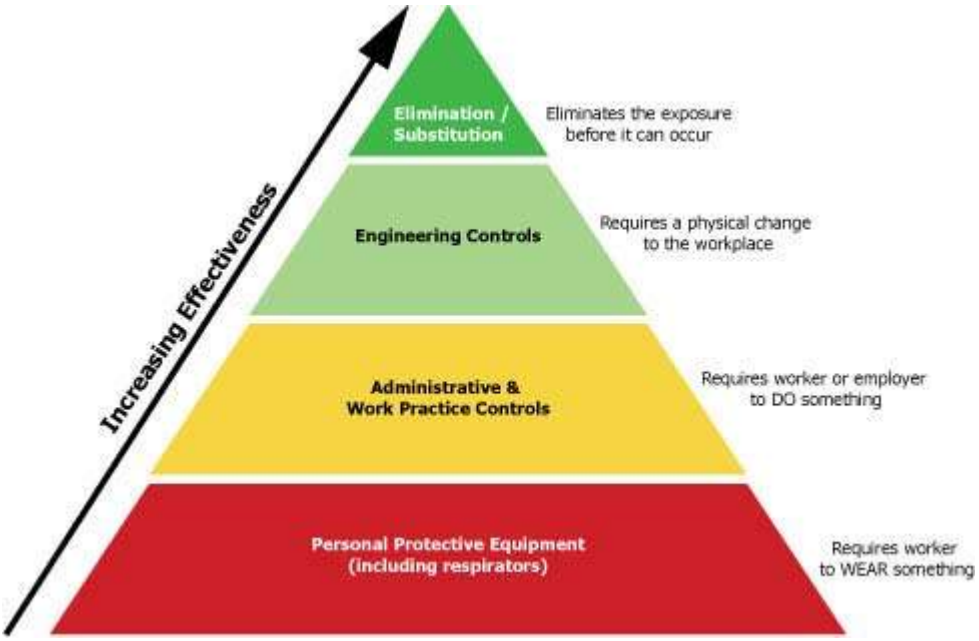

Figure 1: Hazard Mitigation Effectiveness Pyramid

1.5.5 Engineering Controls, Work Practices, and PPE for Substances Regulated in Subparts G and Subpart Z

Engineering controls and work practices will be instituted to reduce and maintain employee exposure at or below the PELs for substances regulated by 29 CFR Part 1910.

Engineering controls that may be feasible include the use of pressurized cabs or control booths on equipment, and/or the use of remotely operated material handling equipment. Work practices may include removing non-essential employees from potential exposure during opening of drums, wetting down dusty operations, and positioning employees upwind of potential hazards.

If engineering controls and work practices are not feasible, or not required, a reasonable combination of engineering controls, work practices, and PPE will be used to reduce and maintain at or below the PELs or dose limits for substances regulated by 29 CFR Part 1910, Subpart Z.

GEI will not implement a schedule of employee rotation as a means of compliance with PELs or dose limits except when there is no other feasible way of complying with the airborne or dermal dose limits for ionizing radiation.

The provisions of 29 CFR, subpart G, will be followed.

1.5.6 Engineering Controls, Work Practices, and Personal Protective Equipment for Substances Not Regulated in Subparts G and Subparts Z

An appropriate combination of engineering controls, work practices, and PPE will be used to reduce and maintain employee exposure to or below published exposure levels for hazardous substances and health hazards not regulated by 29 CFR Part 1910, Subparts G and Subparts Z. GEI will use published literature and Safety Data Sheets (SDS) as a guide in making the determination of what level of protection is appropriate for hazardous substances and health hazards for which there is no permissible exposure limit or published exposure limit.

1.5.7 Decontamination Procedures

Decontamination procedures will be developed, communicated to employees, and implemented before employees or equipment enter areas on site where potential for exposure to hazardous substances exists. Procedures will be developed to minimize employee contact with hazardous substances or with equipment that has contacted hazardous substances.

GEI employees leaving a contaminated area will be properly decontaminated; contaminated clothing and equipment leaving a contaminated area will be properly disposed of or decontaminated.

Decontamination procedures will be monitored by the site safety officer (SSO) to determine their effectiveness. When such procedures are found to be ineffective, the site safety officer will contact the Corporate Health and Safety Officer and appropriate steps will be taken to correct deficiencies.

Location
Decontamination will be performed in areas that will minimize the exposure to employees, equipment, and the environment.

Equipment and Solvents
Equipment and solvents used for decontamination will be decontaminated or disposed of properly.

Personal Protective Clothing and Equipment
Protective clothing and equipment will be decontaminated, cleaned, laundered, maintained, or replaced as needed to maintain their effectiveness.

Employees whose clothing comes in contact with hazardous substances will immediately remove that clothing and follow the directions on packaging or SDS sheet for how to properly clean the exposed area. The clothing will be disposed of or decontaminated before it is removed from the work zone.

Commercial Laundries or Cleaning Establishments
Commercial laundries or cleaning establishments that decontaminate protective clothing or equipment will be informed of the potentially harmful effects of exposures to hazardous substances.

Showers and Changing Rooms
Where the decontamination procedure indicates a need for regular showers and change rooms outside of a contaminated area, these will be provided and meet the requirements of 29 CFR 1910.141 (Sanitation). If temperature conditions prevent the effective use of water, then other effective means for cleansing will be provided and used.

1.6 Injury Reporting

If a GEI employee suffers an injury on the job that is not life threating, call Medcor Triage at 1-800-775-5866 to speak with a medical professional. Then, immediately report the injury to the Supervisor/Project Manager and Regional Health and Safety Officer.

After verbal notification has been made, an Incident Report Form is to be completed by the employee and/or Supervisor/Project Manager and submitted to the People & Safety Team immediately following care of the incident. This form is available on the Safety App (smart phones) and on the Safety page on the GEI intranet.

Upon notification from a Branch or Office Manager, Human Resources, and/or the receipt of the Incident Report Form, the Regional Health & Safety Officer (RHSO) will conduct an investigation and evaluation on what happened and how and why it happened. The Corporate Health and Safety Officer (CHSO) will then recommend (as necessary) engineering controls, personal protection equipment, training or other appropriate measures to minimize the potential for future injuries. The CHSO/RHSO may develop educational information based on lessons learned for distribution to GEI employees.

STANDARD OPERATING PROCEDURES

SOP No. HS-010 Inclement Weather

1.1 Objective

This Standard Operating Procedure (SOP) is intended for use by employees engaged in work with the potential to be affected by inclement weather. The site-specific health and safety plan (HASP) should include a hazard assessment for the project that identifies the potential for working in inclement weather and the control methods to be implemented by GEI employees. These hazards should be reviewed in the project safety briefing and documented on the Project Safety Briefing form, found on the Safety page of the GEI intranet.

1.2 General

Employees should be aware of local weather conditions and monitor advisories issued by the National Weather Service and other local reporting services. Depending on location and season, storms are capable of producing heavy rain, floods, extreme temperatures, high wind conditions, lighting, tornados, and/or snowfall.

1.2.1 Heavy Rain

If working or driving in a rain storm, use extreme caution. When driving, turn your low beam lights on when the rainfall becomes heavy. Employees should be aware of the following:

- Heavy rain decreases visibility, especially when driving.
- Surfaces and tools become slippery.
- If you are working in the rain and your clothes become wet there is a risk of hypothermia when exposed to winds, even in warm temperatures.
- If the storms are going to produce thunder and/or lightning, leave the work area immediately and move to a safe area.
- Use your best judgment to determine if the rainfall becomes too heavy to continue working safely.

1.2.2 Lightning

Lightning can strike as far as 10 miles from the area where it is raining. That's approximately the distance you can hear thunder. **If you can hear thunder, you are within striking distance. Seek safe shelter immediately.** This can be within a building or vehicle. Wait 30 minutes after the last clap of thunder or flash of lightning before going outside again.

1.2.3 Flooding

Flooding may occur as a result of heavy rain in a short period of time. Flooding can be particularly acute in canyon areas where dry creek beds can turn into raging rivers from rainfall in distant or higher elevation areas. Be aware of this and your surroundings and move to a safe place if you begin to see signs that flooding may occur. Signs of potential flooding include sudden appearance of water in dry creek beds, increased water flow in rivers or streams, or quick rise in water levels.

Do not attempt to drive through areas or streets that are flooded. Seek alternate routes. Be particularly cautious at night when flooded areas are difficult to see. Urban flooding can stop traffic; increase the potential for traffic accidents; and can trap people in vehicles.

1.2.4 Extreme Temperatures

Work activities may take place in extreme heat or cold. Be prepared if these conditions are anticipated. Have the appropriate personal protective equipment (PPE) available; exercise proper fluid intake; and take breaks to prevent heat and cold stress. For more information about these conditions see the heat stress and cold stress programs found in GEI's Health and Safety Program.

1.2.5 High Winds, Tropical Storms, and Tornados

High Winds can be extremely dangerous. Appropriate measures will be taken to secure equipment and loose items when working in windy conditions. The project manager should be contacted about the weather conditions and, if necessary, work should be postponed.

Tropical storms are described as storms with sustained winds ranging from 39 to 73 miles per hour (mph) and hurricanes produce sustained winds that exceed 74 mph. When winds approach 40 mph (gale force winds) twigs begin to break off of trees and vehicles will veer off of the road. When winds approach 40 mph or the GEI employee feels unsafe based on the activities being performed, stop work and seek shelter as soon as possible. Blowing or falling debris and overhanging limbs/signs can be a significant hazard. If possible, avoid driving in these conditions; 70 percent of injuries during hurricanes are a result of vehicle accidents. Note that tall or elevated equipment will have manufacturer's safe operating wind speeds defined that could be less than 40 mph. The operator's manual should be consulted prior to operation of the equipment.

A tornado is a violent, dangerous, rotating column of air that is in contact with both the surface of the earth and a cumulonimbus cloud or, in rare cases, the base of a cumulus cloud. The Fujita Scale is used to rate the intensity of a tornado by examining the damage caused by the tornado after it has passed over a man-made structure. Based on the Fujita Scale, or F-Scale, numbers begin at F0: 40-72 mph and go to F6: 319-379 mph (F6 is

generally theoretical). Nearly three-fourths of tornados are on the weak F0-F1 scale with just over two-thirds of deaths resulting from the violent F4-F5 tornados.

If a tornado is seen, stop work and seek shelter immediately. If a tornado siren is sounded move immediately to safety indoors and then move to a windowless interior space, basement, stairwell, or designated fall-out shelter. Windows should not be opened before an oncoming tornado. If there is no shelter available, seat belt yourself into your stationary vehicle or seek a depression or low spot on the land surface.

1.2.6 Snowfall and Ice Conditions

Working in the winter months may result in activities taking place during periods of snowfall or icy conditions. If you are working during or after snow has fallen, dress appropriately for the conditions. Snow and ice can cause working surfaces to become slippery. Clear snow and ice from work areas to prevent slip hazards. Use caution when performing snow or ice removal activities to prevent injuries. Driving in snowy and icy conditions is also hazardous. Reduce speed and use caution if you must drive in these conditions.

If the weather conditions deteriorate and you do not feel safe working in these conditions, stop work, move to a safe indoor location, and contact your project manager to let them know the weather, work conditions, and your location.

1.3 Injury Reporting

If a GEI employee suffers an injury on the job that is not life threating, call Medcor Triage at 1-800-775-5866 to speak with a medical professional. Then, immediately report the injury to the Supervisor/Project Manager and Regional Safety Officer.

After verbal notification has been made, an Incident Report Form is to be completed by the employee and/or Supervisor/Project Manager and submitted to the People & Safety Team immediately following care of the incident. This form is available on the Safety App (smart phones) and on the Safety page on the GEI intranet.

Upon notification from a Branch or Office Manager, Human Resources, and/or the receipt of the Incident Report Form, the Regional Health & Safety Officer (RHSO) will conduct an investigation and evaluation on what happened and how and why it happened. The Corporate Health and Safety Officer (CHSO) will then recommend (as necessary) engineering controls, personal protection equipment, training or other appropriate measures to minimize the potential for future injuries. The CHSO/RHSO may develop educational information based on lessons learned for distribution to GEI employees.

1.4 Limitations

Follow safety procedures as defined in the site-specific HASP. Appropriate PPE must be worn correctly to provide the intended level of protection. Protection in extreme weather conditions can best be accomplished if the conditions are anticipated and actions are taken. Monitor local weather conditions prior to starting work.

- May 2014
- July 2016

STANDARD OPERATING PROCEDURES

SOP No. HS-012 Noise Exposures

1.1 Objective

This Standard Operating Procedure (SOP) is intended for use by employees engaged in work with elevation noise levels. The site-specific health and safety plan (HASP) should include a hazard assessment for the project that identifies the potential for work in loud environments and the control methods to be implemented by GEI employees. These hazards should be reviewed in the project safety briefing and documented on the Project Safety Briefing form, found on the Safety page of the GEI intranet.

1.2 General

Working in loud environments can cause hearing damage and loss if the proper protection is not in place. The following procedures describe methods to mitigate unhealthy noise levels and protect hearing.

1.3 Hazard Identification

If projects involve noise levels above OSHA regulations, employees should take steps to remove the noise exposure. Common sources of elevated noise levels are heavy equipment, power tools, pumps, and generators. GEI has an established Hearing Conservation Program located in the GEI Health and Safety Program.

1.4 Risk Identification

Hearing protection is required if noise levels in a work area are known to be above 85 decibels (dB), which can be measured with a noise meter. When decibel levels are not known, hearing protection is required if you need to raise your voice to talk to someone standing within a normal speaking distance from you.

1.5 Mitigation

There are three options that can be used to help mitigate a noise hazard:

1.) Remove the hazard by taking away the source of the noise.

2.) Remove the employee from the source of the noise.

3.) Provide the employee with appropriate personal protective equipment (PPE).

The first option for employee protection is to remove the hazard by taking away the source of the noise or using engineering controls to reduce the level.

If this cannot be accomplished, the next control measure is to remove the employee from the source. This can be done by moving the work area to a quieter location or distancing the employee from the noise source. For example, GEI employees do not need to be standing next to an operating drill rig or other heavy equipment. By distancing themselves from heavy equipment or other noise sources the need for hearing protection can be eliminated/reduced.

The final option, if the above two options aren't feasible, disposable ear plugs that are made available to GEI employees are to be used. Additional means of hearing protection will be provided, such as ear muffs, if the disposable ear plugs are not adequate.

When using hearing protection, employees will need to make a greater effort to be aware of the surroundings which may include moving equipment, traffic, and other site hazards.

1.6 Proper Use of Hearing Protection

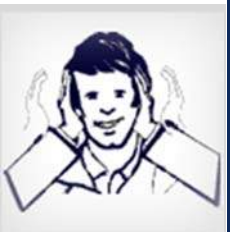
DISPOSABLE EAR PLUG FITTING INSTRUCTIONS

Before fitting any ear plugs, make sure your hands are clean.
Foam ear plugs are disposable and not intended for reuse.

Hold the ear plug between your thumb and forefinger. Roll and compress the entire ear plug to a small, crease-free cylinder. While still rolling, use your other hand to reach over your head and pull up and back on your outer ear. This straightens the ear canal, making way for a snug fit.

Insert the ear plug and hold for 20 to 30 seconds. This allows the ear plug to expand and fill your ear canal.

Test the fit. In a noisy environment, and with earplugs inserted, cup both hands over your ears and release. You should not notice a significant difference in the noise level. If the noise seems to lessen when your hands are cupped over your ears, your ear plugs are not fitted properly. Carefully remove the earplugs (see instructions below) and refit following instructions, above.



Always remove ear plugs slowly, twisting them to break the seal. If you remove them too quickly, you could damage your ear drum.	

REUSABLE EAR PLUG FITTING INSTRUCTIONS

Before fitting any ear plugs, make sure your hands are clean.

Reusable ear plugs should be inspected and cleaned often in soapy water. If they become hard, torn, or deformed they should be discarded and replaced.

Reach around your head and pull up and back on your outer ear. This straightens out the ear canal, making way for a snug fit. Hold the stem end of the ear plug and insert it well inside your ear canal until you feel it sealing and the fit is comfortable.	
Test the fit. In a noisy environment, and with ear plugs inserted, cup both hands over your ears and release. You should not notice a significant difference in the noise level. If the noise seems to lessen when your hands are cupped over your ears, your ear plugs are not fitted properly. Carefully remove the ear plugs (see instructions below) and refit following instructions, above.	
Always remove ear plugs slowly, twisting them to break the seal. If you remove them too quickly, you could damage your ear drum.	

1.7 Injury Reporting

If a GEI employee suffers an injury on the job that is not life threating, call Medcor Triage at 1-800-775-5866 to speak with a medical professional. Then, immediately report the injury to the Supervisor/Project Manager and Regional Safety Officer.

After verbal notification has been made, an Incident Report Form is to be completed by the employee and/or Supervisor/Project Manager and submitted to the People & Safety

Team immediately following care of the incident. This form is available on the Safety App (smart phones) and on the Safety page on the GEI intranet.

Upon notification from a Branch or Office Manager, People Team, and/or the receipt of the Incident Report Form, the Regional Health & Safety Officer (RHSO) will conduct an investigation and evaluation on what happened and how and why it happened. The Corporate Health and Safety Officer (CHSO) will then recommend (as necessary) engineering controls, personal protection equipment, training or other appropriate measures to minimize the potential for future injuries. The CHSO/RHSO may develop educational information based on lessons learned for distribution to GEI employees.

1.8 Limitations

Follow safety procedures as defined in the site-specific HASP. Appropriate PPE must be worn correctly to provide the intended level of protection.

STANDARD OPERATING PROCEDURE

SOP HS-014 Utility Mark-out

1.1 Objective

This Standard Operating Procedure (SOP) provides guidance for utility mark-out procedures related to drilling, excavation, or other sub-surface or intrusive activities to avoid injury to GEI employees or property damage. This SOP is applicable when GEI is responsible for its operation or our subcontractor's operation for utility mark-out. A utility mark out is when paint, flags or other markers are put in place to identify the location of an underground utility.

Clients or local agencies may have additional requirements or procedures to mark out of utilities. If local utility mark-out procedures differ from those described within this SOP, applicable state or municipal regulations should be followed.

1.2 General

This SOP is intended for use by employees engaged in work with sub-surface or intrusive activities. The site-specific health and safety plan (HASP) should include a hazard assessment for the project that identifies the potential for subsurface hazards and the control methods to be implemented by GEI employees. These hazards should be reviewed in the project safety briefing and documented on the Project Safety Briefing form, found on the Safety page of the GEI intranet.

1.2.1 Contractor/GEI Responsibilities

- The contractor or GEI employee will pinpoint each exploration area with white paint, flags, or stakes. personal protection equipment (PPE), including eye protection when using spray paint will be worn.
- Exploration locations should be marked-out with sample identification number(s) and type of sample (e.g., boring, test-pit, or monitoring well).
- The contractor compiles information about the work areas on a request form specified by the state utility mark-out program and submits it. Work area location maps can be sent to the utility mark-out program to clarify locations.
- The mark-out program customer service representative will provide a mark-out ticket number and a list of utilities notified upon receipt of the request information. This information will be recorded on the GEI documentation form in Appendix B and/or in other project documents.
- If known, the contractor or GEI employee will also notify non-member utility operators (e.g., apartment complexes, commercial complexes, railroads with communication cables, etc.).

1.2.2 Utility Mark Outs

- Utility companies or their sub-contractors will only mark-out, or clear, utilities under their responsibility. Generally, this means that they will only mark-out utilities within the public right-of-way up to private property boundaries. Information needed to determine the location of utilities on private properties will be requested from the property owner. This may include available property drawings or as-built figures. If this information is not available, additional non-intrusive surveys of the property may be required by a private utility locator to find underground utilities by using techniques such as ground penetrating radar (GPR).
- American Public Works Association (APWA) Uniform Color Code For Marking Underground Utility Lines are:
    1. **White** – Proposed Excavation
    2. **Pink** – Temporary Survey Markings
    3. **Red** – Electric Power Lines, Cables, Conduit and Lighting Cables
    4. **Yellow** – Gas, Oil, Steam, Petroleum, and Gaseous Material
    5. **Orange** – Communications, Alarm, Signal Lines, Cables or Conduit
    6. **Blue** – Water
    7. **Purple** – Radioactive Materials
    8. **Green** – Sanitary and Storm Sewers and Drain Lines

1.2.3 Utility Mark Out Review

- Before the intrusive work activities begin, the contractor or GEI employee will verify that each utility company has completed a utility location for the work area or the location has been cleared by a private locator and record this on the mark-out request information sheet.
- A visual survey of the project area will be done prior to the start of intrusive activities. This visual inspection will be done to identify signs, manholes, utility boxes, or other evidence of an underground utility is present and has been considered.
- The contractor or GEI employee can begin work on the scheduled work date and time if the utility operators have responded, taking care to find and preserve markings that have been made.
- Completed clearance documentation will be located on the excavation site during excavation activities and kept in project files.

1.2.4 Excavations

- When excavating near a buried utility, observe the approximate location around that utility.
- If exposing a utility, proper support and protection must be provided so that the utility will not be damaged.
- If the excavation work requires significant spans of the utility to be exposed, it is the contractor's responsibility to support the infrastructure (to prevent sagging or collapse) as needed. Contact the utility operator for support, guidance, or assistance.
- When the excavation is complete, provide proper backfill for utilities that have been exposed.
- Take care not to damage the conduit or protective coating of a utility. If the damage occurs, leave the damaged utility exposed and immediately call the utility owner.
- If a gas line is encountered, everyone will be evacuated according to the site evacuation procedures and the contractor must notify police, fire, and emergency personnel. No attempt should be made to tamper with or correct the damaged utility. All site personnel are to evacuate to the site's predetermined meeting point or a location a minimum of 300 feet away from the incident location.
- If the contractor needs to dig within the approximate location of a combustible, hazardous fluid, or gas line (natural gas, propane or gasoline), soft digging is required (hand digging, vacuum extraction) to a maximum depth of 5 feet. The approximate location is defined as 24 inches on either side of the designated center line of the utility if the diameter is not provided or 24 inches from each outside edge if the diameter is provided.

1.3 Injury Reporting

If a GEI employee suffers an injury on the job that is not life threating, call Medcor Triage at 1-800-775-5866 to speak with a medical professional. Then, immediately report the injury to the Supervisor/Project Manager and Regional Health & Safety Officer (RHSO).

After verbal notification has been made, an Incident Report Form is to be completed by the employee and/or Supervisor/Project Manager and submitted to the People & Safety Team immediately following care of the incident. This form is available on the Safety App (smart phones) and on the Safety page on the GEI intranet.

Upon notification and/or the receipt of the Incident Report Form, RHSO will conduct an investigation and evaluation on what happened and how and why it happened. The Corporate Health and Safety Officer (CHSO) will then recommend (as necessary) engineering controls, personal protection equipment, training or other appropriate measures to minimize the potential for future injuries. The CHSO/RHSO may develop educational information based on lessons learned for distribution to GEI employees.

1.4 Limitations

- Follow safety procedures as defined in the site-specific HASP. Appropriate PPE must be worn correctly to provide the intended level of protection.
- Mark-out notification time usually does not include holidays. Make sure holidays are considered and mark-out time is scheduled accordingly. Under no circumstances are intrusive activities allowed to be performed prior to the required mark-out.
- Do not use white paint if precipitation is eminent. Consider using stakes if snow is predicted.

STANDARD OPERATING PROCEDURES

SOP No. HS-016 Traffic Hazard Management

1.1 Objective

The objective of this Standard Operating Procedure (SOP) is to prevent or limit the potential for GEI personnel to encounter traffic hazards during field activities.

1.2 General

This SOP is intended for use by employees engaged in work with the potential for traffic hazards. The site-specific health and safety plan (HASP) will include a hazard assessment for the project that identifies the potential for exposure to traffic hazards and the control methods to be implemented by GEI employees, including review or attainment of necessary permits, traffic control plans, and flagger/police detail requirements for the local jurisdiction. Routine checks of the work zone will be made to ensure there are adequate levels of protection. These hazards will be reviewed in the project safety briefing and documented on the Project Safety Briefing form, found on the Safety page of the GEI intranet.

1.3 Traffic Hazard Management

Traffic Hazard Management is the process of identifying and managing the potential risks associated with the movement of traffic through, around, or past a work area. This Traffic Hazard Management SOP is designed to assist employees in identifying and managing these hazards. Work areas should be as safe as possible. It is the responsibility of GEI employees to follow the Traffic Hazard Management SOP and adhere to these safety standards. Safety is not negotiable.

Under no circumstances are GEI employees permitted to commence work in a situation that the employee believes or knows their health and safety, or the health and safety of others, is at risk.

Major risk factors for work site Traffic Hazard Management include:

- The speed of traffic moving through a work site.
- The distance and clearance between moving traffic, workers, vehicles and equipment, and over-head power lines.
- Traffic volume and vehicle composition.
- Nature and conditions at the work site and approaches to the work site.

- Other factors such as the time of day, sight distance, weather, presence of pedestrians, or cyclists, and the type of work being carried out.
- Other hazards in proximity to the work site (e.g., power lines, open excavations) that may have conflicting safety management measures that need to be considered when developing the HASP.

1.4 Site Preparation

The following management measures will be considered whenever working in traffic areas. In addition, remain aware of the amount of traffic around the working area. The work space should be large enough for the job to be completed safely. Check permit, traffic control plans, and flagger/police detail requirements for the local jurisdiction. Perform routine checks of the work zone to make sure there are adequate levels of protection.

1.4.1 Traffic Barriers and Warning Signs

GEI employees will comply with the U.S. Department of Transportation's (DOT) Manual on Uniformed Traffic Control Devices (MUTCD) and/or state regulations for temporary traffic barriers (cones, barriers) and sign placement when required for working in traffic areas. Clearly define the work site by placing traffic barriers around the work space to indicate the space that is needed to safely perform the work. The traffic barrier will help make the work site more visible to other workers, pedestrians, cyclists, and moving vehicles. Place traffic barriers in such a way as to give yourself and equipment adequate space to work within the barriers. OSHA suggests placing the first warning sign at a distance calculated to be 4 to 8 times (in feet) the speed limit (in MPH).

1.4.2 Adequate Light

Requirements for night conditions and work areas with poor visibility are similar to day requirements. However there are a number of additional things to consider, such as visibility of the work site to advancing traffic and sufficient lighting. OSHA requires lighting for workers on foot and equipment operators to be at least 5-foot-candles or greater.

Visibility of the work area can be increased by employing the following measures:

- Using parked vehicles hazard and flashing lights.
- Wearing reflective personal protective equipment (PPE), such as a safety vest, in good condition.
- Providing adequate lighting to illuminate the work area with lights positioned so that there is no glare to approaching drivers.
- Placing reflective advance warning signs and traffic barriers so that they are visible to road users.

1.4.3 Distance from the Nearest Traffic Lane

Work areas located along roadsides will have a minimum clearance as defined by DOT's MUTCD and/or state or local DOT regulations for traffic barrier and sign placement.

1.4.4 PPE

The proper PPE, as outlined in the project HASP, will be worn when appropriate. The color/type of safety vest will comply with site regulations.

1.5 Equipment Operation

Vehicles and heavy equipment operators should use a spotter when possible if it is necessary to drive in reverse to reduce risk of collision with oncoming traffic. If it is necessary to drive against the flow of traffic make sure this area is within the work zone and properly blocked off from oncoming traffic.

1.6 Pedestrian Safety

When working near pedestrian traffic, a safe alternate pedestrian route will be established. Refer to local regulations when establishing pedestrian walkways.

1.7 Injury Reporting

If a GEI employee suffers an injury on the job that is not life threating, call Medcor Triage at 1-800-775-5866 to speak with a medical professional. Then, immediately report the injury to the Supervisor/Project Manager and Regional Health & Safety Officer (RHSO).

After verbal notification has been made, an Incident Report Form is to be completed by the employee and/or Supervisor/Project Manager and submitted to the People & Safety Team immediately following care of the incident. This form is available on the Safety App (smart phones) and on the Safety page on the GEI intranet.

Upon notification from a Branch or Office Manager, Human Resources, and/or the receipt of the Incident Report Form, the RHSO will conduct an investigation and evaluation on what happened and how and why it happened. The Corporate Health and Safety Officer (CHSO) will then recommend (as necessary) engineering controls, personal protection equipment, training or other appropriate measures to minimize the potential for future injuries. The CHSO/RHSO may develop educational information based on lessons learned for distribution to GEI employees.

1.8 Limitations

Follow safety procedures as defined in the site-specific HASP, federal DOT, and local jurisdictions. Appropriate PPE must be worn correctly to provide the intended level of protection.

- October 2010 Initially HS-027 Traffic Hazards

STANDARD OPERATING PROCEDURES
HS-017 Water Safety

1.1 Objective

The objective of this Standard Operating Procedure (SOP) provides requirements and best practices for GEI personnel during field activities taking place on board a boat/barge or when working in or near water. If conducting aquatic surveys or electrofishing activities, please *refer to* **HS-022 Aquatic Ecological Surveys and Electrofishing Safety** for additional safety information for working in or near water.

1.2 General

This SOP is intended for use by employees where there is the potential to perform work while on board a boat/barge or when working in or near water. The site-specific health and safety plan (HASP) will include a hazard assessment for the project that identifies the potential hazards and the control methods to be implemented by GEI employees. The site-specific HASP, project hazards, and control methods will be reviewed during the project safety briefing and documented on the Project Safety Briefing form found on the Safety page of the GEI intranet.

1.3 Working near Water

OSHA Construction Industry Standards (29 CFR 1926.106) state, "…employees working over or near water, **where the danger of drowning exists**, will be provided a U.S. Coast Guard-approved life jacket or buoyant work vests." (*Emphasis added, not in original text*) OSHA General Industry Standards (1910) do not address working over or near water; therefore, GEI uses the OSHA Construction Standard for any work near water.

The following safety devices, when appropriate, will be used by employees working near water:

- **Life Jacket or Personal Flotation Devices (PFD).** Employees will be required to wear U.S. Coast Guard-approved personal flotation devices that are marked or labeled Type III PFD or a Type V PFD that is marked or labeled for use as a work vest for commercial use or for use on vessels. GEI employees will inspect personal floatation devices for defects that could alter their strength or buoyancy prior to, and after, each use. Tag worn, damaged, or defective PFDs "Out of Service" and do not use them; notify the Branch Manager so that the PFD can be disposed of and replaced. GEI does not issue or permit the use of unsafe PFDs.
- **Ring Buoys.** U.S. Coast Guard-approved ring buoys with at least 90 feet of line will be readily available for emergency rescue operations. Distance between ring buoys will not exceed 200 feet.

- **Life-saving Skiff.** When GEI employees are working over or adjacent to water, at least one lifesaving skiff will be immediately available for potential rescue purposes.

These requirements can be superseded by the use of 100 percent fall protection. If an employee cannot fall into the water as a result of the use of active or passive fall protection, there is no danger of drowning and the bullet points above are not required. The type of fall protection or the need for the above mentioned safety measures will be described in the site specific HASP. If 100 percent fall protection is in place, the boat will, at a minimum, have U.S. Coast Guard-approved PFDs on board for each person and at least one throw-able flotation device, such as a ring buoy.

GEI employees will not work alone when working near water.

1.4 Boat/Barge Safety Practices

Boat safety practices will be conducted in general accordance with guidance provided in the U.S. Army Corps of Engineers (USACE) Safety and Health Requirements Manual (EM) 385-1-1 and the U.S. Coast Guard. The following safety practices will be adhered to:

- If there is an accident the U.S. Coast Guard must be notified. The attached U.S. Coast Guard accident report form can be used to document the accident. Federal law requires the operator, or owner, if the operator is deceased or unable to make the report, to file a boating accident report with the state reporting authority when, as a result of an occurrence that involves a boat or its equipment:
    - Incident involving a fatality.
    - A person disappears from the vessel under circumstances that indicate death or injury.
    - A person is injured and requires medical treatment beyond first aid.
    - Damage to vessels and other property totals $2,000 (lower amounts in some states and territories) or more.
    - The boat is destroyed.
- Boats operated by GEI will comply with U.S. Coast Guard regulations.
- Any GEI employee that is operating a boat is required to take a Boating Safety Course. The course will be in accordance with the requirements of the state in which the boat will be operated. Documentation of course completion will be sent to the People & Safety Team.
- The boat operator will be familiar with United States Geological Survey navigation rules.

- Any boat operator, whether GEI or a subcontractor, is not to exceed 12 hours of duty time in a 24-hour period.
- GEI employees will wear a PFD as described in Section 1.3 when on board a boat /barge.
- For a boating activity where the vessel launches and is no longer in view of on-shore personnel, a Float Plan will be completed and left with a reliable person who can be depended upon to notify the U.S. Coast Guard, or other rescue organizations, should you not return or check-in as planned. If there is a change of plans after leaving, be sure to notify the person holding the Float Plan. Please *see* the attached U.S. Coast Guard Float Plan form.
- For a task requiring more than 1 day, daily communications with the reliable person will be maintained.
- The consumption of alcoholic beverages and the use of illegal drugs will not be permitted aboard boats/barges on which GEI employees are conducting company business, this includes boats/barges that may belong to someone else (subcontractor, client, etc.).
- Employees working on a boat will monitor the weather, incorporating, as appropriate, National Oceanic and Atmospheric Administration (NOAA) marine weather broadcasts and other local commercial weather forecasting services as may be available.
- For retrieving a person overboard, the boat operator, or other competent person will throw a life ring, that is attached to the boat with at least 90 feet of rope, and use a ladder attached to the boat or the boat step transom to allow the person to climb out of the water.
- Emergency procedures for fire, person overboard, and capsizing will be reviewed on the first day of operations and when there is a change of personnel occurs.
- Check with your local and state agency to verify their boat law/regulations.
- Beware of carbon monoxide poisoning when the boat engine is running in closed or poorly ventilated areas.

1.4.1 Boating Safety Equipment

The U.S. Coast Guard requires particular safety equipment to be aboard a boat. This list includes those items as well as other equipment that GEI requires as a minimum. Other safety equipment may be required based on the type and size of the boat being operated. The boat will be equipped with:

- At least one mounted ABC-1 type U.S. Coast Guard-approved portable fire extinguisher.
- A Type IV life ring attached to at least 90 feet line. Distance between ring buoys will not exceed 200 feet.
- A Coast Guard approved PFD for each person on board.
- A visual distress signal, such as flare.
- VHF-FM Marine Radio with Digital Selective Calling System.
- An efficient sound-producing device, such as a whistle or horn.
- One U.S. Coast Guard approved backfire flame arrestor device on each carburetor of all gasoline engines installed after April 25, 1940, except outboard motors.
    - Devices will be marked to show compliance with SAE J-1928 or UL 1111 Standards.
- Ladder attached to the boat or the boat step transom.
- An adequately-sized first aid kit.
- Charts and navigation aids.

1.5 Training

1.5.1 General

Training will be conducted for employees unfamiliar with the use of safety equipment and personal protective equipment (PPE) required by this SOP. Employees working over or near water will be trained in their responsibilities and the safe work practices associated with working on or near water.

1.5.2 Operating a Boat

A Boating Safety Course is required for employees that will be operating a boat. The course will in accordance with the requirements of state in which the boat will be operated. There is no regulated refresher date; therefore, GEI will require the course be retaken every 5 years to demonstrate continued proficiency. Documentation of course completion will be sent to the Safety Team.

1.6 Wading In Water

GEI employees may be required to wade in water during the performance of project work including but not limited to aquatic surveys and other ecological activities. Employees will be familiar with safe wading procedures and emergency preparedness as described below. Working in and around water can be an inherently hazardous activity (hypothermia, drowning risk) for which safety will be the primary concern.

1.6.1 General Safety

Field sampling operations in and around water will not be carried out alone. A minimum team size is two people. Employees will wear appropriate clothing and PPE in accordance with Section 1.6.2, Personal Protective Equipment Requirements for Wading, as defined below and as discussed in HS-022 Aquatic Ecological Survey and Electrofishing Safety.

Instream crews will have a First Aid kit onsite during wading operations and will work in a manner that is safe for themselves and their co-workers. The crew leader is the recognized authority and operational decision-maker. Crew members have the duty to comply with all of the crew leader's instructions concerning their health and safety and to report to the crew leader anything that is likely to be hazardous to their health or safety or to that of other employees or persons granted access to the work area.

Employees undertaking instream sampling or wading operations will be familiar with the hazards associated with those activities and agree to use common sense and safe wading practices during sampling. Field staff will have up-to-date Cardio-Pulmonary Resuscitation (CPR) and First Aid training.

1.6.2 Personal Protective Equipment Requirements for Wading

The following PPE is required when wading in water and will be provided by GEI:

- Leak-free chest waders or hip waders (neoprene, heavy weight polyurethane, PVC, or high-quality breathables), dependent upon depth. Hip waders can be worn when water depth is known not to be over "knee-deep" on any employee wearing hip waders.
- Non-slip footwear (felt wading shoe or boot, as well as stream wading cleat).
- Wading belt (nylon or rubber acceptable, worn on outside of chest waders).
- Polarized sunglasses (side shields or 'wrap around' style is/are recommended) and a hat with a visor is recommended (e.g., baseball cap style).
- PFDs will be worn where the crew leader considers the water is of sufficient depth or velocity for a PFD to be effective as protection from risk of drowning. PFDs will be U. S. Coast Guard approved personal flotation devices that are marked or labeled Type III or V PFD. Wading should not be carried out where water depth is greater than waist deep.
- In some situations, a wading staff might be useful as a "third leg" to help stabilize personnel during stream crossing or other wading operations.

1.6.3 Safety Procedures for Wading Operations

Office Preparation

- The crew leader will verify all employees have received instruction in the fundamentals of wading safety and working around water.
- It is the crew leader's responsibility to verify that employees are properly outfitted for the intended work.
- Where available, employees should attempt to identify any information on known instream hazards at the intended field site, including current discharge stage.
- Each instream sampling team will establish a means of emergency communication such as using walking talkies or specific hand signals.

Field Preparation

- A crew leader will be designated for activities in water.
- Crew members will be equipped with the personal equipment detailed in Section 1.6.2, Personal Protective Equipment Requirements for Wading.
- Each instream work site will be visually inspected for hazards such as deep holes, submerged logs, animals, etc. before commencing wading operations.
- In order to aid in identifying underwater hazards, all crew members will be equipped with polarized sunglasses. Glasses also protect against eye injury caused by sticks and branches. Wide brimmed hats or 'baseball' style caps are also beneficial in increasing the effectiveness of polarized glasses.
- Using visible landmarks, personnel will assess flow stage for the waterbody and continue to monitor for changes in water level during sampling operations. Changes in water level could indicate the onset of a flash flood.
- Clear command signals will be established between crew members prior to beginning operation. Crew members will inform the crew leader of any dangerous situations. Do not go into water that is above the level you have experienced before and are physically capable of handling.

1.6.4 Wading Procedures

- Operate slowly and carefully. Footing in most streams is poor and most falls occur when crew members are hurrying. Operations should cease when fatigue sets in.
- Plan a route that minimizes your exposure to the strongest currents/deepest water. Sand and gravel bottoms are usually secure and safe bottoms to wade on. Avoid standing on large, smooth rocks as much as possible.

- Plan on generally working in a downstream to upstream direction, ensuring solid footing before shifting positions
- Be aware of floating debris and changing water levels.
- In shallow water, less than knee deep, it may be possible to walk "normally" with a modified, wide stance. As water gets deeper and footing becomes obscured by water depth or turbidity, sidestepping will help maintain a wide, stable base.
- In moderate currents, position your feet so that you are facing upstream with your body side-on to the current to brace yourself and reduce your profile in the current.
- When crossing streams, it is easier and safer to move at a slight downstream angle with the current than to move directly across or upstream against the current.
- In difficult situations, take small shuffling steps, angling your body slightly upstream. If using a wading staff, position it upstream, maintaining two points of contact with the bottom at all times.
- In particularly difficult situations, use a buddy system in which you and a partner cross the stream together arm in arm, one upstream of the other so that you are supporting each other
- If you do happen to lose your footing and begin to float downstream, don't try to swim. Bring your knees up and roll over on your back with your feet downstream, working your way to the sides or to a suitable place to get out.

1.7 Injury Reporting

If a GEI employee suffers an injury on the job that is not life threating, call Medcor Triage at 1-800-775-5866 to speak with a medical professional. Then, immediately report the injury to the Supervisor/Project Manager and Regional Safety Officer.

After verbal notification has been made, an Incident Report Form is to be completed by the employee and/or Supervisor/Project Manager and submitted to the People & Safety Team immediately following care of the incident. This form is available on the Safety App (smart phones) and on the Safety page on the GEI intranet.

Upon notification from a Branch or Office Manager, Human Resources, and/or the receipt of the Incident Report Form, the Regional Health & Safety Officer (RHSO) will conduct an investigation and evaluation on what happened and how and why it happened. The Corporate Health and Safety Officer (CHSO) will then recommend (as necessary) engineering controls, personal protection equipment, training or other appropriate measures to minimize the potential for future injuries. The CHSO/RHSO may develop educational information based on lessons learned for distribution to GEI employees.

1.8 Limitations

Follow safety procedures as defined in the site-specific HASP. Appropriate PPE will be worn correctly to provide the intended level of protection.

STANDARD OPERATING PROCEDURES

SOP No. HS-018 Working Around Heavy Equipment

1.1 Objective

The objective of this Standard Operating Procedure (SOP) is to prevent or limit the physical hazards when working around heavy equipment.

1.2 General

This SOP is intended for use by employees engaged in work with the potential for working near heavy equipment. The project site-specific health and safety plan (HASP) should include a hazard assessment for working near heavy equipment to be implemented by GEI employees. These hazards should be reviewed in the project safety briefing and documented on the Project Safety Briefing form, found on the Safety page of the GEI intranet.

1.3 Heavy Equipment Precautions

Heavy equipment (e.g., excavators, backhoes, drill rigs, etc.), can present many physical hazards that can result in serious injury or death if the proper safety precautions are not followed. The following is a list of precautions to be aware of when working around heavy equipment:

- Wear appropriate personal protective equipment (PPE), including at a minimum reflective, high-visibility safety vest, hard hat, safety glasses, and steel/composite toe boots.
- Always keep your distance from moving equipment.
- Do not assume the operator knows where you are or where you are going.
- Make sure to make eye contact and receive acknowledgement of your presence with the operator.
- Avoid working near heavy equipment, but if unavoidable, communicate your location with the operators. If using hand signals, discuss the signals with the equipment operator prior to starting work.
- Watch for moving equipment. Construction sites can have a lot of activity and equipment may be moving in an unpredictable manner.
- Do not rely on back-up or other alarms. They may not be working or you may not hear them with the noise of other activities taking place in the area.
- Stay out of the swing radius of cranes, excavators, or other equipment that swings or rotates.
- Do not walk beside a moving vehicle, the vehicle may turn, slip, or the load may shift causing the vehicle to go off course.
- Do not ride on the outside of a moving equipment.

- Never walk under or stand too close to a load suspended by cranes or hoists.
- Do not walk behind a piece of equipment that is backing up without acknowledgment from the operator it is safe to proceed. If working next to heavy equipment is unavoidable, be aware of the hazards including pinch points and moving parts. Use a spotter to watch the work area for moving equipment.
- If necessary, ask the operator to stop equipment operation to perform your work tasks.
- Verify the location and operation of emergency shut-off devices on the equipment.
- Be aware of the fuels and chemicals associated with the equipment. Have a spill prevention and response plan in place that includes the appropriate containment materials (i.e., spill kit).
- Do not wear loose fitting clothing when working around moving equipment (i.e., drill rig augers).
- Do not operate heavy equipment.
- Do not use cellular telephones near operating equipment.

1.4 Injury Reporting

If a GEI employee suffers an injury on the job that is not life threating, call Medcor Triage at 1-800-775-5866 to speak with a medical professional. Then, immediately report the injury to the Supervisor/Project Manager and Regional Safety Officer.

After verbal notification has been made, an Incident Report Form is to be completed by the employee and/or Supervisor/Project Manager and submitted to the People & Safety Team immediately following care of the incident. This form is available on the Safety App (smart phones) and on the Safety page on the GEI intranet.

Upon notification from a Branch or Office Manager, Human Resources, and/or the receipt of the Incident Report Form, the Regional Health & Safety Officer (RHSO) will conduct an investigation and evaluation on what happened and how and why it happened. The Corporate Health and Safety Officer (CHSO) will then recommend (as necessary) engineering controls, personal protection equipment, training or other appropriate measures to minimize the potential for future injuries. The CHSO/RHSO may develop educational information based on lessons learned for distribution to GEI employees.

1.5 Limitations

Follow safety procedures as defined in the site-specific HASP. Appropriate PPE must be worn correctly to provide the intended level of protection.

STANDARD OPERATING PROCEDURES
SOP NO. HS-026 Hazard Identification and Management

1.1 Objective
This Standard Operating Procedure (SOP) is intended to outline the steps GEI employees will take to identify potential hazards on site, the risks associated with these hazards, and the proper engineering controls, work practices, and personal protective equipment (PPE) to use to minimize the associated risks.

1.2 Hazard Identification
Establishing proper work procedures by conducting a job hazard analysis will should be performed for all projects involving field work. An initial identification of hazards will be completed based on past and current property usage of the site, what tasks are required to perform the job, what equipment is needed to complete the assigned tasks, what hazards are in the working area etc.

The site-specific health and safety plan (HASP) will include a hazard assessment for the project that identifies the potential hazards and how to alleviate the hazard. These hazards will be reviewed in the project safety briefing and documented on the Project Safety Briefing form, found on the Safety page of the GEI intranet.

1.3 Risk Assessment
A risk assessment will be performed for all aspects of field work. This analysis is to determine the quantitative or qualitative value of risk related to a tangible situation and a recognized hazard. Identification, studies, and monitoring of any hazard to determine its potential, origin, characteristics, and behavior are examples of what could be included and performed during a risk assessment. The assessment will increase awareness of workplace hazards and provide an opportunity to identify and control workplace hazards.

1.3.1 Assessment Guidelines
It is necessary to consider certain general guidelines for assessing the foot, head, eye and face, and hand hazard situations that exist in an occupational operation or process, and to match the protective devices to the particular hazard.

Assessments should be conducted:

- Prior to starting any work at the site
- As conditions change
- Workplace layout changes
- Environmental changes
- Process changes

- Yearly or other pre-determined interval

1.3.2 Hazard Sources

Some examples of hazard sources include but are not limited to:

- Items, materials, or machinery in motion
- Extreme temperatures
- Chemical exposures
- Harmful dust
- Light radiation
- Falling objects or potential from dropping objects
- Sharp objects
- Rolling or pinching objects
- Layout of workplace and location of co-workers
- Electrical hazards
- Noise exposures
- Confined spaces
- Working near or on water
- Fall hazards
- Traffic or other activities taking place on the site
- Air quality issues

1.4 Prevention – Control Methods

Control methods should be considered in the following hierarchy:

- Elimination
- Substitution
- Engineering Controls
- Administrative Controls
- Personal Protective Equipment

1.4.1 Elimination and Substitution

Elimination and substitution, while most effective at reducing hazards, also tend to be the most difficult to implement in an existing process. If the process is still at the design or development stage, elimination and substitution of hazards may be inexpensive and

simple to implement. For an existing process, major changes in equipment and procedures may be required to eliminate or substitute for a hazard. Employees should work with the Safety Team to find solutions.

1.4.2 Engineering Controls

Engineering controls are used to remove a hazard or place a barrier between the work and the hazard. It's implemented to control the hazard at the source. Examples may include machine guards, sound deading/dampening panels, traffic barriers, guardrails, and shields.

1.4.3 Administrative Controls

Administrative controls change the work procedures such as programs, schedules, and supervision to reduce employee exposure to hazards. The controls are frequently used with existing processes where hazards are not particularly well controlled. Examples of administrative controls are requiring frequent breaks or implementing a specific method to perform a task.

1.4.4 Personal Protective Equipment Selection

To select the proper PPE, the potential hazards must be known. The protective equipment selected must ensure a level of protection *greater than* the minimum required in order to help protect employees. The user must be supplied with a properly fitting protective device and given instructions on care and use. Users must be aware of all warning labels for and limitation of the PPE. Employees must be aware that the PPE does not eliminate the hazard.

1.4.5 Hazard Re-Assessment

As necessary, the workplace should be re-assessed for hazards by identifying and evaluating new equipment and processes, reviewing accident records, and re-evaluating the suitability of previously selected PPE. Re-assessment should occur at a defined regular schedule interval.

1.5 Job Safety Analysis

A job safety analysis (JSA) sometimes referred to as a job hazard analysis (JHA) or an activity hazard analysis (AHA) is the breaking down of any method or procedure into its component parts to determine the hazards connected with each key step and the requirements for performing it safely.

When a JSA is being created, make sure it isn't too general where the resulting information is not enough to assess the hazard and select proper controls, and be careful not to add unnecessary steps.

1.6 Injury Reporting

If a GEI employee suffers an injury on the job that is not life threating, call Medcor Triage at 1-800-775-5866 to speak with a medical professional. Then, immediately report the injury to the Supervisor/Project Manager and Regional Health & Safety Officer (RHSO).

After verbal notification has been made, an Incident Report Form is to be completed by the employee and/or Supervisor/Project Manager and submitted to the People & Safety Team immediately following care of the incident. This form is available on the Safety App (smart phones) and on the Safety page on the GEI intranet.

Upon notification from a Branch or Office Manager, Human Resources, and/or the receipt of the Incident Report Form, the RHS) will conduct an investigation and evaluation on what happened and how and why it happened. The Corporate Health and Safety Officer (CHSO) will then recommend (as necessary) engineering controls, personal protection equipment, training or other appropriate measures to minimize the potential for future injuries. The CHSO/RHSO may develop educational information based on lessons learned for distribution to GEI employees.

1.7 Limitations

Limitations may arise on a project specific basis and will be addressed as they arise.

1.8 Attachments

None.

STANDARD OPERATING PROCEDURES

SOP No. HS-028 Trailer Use

1.1 Objective

This Standard Operating Procedure (SOP) provides requirements and recommendations to minimize the potential risks of towing a trailer behind a vehicle.

1.2 General Trailer Operation

Licensing and requirements for towing a trailer vary from state to state. Know and adhere to the specific requirements for your state and for the states in which you may travel with a trailer in tow.

1.2.1 Personal Protective Equipment

Employees will be provided with the personal protective equipment (PPE) necessary to help protect them from the hazards associated with towing a trailer. All employees will wear work gloves and steel toe or composite toe boots, at a minimum. Most hand injures can be avoided with the proper use of PPE. PPE must be maintained in good condition, kept clean and properly stored when not in use. More information regarding PPE is located in Section 6 of GEI's Corporate Health and Safety Program.

1.2.2 Trailer Hook-up and Detachment

Proper attachment of the trailer to the towing vehicle is essential to safety transport equipment and materials and to avoid vehicle and trailer damage, citations/fines, or traffic accidents. Potential risks may include overloading, separation of the trailer from the vehicle, and improperly working trailer brakes or lights.

Consult the tow vehicle owner's manual to confirm that the vehicle is capable of towing a trailer, and note any additional requirements or necessary equipment. Check the tow vehicle's tire pressure, which may need to be increased for hauling heavy loads. If you are towing a trailer that is wider than your tow vehicle, extended side-view mirrors will be needed to see rear and side approaching traffic. Know and understand the weight capacities of the tow vehicle and trailer as well as the weight of your equipment and cargo. If weight of the unloaded trailer is in question, go to a truck scale to confirm the weight.

> Gross Vehicle Weight Rating (GVWR) = amount the tow vehicle may weigh when fully loaded
>
> Gross Combined Weight Rating (GCWR) = amount the tow vehicle actually weighs when fully loaded

Follow these steps when attaching a trailer to the tow vehicle:

- Check tow vehicle's GVWR and trailer's GVWR to find maximum load limit for the vehicle/trailer combination.
- Confirm that the ball size on the tow vehicle matches the trailer tongue receiver.
- Back up to trailer with the assistance of a spotter (if available).
- Always wear appropriate PPE, at a minimum this includes work gloves, safety glasses, and steel or composite toe boots.
- Lower trailer hitch receiver onto ball until jack stand is off the ground, then properly stow jack stand. Make sure fingers and hands are not between the hitch and ball when lowering.
- Lock the latch and insert pin to secure (if possible, lift trailer tongue to check).
- Attach the trailer's safety chains to the tow vehicle, crisscrossing in an "X" shape.
- Plug trailer wiring harness into truck.

After completing attachment, walk around the trailer to verify all connections are secured, hitch is latched, jack stand is stowed, and tire blocks (chocks) are removed.

Prior to departure, these items must be tested and confirmed to be in working order on both the trailer and the tow vehicle:

- Running lights.
- Turn signals.
- Brake lights.
- Tire pressure, per vehicle owner's manual, specific to towing.
- Adjust side view mirrors to allow sight of trailer sides and tires.
- Check that the lug nuts/bolts on the tow vehicle and trailer are tightened to the correct torque, per vehicle owner's manual.
- If the trailer is equipped with brakes, check them by rolling forward and slightly applying the brake pedal. The trailer brakes should engage and you may feel a slight tug.
- Most trucks are equipped with a "Tow Haul" option. Engage the "Tow Haul" option and adjust the braking tension as need. See the vehicle owner's manual for how to do this. Make sure this option is used when hauling the trailer.

1.2.3 Loading Equipment onto Trailer

Confirm that the trailer tongue is securely attached to the ball of the vehicle. Park on level ground and engage the tow vehicle's emergency brake. Have another employee help with the loading/unloading of equipment onto the trailer. *Refer to* SOP No. HS-025 Manual Lifting to ensure safe lifting practices are followed. Lower the loading ramps or place detached loading ramps in designated rail and attach safety straps, if equipped. Adjust

ramps as necessary to accommodate the width of the tires on the equipment being loading if applicable. Align the equipment's tires with the load ramps. If the equipment has an implement attached, lift it to the highest position to prevent dragging on the ground. If the equipment is equipped with a front-end loader, lift the bucket to sufficient height to avoid hitting the trailer or ramps, but do not lift bucket all the way up. Using the lowest gear available, slowly drive equipment onto the trailer, paying close attention to where the tires are tracking on the ramps. Once the equipment is in position, if applicable place it in "park", apply the parking brake, and turn the engine off. Replace the ramps in the transport position and secure with pins.

Cargo Weight Distribution

Position a tractor or other heavy machinery so that it is centered over the trailer's axle(s) or slightly ahead of the axle(s) to provide adequate tongue weight. Too much weight toward the rear of the trailer can result in fishtailing and loss of control while in tow. Distribute cargo weight evenly along the length of the trailer and balance weight from side to side. Refer to the trailers owner's manual for proper load distribution.

Securing Cargo

- Inspect all chains, binders, and ratchet straps for knots, wear, and/or cuts or other damage. Never use compromised materials to secure equipment on the trailer. Damaged equipment must be tagged as "damaged" and reported to the Branch Manager for replacement.
- All cargo shall be secured such that it cannot shift, tip, or roll during transit. Chock the front and rear of the tires of the equipment to prevent rolling.
- Secure tractors or other heavy machinery to trailer with a minimum of two chains, one pulling tractor forward and one pulling backward. The collective working load limit (WLL) for all chains must equal at least half the weight of the tractor/machine.
- Secure implement using at least one chain or strap with the appropriate working load limit.
- All straps, chains, and other tie-downs must be attached and secured in a manner that prevents them from becoming loose, unfastening, opening, or releasing while the vehicle is in transit. Do not place tie-downs where they may be cut or torn by sharp edges on the cargo or trailer.

1.2.4 Driving with Trailer

Approximately 5 to 10 miles from your starting point, pull over in a safe place such as a parking lot to check that the load has not shifted and all cargo is secure. When driving with a trailer take these items into consideration:

- Recheck lights, hitch, and securement at each stop during travel.
- Acceleration is slower with a trailer in tow, so allow extra time/distance when

merging into traffic, changing lanes, and crossing traffic.

- Make wider turns to avoid collision at curves and corners.
- Know your trailer height to ensure you may safely clear bridges and overpasses along your route.
- Allow considerably more distance for stopping. Increase and maintain a greater distance between the tow vehicle and the vehicles in front of it. The amount of distance needed will depend on many factors for example the size of the vehicle and trailer, total weight of both, weather conditions, speed, etc.
- Do not apply brakes if trailer starts to sway; instead, release the accelerator pedal to reduce speed. Once the vehicle is under control, find a safe location to park and re-check the weight distribution.

1.2.5 Backing Up

Whenever possible, use a spotter while backing up. If a spotter is not available, walk around the vehicle and trailer before backing up to ensure no people or objects are in the path. Do not allow the trailer to jackknife. Pull forward to straighten out when necessary.

1.2.6 Parking

When parking the trailer, select level ground and confirm that the parking space is of sufficient size (length and width) to accommodate the trailer's dimensions, including wheel wells and tongue. Place chocks at the front and rear of the trailer wheels to prevent rolling.

1.3 Training

Drivers must complete training and pass a skills test before being approved as an operator qualified to tow vehicles.

1.4 Injury Reporting

If a GEI employee suffers an injury on the job that is not life threating, call Medcor Triage at 1-800-775-5866 to speak with a medical professional. Then, immediately report the injury to the Supervisor/Project Manager and Regional Safety Officer.

After verbal notification has been made, an Incident Report Form is to be completed by the employee and/or Supervisor/Project Manager and submitted to the People & Safety Team immediately following care of the incident. This form is available on the Safety App (smart phones) and on the Safety page on the GEI intranet.

Upon notification from a Branch or Office Manager, Human Resources, and/or the receipt of the Incident Report Form, the Regional Health & Safety Officer (RHSO) will conduct an investigation and evaluation on what happened and how and why it happened. The Corporate Health and Safety Officer (CHSO) will then recommend (as necessary) engineering controls, personal protection equipment, training or other appropriate

measures to minimize the potential for future injuries. The CHSO/RHSO may develop educational information based on lessons learned for distribution to GEI employees.

1.5 Limitations

Each driver must operate within the specific limitations set forth by his or her current driver's or operator's license.
